1104. Numerous new entrants and state commissions recommend that bill-and-keep arrangements be implemented on an interim basis[2673] and note that reciprocal compensation arrangements will not be practical until mechanisms are developed to measure the relevant traffic volumes.[2674] Ameritech, however, argues that parties advocating mandating bill-and-keep arrangements on an interim basis do not take into account that the period during which the new carriers first enter a local market will be the time during which traffic is most unbalanced between the new entrants and the incumbent LEC.[2675] BellSouth argues that characterizing bill and keep as an interim arrangement does not remedy the problems associated with bill and keep.[2676]

1105. Some commenters opposed to bill-and-keep arrangements also argue that mandating these arrangements violates the takings clause of the Fifth Amendment.[2677] Numerous incumbent LECs argue that mandating bill-and-keep arrangements requires a LEC to transport and terminate traffic of another LEC, constituting a physical intrusion into the LEC's property.[2678] BellSouth further asserts that bill and keep would lead to no compensation for use of incumbent LEC property and will therefore constitute an uncompensated taking in violation of the Constitution.[2679] AT&T responds that there is no basis for the argument that bill and keep would be a taking.[2680] AT&T asserts that these claims are speculative and rest on an erroneous premise that bill-and-

---

keep would provide no (or inadequate) compensation.[2681] AT&T argues that, as Congress recognizes, bill and keep allows each carrier in-kind compensation in the form of access to the other carrier's network.[2682] Similarly, Ohio Consumers' Counsel argues that a bill-and-keep mechanism makes each company whole through its own rate design and structure. As such, Ohio Consumers' Counsel argues that allegations that bill and keep means that a competing carrier gets to use the incumbent LEC's network for free cannot withstand scrutiny.[2683] NCTA asserts that bill and keep is not "physical occupation" of the incumbent LEC property, and furthermore does not authorize an invasion of incumbent LEC property, any more than it authorizes incumbent LECs to invade a new entrant's property.[2684] In response to the confiscation argument, NCTA contends that rate regulation does not violate the takings clause unless it is so "unjust as to destroy the value of the property for all purposes for which it was acquired."[2685]

1106. Some wireless commenters argue that bill-and-keep arrangements are not appropriate for incumbent LEC-narrowband CMRS or incumbent LEC-paging reciprocal compensation.[2686] ProNet argues that, because paging carriers' incremental termination costs are above zero and there is no evidence that paging demand is inelastic, imposing bill and keep would likely result in serious resource misallocation.[2687] In addition, PageNet argues that, with respect to paging, the cost of termination is not small and in fact comprises a significant portion of the total revenue requirement for paging services.[2688] With respect to rural incumbent LECs, Bay Spring argues that states should be prohibited from adopting bill-and-keep arrangements to the extent that they force rural incumbent LECs to terminate other carriers' calls on their rural networks without compensation.[2689]

[2689] Bay Springs, et. al comments at 17; *see also* GVNW comments at 41; Bay Springs et. al reply at 11-12 (incremental termination costs are higher for small LECs because the smaller size of their networks reduce economies of scale).

1107. *LEC-CMRS Interconnection NPRM.* CMRS providers, with the exception of paging providers, generally support the Commission's proposal to adopt an interim bill-and-keep compensation mechanism.[2690] Some supporters of an interim bill-and-keep compensation model argue that it should be adopted on a permanent basis,[2691] and others argue that it should be extended to transport charges.[2692] PageNet and other paging providers oppose application of a bill-and-keep compensation mechanism to the paging industry because traffic flows are entirely one-way.[2693] Sprint supports application of an interim bill-and-keep model solely for incumbent LEC-PCS interconnection.[2694]

1108. Most CMRS providers contend that bill and keep is an appropriate interim compensation mechanism because the incremental cost of incumbent LEC-CMRS interconnection is so low that there is little difference between a cost-based and zero rate.[2695] Cox and other commenters cite the Brock study's conclusions that the national average incremental cost of incumbent LEC-CMRS interconnection is 0.2 cents per minute and that the off-peak cost is close to zero as support for adoption of an interim bill-and-keep model.[2696] Cox contends that none of the incumbent LECs has submitted evidence that the average incremental cost of call termination is anything other than 0.2 cents per minute.[2697] In addition, APC notes that it has relatively balanced traffic flows with incumbent LECs[2698] and a number of CMRS providers assert that incumbent LEC-cellular traffic flows will become more balanced in the future.[2699] AT&T states

that any traffic imbalances are offset by the higher cost to CMRS providers of terminating incumbent LEC-originated calls.[2700] Similarly, CTIA asserts that the relevant inquiry is whether the costs each carrier incurs to terminate traffic are balanced, not whether total traffic is balanced.[2701] Some commenters argue that bill and keep is necessary to curb incumbent LEC market power and to remedy incumbent LECs' failure to provide mutual compensation.[2702]

1109. Incumbent LEC commenters, however, generally oppose the Commission's proposal to adopt an interim bill-and-keep compensation mechanism.[2703] A number of incumbent LECs contend that neither of the two conditions that justify a bill-and-keep compensation mechanism -- balanced traffic flows or interconnection costs near zero -- are present in the context of incumbent LEC-CMRS interconnection.[2704] SBC states that bill-and-keep is inappropriate where 80 percent of traffic is CMRS-to-incumbent LEC.[2705] USTA asserts that CMRS interconnection causes incumbent LECs to incur costs for which they should be compensated, and estimates that those costs are 1.3 cents ($0.013) per minute.[2706] Other incumbent LECs contend that the Brock study underestimates the costs of incumbent LEC-CMRS interconnection, but provide no cost estimates of their own.[2707] In addition, many opponents of bill-and-keep contend that it will create market distortions and encourage arbitrage.[2708] Some incumbent LEC commenters assert that incumbent LECs will be unable to recover from ratepayers the lost revenues from LEC-CMRS interconnection charges,[2709] and that bill and keep

is an unlawful taking.[2710] U S West disputes the Commission's contention that bill-and-keep is administratively efficient because, it argues, carriers will still have to develop billing and accounting systems.[2711]

1110. Several commenters propose alternatives to the Commission's proposed bill-and-keep interim compensation mechanism. For example, Frontier suggests that the Commission adopt a benchmark compensation scheme similar to that offered by Ameritech in Illinois, which sets a rate of .5 cents ($0.005) per minute for end office termination and .75 cents ($0.0075) per minute for tandem termination.[2712] CMS recommends that bill and keep apply for a two year voluntary period, after which a mandatory negotiation period under bill and keep would be imposed if the parties fail to reach agreement.[2713] RCC proposes that bill and keep be used only until a "carrier access billing system" can be implemented.[2714]

c. Discussion

1111. As an additional option for reciprocal compensation arrangements for termination services, we conclude that state commissions may impose bill-and-keep arrangements if neither carrier has rebutted the presumption of symmetrical rates and if the volume of terminating traffic that originates on one network and terminates on another network is approximately equal to the volume of terminating traffic flowing in the opposite direction, and is expected to remain so, as defined below. We disagree with commenters who contend that the Commission and states do not have the authority to mandate bill-and-keep arrangements under any circumstances. Section 252(d)(2)(B)(i) provides that the definition of what may be considered "just and reasonable" terms and conditions for reciprocal compensation "shall not be construed to preclude arrangements that afford mutual recovery (such as bill-and-keep arrangements)."[2715] We conclude that section 252(d)(2) would be superfluous if bill-and-keep arrangements were limited to negotiated agreements, because none of the standards in section 252(d) apply to voluntarily-negotiated agreements. Therefore, it is clear that bill-and-keep arrangements may be imposed in the context of the arbitration process for termination of traffic, at least in some circumstances.

[2710] *See, e.g.*, Bell Atlantic comments in CC Docket No. 95-185 at 8; BellSouth comments in CC Docket No. 95-185 at 20; Pacific Bell comments in CC Docket No. 95-185 at 79; U S West comments in CC Docket No. 95-185 at 49.

[2713] CMS comments in CC Docket No. 95-185 at 17.

[2714] RCC comments in CC Docket No. 95-185 at 8-9.

[2715] 47 U.S.C. § 252(d)(2)(B)(i).

1112. Section 252(d)(2)(A)(i) provides that to be just and reasonable, reciprocal compensation must "provide for the mutual and reciprocal recovery by each carrier of costs associated with transport and termination."[2716] In general, we find that carriers incur costs in terminating traffic that are not *de minimis*, and consequently, bill-and-keep arrangements that lack any provisions for compensation do not provide for recovery of costs. In addition, as long as the cost of terminating traffic is positive, bill-and-keep arrangements are not economically efficient because they distort carriers' incentives, encouraging them to overuse competing carriers' termination facilities by seeking customers that primarily originate traffic. On the other hand, when states impose symmetrical rates for the termination of traffic,[2717] payments from one carrier to the other can be expected to be offset by payments in the opposite direction when traffic from one network to the other is approximately balanced with the traffic flowing in the opposite direction. In such circumstances, bill-and-keep arrangements may minimize administrative burdens and transaction costs. We find that, in certain circumstances, the advantages of bill-and-keep arrangements outweigh the disadvantages, but no party has convincingly explained why, in such circumstances, parties themselves would not agree to bill-and-keep arrangements. We are mindful, however, that negotiations may fail for a variety of reasons. We conclude, therefore, that states may impose bill-and-keep arrangements if traffic is roughly balanced in the two directions and neither carrier has rebutted the presumption of symmetrical rates.

1113. We further conclude that states may adopt specific thresholds for determining when traffic is roughly balanced. If state commissions impose bill-and-keep arrangements, those arrangements must either include provisions that impose compensation obligations if traffic becomes significantly out of balance or permit any party to request that the state commission impose such compensation obligations based on a showing that the traffic flows are inconsistent with the threshold adopted by the state.[2718] States may, however, also apply a general presumption that traffic between carriers is balanced and is likely to remain so. In that case, a party asserting imbalanced traffic arrangements must prove to the state commission that such imbalance exists. Under such a presumption, bill-and-keep arrangements would be justified unless a carrier seeking to rebut this presumption satisfies its burden of proof. We also find that states that have adopted bill-and-keep arrangements prior to the date that this order becomes effective, either in arbitration or rulemaking proceedings, may retain such arrangements, unless a party proves to the state commission that traffic is not roughly balanced. In that case, the state commission is to determine the termination rates based either on the forward-looking economic cost-based methodology or consistent with the default proxies in this order. Finally, we observe

---

[2716] 47 U.S.C. § 252(d)(2)(A)(i).

[2717] *See infra*, Section XI.A.4.c. for a discussion of symmetrical rates.

[2718] For example, the Michigan Commission adopted a five percent threshold for the difference between the traffic flows in the two directions. Michigan Commission comments at Attachment 1 (Michigan Public Service Commission Case No. U-10647), p.29.

that carriers have an incentive to agree to bill-and-keep arrangements if it is economically efficient to do so, and that nothing in the Act prevents parties from agreeing to bill-and-keep arrangements even if a state declines to mandate such arrangements. For example, we note that Time Warner/BellSouth interconnection agreement provides for a bill-and-keep arrangement based on a "roughly balanced traffic" concept.[2719]

1114. In determining whether traffic is balanced, we find that precise traffic measurement is not necessary. It is sufficient to use approximations based on samples and studies comparable to reports on percentages of interstate use often used for access charge billing. Such an approach is likely to reduce implementation costs and complexities. Alternatively, state commissions may require that traffic flowing in the two directions be measured as accurately as possible during some defined period of time, which may commence no later than six months after an interconnection arrangement goes into effect. All affected carriers are required to cooperate with the state commission in implementing this measurement. A state commission that adopts a traffic flow measurement approach may adopt a "true-up" mechanism to ensure that no carrier is disadvantaged by an interim rate that differs from the rate established once such a measurement is undertaken. Finally, state commissions may require that local traffic and access traffic be carried on separate trunk groups if they deem such measures to be necessary to ensure accurate measurement and billing.

1115. We have considered the economic impact of our rules in this section on small incumbent LECs. For example, RTC argues that bill-and-keep arrangements fail to adequately deal with each carrier's costs.[2720] In addition to basing reciprocal compensation on the incumbent LECs costs, we believe that by allowing carriers to rebut a presumption of balanced traffic volumes, the concern that bill-and-keep arrangements fail to adequately deal with each carrier's costs are addressed. We also note that certain small incumbent LECs are not subject to our rules under section 251(f)(1) of the 1996 Act, unless otherwise determined by a state commission, and certain other small incumbent LECs may seek relief from their state commissions from our rules under section 251(f)(2) of the 1996 Act.

1116. We disagree with commenters that argue that mandating bill-and-keep arrangements

---

[2719] Letter from W.W. Jordan, Executive Director, BellSouth, to William F. Caton, Acting Secretary, FCC, July 11, 1996. Per the agreement, no party shall owe compensation to the other unless the net minutes of use for terminating local traffic results in a dollar amount in excess of the amount designated for each month during the calculation period as follows: (1) during the first six month period of operation, no charges shall accrue, or compensation paid for the termination of local traffic, however, parties shall exchange billing information and usage data during this initial period for the purpose of reviewing for accuracy only; (2) during the second six months, $40,000 per month/billing period; (3) during the third six months, $30,000 per month/billing period; (4) during the fourth six months, $20,000 per month/billing period; and (5) during any extension of this agreement pursuant to Article II, paragraph 2.03, $0 per month/billing period.

[2720] RTC comments at 23.

in these circumstances violates the taking clause of Fifth Amendment. We reject BellSouth's argument that mandating bill-and-keep mechanisms would constitute a physical intrusion of LEC property. As NCTA observes, bill-and-keep arrangements are not a "physical occupation" of incumbent LEC property and thus *per se* takings cases[2721] are irrelevant. We also reject arguments that the bill-and-keep arrangements we adopt here would not adequately compensate incumbent LECs for transport and termination. As Congress recognized, bill-and-keep arrangements allow each carrier compensation "in-kind" in the form of access to the other carrier's network.[2722] Therefore, the type of bill-and-keep arrangements that we have permitted states to adopt are not unconstitutionally confiscatory.

1117. Commenters in the *LEC-CMRS Interconnection NPRM* assert that the estimated per minute cost of LEC termination ranges from 0.2 to 1.3 cents, and most of the estimates are clustered near the lower end of this range.[2723] These estimates are based primarily on interconnection at a LEC end office,[2724] while most interconnections occur at tandem offices where LECs' costs of call completion are higher than terminations routed directly through the end office switch.[2725] Moreover, the record contains no estimates of the cost of CMRS termination. That cost is generally considered to be greater than the cost of LEC termination;[2726] but only one oral, *ex parte* estimate of CMRS cost has been offered: 2.25 to 4.0 cents per minute.[2727] Further, there is no showing that the transaction costs of measuring traffic flows and making net payments would be so high that a bill-and-keep regime would be more efficient. Moreover, no party has demonstrated that aggregate cost flows between interconnecting LECs and CMRS providers are in balance.

[2721] *See Loretto v. Teleprompter Manhattan CATV Corp.*, 458 U.S. 419, 426 (1982); *Lucas v. South Carolina Coastal Council*, 112 S.Ct. 2886, 2893 (1992).

[2722] Joint Explanatory Statement at 120.

[2723] For the .2 cents per minute estimate, see letter from Robert F. Roche, CTIA, to William F. Caton, Acting Secretary, Federal Communications Commission, filed in CC Docket No. 94-54, Gerald W. Brock, *The Economics of Interconnection: Incremental Cost of Local Usage* (April 1995). For the 1.3 cents per minute estimate, *see* USTA Comments, CC Docket No. 95-185, submission of Jeffrey H. Rohlfs, Harry M. Shooshan III, and Calvin S. Monson, at 9-10.

[2724] *See supra*, Section VII.C.2.b.(2), for a complete discussion of cost estimates for terminations at both the end office and tandem office switches.

[2726] *See, e.g.*, AT&T comments in CC Docket No. 95-185 at Attachment (Declaration of Bruce M. Owen), p. 5-6.

[2727] Steven R. Brenner and Bridger M. Mitchell, CTIA *ex parte* briefing, CC Docket No. 95-185, Mar. 21, 1996.

1118. In light of the overall transport and termination policy we are adopting, we do not adopt the interim bill and keep arrangement tentatively proposed in the LEC-CMRS Interconnection NPRM. Notwithstanding our conclusions about bill and keep above, under which states may rule on bill and keep for particular pairs of firms based on the circumstances prevailing between them, we conclude that we are correct in not adopting bill and keep as a single, nationwide policy that would govern all LEC-CMRS transport and termination of traffic. Thus, we reject our tentative conclusion in the LEC-CMRS Interconnection NPRM. We expect, however, that when it is economically efficient to do so, parties will adopt bill and keep arrangements in the negotiation process. Also, as described above, a state commission may impose bill-and-keep arrangements with respect to CMRS-LEC traffic when it finds that traffic is roughly balanced and is expected to remain so.

B. ACCESS TO RIGHTS OF WAY

1. Overview

1119. Section 251(b)(4) imposes upon each LEC the "duty to afford access to the poles, ducts, conduits, and rights-of-way of such carrier to competing providers of telecommunications services on rates, terms, and conditions that are consistent with section 224."[2728] The access provisions of section 224, as amended by the 1996 Act, differ from the requirements of section 251(b)(4) with respect to both the entities required to grant access and the entities that may demand access. Section 224(f)(1) imposes upon all utilities,[2729] including LECs, the duty to "provide a cable television system or any telecommunications carrier with nondiscriminatory access to any pole, duct, conduit, or right-of-way owned or controlled by it."[2730] For purposes of section 224, the term "telecommunications carrier" excludes any incumbent LEC as that term is defined in section 251(h).[2731]

1120. In the NPRM, we sought comment on various aspects of this access requirement, as well as on section 224(f)(2) which creates the following limited exception to the obligations of section 224(f)(1):

> Notwithstanding paragraph (1), a utility providing electric service may deny a cable

---

[2728] 47 U.S.C. § 251(b)(4).

[2729] A "utility" is "any person who is a local exchange carrier or an electric, gas, water, steam, or other public utility, and who owns or controls poles, ducts, conduits, or rights-of-ways used, in whole or in part, for wire communications," but does not include any railroad, any cooperative, or any federally or state-owned entities. 47 U.S.C. § 224(a)(1).

[2730] 47 U.S.C. § 224(f)(1). *See* 47 U.S.C. § 153(44) (definition of "telecommunications carrier").

[2731] 47 U.S.C. § 224(a)(5).

television system or any telecommunications carrier access to its poles, ducts, conduits, or rights-of-way, on a non-discriminatory basis where there is insufficient capacity and for reasons of safety, reliability and generally applicable engineering purposes.[2732]

1121. Additionally, we sought comment on section 224(h), which provides:

Whenever the owner of a pole, duct, conduit, or right-of-way intends to modify or alter such pole, duct, conduit, or right-of-way, the owner shall provide written notification of such action to any entity that has obtained an attachment to such conduit or right-of-way so that such entity may have a reasonable opportunity to add to or modify its existing attachment. Any entity that adds to or modifies its existing attachment after receiving such notification shall bear a proportionate share of the costs incurred by the owner in making such pole, duct, conduit, or right-of-way accessible.[2733]

1122. In this Order, we establish rules implementing these provisions. Based on the comments received and the plain language of the statute, and in furtherance of our original mandate to institute an expeditious procedure for determining just and reasonable pole attachment rates with a minimum of administrative costs and consistent with fair and efficient regulation,[2734] we adopt herein a program for nondiscriminatory access to poles, ducts, conduits and rights-of-way. This Order includes several specific rules as well as a number of more general guidelines that are designed to give parties flexibility to reach agreements on access to utility-controlled poles, ducts, conduits, and rights-of-way, without the need for regulatory intervention. We provide for expedited dispute resolution when good faith negotiations fail, and we establish requirements concerning modifications to pole attachments and the allocation of the cost of such modifications. We also explain the division of responsibility between federal and state regulation envisioned by the 1996 Act.

2. Section 224(f): Non-discriminatory access

a. Background

1123. Pursuant to section 224(f)(1), a utility must grant telecommunications carriers and cable operators nondiscriminatory access to all poles, ducts, conduits, and rights-of-way owned or

[2732] 47 U.S.C. § 224(f)(2).

[2733] 47 U.S.C. § 224(h).

[2734] S. Rep. No. 580, 95th Cong., 1st Sess. 19 (1977).

controlled by the utility.[2735] This directive seeks to ensure that no party can use its control of the enumerated facilities and property to impede, inadvertently or otherwise, the installation and maintenance of telecommunications and cable equipment by those seeking to compete in those fields. Section 224(f)(1) appears to mandate access every time a telecommunications carrier or cable operator seeks access to the utility facilities or property identified in that section, with a limited exception allowing electric utilities to deny access "where there is insufficient capacity and for reasons of safety, reliability and generally applicable engineering purposes."[2736] While Congress recognized the legitimate interests of utilities in protecting and promoting the safety and reliability of their core services, on balance we believe section 224(f) reflects Congress' determination that utilities generally must accommodate requests for access by telecommunications carriers and cable operators.

b. Comments

1124. The comments relating to nondiscriminatory access describe in substantial detail a wide variety of largely technical issues and concerns. We will review the finer points raised by commenters in subsequent discussion sections devoted to particular issues. Here, we discuss the comments to the extent they provide an overview of access issues and we summarize the positions of the parties generally.

1125. NEES states that, historically, providers of electric and telephone services have installed and maintained transmission and distribution lines overhead and underground.[2737] According to NEES, the methods by which utilities install and maintain facilities vary depending upon a number of factors, including the type of utility service provided, the specific type of equipment being used, and various local conditions and regulations. Utilities state that their facilities often occupy public rights-of-way with other utilities or are constructed on private property pursuant to easements granted by the property owners.[2738] Utilities often are empowered to take property by eminent domain in order to install facilities and provide service.[2739] Because

---

[2735] As noted, a utility's obligations under section 224(f)(1), however, do not extend to incumbent LECs which are excluded from the definition of "telecommunications carriers" under section 224(a)(5). *See infra*, Section E(3)(c) for a discussion of the incorporation of this provision into section 251(b)(4).

[2736] 47 U.S.C. § 224(f)(2).

[2737] Facilities used to transport electricity generally can be divided into transmission facilities and distribution facilities. Transmission facilities deliver bulk power at high voltages across long distances for the ultimate use of a large number of customers. Distribution facilities deliver electricity at lower voltages to individual subscribers within a community. Electric transmission and distribution lines can be installed either on overhead poles and towers, or within underground ducts and conduit. NEES comments at 3.

[2738] PECO comments at 2-3; NEES comments at 4.

[2739] PECO comments at 2-3; Duquesne comments at 14-15.

of economic factors and space considerations, new entrants in the utility fields, as well as providers of cable television and other services, generally must "piggyback" on the poles and conduits of the incumbent utilities in order to provide service.[2740]

1126. The relationship between the general access requirement of section 224(f)(1) and the limited exception contained in section 224(f)(2) reflects long-standing, and sometimes contentious, relationships between utilities and various service providers seeking access to those facilities.[2741] Historically, access to utility poles, conduits, and other facilities has been governed by private pole attachment agreements entered into between the parties in accordance with a patchwork of federal, state, and local regulations and industry standards.[2742] Commenters extensively debate the extent to which our rules implementing section 224(f)(1) and (f)(2) should incorporate various aspects of these standards and requirements. Many utilities claim that existing regulations and standards, including those imposed unilaterally by individual utility companies, should continue to be observed.

1127. Generally, utilities argue that the nondiscrimination obligations set forth in the Act should not be triggered when a utility's facility has not previously been used by cable or telecommunications service providers.[2743] Requiring access accommodation, it is argued, may constitute a taking under the Fifth Amendment takings clause because the right to exclude others from the facility is an inherent attribute of property ownership that would be compromised by mandated access provisions.[2744] Alternatively, some parties suggest that, if access is allowed, utilities should have substantial discretion to set the terms and conditions of such access depending on the nature of the service involved because different technologies present varying levels of risk.[2745] Utilities contend that a wide variety of issues arise in the pole attachment context and that national rules governing questions of access would fail to accommodate the range of concerns that could justify a denial of access.[2746] For this reason, they request that the Commission eschew national rules in favor of individual case adjudication when a cable operator

or telecommunications carrier is denied access to a utility's pole or other facility.[2747] Electric utilities, in their comments, request that distinctions be made between facilities used for electric power and those used for other services, including telecommunications services.

1128. On the issue of capacity constraints, utilities strongly favor explicit provisions that would allow utilities to reserve capacity sufficient to meet future needs.[2748] They suggest space reservations are critical to enable utilities to meet expansion plans and ensure the fulfillment of existing obligations. For example, reserve space may be needed for the emergency replacement of failed components.[2749] Although capacity can sometimes be expanded, utilities argue for authority to deny access when providing access would require the expansion of existing capacity.[2750] If Congress intended utilities to expand existing capacity to accommodate new service providers, they argue, it would have granted utilities the power of eminent domain for this purpose.[2751]

1129. Utility commenters present various approaches to determining the amount of reserved capacity that should be recognized under the Commission's rules. Some oppose precise quantifiable reservations, advocating instead a case-by-case adjudication of the allowed reservation with deference to a utility's prior practices.[2752] At least one commenter, however, supports quantifiable limits as a safe harbor for access denials and suggests that a utility be permitted to reserve of 25% of remaining pole space.[2753]

1130. As for safety and reliability factors upon which access can be denied, utilities urge the Commission to resist the adoption of specific rules because the circumstances affecting safety and reliability are too diverse for precise regulatory packaging. One commenter suggests that the method of delivering electricity varies among utilities and a single set of safety rules would not account for these varying delivery methods.[2754] Although utilities have indicated that some broad

national safety standards, such as the National Electric Safety Code ("NESC"),[2755] may be useful to guide parties regarding access generally, they argue stricter standards beyond such accepted codes would not be workable. Instead, utilities propose case-by-case adjudication of disputes because the range of applicable circumstances will frustrate attempts at regulatory specificity.[2756]

1131. To some degree, the comments of LECs reflect concerns similar to those expressed by electric utilities. With respect to the definition of nondiscrimination, however, the Commission received a diverse range of opinion from LEC commenters. Some LECs argue that nondiscrimination does not require parity with the access terms that a facility owner provides to itself because the statute does not explicitly require such parity,[2757] or because requiring parity would work an unconstitutional taking by relegating a facility owner to non-owning status.[2758] Other LECs argue that nondiscrimination obligates facility owners to provide access similar to what the owner provides to itself for similar uses.[2759] Another commenter suggests that the requirement of nondiscrimination prohibits discrimination against entities competing against the facility owner's affiliate, but does not necessarily require parity as long as the facility owner does not impose unreasonable impediments on the use of the facility by unaffiliated entities.[2760]

1132. Generally, LECs oppose detailed rules regarding nondiscrimination and access, arguing in favor of flexibility to accommodate individual circumstances,[2761] and to promote private industry negotiation.[2762] LEC commenters cite a variety of situations that, in their view, present circumstances that cannot be regulated beyond the articulation of broad guidelines or principles. They argue against the imposition of standards for determining sufficient capacity because utilities need flexibility to make good faith judgments about future service demands.[2763] One LEC commenter, however, advocates capacity reservations based on a five-year business

forecast.[2764]

1133. Similarly, LECs oppose specific standards governing access denials due to safety and engineering concerns. LECs argue that municipal rules have governed this area for years, obviating the need for federal guidelines.[2765] In their view, established safety codes exist and additional standards imposed at the federal level may conflict with these accepted standards.[2766] A wide variety of concerns could affect the safety and reliability of a network and attachments to poles within a network, according to commenters, including wind resistance, local height regulations, working space requirements between attachments, national safety codes and federal and state occupational safety rules.[2767] Although the precise language of section 224(f)(2) allows electric utilities to deny access for safety, reliability, and engineering concerns, LECs contend they confront the same concerns and need the same authority to deny access when safety or network reliability is jeopardized.[2768]

1134. IXCs argue that nondiscrimination requires an incumbent LEC to provide access on the same terms and conditions that apply to the incumbent LEC or its affiliate.[2769] One IXC suggests that all users of poles and rights-of-way should pay the same rate regardless of the service provided. Under this view, uniform pricing would promote incipient competition.[2770] IXCs contend, however, that access obligations are not reciprocal or symmetrical under section 224. Rather, they contend regulatory asymmetry is required under section 251(b)(4) because that section incorporates section 224 which specifically exempts incumbent LECs from the class of entities entitled to access.[2771]

1135. On capacity questions, IXCs argue strongly for limits on the amount of capacity utilities can reserve for future use. Essentially, they contend the reservation of space, if allowed at all, must be circumscribed by precise standards. For example, a reservation might be allowed

[2771] *See* 47 U.S.C. § 224(a)(5); AT&T reply at 24. One LEC argues, however, that section 251 obligations apply to all LECs, including IXCs if they become LECs within the meaning of the Act. PacTel reply at 23.

for use within a one-year forecast period.[2772] IXCs also contend that claims of insufficient capacity must be scrutinized carefully and that LECs, to the extent they deny access due to capacity constraints, must carry the burden of proving access requests from competitors cannot be accommodated.[2773]

1136. As for safety and reliability concerns, AT&T argues for specific standards to define circumstances under which access can be denied. Whether or not quantifiable standards are adopted, AT&T suggests that the burden of proof should be on utilities to prove they meet applicable standards because utilities or other facility owners, rather than the parties requesting attachments, would have access to information needed to evaluate a particular claim.[2774] Moreover, AT&T argues, under the literal terms of section 224(f)(2), only electric utilities, not incumbent LECs, have explicit authority to justify access denials based on safety, reliability or engineering concerns.[2775]

1137. CAPS favor a literal construction of nondiscrimination, arguing that a loose definition of the term could entice incumbent LECs and utilities to obstruct competition.[2776] Despite recognition that, for the most part, incumbent LECs have been cooperative in allowing access to poles, they contend that on several occasions, LECs and utilities have obstructed such access.[2777] With respect to capacity sufficiency, CAPS agree with LECs that available capacity is a fact-dependent issue, but encourage the Commission to establish standards that would ensure access when existing facilities can be configured to accommodate new telecommunications entrants.[2778] In addition, they support placing the burden of proof to justify denials of access on LECs and utilities subject to an audit of LEC outside plant records.[2779] Similarly, with respect to safety and reliability issues, CAPS advocate the adoption of standards requiring quantifiable threats to safety or reliability before access can be denied.[2780] They, along with the Telecommunications Resellers Association, also favor imposing proof burdens on LECs and

utilities in such cases.[2781] In addition, CAPS support limits on survey or engineering fees that utilities may charge before proceeding with a competitor's attachment or other facility installation.[2782]

1138. Cable operators emphasize that access to poles, conduits and other facilities of LECs and utilities is critical to their ability to compete in the provision of telecommunications services as facilities-based competitors.[2783] Generally, cable operators support a definition of nondiscrimination that ensures that utilities cannot provide access to their facilities that is inferior to that provided to themselves or their affiliates.[2784] Moreover, small cable operators expressed support for the adoption of detailed national rules which they contend will strengthen their ability to negotiate acceptable pole attachment terms.[2785]

1139. With respect to capacity concerns, cable operators urge the Commission to construe narrowly the conditions under which access can be denied based on claims of insufficient capacity. Because access is critical to facilities-based competition, they argue, the Commission should adopt capacity standards that presume the availability of access as long as the new competitor can overcome whatever obstacles stand in the way of making the pole or facility capable of additional attachments.[2786] To underscore the importance of access to facilities-based competition, NCTA notes that Congress explicitly incorporated access to poles, conduits and rights-of-way in both section 251(b)(4) and section 271(c)(2) of the 1996 Act, recognizing that accessibility to such facilities is critical to finding genuine competition in the provision of local exchange service.[2787]

1140. Similarly, with regard to access denials based on claims of safety, reliability or engineering concerns, cable operators support using the NESC as the benchmark for resolving disputes over such issues. To the degree factors or standards other than those set forth in the NESC are relied upon to justify access, cable operators support a presumption that such denials are unreasonable and support the imposition of proof burdens on any LEC or utility making such

claims.[2788]

1141. In their comments, state commissions emphasize their experience in dealing with pole attachment issues. One state commission indicates that its procedures for handling disputes concerning access to poles, conduits, and rights-of-way are sufficient and that any changes in procedures are unnecessary at this time.[2789] Moreover, state Commissions emphasize that the statute itself recognizes the prominent role of state and local regulation in the area of pole attachments, citing the preservation of state preemption of federal rules when a state has regulated in this area.[2790]

1142. With respect to the definition of nondiscrimination, state commissions urge us to ensure that incumbent LECs provide access to poles and other facilities on terms that do not discriminate unreasonably between similarly situated carriers.[2791] The Ohio Consumers' Counsel agrees, suggesting that nondiscrimination requires that LECs provide competitors access on the same terms it provides to itself or its affiliates.[2792] As for the various reasons that may be asserted to justify denial of access, the Ohio Commission and Ohio Consumers' Counsel argue that a heavy burden should be placed on the LEC or utility denying access to demonstrate whenever capacity constraints, safety issues or reliability concerns are claimed for the access denial.[2793]

c. Discussion

(1) Generally

1143. We conclude that the reasonableness of particular conditions of access imposed by a utility should be resolved on a case-specific basis. We discuss below the forum for such resolutions.[2794] The record makes clear that there are simply too many variables to permit any other approach with respect to access to the millions of utility poles and untold miles of conduit

[2794] *See infra*, Section E.

in the nation.[2795] The broader access mandated by the Act, in conjunction with the reasonableness variables mentioned here, will likely increase the number of disputes over access. In turn, this may cause small incumbent LECs and small entities to incur the need for additional resources to evaluate, process, and resolve such disputes, as well as to make poles and conduits physically accessible.[2796] We will not enumerate a comprehensive regime of specific rules, but instead establish a few rules supplemented by certain guidelines and presumptions that we believe will facilitate the negotiation and mutual performance of fair, pro-competitive access agreements. We will monitor the effect of this approach and propose more specific rules at a later date if reasonably necessary to facilitate access and the development of competition in telecommunications and cable services. We believe that the rules, guidelines and presumptions established herein strike the appropriate balance between the need for uniformity, on the one hand, and the need for flexibility, on the other, which should minimize the regulatory burdens and economic impact for both small entities and small incumbent LECs.[2797]

1144. We also address the impact on small incumbent LECs. For example, the Rural Telephone Coalition opposes adoption of sweeping national rules because local circumstances will be relevant to disputes over access to poles or rights-of-way.[2798] We have considered the economic impact of our rules in this section on small incumbent LECs. For example, we have adopted a flexible regulatory approach to pole attachment disputes that ensures consideration of local conditions and circumstances.

1145. Our determination not to prescribe numerous specific rules is supported by acknowledgements in the relevant national industry codes that no single set of rules can take into account all of the issues that can arise in the context of a single installation or attachment. The NESC, one of the national codes that virtually all commenters regard as containing reasonable attachment requirements, contains thousands of rules and dozens of tables and figures, all designed to ensure "the practical safeguarding of persons during the installation, operation, or maintenance of electric supply and communication lines and associated equipment."[2799]

1146. For example, with respect to overhead wires, the NESC contains 64 pages of rules dictating minimum "clearances," i.e., the minimum separations between a particular wire, cable,

[2798] RTC comments at 14.

[2799] NESC § 010.

or other piece of equipment and other wires, cables, equipment, structures, and property.[2800] A short list of only a few of the variables in that discussion includes: the type of wire or equipment in question; the type of current being transmitted; the nature of the structure supporting the wires; the proximity and nature of other equipment and structures; the temperature of the conducting element; and the use of the land below the wires. These separation requirements dictate the required distances between various wires and other transmission and distribution equipment, as well distances between such equipment and other objects that are not a part of the transmission and distribution network. Prescribed separations between wires will vary between the point at which wires are attached to a pole and at mid-points between poles, with the latter separations dictated by the predicted amount of sag that the wires will experience. The amount of sag will itself depend upon additional variables. Changing just one variable can radically alter the separation requirements.[2801] Other rules dictate: electrical loading requirements that vary depending upon wind and ice conditions and the predicted sag of the lines being installed; structural strength requirements that vary depending upon the amount and type of installations and the nature of the supporting structure; and line insulation requirements. A wholly separate and equally extensive array of rules apply to underground lines.

1147. Despite this specificity, the introduction to the NESC states that the code "is not intended as a design specification or an instruction manual."[2802] Indeed, utilities typically impose requirements more stringent than those prescribed by NESC and other industry codes.[2803] In some cases stricter requirements and restrictions are dictated by federal, state, or local law.[2804] Potentially applicable federal regulations include rules promulgated by the Federal Energy Regulatory Commission ("FERC") and by the Occupational Safety and Health Administration ("OSHA").[2805] Various restrictions can apply at the state level as well.[2806] Some local requirements governing zoning, aesthetics, or road clearances impose more stringent or more

---

[2800] NESC § 23.

[2801] For example, depending upon other conditions there are at least 16 potentially applicable clearance requirements relating specifically to wires passing over or near swimming pools. Separate sets of clearance requirements apply to wires in the vicinity of rail cars, and for wires attached near bridges.

specific requirements than those of the national industry codes or of federal or state law.[2807]

1148. In addition to operating under federal, state, and local requirements, a utility normally will have its own operating standards that dictate conditions of access.[2808] Utilities have developed their own individual standards and incorporated them into pole attachment agreements because industry-wide standards and applicable legal requirements are too general to take into account all of the variables that can arise.[2809] A utility's individual standards cover not simply its policy with respect to attachments, but all aspects of its business. Standards vary between companies and across different regions of the country based on the experiences of each utility and on local conditions.[2810] As Duquesne notes, the provision of electricity is the result of varied engineering factors that continue to evolve.[2811] Because there is no fixed manner in which to provide electricity, there is no way to develop an exhaustive list of specific safety and reliability standards.[2812] In addition, increasing competition in the provision of electricity is forcing electric utilities to engineer their systems more precisely, in a way that is tailored to meet the specific needs of the electric company and its customers.[2813] As a result, each utility has developed its own internal operating standards to suit its individual needs and experiences.[2814]

1149. The record contains numerous factors that may vary from region to region, necessitating different operating procedures particularly with respect to attachments. Extreme temperatures, ice and snow accumulation, wind, and other weather conditions all affect a utility's safety and engineering practices.[2815] In some instances, machinery used by local industries requires higher than normal clearances. Particular utility work methods and equipment may require specific separations between attachments and may restrict the height of the poles that a

utility will use.[2816] The installation and maintenance of underground facilities raise distinct safety and reliability concerns.[2817] It is important that such variables be taken into account when drafting pole attachment agreements and considering an individual attachment request. The number of variables makes it impossible to identify and account for them all for purposes of prescribing uniform standards and requirements.[2818] Universally accepted codes such as the NESC do not attempt to prescribe specific requirements applicable to each attachment request and neither shall we.

1150. We are sensitive to concerns of cable operators and telecommunications carriers regarding utility-imposed restrictions that could be used unreasonably to prevent access.[2819] We note in particular that a utility that itself is engaged in video programming or telecommunications services has the ability and the incentive to use its control over distribution facilities to its own competitive advantage. A number of utilities have obtained, or are seeking, the right and ability to provide telecommunications or video programming services.[2820] We agree, however, with Duquesne that the best safeguard is not the adoption of a comprehensive set of substantive engineering standards, but the establishment of procedures that will require utilities to justify any conditions they place on access.[2821] These procedures are outlined in section E below. In the next two sections, we set forth rules of general applicability and broader guidelines relating to specific issues that are intended to govern access negotiations between the parties.

(2) Specific Rules

1151. We establish five rules of general applicability. First, in evaluating a request for access, a utility may continue to rely on such codes as the NESC to prescribe standards with respect to capacity, safety, reliability, and general engineering principles. We have no reason to question the reasonableness of the virtually unanimous judgment of the commenters, many of whom have otherwise diverse and conflicting interests, in this regard.[2822] Utilities may incorporate such standards into their pole attachment agreements in accordance with section

224(f)(2). Other industry codes also will be presumed reasonable if shown to be widely-accepted objective guides for the installation and maintenance of electrical and communications facilities.

1152. Second, federal requirements, such as those imposed by FERC and OSHA, will continue to apply to utilities to the extent such requirements affect requests for attachments to utility facilities under section 224(f)(1). We see no reason to supplant or modify applicable federal regulations promulgated by FERC, OSHA, or other federal agencies acting in accordance with their lawful authority.

1153. Third, we will consider state and local requirements affecting pole attachments. We note that section 224(c)(1) provides:

> Nothing in this section shall be construed to apply to, or to give the Commission jurisdiction with respect to rates, terms and conditions, or access to poles, ducts, conduits, and rights-of-way as provided in subsection (f), for pole attachments in any case where such matters are regulated by the State.[2823]

1154. In a separate section we discuss the authority of a state to preempt federal regulation of pole attachments.[2824] For present purposes, we conclude that state and local requirements affecting attachments are entitled to deference even if the state has not sought to preempt federal regulations under section 224(c).[2825] The 1996 Act increased significantly the Commission's role with respect to attachments by creating federal access rights and obligations, which for decades had been the subject of state and local regulation. Such regulations often relate to matters of local concern that are within the knowledge of local authorities and are not addressed by standard codes such the NESC.[2826] We do not believe that regulations of this sort necessarily conflict with the scheme established in this Order. More specifically, we see nothing in the statute or in the record that compels us to preempt such local regulations as a matter of course. Regulated entities and other interested parties are familiar with existing state and local requirements and have adopted operating procedures and practices in reliance on those requirements. We believe it would be unduly disruptive to invalidate summarily all such local requirements. We thus agree with commenters who suggest that such state and local requirements should be presumed reasonable.[2827] Thus, even where a state has not asserted preemptive authority in accordance with section 224(c), state and local requirements affecting pole

attachments remain applicable, unless a complainant can show a direct conflict with federal policy. Where a local requirement directly conflicts with a rule or guideline we adopt herein, our rules will prevail. We note that a standard prescribed by the NESC is not a specific Commission rule, and therefore a state requirement that is more restrictive than the corresponding NESC standard may still apply.

1155. It is important to note that the discretion of state and local authorities to regulate in the area of pole attachments is tempered by section 253, which invalidates all state or local legal requirements that "prohibit or have the effect of prohibiting the ability of any entity to provide any interstate or intrastate telecommunications service."[2828] This restriction does not prohibit a state from imposing "on a competitively neutral basis and consistent with section 254, requirements necessary to preserve and advance universal service, protect the public safety and welfare, ensure the continued quality of telecommunications services, and safeguard the rights of consumers."[2829] In addition, section 253 specifically recognizes the authority of state and local governments to manage public rights-of-way and to require fair and reasonable compensation for the use of such rights-of-way.[2830]

1156. Fourth, where access is mandated, the rates, terms, and conditions of access must be uniformly applied to all telecommunications carriers and cable operators that have or seek access.[2831] Except as specifically provided herein, the utility must charge all parties an attachment rate that does not exceed the maximum amount permitted by the formula we have devised for such use, and that we will revise from time to time as necessary.[2832] Other terms and conditions also must be applied on a nondiscriminatory basis.[2833]

1157. Fifth, except as specifically noted below, a utility may not favor itself over other parties with respect to the provision of telecommunications or video programming services.[2834] We interpret the statutory requirement of nondiscriminatory access as compelling this result, particularly when read in the context of other provisions of the statute. This element of

[2828] 47 U.S.C. § 253(a).

[2829] 47 U.S.C. § 253(b); section 254 sets forth specific provisions related to universal service.

[2830] 47 U.S.C. § 253(c). *See* Ameritech reply at 10.

[2831] 47 U.S.C. § 224(f)(1). As noted above, incumbent LECs are excluded from the definition of "telecommunications carrier" for purposes of section 224. 47 U.S.C. § 224(a)(5).

[2832] *See* 47 C.F.R. § 1.1404.

[2833] *See supra*, Sections IV.G. and V.G. for a discussion of the meaning of "nondiscriminatory."

[2834] 47 U.S.C. § 224(f)(1); *see* Ohio Consumers' Counsel comments at 5; California comments at 5; MCI comments at 21; Sprint comments at 16; ACSI comments at 6-7.

nondiscrimination is evident in section 224(g), which requires a utility to impute to itself or to its affiliate the pole attachment rate such entity would be charged were it a non-affiliated entity.[2835] Further, we believe it unlikely that Congress intended to allow an incumbent LEC to favor itself over its competitors with respect to attachments to the incumbent LEC's facilities, given that section 224(a)(5) has just the opposite effect in that it operates to preclude the incumbent LEC from obtaining access to the facilities of other LECs. A utility will be able to discriminate in favor of itself with respect to the provision of telecommunications or cable services only as expressly provided herein.

1158. Aside from the conditions described above, we will not adopt specific rules to determine when access may be denied because of capacity, safety, reliability, or engineering concerns. In addition, we reject the contention of some utilities that they are the primary arbiters of such concerns, or that their determinations should be presumed reasonable.[2836] We recognize that the public welfare depends upon safe and reliable provision of utility services, yet we also note that the 1996 Act reinforces the vital role of telecommunications and cable services. As noted above, section 224(f)(1) in particular reflects Congress' intention that utilities must be prepared to accommodate requests for attachments by telecommunications carriers and cable operators.

(3) Guidelines Governing Certain Issues

1159. In addition to the rules articulated above, we will establish guidelines concerning particular issues that have been raised in this proceeding. These guidelines are intended to provide general ground rules upon which we expect the parties to be able to implement pro-competitive attachment polices and procedures through arms-length negotiations, rather than having to rely on multiple adjudications by the Commission in response to complaints or by other forums. We do not discuss herein every issue raised in the comments. Rather, we discuss only major issues that we believe will arise often. Issues not discussed herein may be important in a particular case, but are not susceptible to any general observation or presumption.

1160. We note that a utility's obligation to permit access under section 224(f) does not depend upon the execution of a formal written attachment agreement with the party seeking access. We understand that such agreements are the norm and encourage their continued use, subject to the requirements of section 224. Complaint or arbitration procedures will, of course, be available when parties are unable to negotiate agreements.[2837]

[2835] 47 U.S.C. § 224(g).

[2837] *See infra*, Section E.

(a) Capacity Expansions

1161. When a utility cannot accommodate a request for access because the facility in question has no available space, it often must modify the facility to increase its capacity.[2838] In some cases, a request for access can be accommodated by rearranging existing facilities to make room for a new attachment.[2839] Another method of maximizing useable capacity is to permit "overlashing," by which a new cable is wrapped around an existing wire, rather than being strung separately.[2840] A utility pole filled to capacity often can be replaced with a taller pole.[2841] New underground installations can be accommodated by the installation of new duct, including subducts that divide a standard duct into four separate, smaller ducts.[2842] Cable companies and others contend that there is rarely a lack of capacity given the availability of taller poles and additional conduits.[2843] These commenters suggest that utilities should rarely be permitted to deny access on the basis of a lack of capacity, particularly since under section 224(h) the party or parties seeking to increase capacity will be responsible for all associated costs.[2844] Utilities argue that neither the statute nor its legislative history requires facility owners to expand or alter their facilities to accommodate entities seeking to lease space.[2845] These commenters argue that, if Congress intended such a result, the statute would have imposed the requirement explicitly.[2846]

1162. A utility is able to take the steps necessary to expand capacity if its own needs require such expansion. The principle of nondiscrimination established by section 224(f)(1) requires that it do likewise for telecommunications carriers and cable operators.[2847] In addition, we note that section 224(f)(1) mandates access not only to physical utility facilities (*i.e.*, poles,

[2847] AT&T reply at 14-15; MFS reply at 22. We note that this standard differs from the one we adopt for collocation of equipment on incumbent LEC premises under section 251(c)(6). *See supra*, Section VI.

ducts, and conduit), but also to the rights-of-way held by the utility. The lack of capacity on a particular facility does not necessarily mean there is no capacity in the underlying right-of-way that the utility controls. For these reasons, we agree with commenters who argue that a lack of capacity on a particular facility does not automatically entitle a utility to deny a request for access. Since the modification costs will be borne only by the parties directly benefitting from the modification,[2848] neither the utility nor its ratepayers will be harmed, despite the assertions of utilities to the contrary.[2849]

1163. In some cases, however, increasing capacity involves more than rearranging existing attachments or installing a new pole or duct. For example, the record suggests that utility poles of 35 and 40 feet in height are relatively standard, but that taller poles may not always be readily available.[2850] The transportation, installation, and maintenance of taller poles can entail different and more costly practices.[2851] Many utilities have trucks and other service equipment designed to maintain poles of up to 45 feet, but no higher.[2852] Installing a 50 foot pole may require the utility to invest in new and costly service equipment.[2853] Expansion of underground conduit space entails a very complicated procedure, given the heightened safety and reliability concerns associated with such facilities.[2854] Local regulators may seek to restrict the frequency of underground excavations. We find it inadvisable to attempt to craft a specific rule that prescribes the circumstances in which, on the one hand, a utility must replace or expand an existing facility in response to a request for access and, on the other hand, it is reasonable for the utility to deny the request due to the difficulties involved in honoring the request. We interpret sections 224(f)(1) and (f)(2) to require utilities to take all reasonable steps to accommodate requests for access in these situations. Before denying access based on a lack of capacity, a utility must explore potential accommodations in good faith with the party seeking access.

1164. We will not require telecommunications providers or cable operators seeking access to exhaust any possibility of leasing capacity from other providers, such as through a resale

agreement, before requesting a modification to expand capacity.[2855] As indicated elsewhere in this Order, resale will play an important role in the development of competition in telecommunications. However, as we also have noted, there are benefits to facilities-based competition as well. We do not wish to discourage unduly the latter form of competition solely because the former might better suit the preferences of incumbent utilities with respect to pole attachments.

(b) Reservation of space by utility

1165. Utilities routinely reserve space on their facilities to meet future needs.[2856] Local economic growth and property development may require an electric utility to install additional lines or transformers that use previously available space on the pole.[2857] A utility may install an underground duct in which it can later install additional distribution lines, if necessitated by a subsequent increase in demand or by damage to the original lines.[2858] Reserving space allows the utility to respond quickly and efficiently to changed circumstances. This practice, however, also can result in a utility denying access to a telecommunications carrier or a cable operator even though there is unused capacity on the pole or duct.

1166. This issue is of particular concern because section 224(h) imposes the cost of modifying attachments on those parties that benefit from the modification.[2859] If, for example, a cable operator seeks to make an attachment on a facility that has no available capacity, the operator would bear the full cost of modifying the facility to create new capacity, such as by replacing an existing pole with a taller pole. Other parties with attachments would not share in the cost, unless they expanded their own use of the facilities at the same time. If the electric utility decides to change a pole for its own benefit, and no other parties derive a benefit from the modification, then the electric company would bear the full cost of the new pole.

1167. Some commenters contend that utilities will reserve space on a pole and then claim there is no capacity available, as a way of forcing cable operators and telecommunications carriers to pay for new utility facilities. These commenters contend that we should restrict or eliminate

[2859] *See infra*, Section (C)(3).

the authority of utilities to reserve space.[2860] Utilities respond that it is unfair to force a utility to accommodate full occupation of its facility by third parties and then to saddle the utility with the cost of modifying the facility when the utility's own needs change and require a costly increase in capacity.[2861]

1168. The near-universal public demand for their core utility services, while imposing certain obligations, arguably entitles utilities to certain prerogatives vis-a-vis other parties, including the right to reserve capacity to meet anticipated future demand for those utility services.[2862] Recognition of such a right, however, could conflict with the nondiscrimination requirement of section 224(f)(1) which prohibits a utility from favoring itself or its affiliates with respect to the provision of telecommunications and video services.[2863] In addition, allowing space to go unused when a cable operator or telecommunications carrier could make use of it is directly contrary to the goals of Congress.

1169. Balancing these concerns leads us to the following conclusions. We will permit an electric utility to reserve space if such reservation is consistent with a bona fide development plan that reasonably and specifically projects a need for that space in the provision of its core utility service. The electric utility must permit use of its reserved space by cable operators and telecommunication carriers until such time as the utility has an actual need for that space. At that time, the utility may recover the reserved space for its own use. The utility shall give the displaced cable operator or telecommunications carrier the opportunity to pay for the cost of any modifications needed to expand capacity and to continue to maintain its attachment.[2864] An electric utility may not reserve or recover reserved space to provide telecommunications or video programming service and then force a previous attaching party to incur the cost of modifying the facility to increase capacity, even if the reservation of space were pursuant to a reasonable development plan. The record does not contain sufficient data for us to establish a presumptively reasonable amount of pole or conduit space subject that an electric utility may reserve. If parties cannot agree, disputes will be resolved on a case-by-case approach based on the reasonableness of the utility's forecast of its future needs and any additional information that is relevant under the circumstances.

[2864] This standard differs from the one we anopt for allocation of collocation space under section 251(c)(4). *See supra*, Section VI

1170. With respect to a utility providing telecommunications or video services, we believe the statute requires a different result. Section 224(f)(1) requires nondiscriminatory treatment of all providers of such services and does not contain an exception for the benefit of such a provider on account of its ownership or control of the facility or right-of-way. Congress seemed to perceive such ownership and control as a threat to the development of competition in these areas, thus leading to the enactment of the provision in question. Allowing the pole or conduit owner to favor itself or its affiliate with respect to the provision of telecommunications or video services would nullify, to a great extent, the nondiscrimination that Congress required. Permitting an incumbent LEC, for example, to reserve space for local exchange service, to the detriment of a would-be entrant into the local exchange business, would favor the future needs of the incumbent LEC over the current needs of the new LEC. Section 224(f)(1) prohibits such discrimination among telecommunications carriers. As indicated above, this prohibition does not apply when an electric utility asserts a future need for capacity for electric service, to the detriment of a telecommunications carrier's needs, since the statute does not require nondiscriminatory treatment of all utilities; rather, it requires nondiscriminatory treatment of all telecommunications and video providers.

(c) Definition of "Utility"

1171. The access obligations of section 224(f) apply to any "utility," which is defined as:

> any person who is a local exchange carrier or an electric, gas, water, steam, or other public utility, and who owns or controls poles, ducts, conduits, or other rights-of-way used, in whole or in part, for any wire communications. Such term does not include any railroad, any person who is cooperatively organized, or any person owned by the Federal Government or any State.[2865]

1172. Arguably a provider of utility service does not fall within this definition if it has refused to permit any wired communications use of its facilities and rights-of-way since, in that case, its facilities and rights-of-way are not "used, in whole or in part, for wire communications." Under this construction, an electric utility would have no obligation to grant access under section 224(f) until the utility voluntarily has granted access to one communications provider or has used its facilities for wire communications.[2866] Only after its facilities were being used for wire communications would the utility have to grant access to all telecommunications carriers and cable operators on a nondiscriminatory basis.

1173. We conclude that this construction of the statute is mandated by its plain language

---

[2865] 47 U.S.C. § 224(a)(1).

[2866] NU Systems comments at 2-3; UTC comments at 6-7.

and is indeed nondiscriminatory, since denial of access to all discriminates against none. We see no statutory basis, however, for the argument made by some utilities that they should be permitted to devote a portion of their poles, ducts, conduits, and rights-of-way to wire communications without subjecting all such property to the access obligations of section 224(f)(1).[2867] Those obligations apply to any "utility," which section 224(a)(1) defines to include an entity that controls "poles, ducts, conduits, or rights-of-way used, in whole or in part, for any wire communications."[2868] The use of the phrase "in whole or in part" demonstrates that Congress did not intend for a utility to be able to restrict access to the exact path used by the utility for wire communications. We further conclude that use of any utility pole, duct, conduit, or right-of-way for wire communications triggers access to all poles, ducts, conduits, and rights-of-way owned or controlled by the utility, including those not currently used for wire communications.

1174. We reject the contention that, because an electric utility's internal communications do not pose a competitive threat to third party cable operators or telecommunications carriers, such internal communications are not "wire communications" and do not trigger access obligations.[2869] Although internal communications are used solely to promote the efficient distribution of electricity, the definition of "wire communication" is broad and clearly encompasses an electric utility's internal communications.[2870]

(d) Application of Section 224(f)(2) to Non-Electric Utilities

1175. While all utilities are subject to the access obligations of section 224(f)(1), the provisions of section 224(f)(2), permitting a utility to deny access due to a lack of capacity or for reasons of safety, reliability, and generally applicable engineering purposes, apply only to "a utility providing electric service . . . ."[2871] Based on this statutory language, some commenters suggest that LECs and other utilities that do not provide electric service must grant requests for access, regardless of any concerns relating to safety, reliability, and general engineering principles.[2872] If there is a lack of capacity, a LEC must create more capacity, according to these

---

[2867] *See* American Electric comments at 12, n. 7.

[2868] 47 U.S.C. § 224(a)(1).

[2869] *See* UTC comments at 7; Delmarva reply at 5.

[2870] *See* 47 U.S.C. 3(51) ("The term 'wire communication' . . . means the transmission of writing, signs, signals, pictures, and sounds of all kinds by aid of wire, cable, or other like connection . . .").

[2871] 47 U.S.C. § 224(f)(2).

[2872] *See, e.g.*, AT&T comments at 16-17.

commenters.[2873]

1176. While the express language of sections 224(f)(1) and (f)(2) suggests that only utilities providing electric service can take into consideration concerns relating to safety and reliability, we are reluctant to ignore these concerns simply because the pole owner is not an electric utility. Even parties seeking broad access rights under section 224 recognize that, in some circumstances, a LEC will have legitimate safety or engineering concerns that may need to be accommodated.[2874] We believe that Congress could not have intended for a telecommunications carrier to ignore safety concerns when making pole attachment decisions. Rather than reach this dangerous result which would require us to ignore the dictates of sections 1[2875] and 4(o)[2876] of the Communications Act, we conclude that any utility may take into account issues of capacity, safety, reliability and engineering when considering attachment requests, provided the assessment of such factors is done in a nondiscriminatory manner.

1177. Nevertheless, we believe that section 224(f)(2) reflected Congress' acknowledgment that issues involving capacity, safety, reliability and engineering raise heightened concerns when electricity is involved, because electricity is inherently more dangerous than telecommunications services. Accordingly, although we determine that it is proper for non-electric utilities to raise these matters, they will be scrutinized very carefully, particularly when the parties concerned have a competitive relationship.

(e) Third-Party Property Owners

1178. Section 224(f)(1) mandates that the utility grant access to any pole, duct, conduit, or right-of-way that is "owned or controlled by it." Some utilities and LECs argue that certain private easement agreements, when interpreted under the applicable state property laws, deprive the utilities of the ownership or control that triggers their obligation to accommodate a request for access.[2877] Moreover, they contend, access to public rights-of-way may be restricted by state law

---

[2873] *Id.* at 16-17.

[2874] AT&T reply at 17, n. 40

[2875] 47 U.S.C. § 151 (establishing the Commission for the purpose of promoting a "rapid, efficient Nation-wide, and world-wide wire and radio and communication service with adequate facilities . . . [and] promoting safety of life and property . . .").

[2876] 47 U.S.C. § 154 (o) (promoting the "safety of life and property" with respect to the use of radio and wire communications).

[2877] UTC comments at 7-8, GVNW comments at 9; U S West reply at 6; BellSouth reply at 9; *see* BOMA reply at 3.

or local ordinances.[2878] Opposing commenters contend that the addition of cable television or telecommunications facilities is compatible with electric service and therefore does not violate easements that have been granted for the provision of electric service.[2879] These commenters also assert that the statute does not draw specific distinctions between private and public easements.[2880] Further, some cable operators contend that utility easements are accessible to cable operators pursuant to section 621(a)(2) of the Communications Act as long as the easements are physically compatible with such use, regardless of the terms of a written easement agreement.[2881] Another commenter suggests utilities are best positioned to determine when access requests would affect a private easement, foreclosing the need to determine whether a private owner would consent to the requested attachment.[2882] As for local ordinances restricting access to public rights-of-way, one commenter suggests that such restrictions would violate section 253(a) of the Act, which blocks state or local rules that prohibit competition.[2883]

1179. The scope of a utility's ownership or control of an easement or right-of-way is a matter of state law.[2884] We cannot structure general access requirements where the resolution of conflicting claims as to a utility's control or ownership depends upon variables that cannot now be ascertained. We reiterate that the access obligations of section 224(f) apply when, as a matter of state law, the utility owns or controls the right-of-way to the extent necessary to permit such access.

1180. Section 621(a)(2) states that a cable franchise shall be construed as authorizing the construction of cable facilities in public rights-of-way and "through easements . . . which have been dedicated for compatible uses . . . ."[2885] The scope of a cable operator's access to easements under this provision has been the subject of a number of court opinions.[2886] To the extent section

621(a)(2) has been construed to permit access to easements, a cable operator must be permitted to attach to utility poles, ducts, and conduits within such easements in accordance with section 224(f).

1181. Finally, we disagree with those utilities that contend that they should not be forced to exercise their powers of eminent domain to establish new rights-of-way for the benefit of third parties.[2887] We believe a utility should be expected to exercise its eminent domain authority to expand an existing right-of-way over private property in order to accommodate a request for access, just as it would be required to modify its poles or conduits to permit attachments. Congress seems to have contemplated an exercise of eminent domain authority in such cases when it made provisions for an owner of a right-of-way that "intends to modify or alter such right-of-way . . . ."[2888]

(f) Other Matters

1182. Utilities stress the importance of ensuring that only qualified workers be permitted in the proximity of utility facilities. Some utilities seek to limit access to their facilities to the utility's own specially trained employees or contractors, particularly with respect to underground conduits.[2889] According to these commenters, parties seeking to make attachments to utility facilities should be required to pay for the use of the utility's workers if the utility concludes that only its workers are fit for the job. While we agree that utilities should be able to require that only properly trained persons work in the proximity of the utilities' lines, we will not require parties seeking to make attachments to use the individual employees or contractors hired or pre-designated by the utility. A utility may require that individuals who will work in the proximity of electric lines have the same qualifications, in terms of training, as the utility's own workers, but the party seeking access will be able to use any individual workers who meet these criteria. Allowing a utility to dictate that only specific employees or contractors be used would impede the access that Congress sought to bestow on telecommunications providers and cable operators and would inevitably lead to disputes over rates to be paid to the workers.

1183. Some electric utilities argue that high voltage transmission facilities should not be accessible by telecommunications carriers or cable operators under section 224(f)(1).[2890] These commenters contend that transmission facilities, which are used for high voltage transmissions

[2887] *But see* UTC comments at 15, Ohio Edison comments at 14-15.

[2888] 47 U.S.C. § 224(h).

[2889] Kansas City at 3-4.

[2890] NEES comments at 15-16, PECO comments at 4.

over great distances, are far more delicate and dangerous than local distribution facilities. Permitting attachments to transmission facilities, they argue, poses a greater risk to the safety and reliability of the electric distribution system than is the case with distribution lines. They further state that transmission facilities generally are not located where cable operators and telecommunications carriers need to install facilities. ConEd suggests that transmission towers do not even fall within the scope of the statute.[2891]

1184. Section 224(f)(1) mandates access to "any pole, duct, conduit, or right-of-way," owned or controlled by the utility. The utilities do not suggest that transmission facilities do not use poles or rights-of-way, for which the statute does mandate the right of access. The utilities' arguments for excepting transmission facilities from access requirements are based on safety and reliability concerns. We believe that the breadth of the language contained in section 224(f)(1) precludes us from making a blanket determination that Congress did not intend to include transmission facilities. As with any facility to which access is sought, however, section 224(f)(2) permits the electric utility to impose conditions on access to transmission facilities, if necessary for reasons of safety and reliability. To the extent safety and reliability concerns are greater at a transmission facility, the statute permits a utility to impose stricter conditions on any grant of access or, in appropriate circumstances, to deny access if legitimate safety or reliability concerns cannot be reasonably accommodated.[2892]

1185. We note that some commenters favor a broad interpretation of "pole, duct, conduit, or right-of-way" because that approach would minimize the risk that a "pathway" vital to competition could be shut off to new competitors.[2893] Others argue for a narrow construction of this statutory phrase, contending that Congress addressed access to other LEC facilities elsewhere in the 1996 Act.[2894] We recognize that an overly broad interpretation of this phrase could impact the owners and mangers of small buildings, as well as small incumbent LECs, by requiring additional resources to effectively control and monitor such rights-of-way located on their properties.[2895] We do not believe that section 224(f)(1) mandates that a utility make space available on the roof of its corporate offices for the installation of a telecommunications carrier's transmission tower,[2896] although access of this nature might be mandated pursuant to a request for

interconnection or for access to unbundled elements under section 251(c)(6).[2897] The intent of Congress in section 224(f) was to permit cable operators and telecommunications carriers to "piggyback" along distribution networks owned or controlled by utilities, as opposed to granting access to every piece of equipment or real property owned or controlled by the utility.[2898]

1186. The statute does not describe the specific type of telecommunications or cable equipment that may be attached when access to utility facilities is mandated.[2899] We do not believe that establishing an exhaustive list of such equipment is advisable or even possible. We presume that the size, weight, and other characteristics of attaching equipment have an impact on the utility's assessment of the factors determined by the statute to be pertinent -- capacity, safety, reliability, and engineering principles. The question of access should be decided based on those factors.

3. Constitutional Takings

a. Background

1187. The access provisions of section 224(f) restrict the right of a utility to exclude third parties from its property and therefore may raise Fifth Amendment issues.[2900] While we have no jurisdiction to determine the constitutionality of a federal statute, constitutional concerns are relevant for purposes of construing a statute.[2901] For that reason, we here consider the constitutional issues raised in the comments.

b. Comments

1188. A number of utilities suggest that we must construe section 224(f) as permitting them to make the ultimate decision as to whether to grant access to their facilities and rights-of-way, on the grounds that a statute compelling them to grant access would be an unconstitutional

---

[2897] *See supra*, Section VI.B.

[2898] Ohio Edison reply at 12.

[2899] "The term 'pole attachment' means any attachment by a cable television system or provider of telecommunications service to a pole, duct, conduit, or right-of-way owned or controlled by a utility." 47 U.S.C. § 224(a)(4).

[2900] *See Loretto v. Teleprompter Manhattan CATV Corp.*, 458 U.S. 419 (1982).

taking of their private property under the Fifth Amendment.[2902] AEP notes that in *FCC v. Florida Power Corp.* the Supreme Court upheld the 1978 Pole Attachments Act, in part because nothing in that statute compelled utilities "to enter into, renew, or refrain from terminating pole attachment agreements."[2903] By contrast, the Supreme Court held that a state law requiring a landlord to permit a cable operator to install and maintain cable facilities over the landlord's apartment building constituted a taking of private property.[2904] On the basis of these cases, AEP contends: "To pass constitutional muster, the access required under section 224(f)(1) must be voluntary."[2905] Likewise, Puget argues: "If the Commission interprets the act's access requirement broadly as mandating access to the facility owner's property to all who desire it, the Takings Clause would be violated."[2906]

1189. Other utilities argue that the Fifth Amendment is implicated by the access requirements of section 224(f)(1), but stop short of contending that mandating access under the statue renders it unconstitutional. U S West believes that any discussion of access under section 224(f)(1) "would be incomplete without explicit recognition of the fact that such mandatory occupation . . . constitutes the taking of private property. As such, both the Commission and respective state regulatory agencies must ensure that LECs receive just compensation for their taken property."[2907] Virginia Power believes that any mandatory access requirement would result in a taking of private property, and notes "the potential constitutional issue . . . ."[2908] UTC states that forced access "raises serious questions, regarding at least, the taking of property without just compensation."[2909] Finally, GTE suggests that mandatory access under section 224(f)(1) may be unconstitutional as a taking of private property without just compensation, when considered in conjunction with the method by which pole attachment rates will be determined under section 224(e)(2).[2910]

1190. Other commenters contend that there are no relevant constitutional issues to be confronted. Cole argues that requiring a utility to connect its facilities with those of other parties is simply a condition of providing utility service.[2911] With respect to LECs, for instance, Cole states: "Part of the obligation of being a regulated telecommunications common carrier is to provide services deemed to be necessary by regulators whether the regulated common carrier 'wants' to provide them or not."[2912] Cole contends that mandatory access to poles and other facilities "has no impact on the applicable constitutional standard."[2913] "As long as the rates for pole space and services are not confiscatory," Cole asserts,"there simply is no taking."[2914] In the alternative, Cole argues that "even if the access provision of section 224(f)(1) does constitute a taking, any argument that the compensation provided by the statute is not compensatory must be decided in a specific case, and not in this generic rulemaking."[2915]

c. Discussion

1191. Section 224(f)(1) mandates that a utility grant access to a requesting telecommunications provider or cable system operator, subject to certain conditions that we discuss elsewhere in this Order. That provision is not reasonably susceptible of a reading that gives the pole owner the choice of whether to grant telecommunications carriers or cable television systems access. Even if such mandatory access results in a taking, we cannot agree that it necessarily raises a constitutional issue. The Fifth Amendment permits takings as long the property owner receives just compensation for the property taken.[2916]

1192. As for the amount of compensation provided under the statute, GTE suggests that mandatory access will result in an unconstitutional taking when considered in conjunction with the methodology for pole attachment rates set forth in section 224(e)(2). We, of course, have no power to declare any provision of the Communications Act unconstitutional.[2917] In any event, we cannot agree. Congress has provided for compensation to pole owners, in the event that they cannot resolve a dispute with telecommunications carriers regarding the charges for use of the

[illegible] poles, that would allow them to recover the cost of providing usable space to each entity and two-thirds of the cost of the unusable space apportioned among such users. The Commission soon will initiate a separate rulemaking proceeding that will give greater content to this statutory standard. GTE and others may present their just compensation arguments with respect to the ratemaking standards the Commission adopts in that proceeding. GTE has not shown here, however, how the statutory standard contained in section 224(e) necessarily would deny pole owners just compensation.

4. Modifications

a. Background

1193. In the NPRM we sought comment on section 224(h) which provides:

> Whenever the owner of a pole, duct, conduit, or right-of-way intends to modify or alter such pole, duct, conduit, or right-of-way, the owner shall provide written notification of such action to any entity that has obtained an attachment to such conduit or right-of-way so that such entity may have a reasonable opportunity to add to or modify its existing attachment. Any entity that adds to or modifies its existing attachment after receiving such notification shall bear a proportionate share of the costs incurred by the owner in making such pole, duct, conduit, or right-of-way accessible.[2918]

1194. The NPRM requested comments addressing the manner and timing of the notice that must be provided to ensure a reasonable opportunity to add to or modify its attachment. In addition, we sought comment regarding the establishment of rules apportioning the cost of a modification among the various users of the modified facility. Finally, we requested comment on whether any payment of costs should be offset by the potential increase in revenues to the owner. If, for example, an owner modifies a pole to allow additional attachments that generate additional fees for the owner, should such revenues offset the share of modification costs borne by entities with preexisting access to the pole?

b. Comments

(1) Manner and Timing of Notice

1195. Several commenters state that no firm notice period should be established, due to the impracticalities of applying a single standard to the wide variety of situations that may necessitate modifications. Ameritech argues that the appropriate manner and timing for notice will vary according to local factors, such as the specific facility, the attachment, and the nature,

[2918] 47 U.S.C. § 224(h).

event and reason for the change.[2919] According to Ameritech, time frames for responding to circumstances will vary according to the reason for the modification, including modifications due to damage, deterioration, technological improvements, public works projects and demand growth. Given these variables, Ameritech contends that rigid notification rules could impair the facility owner's ability to respond to emergencies, and would unnecessarily complicate and delay expansion, improvement and maintenance of facilities.[2920]

1196. Most of the commenters agree that exceptions to any firm notice requirements should be made for emergency situations, such as storm restoration work, and minor modifications.[2921] Electric utilities argue that written notification requirements must not restrict their ability to respond to emergencies, customer complaints or routine maintenance.[2922] Incumbent LECs echo these suggestions.[2923] Duquesne urges an exception to any specific notice requirement where the utility's database does not show that the attachment exists.[2924] Duquesne contends that telecommunications providers often make attachments without prior notice to the utility. Although the utility will discover the attachment when it goes to service the pole, Duquesne argues it should not have to suspend that service to give notice to a communications provider that attached without notice to the utility. As proposed by Duquesne, this exception would sunset in five years, by which time the utility would be required to have an accurate database.[2925]

1197. Those commenters who propose specific notice periods varied widely with regard to what they deem "reasonable" notice: periods of 10,[2926] 30,[2927] 60,[2928] 90,[2929] and 180[2930] days

were recommended, with at least one commenter requesting a full year's notice before modifications could take place.[2931] In justifying the various notice periods and exceptions presented, commenters cite existing notification periods in standard contracts.[2932] They also express concerns that longer periods would interfere with a utility's ability to allocate work crews and schedule necessary outages efficiently,[2933] that upgrade schedules could be disrupted if a longer period were mandated,[2934] or that longer periods would be necessary to allow users to determine future business and economic needs.[2935] Teleport recommends that modifications which benefit only some users should not interrupt usage by others.[2936]

1198. A number of commenters express a preference for negotiated notification terms.[2937] For example, BellSouth currently negotiates contractual notice provisions with attaching communications providers and expresses concern that these contracts may have to be re-negotiated should rigid notice periods be established.[2938] BellSouth also has online notification programs, which it argues should be recognized as meeting any written notification obligations.[2939] Similarly, NEES points out that a group of New England utilities, local exchange carriers, and cable systems are developing a joint electronic information system for all construction-related notifications, and notes that specific notice requirements could reduce the effectiveness of such a system.[2940] Bell Atlantic argues that any duty of notice should be deemed waived when an

attachment contract grants the utility modification power as needed.[2941]

(2) Allocation of Costs

1199. Several commenters argue that the circumstances surrounding modifications will vary so greatly that uniform application of a single cost allocation formula is infeasible.[2942] Others propose a variety of cost allocation formulas, including dividing the total cost of the modification by the number of entities modifying their attachments,[2943] tying an entity's share of modification costs to the share of space reserved on the pole for that entity's use,[2944] and applying a total service long-run incremental cost methodology based on proportionate space used by each carrier.[2945] One commenter suggests that costs of modifications should be shared only when the user requests the modification, in which case the user would pay a *pro rata* share of the cost.[2946]

1200. AT&T contends that, while the attacher should pay the cost of the addition, if the addition involves more capacity than is needed by existing users, then the owner should pay the balance, subject to recovery later when other entities seek attachments.[2947] According to AT&T, attachers should not pay the cost of modifications by owner, but should only pay their share of the costs to make the structure accessible.[2948] AT&T adds that owners should not be allowed to charge new attachers for modifications paid for by existing attachers.[2949] PECO argues that if the utility has decided to replace a 50-foot pole with a 55-foot pole, an attaching party should not be permitted to request a 60-foot pole unless the requesting party intended to make a modification necessitating the 60-foot pole within six months. According to PECO, the requesting party should be permitted to reserve space in this manner only if it was willing to cover maintenance,

insurance, and other operational costs associated with the reserved space.[2950]

1201. Cole observes that an applicant must pay for the make-ready needed to accommodate its own attachments. This would include the cost to pre-existing users to transfer their lines to new locations on the pole, or to install a new pole if such a pole is necessary to accommodate the new attachment.[2951] Cole argues that the new user should be protected from having to pay for preexisting NESC violations that are corrected at the same time the new attachment is made.[2952] In addition, reading sections 224(h) and (i) together,[2953] Cole concludes that, if a change out is required to correct a pre-existing utility violation on the pole, the utility must bear the cost of the change out, and should also be solely responsible for change out costs if the change out is attributable solely to the needs of the utility, such as an increase in the load carried by the utility. Under this approach, if a change out is necessitated by something other than the needs of an entity that already has, or seeks to have, an attachment, then entities with existing attachments must be given an opportunity to maintain or modify their attachments, with each party bearing their own costs. As an example, all attaching parties would share the cost of a new pole that was needed due to a road widening project.[2954]

1202. A few commenters suggest that cost arrangements currently in place in certain states should be considered as possible solutions to this problem. For example, ConEd recommends adoption of the rule which it says is currently applied in New York and is an accepted practice: "If a utility causes an attachment to be modified within two years of an attachment, then the utility is responsible for the modification. (However, if it is the attaching entity, then the provider would be responsible for these costs.) Then, if a modification is made after two years, the provider is required to pay the costs of the modification."[2955] PacTel currently bills the attacher when it modifies a conduit to facilitate space for that attacher; if the modification is to benefit PacTel, PacTel picks up the whole cost. PacTel requests that this approach, which is currently used in California and Nevada, be recognized as a safe harbor under the 1996 Act.[2956] The NU System Companies contend that costs should be borne equally by all parties that have existing attachments on the facility, claiming that this method has generally been

used among electric and telephone companies in its territories.[2957]

1203. Measuring modification costs poses a separate concern. Electric utilities, for example, contend that modification costs incurred to accommodate an attaching entity impose long-term costs beyond the initial cost of modification. Utilities have argued that the presence of attachments adds to the cost of maintaining and modifying the facility. One commenter suggests that modifications to increase pole height to accommodate attaching parties could impose on utilities additional costs of new trucks to service the pole.[2958] According to this commenter, unless attaching parties cover these added costs, utility owners will be subsidizing attaching parties on a continuous basis.[2959] At the same time, some commenters suggest that facility owners may engage in unnecessary or unduly burdensome modifications, imposing costs that could discourage new entrants from offering telecommunications services.[2960] Other commenters contend that normal market forces will prevent facility owners from making such modifications.[2961]

1204. Delmarva contends that it will be difficult, if not impossible, for the Commission to establish a rule that fairly defines what modifications are "unnecessary or unduly burdensome." Similarly, the NU System Companies argue that limitations on an owner's right to modify a facility and on "unnecessary or unduly burdensome modifications" would potentially and directly interfere with crucial day-to-day utility operations. They further argues that applicable codes, state laws and company standards will generally dictate when and where modifications are needed, and it would be impractical to suggest a "limitation" or standard that could be applied in all cases.[2962] A number of commenters note that if a utility seeks to modify a facility and the attaching carrier will not benefit from the modification, the attaching entity bears none of the costs associated with the modification. Given the large costs associated with such arrangements, this allocation of rearrangement costs will preclude utilities from making any "unnecessary or unduly burdensome" modifications, according to these commenters.[2963]

[2963] Delmarva comments at 26-27; *accord* Duquesne comments at 28.

1205. Some commenters supported,[2964] while many opposed,[2965] our proposal to require facility owners to offset modification costs with additional revenues from new attachments made possible by those modifications. Several of those opposed to offsetting note that pole owners modify out of necessity, not to attract additional attachers, and any additional revenues generated by the new capacity added through modifications would be speculative.[2966] One commenter notes that offsetting costs by potential additional revenues would be inconsistent with a scheme that allocates the cost of modifications only to those parties who benefit from such modifications.[2967] ConEd adds that the facility belongs to the utility and it therefore should be permitted to receive any revenues it can from the use of those facilities.[2968]

1206. Cole suggests that regular attachment fees paid over the term of a pole attachment agreement constitute a return on the utility's investment in the pole. Cole contends such fees should be minimal if parties with attachments have contributed to the cost of a new pole. "Otherwise," Cole states, "the utility will be recovering a return and other compensation for an investment which was made in part by its tenants."[2969] In such circumstances, Cole recommends that the ongoing rental fee should be limited to the incremental cost to the utility of the attachment.[2970]

c. Discussion

1207. We recognize that, when a modification is planned, parties with preexisting attachments to a pole or conduit need time to evaluate how the proposed modification affects their interest and whether activity related to the modification presents an opportunity to adjust the attachment in a desirable manner.[2971] At the same time, we also recognize that not all adjustments to utility facilities are alike. Some adjustments may be sufficiently routine or minor as to not create the type of opportunity that triggers the notice requirement.[2972] Indeed, it is possible that in

some cases lengthy notice requirements could delay unnecessarily the kinds of modifications that would expedite the onset of meaningful competition in the provision of telecommunications services.[2973] Although the period of advance notice has varied widely among commenters, we note that 60 days has been advocated by several parties.[2974]

1208. Several commenters expressed a preference for negotiated notification terms.[2975] They have explained that circumstances will vary among owners of facilities.[2976] The time needed to commence a modification could vary according to pole conditions, technological improvements and demand growth.[2977] Attaching parties in rural markets may need more time to study facilities than facility users in urban markets.[2978] To demonstrate their ability to develop appropriate negotiated agreements, some commenters have described notice requirements in existing agreements. Such cases, they contend, illustrate that notification rules are unnecessary.[2979]

1209. We conclude that, absent a private agreement establishing notification procedures, written notification of a modification must be provided to parties holding attachments on the facility to be modified at least 60 days prior to the commencement of the physical modification itself. Notice should be sufficiently specific to apprise the recipient of the nature and scope of the planned modification. These notice requirements should provide small entities with sufficient time to evaluate the impact of or opportunities made possible by the proposed modifications on their interests and plan accordingly.[2980] If the contemplated modification involves an emergency situation for which advanced written notice would prove impractical, the notice requirement does not apply except that notice should be given as soon as reasonably practicable, which in some cases may be after the modification is completed. Further, we believe that the burden of requiring specific written notice of routine maintenance activities would not produce a commensurate benefit. Utilities and parties with attachments should exchange maintenance

[2980] *See* Regulatory Flexibility Act, 5 U.S.C. §§ 601 et seq.

handbooks or other written descriptions of their standard maintenance practices.[2981] Changes to these practices should be made only upon 60 days written notice. Recognizing that the parties themselves are best able to determine the circumstances where notice would be reasonable and sufficient, as well as the types of modifications that should trigger notice obligations, we encourage the owner of a facility and parties with attachments to negotiate acceptable notification terms.

1210. Even with the adoption of a specific notice period, however, we still encourage communication among owners and attaching parties. Indeed, in cases where owners and users routinely share information about upgrades and modifications, agreements regarding notice periods and procedures are ancillary matters.[2982]

1211. With respect to the allocation of modification costs, we conclude that, to the extent the cost of a modification is incurred for the specific benefit of any particular party, the benefiting party will be obligated to assume the cost of the modification, or to bear its proportionate share of cost with all other attaching entities participating in the modification.[2983] If a user's modification affects the attachments of others who do not initiate or request the modification, such as the movement of other attachments as part of a primary modification, the modification cost will be covered by the initiating or requesting party.[2984] Where multiple parties join in the modification, each party's proportionate share of the total cost shall be based on the ratio of the amount of new space occupied by that party to the total amount of new space occupied by all of the parties joining in the modification. For example, a CAP's access request might require the installation of a new pole that is five feet taller than the old pole, even though the CAP needs only two feet of space. At the same time, a cable operator may claim one foot of the newly-created capacity. If these were the only parties participating in the modification, the CAP would pay two-thirds of the modification costs and the cable operator one-third.

1212. As a general approach, requiring that modification costs be paid only by entities for whose benefit the modification is made simplifies the modification process. For these purposes, however, if an entity uses a proposed modification as an opportunity to adjust its preexisting attachment, the "piggybacking" entity should share in the overall cost of the modification to reflect its contribution to the resulting structural change. A utility or other party that uses a modification as an opportunity to bring its facilities into compliance with applicable safety or

---

[2981] Although we do not offer a definition of "routine maintenance" in this proceeding, we anticipate that the parties to an attachment agreement will have established understandings in this regard. We do not believe that routine maintenance of a facility encompasses actions that would disrupt or impair the service of a facility user.

[2982] Frontier comments at 7.

[2983] NYNEX reply at 8; Carolina Power Reply comments at 3.

[2984] Cole comments at 18; MFS reply at 24.

other requirements will be deemed to be sharing in the modification and will be responsible for its share of the modification cost. This will discourage parties from postponing necessary repairs in an effort to avoid the associated costs.

1213. We recognize that limiting cost burdens to entities that initiate a modification, or piggyback on another's modification, may confer incidental benefits on other parties with preexisting attachments on the newly modified facility. Nevertheless, if a modification would not have occurred absent the action of the initiating party, the cost should not be borne by those that did not take advantage of the opportunity by modifying their own facilities. Indeed, the Conference Report accompanying the passage of the 1996 Act imposes cost sharing obligations on an entity "that takes advantage of such opportunity to modify its own attachments." This suggests that an attaching party, incidentally benefiting from a modification, but not initiating or affirmatively participating in one, should not be responsible for the resulting cost.[2985] As for pole owners themselves, the imposition of cost burdens for modifications they do not initiate could be particularly cumbersome if excess space created by modifications remained unused for extended periods.[2986]

1214. Apart from entities that initiate modifications and preexisting attachers that use the opportunity to modify their own attachments, some entities may seek to add new attachments to the modified facility after the modification is completed to avoid any obligation to share in the cost. If this occurs, the entity initiating and paying for the modification might pay the entire cost of expanding a facility's capacity only to see a new competitor take advantage of the additional capacity without sharing in the cost.[2987] Moreover, entities with preexisting attachments may, due to cost considerations, forgo the opportunity to adjust their attachment only to see a new entrant attach to a pole without sharing the modification cost. To protect the initiators of modifications from absorbing costs that should be shared by others, we will allow the modifying party or parties to recover a proportionate share of the modification costs from parties that later are able to obtain access as a result of the modification. The proportionate share of the subsequent attacher should be reduced to take account of depreciation to the pole or other facility that has occurred since the modification. These provisions are intended to ensure that new entrants, especially small entities with limited resources, bear only their proportionate costs and are not forced to subsidize their later-entering competitors. To the extent small entities avail themselves of this cost-saving mechanism, however, they will incur certain record keeping obligations.[2988]

[2986] Cincinnati Bell reply at 8.

[2987] *See* AT&T comments at 19.

[2988] *See* Regulatory Flexibility Act, 5 U.S.C. §§ 601 et seq.

1215. Parties requesting or joining in a modification also will be responsible for resulting costs to maintain the facility on an ongoing basis. We believe determining the method by which to allocate such costs can best be resolved in the context of a proceeding addressing the determination of appropriate rates for pole attachments or other facility uses.[2989] We will postpone consideration of these issues until such time.

1216. We recognize that in some cases a facility modification will create excess capacity that eventually becomes a source of revenue for the facility owner, even though the owner did not share in the costs of the modification.[2990] We do not believe that this requires the owner to use those revenues to compensate the parties that did pay for the modification. Section 224(h) limits responsibility for modification costs to any party that "adds to or modifies its existing attachment after receiving notice" of a proposed modification.[2991] The statute does not give that party any interest in the pole or conduit other than access. Creating a right for that party to share in future revenues from the modification would be tantamount to bestowing an interest that the statute withholds.[2992] Requiring an owner to offset modification costs by the amount of future revenues emanating from the modification expands the category of responsible parties based on factors that Congress did not identify as relevant. Since Congress did not provide for an offset, we will not impose it ourselves. Indeed, a requirement that utilities pass additional attachment fees back to parties with preexisting attachments may be a disincentive to add new competitors to modified facilities, in direct contravention of the general intent of Congress.

5. Dispute Resolution

a. Background

1217. Implementation of the access requirements of sections 224 and 251(b)(4) require the adoption of enforcement procedures. In the NPRM, we sought comment on, among other things, whether to impose upon a utility the burden of justifying its denial of access to its poles, ducts, conduits, and rights-of-way due to lack of capacity, safety, reliability, and engineering issues.[2993]

b. Comments

[2989] BellSouth comments at 18; NYNEX comments at 14; SBC comments at 18.

[2990] AT&T comments at 21; GST Telecom comments at 9; WinStar reply at 8-9.

[2991] 47 U.S.C. § 224(h).

[2992] American Electric Power reply at 46.

[2993] NPRM at para. 223; *see* 47 U.S.C. § 224(f)(2).

1218. With respect to dispute resolution procedures generally, a few commenters note that existing complaint procedure mechanisms have worked well in the cable television pole context and should be adequate in this broader context as well.[2994] Other commenters argue that dispute resolution should be left to the states, with federal intervention only where the states failed to regulate.[2995] Some commenters request that any complaint mechanism established should provide for the expeditious resolution of disputes, with short time frames for responses and final resolution.[2996]

1219. Several commenters argue that, where access has been denied, the party denying access should have the burden of proving that such denial was justified.[2997] Others contend that, historically, cable operators have had the burden of proof in pole attachment cases, and that no principled basis exists for altering historic procedures.[2998] In addition, commenters expressed concern that placing the burden of proof on a utility unfairly presumes bad faith.[2999]

1220. PECO agrees with some cable commenters that the reasonableness of a denial of access should be based on industry safety and operational standards. A restriction on access imposed in accordance with such standards should be irrebuttably presumed reasonable, according to PECO. If the utility seeks to impose stricter standards, the burden would be on the utility to establish the reasonableness of the stricter standard. Predicting the likelihood of fact-intense disputes on such issues, PECO recommends the adoption of adequate dispute-resolution procedures.[3000] Similarly, Cole contends that a utility cannot deny a request for access based upon safety or reliability concerns as long as the applicant is willing to undertake the obligations necessary to comply with NESC standards.[3001] Safety and reliability standards that exceed NESC standards should be presumed unreasonable if they are used to deny access to a pole. The utility

[3000] PECO comments at 6.

[3001] Cole comments at 16.

would then have the burden of showing the reasonableness of such standards.[3002]

1221. Duquesne argues that it is appropriate for the utility to bear the burden of establishing a threat to reliability if that rationale is used to deny access. Once a utility makes a showing, based on an engineering analysis, that the attachments "quantifiably threaten reliability," the burden would shift to the party seeking the attachment to show that the utility's analysis is incomplete or invalid, with the utility holding the ultimate burden of proof.[3003]

c. Discussion

(1) General Complaint Procedures Under Section 224

1222. Section 224(f)(2) provides that an electric utility may deny non-discriminatory access "where there is insufficient capacity and for reasons of safety, reliability and generally applicable engineering purposes."[3004] We have determined that other utilities also may consider these concerns when faced with an access request.[3005] A denial of access, while proper in some cases, is an exception to the general mandate of section 224(f). We note that utilities contend that they are in the best position to determine when access should be denied, because they possess the information and expertise to make such decisions and because of the varied circumstances impacting these decisions.[3006] We think it appropriate that the utility bear the burden of justifying why its denial of access to a cable television or telecommunications carrier fits within that exception.[3007] We therefore agree that utilities have the ultimate burden of proof in denial-of-access cases.[3008] We believe this will minimize uncertainty and reduce litigation and transaction costs, because new entrants generally, and small entities in particular, are unlikely to have access to the relevant information without cooperation from the utilities.[3009]

[3009] *See* Regulatory Flexibility Act, 5 U.S.C. §§ 601 et seq.

1223. We also agree with Virginia Power that a telecommunications carrier or cable television provider filing a complaint with the Commission must establish a prima facie case.[3010] A petitioner's complaint, in addition to showing that it is timely filed, must state the grounds given for the denial of access, the reasons those grounds are unjust or unreasonable, and the remedy sought. The complaint must be supported by the written request for access, the utility's response, and information supporting its position.[3011] The Commission will deny the petitioner's claim if a prima facie case is not established.[3012] A complaint will not be dismissed if a petitioner is unable to obtain a utility's written response, or if a petitioner is denied any other relevant information by the utility needed to establish a prima facie case. Thus, we expect a utility that receives a legitimate inquiry regarding access to its facilities or property to make its maps, plats, and other relevant data available for inspection and copying by the requesting party, subject to reasonable conditions to protect proprietary information.[3013] This provision eliminates the need for costly discovery in pursuing a claim of improper denial of access, allowing attaching parties, including small entities with limited resources, to seek redress of such denials.[3014]

1224. We agree with the Joint Cable Commenters that "time is of the essence."[3015] The Joint Cable Commenters contend that the Commission should implement an expedited review process for denial of access cases.[3016] By implementing specific complaint procedures for denial of access cases, we seek to establish swift and specific enforcement procedures that will allow for competition where access can be provided.[3017] In order to provide a complete record, written requests for access must be provided to the utility. If access is not granted within 45 days of the request, the utility must confirm the denial in writing by the 45th day. Although these written requirements involve some recordkeeping obligations, which could impose a burden on small incumbent LECs and small entities, we believe that burden is outweighed by the benefits of

[3017] Joint Cable Commenters reply at 24.

certainty and expedient resolution of disputes which this procedure encourages.[3018] The denial must be specific, and include all relevant evidence or information supporting its denial. It must enumerate how the evidence relates to one of the reasons that access can be denied under section 224(f)(2), *i.e.*, lack of capacity, safety, reliability or engineering standards.

1225. For example, a utility may attempt to deny access because of lack of capacity on a 40-foot pole. We would expect a utility to provide the information demonstrating why there is no capacity. In addition, the utility should show why it declined to replace the pole with a 45-foot pole. Upon the receipt of a denial notice from the utility, the requesting party shall have 60 days to file its complaint with the Commission. We anticipate that by following this procedure the Commission will, upon receipt of a complaint, have all relevant information upon which to make its decision. The petition must be served pursuant to section 1.1404(b) of the Commission's rules.[3019] Final decisions relating to access will be resolved by the Commission expeditiously.[3020] Because we are using the expedited process described herein, we do not believe stays or other equitable relief will be granted in the absence of a specific showing, beyond the prima facie case, that such relief is warranted.

(2) Procedures Under Section 251

1226. A telecommunications carrier seeking access to the facilities or property of a LEC may invoke section 251(b)(4) in lieu of, or in addition to, section 244(f)(1). Because section 251(b)(4) mandates access "on rates terms, and conditions that are consistent with ...tion 224," we believe that the section 224 complaint procedures established above should be available regardless of whether a telecommunications provider invokes section 224(f)(1) or section 251(b)(4), or both.

1227. If a telecommunications carrier seeks access to the facilities or property of an incumbent LEC, however, it shall have the option of invoking the procedures established by section 252 in lieu of filing a complaint under section 224. Section 252 governs procedures for the negotiation, arbitration, and approval of certain agreements between incumbent LECs and telecommunications carriers.[3021] In pertinent part, section 252(a)(1) provides:

[3018] *See* Regulatory Flexibility Act, 5 U.S.C. §§ 601 et seq.

[3019] 47 C.F.R. § 1.1404(b).

[3020] We note, however, that if the Commission requests additional information from any party, such party will have 5 days to respond to the request. Failure to provide the requested information within the 5 days, will result in a review of the record provided thus far.

[3021] 47 U.S.C. § 252. The requirements of section 252, and the conditions set forth in this section 3(a) of this Order, do not apply if the party seeking access is not a telecommunications carrier, or if the party receiving the request for access is not an incumbent LEC.

> Upon receiving a request for interconnection, services, or network elements pursuant to section 251, an incumbent local exchange carrier may negotiate and enter into a binding agreement with the requesting telecommunications carrier or carriers without regard to the standards set forth in subsections (b) or (c) of section 251.[3022]

1228. Where parties are unable to reach an agreement under this section, any party may petition the relevant state commission to arbitrate the open issues.[3023] In resolving the dispute, the state commission must ensure, among other things, that the ultimate resolution "meet[s] the requirements of section 251, including the regulations prescribed by the Commission pursuant to section 251 . . . . ."[3024] The Commission may assume the state's authority under section 252 if the state "fails to carry out its responsibility" under that section.[3025]

1229. Section 251(c)(1) creates an obligation on the part of an incumbent LEC "to negotiate in good faith in accordance with section 252 the particular terms and conditions of agreements . . . " to fulfill its section 251(b)(4) obligation.[3026] Therefore, a telecommunications carrier may seek access to the facilities or property of an incumbent LEC pursuant to section 251(b)(4) and trigger the negotiation and arbitration procedures of section 252. If a telecommunications carrier intends to invoke the section 252 procedures, it should affirmatively state such intent in its formal request for access to the incumbent LEC. We impose this requirement because the two procedures have separate deadlines by which the parties may or must take certain steps, and therefore the incumbent LEC receiving the request has a need to know which procedure has been invoked. Section 224 shall be the default procedure that will apply if the telecommunications carrier fails to make an affirmative election.

1230. We note that section 252 does not impose any obligations on utilities other than incumbent LECs, and does not grant rights to entities that are not telecommunications providers. Therefore, section 252 may be invoked in lieu of section 224 only by a telecommunications carrier and only if it is seeking access to the facilities or property of an incumbent LEC.

1231. In addition, incumbent LECs cannot use section 251(b)(4) as a means of gaining access to the facilities or property of a LEC. A LEC's obligation under section 251(b)(4) is to afford access "on rates, terms, and conditions that are consistent with section 224." Section 224

[3022] 47 U.S.C. § 251(a).

[3023] 47 U.S.C. § 252(b)(1).

[3024] 47 U.S.C. § 252(c)(1).

[3025] 47 U.S.C. § 252(e)(5).

[3026] 47 U.S.C. § 251(c)(1).

does not prescribe rates, terms, or conditions governing access by an incumbent LEC to the facilities or rights-of-way of a competing LEC. Indeed, section 224 does not provide access rights to incumbent LECs. We cannot infer that section 251(b)(4) restores to an incumbent LEC access rights expressly withheld by section 224. We give deference to the specific denial of access under section 224 over the more general access provisions of section 251(b)(4). Accordingly, no incumbent LEC may seek access to the facilities or rights-of-way of a LEC or any utility under either section 224 or section 251(b)(4).

6. Reverse preemption

a. Background

1232. Even prior to enactment of the 1996 Act, section 224(b)(1) gave the Commission jurisdiction to "regulate the rates, terms, and conditions for pole attachments . . . ."[3027] Under former section 224(c)(1), that jurisdiction was preempted where a state regulated such matters. Such reverse preemption was conditioned upon the state following a certification procedure and meeting certain compliance requirements set forth in sections 224(c)(2) and (3). The 1996 Act expanded the Commission's jurisdiction to include not just rates, terms, and conditions, but also the authority to regulate non-discriminatory access to poles, ducts, conduits and rights-of-way under section 224(f).[3028] At the same time, the 1996 Act expanded the preemptive authority of states to match the expanded scope of the Commission's jurisdiction. section 224(c)(1) now provides:

> Nothing in this section shall be construed to apply to, or to give the Commission jurisdiction with respect to rates, terms and conditions, or access to poles, ducts, conduits, and rights-of-way as provided in subsection (f), for pole attachments in any case where such matters are regulated by the State.[3029]

b. Comments

1233. Cole contends that the nondiscriminatory access provisions of section 224 and our jurisdiction thereunder survive when a telecommunications provider seeks access to the facilities or property of a LEC under section 251(b)(4), even where such matters are regulated by a

[3027] 47 U.S.C. § 224(b)(1).

[3028] 47 U.S.C. § 224(f).

[3029] 47 U.S.C. § 224(c)(1).

state.[3030] Cole notes that section 251(b)(4) requires LECs to afford access to its facilities and rights-of-way to competing telecommunications carriers "on rates, terms, and conditions that are consistent with section 224," with no reference to the possibility of state regulation.[3031] Cole further cites the competitive checklist of section 271 which requires an RBOC to provide such access "in accordance with the requirements of section 224," but which does not provide for state regulation of access.[3032] Cole argues that neither section 251 nor section 271 exempts a LEC or BOC from the access requirements of section 224 where the state has undertaken regulation of such matters. Cole argues that allowing states to preempt federal authority "would defeat the purpose of the Act to promote access" to local facilities.[3033]

1234. Similarly, Nextlink contends that the Commission's access requirements should apply to any LEC that receives an access request under section 251(b)(4), regardless of whether a state has attempted to assert jurisdiction under section 224(c).[3034] Nextlink describes section 251 as "an entirely separate section providing entirely different bases for Commission jurisdiction."[3035]

1235. Other commenters argue that a request for access under section 251(b)(4) always implicates section 224, including the provisions of section 224(c)(1) that allow the states to preempt federal regulation.[3036] The District of Columbia Commission argues that section 251(b)(4) only requires that access be given "'on rates, terms and conditions that are consistent with section 224.'"[3037] Thus, this commenter asserts that any federal regulation of access under section 251(b)(4) is subject to the state's authority under section 224(c)(1).[3038] Bell Atlantic agrees, arguing that the only obligation of section 251(b)(4) is to provide access consistent with section 224 and that providing access in accordance with a valid scheme of state access regulations meets this requirement, regardless of any federal access requirements that otherwise

[3038] *Id.*

would apply.[3039] UTC states that "the statute clearly gives the states authority to establish access requirements if they elect to assert jurisdiction."[3040]

c. Discussion

1236. To resolve this issue, we will begin with access requests that can arise solely under section 224(f)(1). These circumstances include when a cable system or telecommunications carrier seeks access to the facilities or rights-of-way of a non-LEC utility. In such cases, the expansion of the Commission's authority to require utilities to provide nondiscriminatory access under section 224(f) is countered by a corresponding expansion in the scope of a state's authority under section 224(c)(1) to preempt federal requirements. The authority of a state under section 224(c)(1) to preempt federal regulation in these cases is clear.[3041]

1237. The issue becomes more complicated when a telecommunications carrier seeks access to LEC facilities or property under section 251(b)(4). By its express terms, section 251(b)(4) imposes upon LECs, "[t]he duty to afford access to the poles, ducts, conduits, and rights-of-way of such a carrier to competing providers of telecommunications services on rates, terms and conditions that are consistent with section 224."[3042] We believe the reference in section 251(b)(4) to section 224 incorporates all aspects of the latter section, including the state preemption authority of section 224(c)(1). This interpretation is consistent not only with the plain meaning of the statute but with the overall application of sections 251 and 252.

1238. In the 1996 Act, Congress expanded section 224(c)(1) to reach access issues. Congress' clear grant of authority to the states to preempt federal regulation in these cases undercuts the suggestion that Congress sought to establish federal access regulations of universal applicability. Moreover, we do not find it significant that the access provisions of sections 251 and 271 contain no specific reference to the preemptive authority of states under section 224(c)(1), since both provisions expressly refer to section 224 generally.

1239. Thus, when a state has exercised its preemptive authority under section 224(c)(1), a LEC satisfies its duty under section 251(b)(4) to afford access by complying with the state's regulations. If a state has not exercised such preemptive authority, the LEC must comply with the

---

[3039] Bell Atlantic comments at 12.

[3040] UTC reply at 29.

[3041] As in other circumstances, and subject to certain limitations, the Commission may preempt an otherwise valid state or local access requirement that "prohibit[s] or ha[s] the effect of prohibiting the ability of any entity to provide any interstate or intrastate telecommunication service." 47 U.S.C. § 253(a).

[3042] 47 U.S.C. § 254(b)(1)(4).

federal rules. Similarly, when a telecommunications carrier seeks access rights from an incumbent LEC by choosing to avail itself of the negotiation and arbitration procedures established in section 252, a state that has exercised its preemption rights will apply its own set of regulations in the arbitration process pursuant to section 252 (c)(1). Finally, we note that state regulation in this area is subject to the provisions of section 253.

1240. We note that Congress did not amend sections 224(c)(2) to prescribe a certification procedure with respect to access (as distinct from the rates, terms, and conditions of access). Therefore, upon the filing of an access complaint with the Commission, the defending party or the state itself should come forward to apprise us whether the state is regulating such matters.[3043] If so, we shall dismiss the complaint without prejudice to it being brought in the appropriate state forum. A party seeking to show that a state regulates access issues should cite to state laws and regulations governing access and establishing a procedure for resolving access complaints in a state forum. Especially probative will be a requirement that the relevant state authority resolve an access complaint within a set period of time following the filing of the complaint.[3044]

C. IMPOSING ADDITIONAL OBLIGATIONS ON LECS

1. Background

1241. Section 251(c) imposes obligations on incumbent LECs in addition to the obligations set forth in sections 251(a) and (b). It establishes obligations of incumbent LECs regarding: (1) good faith negotiation; (2) interconnection; (3) unbundling network elements; (4) resale; (5) providing notice of network changes; and (6) collocation.

1242. Section 251(h)(1) defines an incumbent LEC as a LEC within a particular service area that: (1) as of the enactment of the 1996 Act, provided telephone exchange service in such area; and (2) as of the enactment of the 1996 Act, was deemed to be a member of the exchange carrier association pursuant to 47 C.F.R. § 69.601(b) or, on or after the enactment of the 1996 Act, became a successor or assign of such carrier. Section 252(h)(2) provides that, "[t]he Commission may, by rule, provide for the treatment of a local exchange carrier (or class or category thereof) as an incumbent local exchange carrier for purposes of this section if (A) such carrier occupies a position in the market for telephone exchange service within an area that is comparable to the position occupied by a carrier described in paragraph (1); (B) such carrier has substantially replaced an incumbent local exchange carrier described in paragraph (1); and (C) such treatment is consistent with the public interest, convenience, and necessity and the purposes

---

[3043] Our rules require service of a pole attachment complaint on both the defending utility and the state. 47 C.F.R. § 1.1404(b).

[3044] *See* 47 U.S.C. § 224(c)(3) (establishing deadlines for states to take final action on complaints concerning the rates, terms, or conditions of access).

of this section."[3045]

1243. In the NPRM, we sought comment on whether we should establish at this time standards and procedures by which interested parties could prove that a particular LEC should be treated as an incumbent LEC. We also sought comment on whether carriers that are not deemed to be incumbent LECs under section 251(h) may be required to comply with any or all of the obligations that apply to incumbent LECs, and whether states may impose on non-incumbent LECs the obligations that are imposed on incumbent LECs under section 251(c).[3046]

2. Comments

1244. Most parties that commented on the issue contend that the Commission should not establish in this proceeding standards and procedures for determining whether a LEC should be treated as an incumbent LEC.[3047]

1245. Many incumbent LECs and state commissions contend that it is not inconsistent with the Act for states to impose the requirements in section 251(c) on carriers that do not fall within the 1996 Act's definition of incumbent. These parties note that sections 251(d)(3), 252(e)(3), and 253(b) permit states to impose additional requirements on carriers.[3048] State commissions allege that they are in the best position to determine when it is appropriate to impose particular obligations on new entrants.[3049] These parties contend that state imposition of reciprocal obligations would be equitable,[3050] and would help promote fair negotiation and realistic demands by the new entrants.[3051]

[3048] *See, e.g.*, BellSouth comments at 10; California Commission comments at 12; Illinois Commission comments at 19-20 (it is not inconsistent with the Act for states to impose additional obligations on non-incumbents, although it would not be permissible for FCC to do so); Ohio Commission comments at 21-22; PacTel comments at 16; Pennsylvania Commission comments at 19.

[3049] *See, e.g.*, District of Columbia Commission comments at 14.

[3050] *See, e.g.*, Colorado Commission comments at 14-15; MECA comments at 18; Municipal Utilities comments at 10-12 (reciprocal obligations should be permitted as long as they are allowed under state law and city charter); Ohio Consumers' Counsel comments at 5-6 (the loop is a bottleneck regardless of whether the provider is an incumbent or a new entrant); Ohio Commission reply at 8.

[3051] *See, e.g.*, MCI comments at 16, 20; New Jersey Commission at 1.

1246. Potential local competitors argue that states may not impose any of the requirements of section 251(c) on non-incumbent LECs.[3052] These parties contend that the 1996 Act specifically imposes different, and additional obligations on incumbent carriers.[3053] In addition, these parties contend that imposing the same regulatory obligations on non-incumbents is unnecessary because they lack market power,[3054] and is contrary to Congress's desire to facilitate new entry into the local telephone market.[3055] In addition, they assert that section 251(h)(2), which gives the FCC authority to determine when to treat additional carriers as incumbent LECs, would be meaningless if states could decide on their own to subject any LEC to obligations imposed by section 251(c) on incumbent LECs.[3056] Some parties assert that states already impose reciprocal obligations on new entrants, or require them to comply with requirements the 1996 Act only imposes on incumbent LECs.[3057]

3. Discussion

1247. We conclude that allowing states to impose on non-incumbent LECs obligations that the 1996 Act designates as "Additional Obligations on Incumbent Local Exchange Carriers," distinct from obligations on all LECs,[3058] would be inconsistent with the statute.[3059] Some parties

[3053] *See, e.g.*, ACTA comments at 5, Comcast comments at 17, Sprint comments at 10, Cox reply at 41, ICTA reply at 5.

[3054] *See, e.g.*, Comcast comments at 15-16, DoJ comments at 7 (absent a showing of market power, there is no basis for imposing additional obligations on new entrants), MCI comments at 5 n.7, Cox reply at 40, Time Warner reply at 11.

[3055] *See, e.g.*, Continental comments at 18, Metricom comments at 2 (imposing such requirements on non-dominant carriers would hinder competition), NEXTLINK comments at 15-16 (for states to impose additional obligations on non-incumbent LECs could constitute a barrier to entry in violation of section 253), Cox reply at 41, ICTA reply at 6 (imposing 251(c) requirements on new entrants would raise costs and thereby discourage potential competitors from entering the local market).

[3056] *See, e.g.*, GST comments at 3-4, MFS comments at 10, Time Warner comments at 15 (fact that Congress authorizes the FCC (but not state commissions) to impose incumbent obligations on the FCC suggests that Congress did not intend to give states that authority), TCI reply at 12, Teleport reply at 36.

[3057] TCI comments at 14 n.23; *see also* Colorado Commission comments at 11-12 (stating that it exempts new entrants from certain rules for a period of three years, after which the new entrant must demonstrate the continued need for such exemption), Illinois Commission comments at 19 (stating that it imposes intraLATA presubscription and line-side interconnection obligations on new entrants for policy reasons).

[3058] *Compare* 47 U.S.C. §§ 251(b) and 251(c).

assert that certain provisions of the 1996 Act, such as sections 252(e)(3) and 253(b), explicitly permit states to impose additional obligations. Such additional obligations, however, must be consistent with the language and purposes of the 1996 Act.

1248. Section 251(h)(2) sets forth a process by which the FCC may decide to treat LECs as incumbent LECs. Thus, when the conditions set forth in section 251(h)(2) are met, the 1996 Act contemplates that new entrants will be subject to the same obligations imposed on incumbents. While we find that states may not unilaterally impose on non-incumbent LECs obligations the 1996 Act expressly imposes only on incumbent LECs, we find that state commissions or other interested parties could ask the FCC to classify a carrier as an incumbent LEC pursuant to section 251(h)(2). At this time, we decline to adopt specific procedures or standards for determining whether a LEC should be treated as an incumbent LEC. Instead, we will permit interested parties to ask the FCC to issue an order declaring a particular LEC or a class or category of LECs to be treated as incumbent LECs. We expect to give particular consideration to filings from state commissions. We further anticipate that we will not impose incumbent LEC obligations on non-incumbent LECs absent a clear and convincing showing that the LEC occupies a position in the telephone exchange market comparable to the position held by an incumbent LEC, has substantially replaced an incumbent LEC, and that such treatment would serve the public interest, convenience, and necessity and the purposes of section 251.[3060]

[3059] We understand that some states may be imposing on non-incumbent LECs obligations set forth in section 251(c). *See, e.g.*, Colorado Commission comments at 11-12; Draft Decision, State of Connecticut Department of Public Utility Control, Docket No. 94-10-04 at 60, 65 (Connecticut Commission July 11, 1996); Illinois Commission comments at 19. We believe that these actions may be inconsistent with the 1996 Act.

[3060] 47 U.S.C. § 251(h)(2).

XII. EXEMPTIONS, SUSPENSIONS, AND MODIFICATIONS OF SECTION 251 REQUIREMENTS

A. BACKGROUND

1249. Section 251(f)(1) grants rural telephone companies an exemption from section 251(c), until the rural telephone company has received a bona fide request for interconnection, services, or network elements, and the state commission determines that the exemption should be terminated.[3061] Section 251(f)(2) allows LECs with fewer than two percent of the nation's subscriber lines to petition a state commission for a suspension or modification of any requirements of sections 251(b) and (c). Section 251(f) imposes a duty on state commissions to make determinations under this section, and establishes the criteria and procedures for the state commissions to follow. In the NPRM, we tentatively concluded that state commissions have the sole authority to make determinations under section 251(f). In addition, we sought comment on whether we should issue guidelines to assist state commissions when they make determinations regarding exemptions, suspensions, or modifications under section 251(f).

1250. Although subsections (f)(1) and (f)(2) both address the circumstances under which an incumbent LEC could be relieved of duties otherwise imposed by section 251, subsection 251(f)(2) also applies to non-incumbent LECs. The standard for determining whether to exempt a carrier under subsection 251(f)(1) is different from the standard for determining whether to grant a suspension or modification under subsection (f)(2). Subsection 251(f)(1)(B) requires state commissions to determine that terminating a rural exemption is consistent with the universal service provisions of the 1996 Act.[3062] Subsection 251(f)(2)(A)(i) requires state commissions to grant a suspension or modification if it is necessary to "avoid a significant adverse economic impact on users of telecommunications services generally," and subsection 251(f)(2)(B) requires a suspension or modification to be "consistent with the public interest, convenience, and necessity."[3063] Although we address these two subsections together, we highlight instances in which we believe that differences in statutory language require different treatment by state

---

[3061] A rural telephone company is defined as a local exchange carrier operating entity to the extent that such entity "(A) provides common carrier service to any local exchange carrier study area that does not include either– (i) any incorporated place of 10,000 inhabitants or more, or any part thereof . . . , or (ii) any territory, incorporated or unincorporated, included in an urbanized area . . ., (B) provides telephone exchange service, including exchange access, to fewer than 50,000 access lines, (C) provides telephone exchange service to any local exchange carrier study area with fewer than 100,000 access lines; or (D) has less than 15 percent of its access lines in communities of more than 50,000 on the date of enactment of the Telecommunications Act of 1996." 47 U.S.C. § 153(37).

[3062] The provision states, "the State commission shall terminate the exemption if the request . . . is consistent with section 254 (other than subsections (b)(7) and (c)(1)(D) thereof)." 47 U.S.C. § 251(f)(1)(B).

[3063] 47 U.S.C. § 251(f)(2).

commissions.

1251. We discuss below issues raised by the commenters, and establish some rules regarding the requirements of section 251(f) that we believe will assist state commissions as they carry out their duties under section 251(f). For the most part, however, we expect that states will interpret the requirements of section 251(f) through rulemaking and adjudicative proceedings. We may in the future initiate a Notice of Proposed Rulemaking on certain additional issues raised by section 251(f) if it appears that further action by the Commission is warranted.

B. NEED FOR NATIONAL RULES

1. Comments

1252. Most state commissions[3064] and some other parties[3065] assert that states should have exclusive responsibility for the guidelines and determinations made under this section. Several commenters contend that any guidelines the Commission might issue would be useless, because generalized national guidelines could not take into account the variations among states and among individual LECs.[3066] For example, the Minnesota Independent Coalition argues that the additional grant of authority to states under section 214(e) confirms that state commissions have the sole authority to make determinations under section 251(f).[3067] A number of small telephone companies and associations of LECs advocate mandatory national rules regarding implementation of section 251(f). They assert that such rules would ensure that states carry out this provision in accordance with congressional intent.[3068] Some commenters favor a middle ground, claiming that non-mandatory guidelines from the Commission would be helpful, but that mandatory requirements would conflict with the Act's delegation to the states to make determinations under

section 251(f).[3069]

2. Discussion

1253. We agree with parties, including small incumbent LECs, who argue that determining whether a telephone company is entitled, pursuant to section 251(f), to exemption, suspension, or modification of the requirements of section 251 generally should be left to state commissions.[3070] Requests made pursuant to section 251(f) seek to carve out exceptions to application of the section 251 rules that we are establishing in this proceeding. We find that Congress intended the section 251 requirements, and the Commission's implementing rules thereunder, to apply to all carriers throughout the country, except in the circumstances delineated in the statute. We find convincing assertions that it would be an overwhelming task at this time for the Commission to try to anticipate and establish national rules for determining when our generally-applicable rules should *not* be imposed upon carriers. Therefore, we establish in this Order a very limited set of rules that will assist states in their application of the provisions in section 251(f).

1254. Many parties have proposed varying interpretations of the provisions in section 251(f), and have asked for Commission determination or a statement of agreement. Because it appears that many parties welcome some guidance from the Commission, we briefly set forth our interpretation of certain provisions of section 251(f). Such statements will assist parties and, in particular, state commissions that must make determinations regarding requests for exemption, suspension, and modification.

C. APPLICATION OF SECTION 251(f)

1. Comments

1255. Some commenters urge the Commission to require states to grant exemptions, suspensions, or modifications only on a case-by-case basis, and only to the extent warranted by the particular circumstances. They ask the Commission to prohibit states from granting broad-scale or generalized exemptions, suspensions or modifications.[3071] AT&T argues that, to ensure that states do not allow LECs to avoid the regulatory and policy framework that Congress has mandated, the Commission should clarify that states must narrowly tailor suspensions and

[3070] *See, e.g.*, Minnesota Ind. Coalition comments at 14; Rural Tel. Coalition comments at 11.

[3071] *See, e.g.*, Centennial Cellular Corp. comments at 16; NCTA comments at 64; Vanguard reply at 21-22.

modifications to protect against specific, identifiable harm.[1072] Telecommunications Carriers for Competition and GCI argue that section 251(f) allows states to delay imposing the requirements under section 251(b) and (c), but it does not allow states to protect LECs from those requirements indefinitely.[1073] In response, Rural Tel. Coalition and SNET state that, while the term "suspensions" could be interpreted as allowing a time delay in implementation, the addition of the term "modifications" allows states to act more broadly.[1074] SNET favors allowing the states "broad discretion to change the nature of any requirement imposed by subsections (b) and (c)."[1075] USTA argues that states should not be permitted to eliminate all exemptions for all carriers.[1076]

1256. A number of parties allege that the Commission should encourage or require states to establish a legal presumption that the LEC seeking an exemption, suspension, or modification must prove to the state commission that such request is merited under the criteria set forth in section 251(f). AT&T argues that a carrier petitioning for suspension or modification under section 251(f)(2) should be obliged to demonstrate that "the application to it of the [s]ection 251(b) or (c) obligations that are the subject of its petition would inflict substantial harm on the LEC and customers in its territories that would not be inflicted on larger LECs and customers in their territories."[1077] SCBA asserts that the burden should be upon the incumbent LEC, which has strong disincentives to promote competitive entry.[1078] Local exchange carriers contend, on the other hand, that the party making a request under section 251(b) or (c) should have to prove that an exemption, suspension, or modification is not justified. For example, TCA, Inc. argues that, because of the high cost of providing telephone service in rural areas, competing carriers should be required to prove that competition will benefit a given rural area.[1079] Bay Springs, *et al.* and Bogue, Kansas argue that rural carriers should benefit from a presumption that they continue to qualify for the exemption in section 251(f)(1).[1080] SNET suggests that, if a LEC makes a *prima*

facie case in its petition for suspension or modification, the state should automatically grant a temporary suspension of section 251(b) and (c) obligations, as allowed by section 251(f)(2).[3081]

1257. USTA, some rural LECs, and several other parties advocate that the Commission clarify what constitutes a bona fide request under section 251(f)(1).[3082] USTA recommends that a bona fide request must include, at a minimum: (1) a request for service to begin within one year from the date of the request, with a minimum one-year service period; (2) identification of the points where interconnection is sought, specification of network components and quantities needed, and the date when interconnection is desired; and (3) an indication that the requesting carrier is willing to agree to pay charges sufficient to compensate the LEC for all costs incurred in fulfilling the terms of the interconnection agreement as part of the agreement. USTA also contends that the states should be allowed to mandate longer minimum service periods and require competitive providers to post bonds or submit deposits to ensure that a rural telephone company does not bear the cost of interconnection.[3083] Anchorage Telephone Utility claims that simply responding to requests for interconnection imposes a tremendous burden and expense on rural telephone companies, and that rural LECs should not have to respond to requests that do not meet minimum criteria.[3084] Several parties state that they do not believe that generalized form letter requests should be considered a bona fide request.[3085]

1258. Other commenters either favor a broader definition of a bona fide request or oppose federal standards entirely.[3086] NCTA and GCI argue that a request for interconnection

[3083] USTA comments at 87-88; *accord* Anchorage Tel. Utility comments at 6-7 (carriers that ultimately do not order the items identified in a request for interconnection, services, or network elements should be required to reimburse the incumbent LEC for the costs of responding to such request); Matanuska Tel. Ass'n comments at 5.

[3084] Anchorage Tel. Utility comments at 6 (reporting the receipt of two letters "purporting to request interconnection." "One is a 1-page letter that simply asserts a need for interconnection. The other is an 8-page, single-spaced letter that demands detailed technical, operational and cost information on practically every facet of Anchorage Tel. Utility's local exchange service, without providing any indication of what the requesting carrier actually plans, needs or wants"); *accord* NECA reply at 10-11 (any bona fide request standard should permit LECs to recover costs of responding to requests and enable LECs to avoid unnecessary costs in responding to requests); TDS reply at 5-6.

[3085] TDS reply at 5; Anchorage Tel. Utility comments at 6; Rural Tel. Coalition reply at 24-25.

[3086] *See, e.g.*, Louisiana Commission comments at 22-23 (opposing any attempt by the Commission to define a standard for bona fide requests); *see also* Western Alliance comments at 7 n.16.

should be presumed bona fide until a rural telephone company shows that it is not. They object to a bona fide request requirement, such as the one proposed by USTA, that includes burdensome "pre-filing" requirements as a condition for state review under section 251(f).[3087]

1259. Subsection 251(f)(2) applies to LECs "with fewer than 2 percent of the Nation's subscriber lines installed in the aggregate nationwide."[3088] Several parties suggest that the Commission clarify which carriers meet the numerical standard.[3089] AT&T and a number of other parties argue that the 2 percent should be applied at the holding company level in order to ensure that no BOC operating company can apply for a suspension or modification under this subsection.[3090] Some parties further question whether Tier 1 LECs should be allowed to petition for suspension or modification under subsection (f)(2).[3091] Other parties argue that the two percent statutory cut-off is not a loophole and that the statutory standard should not be altered by the Commission to exclude Tier 1 LECs.[3092] PacTel suggests that the standard should be applied at the operating company level because section 251(f)(2) by its terms applies to "local exchange carrier[s]" not local exchange carriers "and their affiliates."[3093]

1260. Some parties recommend that the Commission offer guidance on how to determine whether a request for exemption, modification, or suspension should be granted.[3094] For example, sections 251(f)(1) and (f)(2) both include consideration of "technical feasibility" in deciding whether to grant an exemption, suspension, or modification. Some parties urge the Commission to clarify whether the standard for determining technical feasibility for purposes of section 251(f)

[3087] NCTA comments at 26-27; GCI reply at 17-18; *but see* USTA reply at 37 (disagreeing that its proposal would constitute "pre-filing" requirements).

[3088] 47 U.S.C. § 251(f)(2).

[3089] BellSouth comments at 76; Ohio Consumers' Counsel comments at 47-48.

[3090] AT&T comments at 90-93; Lincoln Tel. reply at 9-10; GCI reply at 17; TCC reply at 28; Ohio Consumers' Counsel argues that this interpretation is sound because section 251(f)(2) discusses the number of lines "in the aggregate nationwide," and individual operating companies do not operate on a nationwide scale. Ohio Consumers' Counsel reply at 26.

[3091] AT&T comments at 92; TLD comments at 6-7; Centennial Cellular Corp. comments at 12-15.

[3092] Alaska Tel. Ass'n comments at 6; Cincinnati Bell comments at 40, reply at 13; Lincoln Tel. comments at 10-11.

[3093] PacTel reply at 40-41.

[3094] *See, e.g.*, NCTA comments at 63-67 (urging a very limited construction of the exemption, suspension and modification provisions); *contra* Western Alliance reply at 7; Rural Tel. Coalition reply at 21-22.

is different than the technical feasibility standard set forth in sections 251(b) and (c).[3095] Sections 251(f)(1) and (f)(2) require the states to consider whether a request is "unduly economically burdensome."[3096] Generally, comments from rural LECs and others contend that smaller LECs cannot afford to hire staff to respond to requests, or expend funds for additional facilities or operational systems without jeopardizing their financial stability.[3097] In contrast, other parties argue that LECs should not be relieved of any duties otherwise imposed by sections 251(b) and (c) merely because they would require the expenditure of funds.[3098]

1261. Some incumbent LECs recommend that carriers that compete with rural LECs should be required to assume some of the universal service obligations of rural carriers.[3099] They argue that, without such safeguards, competing LECs will enter rural markets and take the incumbent LECs' profitable customers. USTA argues that state commissions should be encouraged to grant waivers until universal service issues are resolved.[3100] Commenters also propose varying interpretations of what constitutes "significant adverse impact on users."[3101] USTA proposes that the definition include any request that would cause a LEC to "have difficulty raising sufficient investment capital, and where the remaining customers . . . would likely bear an increase in rates or a reduction in service to cover a shortfall or subsidy to a new entrant."[3102] TLD proposes that the Commission establish a numerical benchmark, for example, that more than 50 percent of the users would suffer a rate increase of at least 20 percent before a request would be considered in violation of subsection (f)(2)(A)(i).[3103]

3. Discussion

[3095] *See, e.g.*, Bay Springs, *et al.* comments at 11; Lincoln Tel. comments at 23-24; SNET comments at 35; USTA comments at 92; Rural Tel. Coalition reply at 22-23.

[3096] 47 U.S.C. § 251(f).

[3097] A number of parties argue that, if smaller and rural LECs cannot recover their total costs, including any required investments and costs associated with developing rate levels and modifying support systems, the request should be deemed unduly economically burdensome. *See, e.g.*, USTA comments at 92; SNET comments at 36; TLD comments at 2; Lincoln Tel. comments at 23-25; TLD comments at 11-13.

[3098] *See, e.g.*, NCTA comments at 64 n.218.

[3099] Bay Springs, *et al.* comments at 12; TLD comments at 5; *accord* NECA comments at 11.

[3100] USTA comments at 91; *but see* NCTA reply at 25-26.

[3101] 47 U.S.C. § 251(f)(2)(A)(i).

[3102] USTA comments at 92.

[3103] TLD comments at 11.

1262. Congress generally intended the requirements in section 251 to apply to carriers across the country, but Congress recognized that in some cases, it might be unfair or inappropriate to apply all of the requirements to smaller or rural telephone companies.[3104] We believe that Congress intended exemption, suspension, or modification of the section 251 requirements to be the exception rather than the rule, and to apply only to the extent, and for the period of time, that policy considerations justify such exemption, suspension, or modification. We believe that Congress did not intend to insulate smaller or rural LECs from competition, and thereby prevent subscribers in those communities from obtaining the benefits of competitive local exchange service. Thus, we believe that, in order to justify continued exemption once a bona fide request has been made, or to justify suspension, or modification of the Commission's section 251 requirements, a LEC must offer evidence that application of those requirements would be likely to cause undue economic burdens beyond the economic burdens typically associated with efficient competitive entry. State commissions will need to decide on a case-by-case basis whether such a showing has been made.

1263. Given the pro-competitive focus of the 1996 Act, we find that rural LECs must prove to the state commission that they should continue to be exempt pursuant to section 251(f)(1) from requirements of section 251(c), once a bona-fide request has been made, and that smaller companies must prove to the state commission, pursuant to section 251(f)(2), that a suspension or modification of requirements of sections 251(b) or (c) should be granted. We conclude that it is appropriate to place the burden of proof on the party seeking relief from otherwise applicable requirements. Moreover, the party seeking exemption, suspension, or modification is in control of the relevant information necessary for the state to make a determination regarding the request. A rural company that falls within section 251(f)(1) is not required to make any showing until it receives a bona fide request for interconnection, services, or network elements. We decline at this time to establish guidelines regarding what constitutes a bona fide request. We also decline in this Report and Order to adopt national rules or guidelines regarding other aspects of section 251(f). For example, we will not rule in this proceeding on the universal service duties of requesting carriers that seek to compete with rural LECs. We may offer guidance on these matters at a later date, if we believe it is necessary and appropriate.

1264. We find that Congress intended section 251(f)(2) only to apply to companies that, at the holding company level, have fewer than two percent of subscriber lines nationwide. This is consistent with the fact that the standard is based on the percent of subscriber lines that a carrier has "*in the aggregate nationwide*."[3105] Moreover, any other interpretation would permit almost any company, including Bell Atlantic, Ameritech, and GTE affiliates, to take advantage of the suspension and modification provisions in section 251(f)(2). Such a conclusion would render the two percent limitation virtually meaningless.

[3104] 47 U.S.C. § 251(f).

[3105] 47 U.S.C. 251(f)(2) (emphasis added).

1265. We note that some parties recommend that, in adopting rules pursuant to section 251, the Commission provide different treatment or impose different obligations on smaller or rural carriers.[3106] We conclude that section 251(f) adequately provides for varying treatment for smaller or rural LECs where such variances are justified in particular instances. We conclude that there is no basis in the record for adopting other special rules, or limiting the application of our rules to smaller or rural LECs.

[3106] For example, the Rural Tel. Coalition argues that interconnection and collocation points should be set in a flexible manner to take into account size and volume differences among carriers. Rural Tel. Coalition comments at 31.

XIII. ADVANCED TELECOMMUNICATIONS CAPABILITIES

1266. Section 706(a) provides that the Commission "shall encourage the deployment on a reasonable and timely basis of advanced telecommunications capability to all Americans (including, in particular, elementary and secondary schools and classrooms) by utilizing, in a manner consistent with the public interest, convenience, and necessity, price cap regulation, regulatory forbearance, measures that promote competition in the local telecommunications market, or other regulating methods that remove barriers to infrastructure investment."[3107] In the NPRM, we sought comment on how we can advance Congress's section 706(a) goal within the context of our implementation of sections 251 and 252.[3108]

1267. A number of parties suggest that rules allowing them to compete effectively and earn a profit in the telecommunications industry would assist the industry in providing telecommunications services to all Americans.[3109] MFS suggests that "all LECs should be required, as a condition of eligibility for universal service subsidies, to meet network modernization standards for rural telephone companies."[3110] Several state commissions indicate that they have already established programs to assist institutions eligible under section 706 in deploying advanced telecommunications services.[3111] The Alliance for Public Technology asserts that section 706 should underlie all of the FCC's proceedings.[3112] Ericsson states that the industry should work with government agencies to promote leading edge technology to ensure that it is introduced on a reasonably timely basis. For example, it contends that "Plug and Play Internet use" will greatly help the public and schools access information, and that advanced technology such as asynchronous transfer mode (ATM), wireless data/video, and AIN will enhance interconnection capabilities of public and private networks.[3113] The Illinois Commission contends that, depending on the pricing standard the Commission adopts for interconnection and access to unbundled elements, and the Commission's interpretation of the prohibition against discrimination, the Commission should adopt special rules for carriers when they provide interconnection or access to unbundled network elements to serve a school, library, or healthcare

XIV. PROVISIONS OF SECTION 252

A. Section 252(e)(5)

1. Background

1269. Section 252(e)(5) directs the Commission to assume responsibility for any proceeding or matter in which the state commission "fails to act to carry out its responsibility" under section 252.[3115] In the NPRM, we asked whether the Commission should establish rules and regulations necessary to carry out our obligation under section 252(e)(5).[3116] In addition, we sought comment on whether in this proceeding we should establish regulations necessary and appropriate to carry out our obligations under section 252(e)(5). In particular, we sought comment on what constitutes notice of failure to act, what procedures, if any, we should establish for parties to notify the Commission, and what are the circumstances under which a state commission should be deemed to have "fail[ed] to act" under section 252(e)(5).[3117]

1270. Section 252(e)(4) provides that, if the state commission does not approve or reject (1) a negotiated agreement within 90 days, or (2) an arbitrated agreement within 30 days, from the time the agreement is submitted by the parties, the agreement shall be "deemed approved."[3118] We sought comment on the relationship between this provision and our obligation to assume responsibility under section 252(e)(5). We also sought comment on whether the Commission, once it assumes the responsibility of the state commission, is bound by all of the laws and standards that would have applied to the state commission, and whether the Commission is authorized to determine whether an agreement is consistent with applicable state law as the state commission would have been under section 252(e)(3).[3119] In addition, we sought comment on whether, once the Commission assumes responsibility under section 252(e)(5), it retains jurisdiction, or whether that matter or proceeding subsequently should be remanded to the state.

1271. Finally, we sought comment on whether we should adopt, in this proceeding, some standards or methods for arbitrating disputes in the event we must conduct an arbitration under section 252(e)(5). We noted some of the benefits and drawbacks of both "final offer" arbitration and open-ended arbitration, and asked for comment on both.

[3118] 47 U.S.C. § 252(e)(4).

[3119] NPRM at ¶ 267.

2. Comments

1272. The majority of the parties that commented on this issue assert that the Commission should establish guidelines under which it will carry out its responsibilities under section section 252(e)(5).[3120] The Illinois Commission, for example, argues that regulations are needed in order to avoid jurisdictional disputes that may arise.[3121] Some parties, on the other hand, argue that it is not critical for the Commission at this time to develop rules governing the arbitration process.[3122] The Pennsylvania Commission, for example, argues that such rules should be adopted in this proceeding only if the Commission perceives a real possibility that it will be asked in the near future to arbitrate an interconnection agreement.[3123]

1273. A broad range of parties comment on what constitutes a "failure to act" and whether the Commission should establish a definition and procedures for interested parties to notify us if a state commission fails to act.[3124] The Illinois Commission, for example, argues that, upon receipt of a petition to mediate or arbitrate, or a BOC statement of generally available terms, the state commission should issue and serve upon the Commission a notice of its intent to act. This will put the Commission and interested parties on notice that the state commission intends to act.[3125] Some state commissions argue that "failure to act" occurs only if the state commission fails to respond to a request for mediation or arbitration, or fails to issue an arbitration decision within nine months after the incumbent LEC receives a request for interconnection under section 252.[3126]

1274. Other parties contend that failure to act should mean that a state commission has

[3125] Illinois Commission comments at 89.

[3126] District of Columbia Commission comments at 40; Ohio Commission comments at 81-82; *accord* Cable & Wireless comments at 51.

not taken any steps to act upon a request for arbitration, or has not taken any steps to approve an arbitrated agreement within the time set out in section 252(e)(4).[3127] Jones argues that a failure to act occurs where a state fails to respond to a request for arbitration or fails to render a decision on time in the arbitration proceeding.[3128] Ohio Consumers' Counsel contends that failure to carry out a state's responsibility means more than mere inaction, and that, for example, willfully disregarding the standards in section 252(e)(2) for approving or disapproving agreements might also "constitute a failure to act to carry out its responsibility" under section 252.[3129] USTA argues that, where there has been no agreement and the state fails to act, the Commission must step in and, in some instances, the Commission may need to step in to arbitrate or mediate before an agreement has been reached.[3130]

1275. Regarding the relationship between sections 252(e)(5) and 252(e)(4), most commenters assert that, if a state fails to approve a negotiated agreement within 90 days, or an arbitrated agreement within 30 days, the agreement will be deemed approved, and no Commission action is required.[3131] These parties contend that approval or disapproval of negotiated or arbitrated agreements are not reviewable by the Commission, but that aggrieved parties may seek relief in the appropriate federal district court.

1276. A number of commenters believe that it is important that procedures be in place for interested parties to notify the Commission if a state fails to act. These parties argue that notice of failure to act should be in writing, and should contain the relevant factual circumstances including the provision of the statute under which the state allegedly has failed to act.[3132] They contend that notice should be given to allow interested parties and the state adequate time to respond. MCI asserts that existing Commission procedures are adequate. MCI argues that any notice of an alleged state commission failure to act should set forth relevant facts and the

Commission should place the item on public notice.[3133]

1277. A majority of the commenting parties argue that, if the Commission assumes the responsibility of a state commission, it should be bound by laws and standards that would have applied to the state commission.[3134] These parties allege that this approach would produce consistent results, and that Congress did not intend to create another forum with a separate set of rules. Time Warner, on the other hand, argues against the Commission being bound by state law.[3135]

1278. Parties disagree over whether authority would revert back to the states once the Commission assumes a state commission's responsibility. A number of state commissions argue that the Commission does not retain jurisdiction; it only assumes jurisdiction over a particular proceeding or matter but does not substitute for the state commission on an ongoing basis.[3136] The District of Columbia Commission asserts that, at any time, the state should be able to petition the Commission to reconsider its decision to preempt, and such petitions should be granted upon a reasonable assurance the state intends to carry out its obligations.[3137] A number of parties contend that, once the Commission assumes jurisdiction over a proceeding or matter, it should retain jurisdiction.[3138] Teleport, for example, argues that the Commission "should not risk returning jurisdiction to a state that has demonstrated an ineptitude for implementing interconnection agreements."[3139] Pacific Telesis and Cable and Wireless argue that any agreement arbitrated by the Commission must be submitted to the state for approval.[3140]

[3133] MCI comments at 95.

[3134] *See, e.g.*, PacTel comments at 13-14 (if there is any conflict between the Commission's own rules and requirements of that state, the Commission must lay aside its rules and enforce the state's); California Commission comments at 48; Illinois Commission comments at 90; BellSouth comments at 79; Ohio Commission comments at 82; Louisiana Commission comments at 28 (specific questions concerning a state's law could be certified to the state); SBC comments at 105.

[3135] Time Warner comments at 107-108 (the Commission's authority to interpret state law is suspect, and the Commission lacks the resources and expertise to sit as a trier of law in fifty jurisdictions).

[3138] *See, e.g.*, Teleport comments at 89; Jones Intercable comments at 17; Time Warner comments at 109; Oregon Commission comments at 5 (failure by the state to act on one agreement should not vest jurisdiction over other agreements or matters).

[3139] Teleport comments at 89.

[3140] PacTel comments at 100; Cable & Wireless comments at 52.

1279. The vast majority of commenters recommend that the Commission adopt standards for arbitrating disputes in the event that it assumes responsibility under section 252(e)(5).[3141] These parties assert that sufficiently detailed rules should ensure fair and expeditious handling of arbitrations. A few of the commenters favor national rules governing state arbitration proceedings.[3142] SCBA, for example, favors national standards requiring state commissions to use abbreviated, lower cost arbitration proceedings for small cable operators.[3143] The majority of commenters, however, argue against national rules that would govern state arbitration proceedings.[3144]

1280. There is also significant disagreement regarding whether final-offer arbitration should be the arbitration model adopted by the Commission in the event the Commission must conduct the arbitration itself. A broad range of parties argue that final offer arbitration would result in reasonable recommendations to the arbitrator.[3145] Vanguard argues that the "final offer" method of arbitration should permit post-offer negotiation by the parties and allow the parties to tailor counter-proposals.[3146] Under this approach, the Commission would permit negotiation to continue after arbitration offers are exchanged in order to promote negotiated settlements.[3147]

1281. Many competitors oppose a "final offer" arbitration standard.[3148] Sprint, for example, argues that "final-offer" arbitration works well when there is a single, narrowly defined issue on the table, but, where there are numerous complex technical and economic issues, confronting the arbitrator with an "either/or" choice leaves insufficient flexibility to achieve a

result that comports with section 251.[3149] In addition, Sprint asserts that, because arbitration proceedings have a public interest component that sets them apart from mere private disputes, neither party's offer might serve the public interest.[3150] Some parties recommend an "open-ended" arbitration system,[3151] while California is in favor of a hybrid between the two.[3152]

1282. SBC contends that Congress did not intend for arbitration to be binding to the extent that parties are not legally obligated to enter into an agreement after the arbitrator issues a decision.[3153] SBC argues that parties are bound by the arbitrator's decision only if they decide to enter into an agreement. Vanguard responds that SBC's proposal is contrary to the statute, which does not give parties the opportunity to reject the results of arbitration and which does not provide for *de novo* review.[3154]

3. Discussion

1283. After careful review of the record, we are convinced that establishing regulations to carry out our obligations under section 252(e)(5) will provide for an efficient and fair transition from state jurisdiction should we have to assume the responsibility of the state commission under Section 252(e)(5). The rules we establish in this section with respect to arbitration under section 252 apply only to instances where the Commission assumes jurisdiction under section 252(e)(5); we do not purport to advise states on how to conduct arbitration when the Commission has not assumed jurisdiction. The rules we establish will give notice of the procedures and standards the Commission would apply to mediation and arbitration, avoid delay if the Commission had to arbitrate disputes in the near future, and may also offer guidance the states may, at their discretion, wish to consider in implementing their own mediation and arbitration procedures and standards. We decline to adopt national rules governing state arbitration procedures. We believe the states are in a better position to develop mediation and arbitration rules that support the objectives of the 1996 Act. States may develop specific measures that address the concerns of

---

[3150] *Id.*

[3151] *See, e.g.*, Time Warner comments at 111.

[3152] California Commission comments at 50. The California Commission's procedures for resolving interconnection disputes is based on a four-step expedited dispute resolution process for resolving disputes between parties who cannot agree on the terms of interconnection. Step 1 is informal resolution without state intervention. Step 2 provides for dispute resolution with mediation by the Administrative Law Judge (ALJ). Step 3 calls for the parties to submit short pleadings to the ALJ who shall use the state commission's "preferred outcomes" approach as a guideline in resolving dispute. Step 4 allows for a party to challenge an ALJ ruling by filing an expedited complaint.

[3153] SBC comments at 99.

[3154] Vanguard reply at 18-20; *accord* Competition Policy Institute reply at 18-19.

small entities and small incumbent LECs participating in mediation or arbitration.

1284. The rules we adopt herein are minimum, interim procedures. Adopting minimum interim procedures now will allow the Commission to learn from the initial experiences and gain a better understanding of what types of situations may arise that require Commission action. We note that the Commission is not required to adopt procedures and standards for mediation and arbitration within the six-month statutory deadline and that, by adopting minimum interim procedures, the Commission can better direct its resources to more pressing matters that fall within the six-month statutory deadline.

1285. Regarding what constitutes a state's "failure to act to carry out its responsibility under" section 252,[3155] the Commission was presented with numerous options. The Commission will not take an expansive view of what constitutes a state's "failure to act." Instead, the Commission interprets "failure to act" to mean a state's failure to complete its duties in a timely manner. This would limit Commission action to instances where a state commission fails to respond, within a reasonable time, to a request for mediation or arbitration, or fails to complete arbitration within the time limits of section 252(b)(4)(C).[3156] The Commission will place the burden of proof on parties alleging that the state commission has failed to respond to a request for mediation or arbitration within a reasonable time frame. We note the work done by states to date in putting in place procedures and regulations governing arbitration and believe that states will meet their responsibilities and obligations under the 1996 Act.[3157]

1286. We agree with the majority of commenters that argue that our authority to assume the state commission's responsibilities is not triggered when an agreement is "deemed approved" under section 252(e)(4) due to state commission inaction. Section 252(e)(4) provides for automatic approval if a state fails to approve or reject a negotiated or arbitrated agreement within 90 days or 30 days, respectively. Rules of statutory construction require us to give meaning to all provisions and to read provisions consistently, where it is possible to do so. We thus conclude that the most reasonable interpretation is that automatic approval under section 252(e)(4) does not constitute a failure to act.

1287. We also believe that we should establish interim procedures for interested parties to notify the Commission that a state commission has failed to act under section 252. We believe that parties should be required to file a detailed written petition, backed by affidavit, that will, at

---

[3155] 47 U.S.C. § 252(e)(5).

[3156] 47 U.S.C. § 252(b)(4)(C).

[3157] *See, e.g., In the Matter of the Implementation of the Mediation and Arbitration Provisions of the Federal Telecommunications Act of 1996*, Case No. 96-463-TP-UNC, Ohio Commission, (May 30, 1996), *Illinois Commerce Commission On Its Own Motion Adoption of 83 Ill. Adm. Code 761 to Implement the Arbitration Provisions of Section 252 of the Telecommunications Act of 1996*, Docket No. 96-0297, Illinois Commission (June 14, 1996)

the outset, give the Commission a better understanding of the issues involved and the action, or lack of action, taken by the state commission. Allowing less detailed notification increases the likelihood that frivolous requests will be made. With less detailed notification, the Commission's investigations would be broader and more burdensome. A detailed written petition will facilitate a decision about whether the Commission should assume jurisdiction based on section 252(e)(5).

1288. The moving party should submit a petition to the Secretary of the Commission stating with specificity the basis for the petition and any information that supports the claim that the state has failed to act, including, but not limited to the applicable provision(s) of the Act and the factual circumstances which support a finding that a state has failed to act. The moving party must ensure that the applicable state commission and the parties to the proceeding or matter for which preemption is sought are served with the petition on the same date the party serves the petition on the Commission. The petition will serve as notice to parties to the state proceeding and the state commission who will have fifteen days from the date the petition is filed with the Commission to comment. Under section 252(e)(5), the Commission must "issue an order preempting the state commission's jurisdiction of that proceeding or matter" no later than 90 days from the date the petition is filed.[3158] If the Commission takes notice, as section 252(e)(5) permits, that a state commission has failed to act, it will, on its own motion, issue a public notice and provide fifteen days for interested parties to submit comment on whether the Commission should assume responsibility under section 252(e)(5).

1289. If the Commission assumes authority under section 252(e)(5), the Commission must also decide whether it retains authority for that proceeding or matter. We agree with those parties who argue that, once the Commission assumes jurisdiction of a proceeding or matter, it retains authority for that proceeding or matter. For example, if the Commission obtains jurisdiction after a state commission fails to respond to a request for arbitration, the Commission maintains jurisdiction over the arbitration proceeding. Therefore, once the proceeding is before the Commission, any and all further action regarding that proceeding or matter will be before the Commission. We note that there is no provision in the Act for returning jurisdiction to the state commission; moreover, the Commission, with significant knowledge of the issues at hand, would be in the best position efficiently to conclude the matter. Thus, as both a legal and policy matter, we believe that the Commission retains jurisdiction over any matter and proceeding for which it assumes responsibility under Section 252(e)(5).

1290. We reject the suggestion by some parties that, once the Commission has mediated or arbitrated an agreement, the agreement must be submitted to the state commission for approval under state law. We note that section 252(e)(5) provides for the Commission to "assume the responsibility of the State commission under this section with respect to the proceeding or matter

[3158] 47 U.S.C. § 252(e)(5)

and act for the State commission."[3159] This includes acting for the state commission under section 252(e)(1), which calls for state commission approval of "any interconnection agreement adopted by negotiation or arbitration."[3160] We, therefore, do not read section 252(e)(1) or any other provision as calling for state commission approval or rejection of agreements mediated or arbitrated by the Commission. In those instances where a state has failed to act, the Commission acts on behalf of the state and no additional state approval is required.

1291. Requirements set forth in section 252(c) for arbitrated agreements would apply to arbitration conducted by the Commission. We see no reason, and no party has suggested a policy or legal basis, for not applying such standards when the Commission conducts arbitration. Thus, arbitrated agreements must: (1) meet the requirements of section 251, including regulations prescribed by the Commission pursuant to section 251; (2) establish any rates for interconnection, services, or network elements according to section 252(d); and (3) provide a schedule for implementation of the terms and conditions by the parties to the agreement.[3161] We reject the suggestion made by some parties that, if the Commission steps into the state commission role, it is bound by state laws and standards that would have applied to the state commission. While states are permitted to establish and enforce other requirements, these are not binding standards for arbitrated agreements under section 252(c). Moreover, the resources and time potentially needed to review adequately and interpret the different laws and standards of each state render this suggestion untenable. Finally, we conclude that it would not make sense to apply to the Commission the timing requirements that section 252(b)(4)(c) imposes on state commissions. The Commission, in some instances, might not even assume jurisdiction until nine months (or more) have lapsed since a section 251 request was initiated.

1292. Based on the comments of the parties, we conclude that a "final offer" method of arbitration, similar to the approach recommended by Vanguard, would best serve the public interest.[3162] Under "final offer" arbitration, each party to the negotiation proposes its best and final offer and the arbitrator determines which of the proposals become binding. The arbitrator would have the option of choosing one of the two proposals in its entirety, or the arbitrator could decide on an issue-by-issue basis. Each final offer must: (1) meet the requirements of section 251, including the Commission's rules thereunder; (2) establish rates for interconnection, services, or network elements according to section 252(d); and (3) provide a schedule for implementation of the terms and conditions by the parties to the agreement.[3163] If a final offer submitted by one

---

[3159] 47 U.S.C. § 252(e)(5).

[3160] 47 U.S.C. § 252(e)(1).

[3161] 47 U.S.C. § 252(c).

[3162] Vanguard comments at 39-40.

[3163] 47 U.S.C. § 252(c).

or more parties fails to comply with these requirements, the arbitrator would have discretion to take steps designed to result in an arbitrated agreement that satisfies the requirements of section 252(c), including requiring parties to submit new final offers within a time frame specified by the arbitrator, or adopting a result not submitted by any party that is consistent with the requirements in section 252(c).

1293. The parties could continue to negotiate an agreement after they submit their proposals and before the arbitrator makes a decision. Under this approach, the Commission will encourage negotiations, with or without the assistance of the arbitrator, to continue after arbitration offers are exchanged. Parties are not precluded from submitting subsequent final offers following such negotiations. We believe that permitting post-offer negotiations will increase the likelihood that the parties will reach consensus on unresolved issues. In addition, permitting post-offer negotiations will increase flexibility and will allow parties to tailor counter-proposals after arbitration offers are exchanged. To provide an opportunity for final post-offer negotiation, the arbitrator will not issue a decision for at least 15 days after submission of the final offers by the parties. In addition, the offers must be consistent with section 251, including the regulations prescribed by the Commission. We reject SBC's suggestion that an arbitrated agreement is not binding on the parties. Absent mutual agreement to different terms, the decision reached through arbitration is binding. We conclude that it would be inconsistent with the 1996 Act to require incumbent LECs to provide interconnection, services, and unbundled elements, impose a duty to negotiate in good faith and a right to arbitration, and then permit incumbent LECs to not be bound by an arbitrated determination. We also believe that, although competing providers do not have an affirmative duty to enter into agreements under section 252, a requesting carrier might face penalties if, by refusing to enter into an arbitrated agreement, that carrier is deemed to have failed to negotiate in good faith.[3164] Such penalties should serve as a disincentive for requesting carriers to force an incumbent LEC to expand resources in arbitration if the requesting carrier does not intend to abide by the arbitrated decision.

1294. Adopting a "final offer" method of arbitration and encouraging negotiations to continue allows us to maintain the benefits of final offer arbitration, giving parties an incentive to submit realistic "final offers," while providing additional flexibility for the parties to agree to a resolution that best serves their interests. To the extent that these procedures encourage parties to negotiate voluntarily rather than arbitrate, such negotiated agreements will be subject to review pursuant to section 252(e)(2)(A), which would allow the Commission to reject agreements if they are inconsistent with the public interest. This approach also addresses the argument that under "final offer" arbitration neither offer might best serve the public interest, because it allows the parties to obtain feedback from the arbitrator on public interest matters.

1295. We believe that the arbitration proceedings generally should be limited to the requesting carrier and the incumbent local exchange provider. This will allow for a more

[3164] *See* 47 U.S.C. § 252(b)(5) (requiring parties to negotiate in good faith in the course of arbitration).

efficient process and minimize the amount of time needed to resolve disputed issues. We believe that opening the process to all third parties would be unwieldy and would delay the process. We will, however, consider requests by third parties to submit written pleadings. This may, in some instances, allow interested parties to identify important public policy issues not raised by parties to an arbitration.

B. Requirements of Section 252(i)

1. Background

1296. Section 251 requires that interconnection, unbundled element, and collocation rates be "nondiscriminatory" and prohibits the imposition of "discriminatory conditions" on the resale of telecommunications services.[3165] Section 252(i) of the 1996 Act provides that a "local exchange carrier shall make available any interconnection, service, or network element provided under an agreement approved under [section 252] to which it is a party to any other requesting telecommunications carrier upon the same terms and conditions as those provided in the agreement."[3166] In the NPRM, we expressed the view that section 252(i) appears to be a primary tool of the 1996 Act for preventing discrimination under section 251, and we sought comment on whether we should adopt national standards for resolving disputes under section 252(i) in the event that we must assume the state's responsibilities pursuant to section 252(e)(5). In addition, because we may need to interpret section 252(i) if we assume the state commission's responsibilities, we sought comment on the meaning of section 252(i).

1297. We also sought comment in the NPRM on whether section 252(i) requires that only similarly-situated carriers may enforce against incumbent LECs provisions of agreements filed with state commissions, and, if so, how "similarly-situated carrier" should be defined. In particular, we asked whether section 252(i) requires that the same rates for interconnection must be offered to all requesting carriers regardless of the cost of serving that carrier, or whether it would be consistent with the statute to permit different rates if the costs of serving carriers are different. We also asked whether the section can be interpreted to allow incumbent LECs to make available interconnection, services, or network elements only to requesting carriers serving a comparable class of subscribers or providing the same service (*i.e.*, local, access, or interexchange) as the original parties to the agreement. In the NPRM, we tentatively concluded that the language of the statute appears to preclude such differential treatment among carriers.

[3165] 47 U.S.C. §§ 251(c)(2)(D) (interconnection rates, terms, and conditions); 251(c)(3) (unbundled network elements rates, terms, and conditions); 251(c)(6) (collocation rates, terms, and conditions); and 251(c)(4)(B) (resale). Section 252(d)(1) also requires nondiscriminatory interconnection and network element charges. 47 U.S.C. § 252(d)(1).

[3166] 47 U.S.C. § 252(i).

1298. Additionally, we sought comment in the NPRM on whether section 252(i) permits requesting telecommunications carriers to choose among individual provisions of publicly-filed interconnection agreements or whether they must subscribe to an entire agreement. We also sought comment regarding what time period an agreement must remain available for use by other requesting telecommunications carriers.

2. Comments

1299. Two state commissions and SBC believe that implementation of section 252(i) should be left to the states,[3167] while Time Warner favors national standards.[3168] CompTel argues that we should adopt expedited procedures whereby carriers may complain to the Commission when incumbent LECs refuse to make agreements available to them in alleged violation of section 252(i).[3169]

1300. New entrants generally support the view that section 252(i) does not require that requesting carriers seeking to avail themselves of a prior negotiated or arbitrated agreement be "similarly situated" with respect to the original party who negotiated the agreement.[3170] They argue that such a limitation would be contrary to Congress's intent,[3171] or that it could invite perpetual dispute over which carriers are similarly situated and what cost differences are real and material.[3172] Winstar questions whether states could implement a "similarly situated" carrier requirement without unintentionally creating a vehicle for incumbent LECs to discriminate against competitive entrants.[3173] LDDS specifically agrees with the NPRM's tentative conclusion that section 252(i) prohibits incumbent LECs from limiting the availability of agreements to a carrier based on the class of customers the carrier serves or the type of service it provides.[3174] The

[3173] WinStar comments at 18-19.

[3174] LDDS comments at 88.

Telecommunications Resellers Ass'n believes section 252(i) prohibits discrimination on the basis of the cost of serving a carrier, and claims its members have been, and continue to be, denied preferred service offerings and price points in the interexchange market under the guise of a "similarly situated" criterion.[3175]

1301. WinStar suggests we assign to the incumbent LEC a heavy burden of proving that a new carrier is substantially different from the original parties to an agreement, and that we require the incumbent LEC to provide service to the new entrant according to the individual terms of an agreement while the dispute is pending. WinStar asserts that, absent such requirements, the incumbent LEC could use alleged technological differences to create barriers to entry.[3176]

1302. GTE, PacTel, USTA, BellSouth, and the Ohio Consumers' Counsel believe the statute contemplates drawing distinctions between carriers,[3177] such as, for instance, where the incumbent LEC faces different costs in serving different carriers.[3178] According to GTE and PacTel, carriers must be "similarly situated" because the subsequent carrier's technical requirements may be incompatible with the incumbent LEC's network.[3179] GTE asserts that providing service under an agreement to carriers that are not similarly situated with respect to the technical feasibility and costs of interconnection and transport and termination would be inconsistent with the 1996 Act's requirements that interconnection be technically feasible and offered at cost-based rates.[3180]

1303. Incumbent LECs also generally oppose the view that section 252(i) permits competitive carriers to choose among provisions in a publicly-filed interconnection agreement.[3181] For instance, BellSouth contends that the text of section 252(i) supports its view, and that the legislative history reference cited in the NPRM casts no light on Congress' intent because the

House did not recede to the Senate's language.[3182] GTE urges the Commission to treat the availability of agreements under section 252(i) the same way it treats AT&T Tariff 12 and Contract Tariff offerings.[3183] Ameritech, GTE and SBC also contend that section 252(i)'s requirement that a requesting carrier take service upon the same terms and conditions as the original carrier precludes unbundled availability.[3184] USTA argues unbundled availability of agreement provisions will skew the individualized nature of negotiations, magnify the importance of each individual term of an agreement, and encourage incumbent LECs to offer only standardized, relatively high-cost packages.[3185]

1304. New entrants, joined by the Ohio Commission, support the view that the statute makes individual provisions of agreements available to carriers.[3186] They argue that this comports with the statutory language and legislative history,[3187] and that requiring requesting carriers to take an entire agreement will cause delay[3188] and foster discrimination by enabling incumbent LECs to fashion agreements so that no subsequent carrier may benefit from them.[3189] MCI argues that, although this approach may make incumbents less likely to compromise, the effect on negotiations will be small.[3190] The SBA asserts allowing entrants to utilize individual provisions of agreements will lead to increased competition, which, in turn, will drive prices towards the most economically efficient levels, and that these benefits outweigh any additional burden that

such unbundling may place upon incumbents in negotiating agreements.[3191] SBA further argues that failure to permit unbundling of agreements would deter entry by smaller competitors that are unable or unwilling to pay for all of the elements contained in a an agreement negotiated by a larger competitor.[3192] CompTel asks that we rule that an incumbent LEC may not insist upon the observance of any term or condition that is not reasonable in the context of the requesting carrier.[3193]

1305. ALTS suggests that we permit unbundled availability to the level of the individual paragraphs and sections of section 251, with the exception of network elements provided pursuant to section 251(c)(3), which ALTS believes should be provided individually to non-parties on a disaggregated basis.[3194] ALTS argues such a rule would reduce concern that unbundled availability would slow the negotiation process by magnifying the importance of individual terms.[3195] Jones Intercable requests that we clarify that the statute permits so-called "most favored nation" provisions, which allow a new entrant with an interconnection agreement in place with an incumbent LEC to modify such an agreement to substitute the preferable terms included in a later agreement that the incumbent LEC enters with a subsequent new entrant.[3196]

1306. Parties' suggestions for the length of time agreements should remain on file pursuant to section 252(i) range from a reasonable period,[3197] until changes in the network adopted for independent reasons make it no longer feasible to provide interconnection under an agreement,[3198] to as long as the agreement remains in operation.[3199] Out of concern that incumbent LECs might force competitors to renegotiate agreements at unreasonably short

intervals, the SBA argues that there should be no arbitrary limit on the duration of agreements.[3200]

1307. Several new entrants also raise issues concerning the filing of agreements pursuant to section 252(i). Jones Intercable urges us to require that incumbent LECs file copies of all negotiated agreements at the FCC, as well as at state commissions.[3201]

1308. AT&T and the Telecommunications Resellers Ass'n believe section 252(i) requires that interconnection agreements negotiated prior to enactment of the 1996 Act be available for use by requesting telecommunications carriers,[3202] while F. Williamson opposes this view.[3203] MFS, NCTA and WinStar urge us to find that section 252(i) applies to interconnection agreements between adjacent, non-competing LECs.[3204] BellSouth is opposed.[3205]

3. Discussion

1309. We conclude that it will assist the carriers in determining their respective obligations, facilitate the development of a single, uniform legal interpretation of the Act's requirements and promote a procompetitive, national policy framework to adopt national standards to implement section 252(i). Issues such as whether section 252(i) allows requesting telecommunications carriers to choose among provisions of prior interconnection agreements or requires them to accept an entire agreement are issues of law that should not vary from state to state and are also central to the statutory scheme and to the emergence of competition. National standards will help state commissions and parties to expedite the resolution of disputes under section 252(i).

1310. We conclude that the text of section 252(i) supports requesting carriers' ability to choose among individual provisions contained in publicly filed interconnection agreements. As we note above, section 252(i) provides that a "local exchange carrier shall make available any

interconnection, service, or network element provided under an agreement . . . to which it is a party to any other requesting telecommunications carrier upon the same terms and conditions as those provided in the agreement."[1206] Thus, Congress drew a distinction between "any interconnection, service, or network element[s] provided under an agreement," which the statute lists individually, and agreements in their totality. Requiring requesting carriers to elect entire agreements, instead of the provisions relating to specific elements, would render as mere surplusage the words "any interconnection, service, or network element."

1311. We disagree with BellSouth regarding the significance of the legislative history quoted in the NPRM. The Conference Committee amended section 251(g), S. 652's predecessor to section 252(i), and changed "service, facility, or function" to "interconnection, service, or element." The House of Representatives' bill did not contain a version of section 252(i).[1207] We find that section 252(i)'s language does not differ substantively from the text of the Senate bill's section 251(g). The Senate Commerce Committee stated its provision, section 251(g), was intended to "make interconnection more efficient by making available to other carriers the individual elements of agreements that have been previously negotiated."[1208]

1312. We also find that practical concerns support our interpretation. As observed by AT&T and others, failure to make provisions available on an unbundled basis could encourage an incumbent LEC to insert into its agreement onerous terms for a service or element that the original carrier does not need, in order to discourage subsequent carriers from making a request under that agreement. In addition, we observe that different new entrants face differing technical constraints and costs. Since few new entrants would be willing to elect an entire agreement that would not reflect their costs and the specific technical characteristics of their networks or would not be consistent with their business plans, requiring requesting carriers to elect an entire agreement would appear to eviscerate the obligation Congress imposed in section 252(i).

1313. We also choose this interpretation despite concerns voiced by some incumbent LECs that allowing carriers to choose among provisions will harm the public interest by slowing down the process of reaching interconnection agreements by making incumbent LECs less likely to compromise. In reaching this conclusion, we observe that new entrants, who stand to lose the most if negotiations are delayed, generally do not argue that concern over slow negotiations would outweigh the benefits they would derive from being able to choose among terms of publicly filed agreements. Unbundled access to agreement provisions will enable smaller carriers

---

[1206] 47 U.S.C. § 252(i).

[1207] Although H.R. 1555's section 244(d) contained similar ideas, its language and structure are sufficiently different from that of section 252(i) that we do not consider section 244(d) to be a prior version of section 252(i).

[1208] *Report of the Committee on Commerce, Science and Transportation on S. 652*, S. Rpt. 104-23, 104th Cong., 1st Sess. (1995) at 21-22.

who lack bargaining power to obtain favorable terms and conditions -- including rates -- negotiated by large IXCs, and speed the emergence of robust competition.[3209]

1314. We conclude that incumbent LECs must permit third parties to obtain access under section 252(i) to any individual interconnection, service, or network element arrangement on the same terms and conditions as those contained in any agreement approved under section 252. We find that this level of disaggregation is mandated by section 252(a)(1), which requires that agreements shall include "charges for interconnection and each service or network element included in the agreement," and section 251(c)(3), which requires incumbent LECs to provide "non-discriminatory access to network elements on an unbundled basis." In practical terms, this means that a carrier may obtain access to individual elements such as unbundled loops at the same rates, terms, and conditions as contained in any approved agreement. We agree with ALTS that such a view comports with the statute, and lessens the concerns of carriers that argue that unbundled availability will delay negotiations.

1315. We reject GTE's argument that section 252(i)'s statement, that requesting carriers must receive individual elements "upon the same terms and conditions" as those contained in the agreement, precludes unbundled availability of individual elements. GTE's argument fails to give meaning to Congress's distinction between agreements and elements, and ignores the 1996 Act's prime goals of nondiscriminatory treatment of carriers and promotion of competition. Instead, we conclude that the "same terms and conditions" that an incumbent LEC may insist upon shall relate solely to the individual interconnection, service, or element being requested under section 252(i). For instance, where an incumbent LEC and a new entrant have agreed upon a rate contained in a five-year agreement, section 252(i) does not necessarily entitle a third party to receive the same rate for a three-year commitment. Similarly, that one carrier has negotiated a volume discount on loops does not automatically entitle a third party to obtain the same rate for a smaller amount of loops. Given the primary purpose of section 252(i) of preventing discrimination, we require incumbent LECs seeking to require a third party agree to certain terms and conditions to exercise its rights under section 252(i) to prove to the state commission that the terms and conditions were legitimately related to the purchase of the individual element being sought. By contrast, incumbent LECs may not require as a "same" term or condition the new entrant's agreement to terms and conditions relating to other interconnection, services, or elements in the approved agreement. Moreover, incumbent LEC efforts to restrict availability of interconnection, services, or elements under section 252(i) also must comply with the 1996 Act's general nondiscrimination provisions. *See* Section VII.d.3.

1316. We further conclude that section 252(i) entitles all parties with interconnection agreements to "most favored nation" status regardless of whether they include "most favored nation" clauses in their agreements. Congress's command under section 252(i) was that parties may utilize any individual interconnection, service, or element in publicly filed interconnection

---

[3209] *See* Regulatory Flexibility Act, 5 U.S.C. §§ 601 et seq.

agreements and incorporate it into the terms of their interconnection agreement. This means that any requesting carrier may avail itself of more advantageous terms and conditions subsequently negotiated by any other carrier for the same individual interconnection, service, or element once the subsequent agreement is filed with, and approved by, the state commission. We believe the approach we adopt will maximize competition by ensuring that carriers' obtain access to terms and elements on a nondiscriminatory basis.

1317. We find that section 252(i) permits differential treatment based on the LEC's cost of serving a carrier. We further observe that section 252(d)(1) requires that unbundled element rates be cost-based, and sections 251(c)(2) and (c)(3) require incumbent LECs to provide only technically-feasible forms of interconnection and access to unbundled elements, while section 252(i) mandates that the availability of publicly-filed agreements be limited to carriers willing to accept the same terms and conditions as the carrier who negotiated the original agreement with the incumbent LEC. We conclude that these provisions, read together, require that publicly-filed agreements be made available only to carriers who cause the incumbent LEC to incur no greater costs than the carrier who originally negotiated the agreement, so as to result in an interconnection arrangement that is both cost-based and technically feasible. However, as discussed in Section VII regarding discrimination, where an incumbent LEC proposes to treat one carrier differently than another, the incumbent LEC must prove to the state commission that that differential treatment is justified based on the cost to the LEC of providing that element to the carrier.

1318. We conclude, however, that section 252(i) does not permit LECs to limit the availability of any individual interconnection, service, or network element only to those requesting carriers serving a comparable class of subscribers or providing the same service (*i.e.*, local, access, or interexchange) as the original party to the agreement. In our view, the class of customers, or the type of service provided by a carrier, does not necessarily bear a direct relationship with the costs incurred by the LEC to interconnect with that carrier or on whether interconnection is technically feasible. Accordingly, we conclude that an interpretation of section 252(i) that attempts to limit availability by class of customer served or type of service provided would be at odds with the language and structure of the statute, which contains no such limitation.

1319. We agree with those commenters who suggest that agreements remain available for use by requesting carriers for a reasonable amount of time. Such a rule addresses incumbent LEC concerns over technical incompatibility, while at the same time providing requesting carriers with a reasonable time during which they may benefit from previously negotiated agreements. In addition, this approach makes economic sense, since the pricing and network configuration choices are likely to change over time, as several commenters have observed. Given this reality, it would not make sense to permit a subsequent carrier to impose an agreement or term upon an incumbent LEC if the technical requirements of implementing that agreement or term have changed.

1320. We observe that section 252(h) expressly provides that state commissions maintain for public inspection copies of interconnection agreements approved under section 252(e). We therefore decline Jones Intercable's suggestion that we require carriers to file agreements at the FCC, in addition to section 252(h)'s filing requirement. However, when the Commission performs the state's responsibilities under section 252(e)(5), parties must file their agreements with the Commission, as well as with the state commission.[3210]

1321. We further conclude that a carrier seeking interconnection, network elements, or services pursuant to section 252(i) need not make such requests pursuant to the procedures for initial section 251 requests, but shall be permitted to obtain its statutory rights on an expedited basis. We find that this interpretation furthers Congress's stated goals of opening up local markets to competition and permitting interconnection on just, reasonable, and nondiscriminatory terms, and that we should adopt measures that ensure competition occurs as quickly and efficiently as possible. We conclude that the nondiscriminatory, pro-competition purpose of section 252(i) would be defeated were requesting carriers required to undergo a lengthy negotiation and approval process pursuant to section 251 before being able to utilize the terms of a previously approved agreement. Since agreements shall necessarily be filed with the states pursuant to section 252(h), we leave to state commissions in the first instance the details of the procedures for making agreements available to requesting carriers on an expedited basis. Because of the importance of section 252(i) in preventing discrimination, however, we conclude that carriers seeking remedies for alleged violations of section 252(i) shall be permitted to obtain expedited relief at the Commission, including the resolution of complaints under section 208 of the Communications Act, in addition to their state remedies.

1322. We conclude as well that agreements negotiated prior to enactment of the 1996 Act must be available for use by subsequent, requesting carriers. Section 252(i) must be read in conjunction with section 252(a)(1), which clearly states that "agreement" for purposes of section 252, "includ[es] any interconnection agreement negotiated before the date of enactment . . . ."[3211] We conclude that this language demonstrates that Congress intended 252(i) to apply to agreements negotiated prior to enactment of the 1996 Act and approved by the state commission pursuant to section 252(e), as well as those approved under the section 251/252 negotiation process. Accordingly, we find that agreements negotiated prior to enactment of the 1996 Act must be disclosed publicly, and be made available to requesting telecommunications carriers pursuant to section 252(i).

1323. We also find that section 252(i) applies to interconnection agreements between adjacent, incumbent LECs. We note that section 252(i) requires a local exchange carrier to make

---

[3210] We note section 22.903(d) of our rules, which remains in effect, requires the BOCs to file with us their interconnection agreements with their affiliated cellular providers. 47 C.F.R. § 22.903(d).

[3211] 47 U.S.C. § 252(a)(1).

available to requesting telecommunications carriers "any interconnection service, or network element *provided under an agreement approved under this section* . . . ."[3212] The plain meaning of this section is that any interconnection agreement approved by a state commission, including one between adjacent LECs, must be made available to requesting carriers pursuant to section 252(i). Requiring availability of such agreements will provide new entrants with a realistic benchmark upon which to base negotiations, and this will further the Congressional purpose of increasing competition. As stated in Section III of this Order, adjacent, incumbent LECs will be given an opportunity to renegotiate such agreements before they become subject to section 252(i)'s requirements. In Section III, we also consider, and reject, the Rural Tel. Coalition's argument that making agreements between adjacent, non-competing LECs available under section 252 will have a detrimental effect on small, rural carriers. *See* Section III, *supra*.

[3212] 47 U.S.C. § 252(i) (emphasis supplied).

XV. FINAL REGULATORY FLEXIBILITY ANALYSIS

1324. As required by Section 603 of the Regulatory Flexibility Act (RFA), 5 U.S.C. § 603, an Initial Regulatory Flexibility Analysis (IRFA) was incorporated in the NPRM. The Commission sought written public comment on the proposals in the NPRM. The Commission's Final Regulatory Flexibility Analysis (FRFA) in this Order conforms to the RFA, as amended by the Contract With America Advancement Act of 1996 (CWAAA), Pub. L. No. 104-121, 110 Stat. 847 (1996).[3213]

A. Need for and Objectives of this Report and Order and the Rules Adopted Herein

1325. The Commission, in compliance with section 251(d)(1) of the Communications Act of 1934, as amended by the Telecommunications Act of 1996 (the 1996 Act), promulgates the rules in this Order to ensure the prompt implementation of sections 251 and 252 of the 1996 Act, which are the local competition provisions. Congress sought to establish through the 1996 Act "a pro-competitive, de-regulatory national policy framework" for the United States telecommunications industry.[3214] Three principal goals of the telephony provisions of the 1996 Act are: (1) opening local exchange and exchange access markets to competition; (2) promoting increased competition in telecommunications markets that are already open to competition, particularly long distance services markets; and, (3) reforming our system of universal service so that universal service is preserved and advanced as local exchange and exchange access markets move from monopoly to competition.

1326. The rules adopted in this Order implement the first of these goals -- opening local exchange and exchange access markets to competition. The objective of the rules adopted in this Order is to implement as quickly and effectively as possible the national telecommunications policies embodied in the 1996 Act and to promote the development of competitive, deregulated markets envisioned by Congress.[3215] In doing so, we are mindful of the balance that Congress struck between this goal of bringing the benefits of competition to all consumers and its concern for the impact of the 1996 Act on small incumbent local exchange carriers, particularly rural carriers, as evidenced in section 251(f) of the 1996 Act.

[3213] Subtitle II of the CWAAA is "The Small Business Regulatory Enforcement Fairness Act of 1996" (SBREFA), codified at 5 U.S.C. § 601 *et seq*

[3214] S. Conf. Rep. No. 230, 104th Cong., 2d Sess. 1 (1996).

[3215] *Id.*

B. Analysis of Significant Issues Raised in Response to the IRFA

1327. *Summary of the Initial Regulatory Flexibility Analysis (IRFA).* In the NPRM, the Commission performed an IRFA.[3216] In the IRFA, the Commission found that the rules it proposed to adopt in this proceeding may have a significant impact on a substantial number of small business as defined by section 601(3) of the RFA. The Commission stated that its regulatory flexibility analysis was inapplicable to incumbent LECs because such entities are dominant in their field of operation. The Commission noted, however, that it would take appropriate steps to ensure that the special circumstances of smaller incumbent LECs are carefully considered in our rulemaking. The Commission also found that the proposed rules may overlap or conflict with the Commission's Part 69 access charge and *Expanded Interconnection* rules. Finally, the IRFA solicited comment on alternatives to our proposed rules that would minimize the impact on small entities consistent with the objectives of this proceeding.

1. Treatment of Small LECs

1328. *Comments.* The Small Business Administration (SBA), the Rural Telephone Coalition (Rural Tel. Coalition), and CompTel maintain that the Commission violated the RFA when it failed to include small incumbent LECs in its IRFA without first consulting SBA to establish a definition of "small business."[3217] Rural Tel. Coalition and CompTel also argue that the Commission failed to explain its statement that "incumbent LECs are dominant in their field of operation" or how that finding was reached.[3218] Rural Tel. Coalition states that such an analysis of the market power of incumbent LECs is necessary because incumbent LECs are now facing competition from a variety of sources, including wireline and wireless carriers. Rural Tel. Coalition recommends that the Commission abandon its determination that all incumbent LECs are dominant, and perform regulatory flexibility analysis for incumbent LECs having fewer than 1500 employees.[3219]

1329. *Discussion.* In essence, SBA and Rural Tel. Coalition argue that we exceeded our authority under the RFA by certifying all incumbent LECs as dominant in their field of operation, and concluding on that basis that they are not small businesses under the RFA. SBA and Rural Tel. Coalition contend that the authority to make a size determination rests solely with SBA and that, by excluding a group (small incumbent LECs) from coverage under the RFA, the

[3219] Rural Tel. Coalition reply at 40.

Commission made an unauthorized size determination.[3220] Neither SBA nor Rural Tel. Coalition cites any specific authority for this latter proposition.

1330. We have found incumbent LECs to be "dominant in their field of operation" since the early 1980's, and we consistently have certified under the RFA[3221] that incumbent LECs are not subject to regulatory flexibility analyses because they are not small businesses.[3222] We have made similar determinations in other areas.[3223] We recognize SBA's special role and expertise with regard to the RFA, and intend to continue to consult with SBA outside the context of this proceeding to ensure that the Commission is fully implementing the RFA. Although we are not fully persuaded on the basis of this record that our prior practice has been incorrect, in light of the special concerns raised by SBA and Rural Tel. Coalition in this proceeding, we will, nevertheless, include small incumbent LECs in this FRFA to remove any possible issue of RFA compliance. We, therefore, need not address Rural Tel. Coalition's arguments that incumbent LECs are not dominant.[3224]

2. Other Issues

1331. *Comments.* Parties raised several other issues in response to the Commission's IRFA in the NPRM. SBA and CompTel contend that commenters should not be required to separate their comments on the IRFA from their comments on the other issues raised in the NPRM.[3225] SBA maintains that separating RFA comments and discussion from the rest of the comments "isolates" the regulatory flexibility analysis from the remainder of the discussion, thereby handicapping the Commission's analysis of the impact of the proposed rules on small businesses.[3226] SBA further suggests that our IRFA failed to: (1) give an adequate description of the projected reporting, recordkeeping, and other compliance requirements of the proposed rules,

[3226] *Id.*

including an estimate of the classes of small entities that will be subject to the requirement and the professional skills necessary to prepare such reports or records;[3227] and (2) describe significant alternatives that minimize the significant economic impact of the proposal on small entities, including exemption from coverage of the rule.[3228] SBA also asserts that none of the alternatives in the NPRM is designed to minimize the impact of the proposed rules on small businesses.

1332. The Idaho Commission argues that the Commission's rules will be devised for large carriers and therefore will be "de facto burdensome" to Idaho's incumbent LECs and probably to potential new entrants, which may be small companies.[3229] Therefore, Idaho requests that state commissions be permitted flexibility to address the impacts of our rules on smaller incumbent LECs.

1333. The Small Cable Business Association (SCBA) contends that the Commission's IRFA is inadequate because it does not state that small cable companies are among the small entities affected by the proposed rules.[3230] In its comments on the IRFA, SCBA refers to its proposal that the Commission establish the following national standards for small cable companies: (1) the definition of "good faith" negotiation; (2) the development of less burdensome arbitration procedures for interconnection and resale; (3) the designation of a small company contact person at incumbent LECs and state commissions; and (4) the application of section 251(f) of the 1996 Act.[3231]

1334. *Discussion.* We disagree with SBA's assessment of our IRFA. Although the IRFA referred only generally to the reporting and recordkeeping requirements imposed on incumbent LECs, our Federal Register notice set forth in detail the general reporting and recordkeeping requirements as part of our Paperwork Reduction Act statement.[3232] The IRFA also sought comment on the many alternatives discussed in the body of the NPRM, including the statutory exemption for certain rural telephone companies.[3233] The numerous general public comments concerning the impact of our proposal on small entities in response to the NPRM, including

[3232] NPRM, at para. 283 (rel. Apr. 19, 1996), *summarized at* 61 Fed. Reg. 18311, 18312 (Apr. 25, 1996).

[3233] 47 U.S.C. § 251(f).

comments filed directly in response to the IRFA,[3234] enabled us to prepare this FRFA. Thus, we conclude that the IRFA was sufficiently detailed to enable parties to comment meaningfully on the proposed rules and, thus, for us to prepare this FRFA. We have been working with, and will continue to work with SBA, to ensure that both our IRFAs and FRFAs fully meet the requirements of the RFA.

1335. SBA also objects to the NPRM's requirement that responses to the IRFA be filed under a separate and distinct heading, and proposes that we integrate RFA comments into the body of general comments on a rule.[3235] Almost since the adoption of the RFA, we have requested that IRFA comments be submitted under a separate and distinct heading.[3236] Neither the RFA nor SBA's rules prescribe the manner in which comments may be submitted in response to an IRFA[3237] and, in such circumstances, it is well established that an administrative agency can structure its proceedings in any manner that it concludes will enable it to fulfill its statutory duties.[3238] Based on our past practice, we find that separation of comments responsive to the IRFA facilitates our preparation of a compulsory summary of such comments and our responses to them, as required by the RFA. Comments on the impact of our proposed rules on small entities have been integrated into our analysis and consideration of the final rules. We, therefore, reject SBA's argument that we improperly required commenters to include their comments on the IRFA in a separate section.

1336. We also reject SBA's assertion that none of the alternatives in the NPRM is designed to minimize the impact of the proposed rules on small businesses. For example, we proposed that incumbent LECs be required to offer competitors access to unbundled local loop, switching, and transport facilities.[3239] These proposals permit potential competitors to enter the market by relying, in part or entirely, on the incumbent LEC's facilities. Reduced economic entry barriers are designed to provide reasonable opportunities for new entrants, particularly small entities, to enter the market by minimizing the initial investment needed to begin providing service. In addition, we believe section 251(f) and our rules provide states with significant

[3239] NPRM paras. 94-97.

flexibility to "deal with the needs of individual companies in light of public interest concerns," as requested by the Idaho Commission. With regard to the potential burdens on small entities other than incumbent LECs, we believe our rules permit states to structure arbitration procedures, for example, in ways that minimize filing or other burdens on new entrants that are small entities.

1337. We also disagree with SCBA's assertion that the IRFA was deficient because it did not identify small cable operators as entities that would be affected by the proposed rules. The IRFA in the NPRM states: "Insofar as the proposals in this Notice apply to telecommunications carriers other than incumbent LECs (generally interexchange carriers and new LEC entrants), they may have a significant impact on a substantial number of small entities."[3240] The phrase "new LEC entrants" clearly encompasses small cable operators that become providers of local exchange service. The NPRM even identifies cable operators as potential new entrants.[3241]

1338. We agree with SCBA's argument that the Commission should identify certain minimum standards to provide guidance on the requirement that parties negotiate in good faith.[3242] As discussed in Section III.B, we conclude that we should establish minimum standards that will offer parties guidance in determining whether they are acting in good faith. We believe that these minimum standards address SCBA's assertion that federal guidelines for good faith negotiations may be particularly important for small entities because unreasonable delays in negotiations could represent an entry barrier for small entities.

1339. We also agree with SCBA's recommendation that we should establish guidelines for the application of section 251(f) regarding exemptions, suspensions, and modifications of our rules governing interconnection with rural carriers. As discussed in section XII.B, we find that a rural incumbent LEC should not be able to obtain an exemption, suspension, or modification of its obligations under section 251 unless it offers evidence that the application of those requirements would be likely to cause injury beyond the financial harm typically associated with efficient competitive entry. We are also persuaded by the suggestion of SCBA and others that incumbent LECs should bear the burden of showing that they should be exempt pursuant to section 251(f)(1) from national interconnection requirements. We believe that this finding is consistent with the pro-competitive goals of the 1996 Act and our determination in Section XII that Congress did not intend to withhold from consumers the benefits of local telephone competition that could be provided by small entities, such as small cable operators.

[3240] NPRM para. 277.

[3241] NPRM para. 7.

[3242] This good faith requirement is found in 47 U.S.C. § 251(c)(1).

1340. We do not adopt SCBA's proposal to establish abbreviated arbitration procedures.[3243] Most commenters oppose adoption of federal rules to govern state mediation and arbitration proceedings. As set out in Section XIV.A, we conclude that state commissions are better positioned to develop rules for mediation and arbitration that support the objectives of the 1996 Act. The rules we adopt in Section XIV.A apply only where the Commission assumes a state commission's responsibilities pursuant to section 252(e)(5). States may develop specific measures that address the concerns of small entities participating in mediation or arbitration, as suggested by SCBA. In addition, although we do not specifically incorporate SCBA's request that the Commission designate a "small company contact person at incumbent LECs and state commissions,"[3244] we find that a refusal throughout the negotiation process to designate a representative with authority to make binding representations on behalf of the party, and thereby significantly delay resolution of issues, would constitute failure to negotiate in good faith. Therefore, we conclude that the potential benefits of SCBA's proposal are achieved by our determination that the failure of an incumbent LEC to designate a person authorized to bind his or her company in negotiations is a violation of the good faith obligation of section 251.

C. Description and Estimates of the Number of Small Entities Affected by this Report and Order

1341. For the purposes of this Order, the RFA defines a "small business" to be the same as a "small business concern" under the Small Business Act, 15 U.S.C. § 632, unless the Commission has developed one or more definitions that are appropriate to its activities.[3245] Under the Small Business Act, a "small business concern" is one that: (1) is independently owned and operated; (2) is not dominant in its field of operation; and (3) meets any additional criteria established by the Small Business Administration (SBA).[3246] SBA has defined businesses in Standard Industrial Classification (SIC) categories 4812 (Radiotelephone Communications) and 4813 (Telephone Communications, Except Radiotelephone) to be small entities when they have fewer than 1,500 employees.[3247] We first discuss generally the total number of small telephone companies falling within both of those SIC categories. Then, we discuss the number of small businesses within the two subcategories, and attempt to refine further those estimates to correspond with the categories of telephone companies that are commonly used under our rules.

[3243] SCBA RFA comments at 1-2.

[3244] SCBA RFA comments at 2.

[3245] *See* 15 U.S.C. § 601(3) (incorporating by reference the definition of "small business concern" in 5 U.S.C. § 632).

[3246] 15 U.S.C. § 632. *See, e.g., Brown Transport Truckload, Inc. v. Southern Wipers, Inc.*, 176 B.R. 82 (N.D. Ga. 1994).

[3247] 13 C.F.R. § 121.201.

1342. Consistent with our prior practice, we shall continue to exclude small incumbent LECs from the definition of a small entity for the purpose of this FRFA. Nevertheless, as mentioned above, we include small incumbent LECs in our FRFA. Accordingly, our use of the terms "small entities" and "small businesses" does not encompass "small incumbent LECs." We use the term "small incumbent LECs" to refer to any incumbent LECs that arguably might be defined by SBA as "small business concerns."[3248]

1. Telephone Companies (SIC 481)

1343. *Total Number of Telephone Companies Affected.* Many of the decisions and rules adopted herein may have a significant effect on a substantial number of the small telephone companies identified by SBA. The United States Bureau of the Census ("the Census Bureau") reports that, at the end of 1992, there were 3,497 firms engaged in providing telephone services, as defined therein, for at least one year.[3249] This number contains a variety of different categories of carriers, including local exchange carriers, interexchange carriers, competitive access providers, cellular carriers, mobile service carriers, operator service providers, pay telephone operators, PCS providers, covered SMR providers, and resellers. It seems certain that some of those 3,497 telephone service firms may not qualify as small entities or small incumbent LECs because they are not "independently owned and operated."[3250] For example, a PCS provider that is affiliated with an interexchange carrier having more than 1,500 employees would not meet the definition of a small business. It seems reasonable to conclude, therefore, that fewer than 3,497 telephone service firms are small entity telephone service firms or small incumbent LECs that may be affected by this Order.

1344. *Wireline Carriers and Service Providers.* SBA has developed a definition of small entities for telephone communications companies other than radiotelephone (wireless) companies. The Census Bureau reports that, there were 2,321 such telephone companies in operation for at least one year at the end of 1992.[3251] According to SBA's definition, a small business telephone company other than a radiotelephone company is one employing fewer than 1,500 persons.[3252] All but 26 of the 2,321 non-radiotelephone companies listed by the Census Bureau were reported to have fewer than 1,000 employees. Thus, even if all 26 of those companies had more than 1,500 employees, there would still be 2,295 non-radiotelephone companies that might qualify as

---

[3249] United States Department of Commerce, Bureau of the Census, *1992 Census of Transportation, Communications, and Utilities: Establishment and Firm Size*, at Firm Size 1-123 (1995) (*1992 Census*).

[3250] 15 U.S.C. § 632(a)(1).

[3251] *1992 Census, supra*, at Firm Size 1-123.

[3252] 13 C.F.R. § 121.201, Standard Industrial Classification (SIC) Code 4812.

small entities or small incumbent LECs. Although it seems certain that some of these carriers are not independently owned and operated, we are unable at this time to estimate with greater precision the number of wireline carriers and service providers that would qualify as small business concerns under SBA's definition. Consequently, we estimate that there are fewer than 2,295 small entity telephone communications companies other than radiotelephone companies that may be affected by the decisions and rules adopted in this Order.

1345. *Local Exchange Carriers.* Neither the Commission nor SBA has developed a definition of small providers of local exchange services (LECs). The closest applicable definition under SBA rules is for telephone communications companies other than radiotelephone (wireless) companies. The most reliable source of information regarding the number of LECs nationwide of which we are aware appears to be the data that we collect annually in connection with the Telecommunications Relay Service (TRS). According to our most recent data, 1,347 companies reported that they were engaged in the provision of local exchange services.[3253] Although it seems certain that some of these carriers are not independently owned and operated, or have more than 1,500 employees, we are unable at this time to estimate with greater precision the number of LECs that would qualify as small business concerns under SBA's definition. Consequently, we estimate that there are fewer than 1,347 small incumbent LECs that may be affected by the decisions and rules adopted in this Order.

1346. *Interexchange Carriers.* Neither the Commission nor SBA has developed a definition of small entities specifically applicable to providers of interexchange services (IXCs). The closest applicable definition under SBA rules is for telephone communications companies other than radiotelephone (wireless) companies. The most reliable source of information regarding the number of IXCs nationwide of which we are aware appears to be the data that we collect annually in connection with TRS. According to our most recent data, 97 companies reported that they were engaged in the provision of interexchange services.[3254] Although it seems certain that some of these carriers are not independently owned and operated, or have more than 1,500 employees, we are unable at this time to estimate with greater precision the number of IXCs that would qualify as small business concerns under SBA's definition. Consequently, we estimate that there are fewer than 97 small entity IXCs that may be affected by the decisions and rules adopted in this Order.

1347. *Competitive Access Providers.* Neither the Commission nor SBA has developed a definition of small entities specifically applicable to providers of competitive access services (CAPs). The closest applicable definition under SBA rules is for telephone communications

---

[3253] Federal Communications Commission, CCB, Industry Analysis Division, *Telecommunications Industry Revenue: TRS Fund Worksheet Data*, Tbl. 21 (Average Total Telecommunications Revenue Reported by Class of Carrier) (Feb. 1996) (*TRS Worksheet*).

[3254] *Id.*

companies other than radiotelephone (wireless) companies. The most reliable source of information regarding the number of CAPs nationwide of which we are aware appears to be the data that we collect annually in connection with the TRS. According to our most recent data, 30 companies reported that they were engaged in the provision of competitive access services.[3255] Although it seems certain that some of these carriers are not independently owned and operated, or have more than 1,500 employees, we are unable at this time to estimate with greater precision the number of CAPs that would qualify as small business concerns under SBA's definition. Consequently, we estimate that there are fewer than 30 small entity CAPs that may be affected by the decisions and rules adopted in this Order.

1348. *Operator Service Providers.* Neither the Commission nor SBA has developed a definition of small entities specifically applicable to providers of operator services. The closest applicable definition under SBA rules is for telephone communications companies other than radiotelephone (wireless) companies. The most reliable source of information regarding the number of operator service providers nationwide of which we are aware appears to be the data that we collect annually in connection with the TRS. According to our most recent data, 29 companies reported that they were engaged in the provision of operator services.[3256] Although it seems certain that some of these companies are not independently owned and operated, or have more than 1,500 employees, we are unable at this time to estimate with greater precision the number of operator service providers that would qualify as small business concerns under SBA's definition. Consequently, we estimate that there are fewer than 29 small entity operator service providers that may be affected by the decisions and rules adopted in this Order.

1349. *Pay Telephone Operators.* Neither the Commission nor SBA has developed a definition of small entities specifically applicable to pay telephone operators. The closest applicable definition under SBA rules is for telephone communications companies other than radiotelephone (wireless) companies. The most reliable source of information regarding the number of pay telephone operators nationwide of which we are aware appears to be the data that we collect annually in connection with the TRS. According to our most recent data, 197 companies reported that they were engaged in the provision of pay telephone services.[3257] Although it seems certain that some of these carriers are not independently owned and operated, or have more than 1,500 employees, we are unable at this time to estimate with greater precision the number of pay telephone operators that would qualify as small business concerns under SBA's definition. Consequently, we estimate that there are fewer than 197 small entity pay telephone operators that may be affected by the decisions and rules adopted in this Order.

[3255] *Id.*

[3256] *Id.*

[3257] *Id.*

1350. *Wireless (Radiotelephone) Carriers.* SBA has developed a definition of small entities for radiotelephone (wireless) companies. The Census Bureau reports that there were 1,176 such companies in operation for at least one year at the end of 1992.[1258] According to SBA's definition, a small business radiotelephone company is one employing fewer than 1,500 persons.[1259] The Census Bureau also reported that 1,164 of those radiotelephone companies had fewer than 1,000 employees. Thus, even if all of the remaining 12 companies had more than 1,500 employees, there would still be 1,164 radiotelephone companies that might qualify as small entities if they are independently owned are operated. Although it seems certain that some of these carriers are not independently owned and operated, we are unable at this time to estimate with greater precision the number of radiotelephone carriers and service providers that would qualify as small business concerns under SBA's definition. Consequently, we estimate that there are fewer than 1,164 small entity radiotelephone companies that may be affected by the decisions and rules adopted in this Order.

1351. *Cellular Service Carriers.* Neither the Commission nor SBA has developed a definition of small entities specifically applicable to providers of cellular services. The closest applicable definition under SBA rules is for telephone communications companies other than radiotelephone (wireless) companies. The most reliable source of information regarding the number of cellular service carriers nationwide of which we are aware appears to be the data that we collect annually in connection with the TRS. According to our most recent data, 789 companies reported that they were engaged in the provision of cellular services.[1260] Although it seems certain that some of these carriers are not independently owned and operated, or have more than 1,500 employees, we are unable at this time to estimate with greater precision the number of cellular service carriers that would qualify as small business concerns under SBA's definition. Consequently, we estimate that there are fewer than 789 small entity cellular service carriers that may be affected by the decisions and rules adopted in this Order.

1352. *Mobile Service Carriers.* Neither the Commission nor SBA has developed a definition of small entities specifically applicable to mobile service carriers, such as paging companies. The closest applicable definition under SBA rules is for telephone communications companies other than radiotelephone (wireless) companies. The most reliable source of information regarding the number of mobile service carriers nationwide of which we are aware appears to be the data that we collect annually in connection with the TRS. According to our most recent data, 117 companies reported that they were engaged in the provision of mobile

[1258] United States Department of Commerce, Bureau of the Census, *1992 Census of Transportation, Communications, and Utilities: Establishment and Firm Size*, at Firm Size 1-123 (1995) (*1992 Census*).

[1259] 13 C.F.R. § 121.201, Standard Industrial Classification (SIC) Code 4812.

[1260] *Id.*

services.[3261] Although it seems certain that some of these carriers are not independently owned and operated, or have more than 1,500 employees, we are unable at this time to estimate with greater precision the number of mobile service carriers that would qualify under SBA's definition. Consequently, we estimate that there are fewer than 117 small entity mobile service carriers that may be affected by the decisions and rules adopted in this Order.

1353. *Broadband PCS Licensees.* The broadband PCS spectrum is divided into six frequency blocks designated A through F. As set forth in 47 C.F.R. § 24.720(b), the Commission has defined "small entity" in the auctions for Blocks C and F as a firm that had average gross revenues of less than $40 million in the three previous calendar years. Our definition of a "small entity" in the context of broadband PCS auctions has been approved by SBA.[3262] The Commission has auctioned broadband PCS licenses in Blocks A, B, and C. We do not have sufficient data to determine how many small businesses bid successfully for licenses in Blocks A and B. There were 90 winning bidders that qualified as small entities in the Block C auction. Based on this information, we conclude that the number of broadband PCS licensees affected by the decisions in this Order includes, at a minimum, the 90 winning bidders that qualified as small entities in the Block C broadband PCS auction.

1354. At present, no licenses have been awarded for Blocks D, E, and F of broadband PCS spectrum. Therefore, there are no small businesses currently providing these services. However, a total of 1,479 licenses will be awarded in the D, E, and F Block broadband PCS auctions, which are scheduled to begin on August 26, 1996. Eligibility for the 493 F Block licenses is limited to entrepreneurs with average gross revenues of less than $125 million.[3263] We cannot estimate, however, the number of these licenses that will be won by small entities under our definition, nor how many small entities will win D or E Block licenses. Given that nearly all radiotelephone companies have fewer than 1,000 employees[3264] and that no reliable estimate of the number of prospective D, E, and F Block licensees can be made, we assume for purposes of this FRFA, that all of the licenses in the D, E, and F Block Broadband PCS auctions may be awarded to small entities under our rules, which may be affected by the decisions and rules adopted in this Order.

[3262] *See Implementation of Section 309(j) of the Communications Act -- Competitive Bidding*, PP Docket No. 93-253, Fifth Report and Order, 9 FCC Rcd 5532, 5581-84 (1994).

[3263] *Amendment of Parts 20 and 24 of the Commission's Rules -- Broadband PCS Competitive Bidding and the Commercial Mobile Radio Service Spectrum Cap*, WT Docket No. 96-59, *Amendment of the Commission's Cellular/PCS Cross-Ownership Rule*, Report and Order, GN Docket No. 90-314, FCC 96-278 (rel. June 24, 1996).

[3264] *1992 Census*, Table 5, Employment Size of Firms: 1992, SIC Code 4812.

1355. *SMR Licensees.* Pursuant to 47 C.F.R. § 90.814(b)(1), the Commission has defined "small entity" in auctions for geographic area 800 MHz and 900 MHz SMR licenses as a firm that had average annual gross revenues of less than $15 million in the three previous calendar years. This definition of a "small entity" in the context of 800 MHz and 900 MHz SMR has been approved by the SBA.[3265] The rules adopted in this Order may apply to SMR providers in the 800 MHz and 900 MHz bands that either hold geographic area licenses or have obtained extended implementation authorizations. We do not know how many firms provide 800 MHz or 900 MHz geographic area SMR service pursuant to extended implementation authorizations, nor how many of these providers have annual revenues of less than $15 million. We assume, for purposes of this FRFA, that all of the extended implementation authorizations may be held by small entities, which may be affected by the decisions and rules adopted in this Order.

1356. The Commission recently held auctions for geographic area licenses in the 900 MHz SMR band. There were 60 winning bidders who qualified as small entities in the 900 MHz auction. Based on this information, we conclude that the number of geographic area SMR licensees affected by the rule adopted in this Order includes these 60 small entities. No auctions have been held for 800 MHz geographic area SMR licenses. Therefore, no small entities currently hold these licenses. A total of 525 licenses will be awarded for the upper 200 channels in the 800 MHz geographic area SMR auction. However, the Commission has not yet determined how many licenses will be awarded for the lower 230 channels in the 800 MHz geographic area SMR auction. There is no basis, moreover, on which to estimate how many small entities will win these licenses. Given that nearly all radiotelephone companies have fewer than 1,000 employees and that no reliable estimate of the number of prospective 800 MHz licensees can be made, we assume, for purposes of this FRFA, that all of the licenses may be awarded to small entities who, thus, may be affected by the decisions in this Order.

1357. *Resellers.* Neither the Commission nor SBA has developed a definition of small entities specifically applicable to resellers. The closest applicable definition under SBA rules is for all telephone communications companies. The most reliable source of information regarding the number of resellers nationwide of which we are aware appears to be the data that we collect annually in connection with the TRS. According to our most recent data, 206 companies reported that they were engaged in the resale of telephone services.[3266] Although it seems certain that some of these carriers are not independently owned and operated, or have more than 1,500

[3265] *See Amendment of Parts 2 and 90 of the Commission's Rules to Provide for the Use of 200 Channels Outside the Designated Filing Areas in the 896-901 MHz and the 935-940 MHz Bands Allotted to the Specialized Mobile Radio Pool*, PR Docket No. 89-583, Second Order on Reconsideration and Seventh Report and Order, 11 FCC Rcd 2639, 2693-702 (1995); *Amendment of Part 90 of the Commission's Rules to Facilitate Future Development of SMR Systems in the 800 MHz Frequency Band*, PR Docket No. 93-144, First Report and Order, Eighth Report and Order, and Second Further Notice of Proposed Rulemaking, 11 FCC Rcd 1463 (1995).

[3266] *TRS Worksheet, supra.*

employees, we are unable at this time to estimate with greater precision the number of resellers that would qualify as small business concerns under SBA's definition. Consequently, we estimate that there are fewer than 206 small entity resellers that may be affected by the decisions and rules adopted in this Order.

2. Cable System Operators (SIC 4841)

1358. SBA has developed a definition of small entities for cable and other pay television services, which includes all such companies generating less than $11 million in revenue annually. This definition includes cable systems operators, closed circuit television services, direct broadcast satellite services, multipoint distribution systems, satellite master antenna systems and subscription television services. According to the Census Bureau, there were 1,323 such cable and other pay television services generating less than $10 million in revenue that were in operation for at least one year at the end of 1992.[3267]

1359. The Commission has developed its own definition of a small cable system operator for the purposes of rate regulation. Under the Commission's rules, a "small cable company," is one serving fewer than 400,000 subscribers nationwide.[3268] Based on our most recent information, we estimate that there were 1,439 cable operators that qualified as small cable system operators at the end of 1995.[3269] Since then, some of those companies may have grown to serve over 400,000 subscribers, and others may have been involved in transactions that caused them to be combined with other cable operators. Consequently, we estimate that there are fewer than 1,468 small entity cable system operators that may be affected by the decisions and rules adopted in this Order.

1360. The Communications Act also contains a definition of a small cable system operator, which is "a cable operator that, directly or through an affiliate, serves in the aggregate fewer than 1 percent of all subscribers in the United States and is not affiliated with any entity or entities whose gross annual revenues in the aggregate exceed $250,000,000."[3270] There were 63,196,310 basic cable subscribers at the end of 1995, and 1,450 cable system operators serving fewer than one percent (631,960) of subscribers.[3271] Although it seems certain that some of these

cable system operators are affiliated with entities whose gross annual revenues exceed $250,000,000, we are unable at this time to estimate with greater precision the number of cable system operators that would qualify as small cable operators under the definition in the Communications Act.

D. Summary Analysis of the Projected Reporting, Recordkeeping, and Other Compliance Requirements and Steps Taken to Minimize the Significant Economic Impact of this Report and Order on Small Entities and Small Incumbent LECs, Including the Significant Alternatives Considered and Rejected

1361. *Structure of the Analysis.* In this section of the FRFA, we analyze the projected reporting, recordkeeping, and other compliance requirements that may apply to small entities and small incumbent LECs as a result of this Order.[3272] As a part of this discussion, we mention some of the types of skills that will be needed to meet the new requirements. We also describe the steps taken to minimize the economic impact of our decisions on small entities and small incumbent LECs, including the significant alternatives considered and rejected.[3273] Due to the size of this Order, we set forth our analysis separately for individual sections of the item, using the same headings as were used above in the corresponding sections of the Order.

1362. We provide this summary analysis to provide context for our analysis in this FRFA. To the extent that any statement contained in this FRFA is perceived as creating ambiguity with respect to our rules or statements made in preceding sections of this Order, the rules and statements set forth in those preceding sections shall be controlling.

Summary Analysis of Section II SCOPE OF THE COMMISSION'S RULES

1363. *Summary of Projected Reporting, Recordkeeping and Other Compliance Requirements.* As discussed in Section II.E, a common carrier, which may be a small entity or a small incumbent LEC, may be subject to an action for relief in several different fora if a party believes that small entity or incumbent LEC violated the standards under section 251 or 252. Should a small entity or a small incumbent LEC be subjected to such an action for relief, it will require the use of legal skills.

1364. *Steps Taken to Minimize Significant Economic Impact on Small Entities and Small Incumbent LECs, and Alternatives Considered.* We believe that our actions establishing minimum national rules will facilitate the development of competition in the local exchange and exchange

---

[3272] *See* 5 U.S.C. § 604(a)(4).

[3273] *See* 5 U.S.C. § 604(a)(5).

access markets for the reasons discussed in Sections II.A and II.B above. For example, national rules may: help equalize bargaining power; minimize the need for duplicative marketing strategies and multiple network configurations; lower administrative costs; lessen the need to re-litigate the same issue in multiple jurisdictions; and reduce delay and transaction costs, which can pose particular burdens for small businesses. In addition, our rules are designed to accommodate differences among regions and carriers, and the reduced regulatory burdens and increased certainty produced by national rules may be expected to minimize the economic impact of our decisions for all parties, including any small entities and small incumbent LECs. As set forth in Section II.A above, we reject suggestions to adopt more, or fewer, national rules than we ultimately adopt in this Order. We reject the arguments that we should establish "preferred outcomes" from which parties could deviate upon an adequate showing, or that we establish a process by which state commissions could seek a waiver from the Commission's rules, for the reasons set forth in Section II.B above.

1365. We believe that our determination that there are multiple methods for bringing enforcement actions against parties regarding their obligations under sections 251 and 252 will assist all parties, including small entities and small incumbent LECs, by providing a variety of methods and fora for seeking enforcement of such obligations. (Section II.E - Authority to Take Enforcement Action.) Similarly, our conclusion that Bell Operating Company (BOC) statements of generally available terms and conditions are governed by the same national rules that apply to agreements arbitrated under section 252 should ease administrative burdens for all parties in markets served by BOCs, which may include small entities, because they will not need to evaluate and comply with different sets of rules. (Section II.F - BOC Statements of Generally Available Terms.) Finally, we decline to adopt different requirements for agreements arbitrated under section 252 and BOC statements of generally available terms and conditions for the reasons set forth in section II.F above.

Summary Analysis of Section III
DUTY TO NEGOTIATE IN GOOD FAITH

1366. *Summary of Projected Reporting, Recordkeeping and Other Compliance Requirements.* Incumbent LECs, including small incumbent LECs that receive requests for access to network elements and/or services pursuant to sections 251 and 252 of the Act will be required to negotiate in good faith over the terms of interconnection agreements. As set forth in Section III.C. above, this Order identifies several practices as violations of the duty to negotiate in good faith, including: (1) a party's seeking or entering into an agreement prohibiting disclosure of information requested by the FCC or a state commission, or supplied in support of a request for arbitration pursuant to section 252(b)(2)(B); (2) seeking or entering into an agreement precluding amendment of the agreement to account for changes in federal or state rules; (3) an incumbent's denial of a reasonable request for cost data during negotiations; and (4) an entrant's failure to provide to the incumbent LEC information necessary to reach agreement. Complying with the projected requirements of this section may require the use of legal skills, as discussed above in

Section III.D. In addition, incumbent LECs and new entrants having interconnection agreements that predate the 1996 Act must file such agreements with the state commission for approval under section 252(e).

1367. *Steps Taken to Minimize Significant Economic Impact on Small Entities and Small Incumbent LECs, and Alternatives Considered.* As set forth above, we believe our decision to establish national rules and a review process concerning parties' duties to negotiate in good faith are designed to facilitate good faith negotiations, which should minimize regulatory burdens and the economic impact of our decisions for all parties, including small entities and small incumbent LECs. (Section III.B. - Advantages and Disadvantages of National Rules.) We also expect economic impacts to be minimized for small entities seeking to enter into agreements with incumbent LECs as a result of the decision that incumbent LECs may not impose a bona fide request requirement on carriers seeking agreements pursuant to sections 251 and 252. (Section III.C. - Specific Practices that may Constitute a Violation of Good Faith Negotiation.) For the reasons set forth in Section III.D. above, we also find that certain additional practices are not always violations of the duty to negotiate in good faith, including the suggested alternative that all nondisclosure agreements violate the good faith duty.

1368. We do not require immediate filing of preexisting interconnection agreements, including those involving small incumbent LECs and small entities. We set an outer time limit of June 30, 1997, by which preexisting agreements between Class A carriers must be filed with the relevant state commission. This decision will ensure that third parties, including small entities, are not prevented indefinitely from reviewing and taking advantage of the terms of preexisting agreements. It also limits burdens that a national filing deadline might impose on small carriers. In addition, the determination that preexisting agreements must be filed with state commissions seems likely to foster opportunities for small entities and small incumbent LECs to gain access to such agreements without requiring investigation or discovery proceedings or other administrative burdens that could increase regulatory burdens. (Section III.D. - Applicability of Section 252 to Preexisting Agreements). For the reasons set forth in Section III.D. above, we reject the alternative of not requiring certain agreements to be filed with state commissions.

Summary Analysis of Section IV
INTERCONNECTION

1369. *Summary of Projected Reporting, Recordkeeping and Other Compliance Requirements.* Incumbent LECs, including small incumbent LECs, are required by section 251(c) to provide interconnection to all requesting telecommunications carriers for the transmission and routing of telephone exchange service and exchange access service. Such interconnection must be: (1) provided at any technically feasible point; (2) at least equal in quality to that provided to the incumbent LEC itself and to any other parties with interconnection agreements; and (3)

provided on rates, terms, and conditions that are "just, reasonable, and nondiscriminatory . . . ."[3274] As set forth in Section IV.A. above, we conclude that interconnection refers solely to the physical linking of networks for the mutual exchange of traffic, and identify a minimum set of technically feasible points of interconnection. The minimum points at which an incumbent LEC, which may be a small incumbent LEC, must provide interconnection are: (1) the line side of a local switch; (2) the trunk side of a local switch; (3) the trunk interconnection points for a tandem switch; (4) central office cross-connect points; and (5) out-of-band signaling facilities. In addition, the points of access to unbundled elements (discussed below) are also technically feasible points of interconnection. Compliance with these requests may require the use of engineering, technical, operational, accounting, billing, and legal skills.

1370. To obtain interconnection pursuant to section 251(c)(2), telecommunications carriers must seek interconnection for the purpose of transmitting and routing telephone exchange traffic, or exchange access traffic, or both. (Section IV.E. - Definition of "Technically Feasible.") This will require new entrants to provide either local exchange service or exchange access service to obtain section 251(c)(2) interconnection. A requesting carrier will be required to bear the additional costs imposed on incumbent LECs as a result of interconnection. (Section IV.F. - Technically Feasible Points of Interconnection.) Carriers seeking interconnection, including small entities, may be required to collect information to refute claims by incumbent LECs that the requested interconnection poses a legitimate threat to network reliability. (*Id.*)

1371. *Steps Taken to Minimize Significant Economic Impact on Small Entities and Small Incumbent LECs, and Alternatives Considered.* The decision to adopt clear national rules in this section of the Order is also intended to help equalize bargaining power between incumbent LECs and requesting carriers, expedite and simplify negotiations, and facilitate comprehensive business and network planning. This could decrease entry barriers and provide reasonable opportunities for all carriers, including small entities and small incumbent LECs, to provide service in markets for local exchange and exchange access services. (Section IV.B. - National Interconnection Rules). National rules should also facilitate the consistent development of standards and resolution of issues, such as technical feasibility, without imposing additional litigation costs on parties, including small entities and small incumbent LECs. We determine that successful interconnection at a particular point in a network creates a rebuttable presumption that interconnection is technically feasible at other comparable points in the network. (Section IV.E - Definition of "Technically Feasible.") We also identify minimum points of interconnection where interconnection is presumptively technically feasible: (1) the line side of a switch; (2) the trunk side of a switch; (3) trunk interconnection points at a tandem switch; (4) central office cross-connect points; and (5) out-of-band signaling facilities. (Section IV.F - Technically Feasible Points of Interconnection.) These decisions may be expected to facilitate negotiations by promoting certainty and reducing transaction costs, which should minimize regulatory burdens

[3274] 47 U.S.C. § 251(c)(2).

and the economic impact of our decisions for all parties, including small entities and small incumbent LECs. We decline, however, to identify additional points where interconnection is technically feasible for the reasons set forth in section IV.F above.

1372. The ability to enter local markets by offering only telephone exchange service or only exchange access service may minimize regulatory burdens and the economic impact of our decisions for some entrants, including small entities. We decline, however, to interpret section 251(c)(2) as requiring incumbent LECs to provide interconnection to carriers seeking to offer only interexchange services for the reasons set forth in section IV.D. above. In addition, we determine that an incumbent LEC may refuse to interconnect on the grounds that specific, significant, and demonstrable network reliability concerns may make interconnection at a particular point sufficiently infeasible. We further determine that the incumbent LEC must prove such infeasibility to the state commission. (Section IV.E - Definition of "Technically Feasible.")

1373. Competitive carriers, many of whom may be small entities, will be permitted to request interconnection at any technically feasible point, and the determination of feasibility must be conducted without consideration of the cost of providing interconnection at a particular point. (Section IV.E. - Definition of "Technically Feasible.") Consequently, our rules permit the party requesting interconnection, which may be a small entity, and not the incumbent LEC to decide the points that are necessary to compete effectively. (Section IV.E. - Definition of "Technically Feasible"). We decline, however, to impose reciprocal terms and conditions for interconnection on carriers requesting interconnection. Our decision that an party requesting interconnection must pay the costs of interconnecting should minimize regulatory burdens and the economic impact of our interconnection decisions for small incumbent LECs. Similarly, regulatory burdens and the economic impact of our decisions may be minimized through the decision that, while a requesting party is permitted to obtain interconnection that is of higher quality than that which the incumbent LEC provides to itself, the requesting party must pay the additional costs of receiving the higher quality interconnection. (Section IV.H - Interconnection that is Equal in Quality.)

Summary Analysis of Section V
ACCESS TO UNBUNDLED NETWORK ELEMENTS

1374. *Summary of Projected Reporting, Recordkeeping and Other Compliance Requirements.* Under section 251(c), incumbent LECs are required to provide nondiscriminatory access to unbundled network elements. We identify a minimum set of network elements: (1) local loops; (2) local and tandem switches; (3) interoffice transmission facilities; (4) network interface devices; (5) signaling and call-related database facilities; (6) operations support systems and functions; and (7) operator and directory assistance facilities. (Section V.J - Specific Unbundling Requirements.) Incumbent LECs are required to provide nondiscriminatory access to operations support systems and information by January 1, 1997. States may require incumbent LECs to provide additional network elements on an unbundled basis. As discussed in Section V.F. above, LECs must perform the functions necessary to combine unbundled elements in a

manner that allows requesting carriers to offer a telecommunications service, and the incumbent LEC may not impose restrictions on the subsequent use of network elements. Compliance with these requests may require the use of engineering, technical, operational, accounting, billing, and legal skills.

1375. If a requesting carrier, which may be a small entity, seeks access to an incumbent LEC's unbundled elements, the requesting carrier is required to compensate the incumbent LEC for any costs incurred to provide such access. For example, in the case of operation support systems functions, such work may include the development of interfaces for competing carriers to access incumbent LEC functions for pre-ordering, ordering, provisioning, maintenance and repair, and billing. Requesting carriers may also have to deploy their own operations support systems interfaces, including electronic interfaces, in order to access the incumbent LEC's operations support systems functions. The development of interfaces may require new entrants, including small entities, to perform engineering work. (Section V.J.5 - Operations Support Systems Unbundling.)

1376. *Steps Taken to Minimize Significant Economic Impact on Small Entities and Small Incumbent LECs, and Alternatives Considered.* The establishment of minimum national requirements for unbundled elements should facilitate negotiations and reduce regulatory burdens and uncertainty for all parties, including small entities and small incumbent LECs. National requirements for unbundling may allow new entrants, including small entities, to take advantage of economies of scale in network design, which may minimize the economic impact of our decision. As set forth in Section V.B, above, we reject several alternatives in making this determination, including proposals suggesting that the Commission should: (1) not identify any required elements; (2) allow the states exclusively to identify required elements; or (3) adopt an exhaustive list of elements.

1377. As set forth above, the 1996 Act defines a network element to include "all facilit(ies) or equipment used in the provision of a telecommunications service," and all "features, functions, and capabilities that are provided by means of such facility or equipment, including subscriber numbers, databases, signaling systems and information sufficient for billing and collection or used in the transmission, routing or other provision of a telecommunications service." (Section V.C - Network Elements.) As a result, new entrants, which may include small entities, should have access to the same technologies and economies of scale and scope that are available to incumbent LECs. In reaching our determination, we reject for the reasons set forth in Section V.C above, the following alternatives: (1) that we should not adopt a method for identifying elements beyond those identified in the 1996 Act; and (2) that features sold directly to end users as retail services are not network elements. Finally, we reject the argument that requesting carriers, which may include small entities, are required to provide all services typically furnished by means of an element they purchase. (*Id.*) Our rejection of this last alternative may reduce burdens for some small entities by permitting them to offer some, but not all, of the services provided by the incumbent LEC.

1378. We conclude that the requirement to provide "access" to unbundled network elements is independent of the interconnection duty imposed by section 251(c)(2), and that such "access" must be provisioned under the rates, terms and conditions applicable to unbundled network elements. We believe these conclusions may provide small entities seeking to compete with incumbent LECs with the flexibility to offer other telecommunications services in addition to local exchange and exchange access services. (Section V.D. - Access to Network Elements.) For the reasons set forth above in Section V.D, we reject the argument that incumbent LECs are not required to provide access to an element's functionality, and that "access" to unbundled elements can only be achieved by interconnecting under the terms of section 251(c)(2).

1379. As set forth above, we conclude that an incumbent LEC, which may be a small incumbent LEC, may decline to provide a network element beyond those identified by the Commission where it can demonstrate that the network element is proprietary, and that the competing provider could offer the proposed telecommunications service using other nonproprietary elements within the incumbent's network. (Section V.E - Standards Necessary to Identify Unbundled Network Elements.) This should minimize regulatory burdens and the economic impact of our decisions for incumbent LECs, including small incumbent LECs, by permitting such entities to retain exclusive use of certain proprietary network elements.

1380. We conclude that incumbent LECs: (1) cannot impose restrictions, requirements or limitations on requests for, or the sale or use of, unbundled network elements; (2) must provide requesting carriers with all of the functionalities of a particular element so that requesting carriers can provide any telecommunications services that can be offered by means of that element; (3) must permit new entrants to combine network elements which new entrants purchase access to, if so requested; (4) must prove to a state commission that they cannot combine elements that are not ordinarily combined within an their network, or that are not ordinarily combined in that manner, because such combination is not technically feasible or it would impair the ability of other carriers to access unbundled elements and interconnect with the incumbent LEC; and (5) must provide the operational and support systems necessary to purchase and combine network elements. As a result of these conclusions, many small entities should face significantly reduced barriers to entry in markets for local exchange services. (Section V.F - Provision of a Telecommunications Service Using Unbundled Network Elements.) For the reasons set forth in section V.F, we reject the following alternatives: (1) that incumbent LECs, in all instances, must combine elements that are not ordinarily combined in their networks; and (2) that incumbent LECs are not obligated to combine elements for requesting carriers.

1381. By establishing minimum national rules concerning nondiscriminatory access to unbundled network elements, requesting carriers, including small entities, may face reduced transaction and regulatory costs in seeking to enter local telecommunications markets. Among these minimum rules are: (1) access and elements which new entrants receive are to be equal in quality between carriers; (2) incumbent LECs must prove technical infeasibility; (3) the rates, terms and conditions established for the provisioning of unbundled elements must be equal

between all carriers, and where applicable, between requesting carriers and the incumbent LEC itself, and they must provide efficient competitors with a meaningful opportunity to compete; and (4) incumbent LECs must provide carriers purchasing unbundled elements with access to electronic interfaces if incumbents use such functions themselves in provisioning telecommunications services. (Section V.G - Nondiscriminatory Access to Unbundled Network Elements.)

1382. As set forth above, we conclude that section 251(c)(3) does not require new entrants to own or control their own local exchange facilities in order to purchase and use unbundled network elements and, thus, new entrants can provide services solely by recombining unbundled network elements. (Section V.H - The Relationship Between Sections 251(c)(3) and 251(c)(4).)

1383. As discussed in Section V.J above, we adopt a minimum list of required unbundled network elements that incumbent LECs, including small incumbent LECs, must make available to requesting carriers. In adopting this list, we sought to minimize the regulatory burdens and economic impact for small incumbent LECs. For example, we declined to adopt a detailed list including many additional elements, as set forth in Section V.B. We also provided for the fact that certain LECs may possess switches that are incapable of performing customized routing for competitors, as discussed in Section V.J.2.(c).(ii).

Summary Analysis of Section VI
METHODS OF OBTAINING INTERCONNECTION AND ACCESS TO UNBUNDLED NETWORK ELEMENTS

1384. *Summary of Projected Reporting, Recordkeeping, and Other Compliance Requirements.* We conclude that Section 251(c)(6) requires incumbent LECs, including small incumbent LECs, to provide for any technically feasible method of interconnection or access to unbundled network elements, including physical collocation, virtual collocation, and meet-point interconnection. With certain modifications, we adopt some of the requirements concerning physical and virtual collocation that we adopted in the *Expanded Interconnection* proceeding. Compliance with these requests may require the use of engineering, technical, operational, accounting, billing, and legal skills.

1385. In a meet-point arrangement the new entrant will build out facilities to the agreed-upon point, which will likely entail the use of engineering and installation personnel as well as the acquisition of equipment. We allow incumbent LECs to impose reasonable restrictions on the warehousing of space by collocators. Therefore, small entities collocating equipment may be required to use the provided space for the collocation of equipment necessary for interconnection or access to unbundled network elements or risk losing the right to use that space. (Section VI.B.1.e - Allocation of Space.) To take advantage of its right to collocate equipment on an incumbent LEC's premises, competitive entrants, which may include small entities, will be

required to build or lease transmission facilities between their own equipment, located outside of the incumbent LECs' premises, and the collocated space. (Section VI.B.1.f - Leasing Transport Facilities.) We allow incumbent LECs to require reasonable security arrangements to separate an entrant's collocation space from the incumbent LEC's facilities. Small entities collocating equipment may therefore be required to pay for such security arrangements. (Section VI.B.1.h - Security Arrangements.)

1386. *Steps Taken to Minimize Significant Economic Impact on Small Entities and Small Incumbent LECs, and Alternatives Considered.* By readopting our *Expanded Interconnection* terms and conditions, which allow competitors to collocate equipment for interconnection with the incumbent LEC, regulatory burdens have likely been reduced because the terms and conditions for collocation have already been established. (Section VI.B.1.b - Adoption of *Expanded Interconnection* Terms and Conditions.) This seems likely to benefit all parties, including small entities and small incumbent LECs, since it should reduce the time and expense of negotiation, and reduce the costs of adapting to new terms and conditions for collocation.

1387. Due to our conclusion that requesting carriers may choose any method of technically feasible interconnection or access to unbundled elements, new entrants, including small entities, should have the flexibility to obtain interconnection or access in the manner that best suits their needs. (Section VI.A. - Methods of Obtaining Interconnection and Access to Unbundled Elements.) In particular, as discussed in Section VI.A.3, we recognize that carriers, including small entities, may find virtual collocation or meet-point arrangements more efficient than physical collocation in certain circumstances, particularly if they lack the resources to collocate physically in a large number of incumbent LEC premises.

1388. We adopt a broad definition of the term "premises," which should allow carriers, including small entities, to collocate equipment for interconnection and access to unbundled network elements at a range of incumbent LEC locations. (Section VI.B.1.c - The Meaning of the Term "Premises.") For the reasons set forth in Section VI.B above, we interpret the term "premises" broadly to include incumbent LEC central offices, serving wire centers and tandem offices, as well as all buildings or similar structures owned or leased by the incumbent LEC that house incumbent LEC facilities. However, as set forth above, we reject the suggestion that security measures be provided only at the request of the entrant, which should minimize regulatory burdens and the economic impact of our decisions for small incumbent LECs. (*Id.*)

1389. We interpret the statute broadly to allow collocation of any equipment used for interconnection or access to unbundled network elements. (Section VI.B.1.d - Collocation Equipment.) This standard should offer all competitors, including small entities, flexibility in collocating equipment they need to interconnect their networks to those of incumbent LECs. Incumbent LECs will also be required to make space available to requesting carriers on a first-come, first-served basis, and collocators seeking to expand their collocated space should be allowed to use contiguous space where available. (Section VI.B.1.e - Allocation of Space.)

These provisions should minimize regulatory burdens and economic impacts for small entity entrants by reducing opportunities for discriminatory treatment based on the size of the requesting carrier. We decline, however, to require incumbent LECs to file reports on the status, planned increase, and use of space for the reasons set forth in Section VI.B.1. above, which will reduce the regulatory burdens and economic impact of our decisions for small incumbent LECs.

1390. We conclude that a competitive entrant should be permitted to lease transmission facilities from the incumbent LEC. (Section VI.B.1.f - Leasing Transport Facilities). This provision will allow small entities to lease transmission facilities from incumbent LECs to transmit traffic between the collocated space and their own networks, which may be comparatively less burdensome for small entities than the alternative of bringing their own facilities to the collocated equipment on the incumbent LEC's premises. We also require incumbent LECs to permit two or more carriers that are collocating at the incumbent LEC's premises to interconnect their networks. (Section VI.B.1.g - Co-Carrier Cross-Connect.) This requirement should make it easier for new entrants to interconnect their networks with those of competitors.

1391. We require incumbent LECs to provide the relevant state commissions with detailed floor plans or diagrams of any premises where the incumbent LEC alleges that there are space constraints. (Section VI.B.1.i. - Allowing Virtual Collocation in Lieu of Physical). This requirement may reduce burdens for all parties, including small entities and small incumbent LECs, by aiding state commissions with their evaluation of incumbent LEC refusals to allow physical collocation on the grounds of space constraints. For the reasons set forth in Section VI.B.1 above, however, we decline to require incumbent LECs to lease additional space or provide trunking at no cost where they have insufficient space for physical collocation, which should minimize the regulatory burdens and economic impact of our decisions for incumbent LECs, including small incumbent LECs.

Summary Analysis of Section VII
PRICING OF INTERCONNECTION AND UNBUNDLED NETWORK ELEMENTS

1392. *Summary of Projected Reporting, Recordkeeping, and Other Compliance Requirements.* Pursuant to sections 251(c) and 252(d) of the 1996 Act, incumbent LECs must provide interconnection and access to unbundled network elements on rates, terms, and conditions that are just, reasonable, and nondiscriminatory. In Section VII above, we adopt a methodology for setting arbitrated prices for interconnection and unbundled elements on the basis of forward-looking economic cost studies prepared in conformance with a methodology prescribed by the Commission. Until states utilize economic studies to develop cost-based prices, they must use default proxies established by the Commission. Small incumbent LECs may be required, therefore, to prepare economic cost studies. In addition, small entities seeking arbitration for rates for interconnection or unbundled elements may find it useful to prepare economic cost

studies or prepare critiques of cost studies prepared by incumbent LECs and others. In both cases, this may entail the use of economic experts, legal advice, and possibly accounting personnel.

1393. *Steps Taken to Minimize Significant Economic Impact on Small Entities and Small Incumbent LECs, and Alternatives Considered.* Our conclusion that prices for interconnection and unbundled elements should be set at forward-looking long-run economic cost, including a reasonable share of forward-looking joint and common costs, should permit new entrants, including small entities, to interconnect with, and acquire unbundled elements from, incumbent LECs at prices that replicate, to the extent possible, those in a competitive market. (Section VII.B.2 - Pricing of Interconnection and Unbundled Elements, Cost-Based Pricing Methodology, Rate Levels.) Our forward-looking economic cost methodology for determining prices is designed to permit incumbent LECs to recover their economic costs of providing interconnection and unbundled elements, which should minimize the economic impact of our decisions on small incumbent LECs.

1394. Our conclusion that embedded costs, opportunity costs and universal service subsidies may not be included in the rates for interconnection and unbundled elements is intended, in part, to avoid distortions in investment decisions, which should lead to more efficient allocation of resources, thereby reducing regulatory burdens and economic impacts for some small entities and small incumbent LECs. (Section VII.B.2 - Pricing of Interconnection and Unbundled Elements, Cost-Based Pricing Methodology, Rate Levels.) We reject proposals that would have permitted incumbent LECs to recover their embedded costs in prices for interconnection and unbundled elements as discussed above in Section VII.B.2.a.(3)(b). As discussed in Section VII.B.2.a.(3)(b), we reject the use of the efficient component pricing rule (ECPR) to set prices for interconnection and unbundled elements.

1395. Our conclusion that forward-looking common costs should be allocated in a reasonable manner should ensure that the prices of network elements that are least likely to be subject to competition are not artificially inflated by large allocations of common costs. This, in turn, may also produce more efficient allocations of resources, thereby minimizing regulatory burdens and economic effects for many parties, including small entities and small incumbent LECs. (Section VII.B.2 - Pricing of Interconnection and Unbundled Elements, Cost-Based Pricing Methodology, Rate Levels.) We permit, but do not require, states to impose peak-sensitive pricing systems for shared facilities as discussed in Section VII.B.3.b.

1396. We conclude that incumbent LECs should not recover access charges from entrants that use unbundled network facilities to provide access services to customers that they win from incumbent LECs. We do, however, permit incumbent LECs to impose on purchasers of unbundled local switching the carrier common line charge and a charge equal to seventy-five percent of the transport interconnection charge for an interim period that shall end no later than June 30, 1997, as discussed in Section VII.B.2.a.(3)(b). As further explained in that section, this

mechanism should serve to reduce any short-term disruptive impact of our decisions on incumbent LECs, including small incumbent LECs.

1397. We conclude that the Act requires rates for interconnection and unbundled elements to be geographically deaveraged, using a minimum of three geographic zones, in a manner that appropriately reflects the costs of the underlying elements. (Section VII.B.3.c. - Geographic/Class-of-Service Averaging.) We also conclude that distinctions between the rates charged to requesting carriers for network elements should not vary based on the classes of service that the requesting carriers provide to their to customers. We expect these decisions to lead to increased competition and a more efficient allocation of resources.

1398. The default proxies we adopt for rates for interconnection and unbundled elements, which states may use to establish prices, are designed to approximate prices that will enable efficient competitors, including small entities, to enter local exchange markets. (Section VII.C. - Default Proxy Ceilings and Ranges.) We reject the use of rates in interconnection agreements that predate the 1996 Act as proxy-based ceilings for interconnection and unbundled element rates as discussed in Section VII.C.1. We also decline to adopt a generic cost model at this time, as discussed in Section VII.C.3.

1399. We determine that the nondiscrimination provisions in the Act prohibit price differences that are not based on cost differences. This should permit small entities to obtain the same terms and conditions of agreements reached by larger carriers that possess greater bargaining power without having to incur the costs of negotiation and/or arbitration. (Section VII.D.3 - Discrimination.)

Summary Analysis of Section VIII
RESALE

1400. *Summary of Projected Reporting, Recordkeeping, and Other Compliance Requirements.* Pursuant to section 251(b)(1), all LECs, which may include small entity competing LECs and small incumbent LECs, may not impose unreasonable or discriminatory conditions on, or limit the resale of, their telecommunications services. Pursuant to section 251(c)(4), incumbent LECs are required to offer for resale at wholesale rates any telecommunications services that they offer to subscribers other than telecommunications carriers. Providing such services for resale may require some small entities and small incumbent LECs to use additional billing, technical, and operational skills.

1401. Under section 252(a), resellers, which may include small entities, are required to prepare and present to incumbent LECs requests for services to resell. We do not establish guidelines for the content of these requests. Such requests may involve legal, engineering, and accounting skills. Resellers may also have to engage in arbitration proceedings with incumbent LECs if voluntary negotiations resulting from the initial request fail to yield an agreement. This

may involve legal and general negotiation skills. Where a reseller is negotiating or arbitrating with an incumbent LEC, the reseller may choose to offer arguments concerning economic and accounting data presented by state commissions or incumbent LECs. Resellers may also choose to make legal and economic arguments that certain resale restrictions are unreasonable. These tasks may require legal, economic, and accounting skills.

1402. *Steps Taken to Minimize Significant Economic Impact on Small Entities and Small Incumbent LECs, and Alternatives Considered.* As set forth in Section VIII.B, above, our decision to adopt clear national rules should reduce regulatory burdens and uncertainty for all parties, including small entities and small incumbent LECs. Moreover, our decision not to impose eligibility requirements on resellers should minimize regulatory burdens for resellers. We reject proposals that the Commission not require resale of bundled service offerings, promotions and discounts lasting longer than 90 days, residential service, and services offered at rates below cost for reasons set forth in Section VIII.A.

1403. As discussed in Section VIII.B, we expect that the opportunity to resell telecommunications services currently offered exclusively by incumbent LECs will lead to increased competition in the provision of telecommunications services. We also determine that non-cost-based factors shall not be considered when arriving at wholesale discounts, and we reject the argument that indirect costs should not be considered avoided costs. We also reject proposals that we either require or forbid a state to include a measure of profit in its avoided cost calculation. As set forth in Section VIII.B, we considered the concerns of small incumbent LECs and small entity resellers when adopting the default range for wholesale discounts. In addition, we allow a state to consider including in wholesale rates the costs that incumbent LECs incur in selling services on a wholesale basis, which may minimize the economic impact for small incumbent LECs.

1404. As discussed in Section VIII.C, we remove obstacles faced by small businesses in reselling telecommunications services by establishing a presumption, applicable to incumbent and non-incumbent LECs, that most restrictions on resale are unreasonable. This presumption should reduce unnecessary burdens on resellers, which may include small entities. It may also produce increased opportunities for resale competition, which may be expected to be beneficial for some small entities and small incumbent LECs. We do not permit state commissions to require non-incumbent LECs to offer their services at wholesale rates for the reasons set forth Section VIII.D For the reasons discussed in Section VIII.C, above, we decline to forbear from the application of section 251(b)(1) to non-incumbent LECs. We also conclude that incumbent LECs are to continue to receive access charge revenues when local services are resold under section 251(c)(4) for reasons set forth in Section VIII.E, and that such access services are not subject to resale at wholesale rates for reasons set forth in Section VIII.A.

Summary Analysis of Section IX
DUTIES IMPOSED ON "TELECOMMUNICATIONS CARRIERS" BY SECTION 251(a)

1405. *Summary of Projected Reporting, Recordkeeping, and Other Compliance Requirements.* Small entities that provide telecommunications services are subject to the same obligations imposed on all telecommunications carriers under section 251(a)(1) and section 251(a)(2), and any reporting requirements that attend such obligations. Among these duties is the duty to interconnect, directly or indirectly, with requesting telecommunications carriers. (Section IX - Duties Imposed on "Telecommunications Carriers" By Section 251(a).) This will likely require small entities to comply with the technical, economic, and legal requirements involved with interconnection, including negotiating contracts, utilizing engineering studies, and adding operational capacity. (*Id.*) Small incumbent LECs may incur similar compliance requirements to the extent they are required to interconnect with entities that qualify as "telecommunications carriers."

1406. Small incumbent LECs and small entities providing telecommunications services will also be under a duty not to install network features, functions, and capabilities that do not comply with standards and guidelines under sections 255 and 256. (Section IX - Duties Imposed on "Telecommunications Carriers" By Section 251(a)(2).) In addition, small entities that provide both information services and telecommunications services are classified as telecommunications carriers and are subject to certain requirements under 251(a). (Section IX - Duties Imposed on "Telecommunications Carriers" By Section 251(a)(2).)

1407. *Steps Taken to Minimize Significant Economic Impact on Small Entities and Small Incumbent LECs, and Alternatives Considered.* Small entities who provide for a fee local, interexchange and international services are defined as telecommunications carriers and, thus, also receive the benefits of section 251 including interconnection, services, and network elements, which may increase their ability to compete. (Section IX - Duties Imposed on "Telecommunications Carriers" By Section 251(a)(2).) We reject the suggestion that CMRS providers, some of which likely are small entities, should not be included in the definition of a "telecommunications carrier." (*Id.*) We determine that entities operating private, internal or shared communications networks do not qualify as telecommunications carriers, however, which excludes them from the obligations and benefits under section 251(a). Small entities providing information services but not telecommunications services are also not classified as telecommunications carriers and, thus, will not be bound by the duties of section 251(a). A carrier that provides both information and telecommunications services is deemed subject to the requirements of section 251(a). We also conclude that telecommunications carriers that have interconnected under either section 251(a)(1) or 251(c)(2) may offer information services through the same arrangement or agreement. This will permit new entrants, many of which may be small entities, to offer full ranges of services to end users without having to provide some of those services inefficiently through distinct facilities or agreements.

1408. We decide that competitive telecommunications carriers that have the obligation to interconnect with requesting carriers may choose, based upon their own characteristics, whether to allow direct or indirect interconnection. (Section IX - Duties Imposed on "Telecommunications Carriers" By Section 251(a).) This should allow significant flexibility for small entities to choose the most efficient and economical arrangement for their particular strategy. As set forth in Section IX, we reject an argument to forbear, under section 10 of the Communications Act,[3273] from imposing any interconnection requirements on non-dominant carriers.

Summary Analysis of Section X
COMMERCIAL MOBILE RADIO SERVICES

1409. *Summary of Projected Reporting, Recordkeeping and Other Compliance Requirements.* We are applying sections 251 and 252 to LEC-CMRS interconnection at this time. (Section X.D - Jurisdictional Authority for Regulation of LEC-CMRS Interconnection Rates.) We may revisit our determination not to invoke jurisdiction under section 332 to regulate LEC-CMRS interconnection rates if we determine that the regulatory scheme established by sections 251 and 252 does not sufficiently address the problems encountered by CMRS providers, many of which may be small entities, in obtaining interconnection on terms and conditions that are just, reasonable, and nondiscriminatory.

1410. Pursuant to our findings in Section X.D, a small CMRS entity seeking to enter into a reciprocal compensation agreement with an incumbent LEC, which may be a small incumbent LEC, will have to comply with sections 251 and 252, and state law. The reporting, recordkeeping, and other compliance requirements associated with reciprocal compensation are summarized in the following section concerning obligations under section 251(b).

1411. *Steps Taken to Minimize Significant Economic Impact on Small Entities and Small Incumbent LECs, and Alternatives Considered.* The Commission's actions may minimize the economic impact on CMRS providers, many of which are small entities, by declaring that CMRS providers are not required to comply with the obligations of LECs under section 251(b)(5). We decline to adopt the alternative of finding that a CMRS provider is a LEC for the reasons set forth in Section X.A. We also determine that CMRS providers are entitled to request reciprocal compensation under section 251(b)(5), and that certain CMRS providers are also entitled to request interconnection under section 251(c)(2). As discussed in the following section concerning obligations under section 251(b), these decisions may permit small entity CMRS providers the opportunity to considerably expand their businesses.

Summary Analysis of Section XI
OBLIGATIONS IMPOSED ON LECS BY 251(b)

[3273] 47 U.S.C. § 160.

A Reciprocal Compensation for Transport and Termination of Telecommunications

1412. *Summary of Projected Reporting, Recordkeeping, and Other Compliance Requirements.* All local exchange carriers, including small incumbent LECs and perhaps some small entities offering competing local exchange services, have a duty to establish reciprocal compensation for the transport and termination of local telecommunications traffic, as defined by state commissions. As such, small incumbent LECs and small entities offering competitive local exchange services may be required to measure the exchange of traffic, and to bill and collect payment from other carriers. (Section XI.A - Reciprocal Compensation for Transport and Termination of Telecommunications.) Reciprocal compensation for the transport and termination of traffic may be based on the incumbent LEC's cost studies, which may require small incumbent LECs to use economic skills to perform cost studies. To the extent that a competing provider of local exchange services, which may include a small entity, believes its costs for the transportation and termination of traffic differ from those of the incumbent LEC, it would also be required to provide a forward-looking, economic cost study. (*Id.*)

1413. If a CMRS provider entered into an agreement with an incumbent LEC prior to August 8, 1996 that does not provide for mutual compensation, the CMRS provider may demand to renegotiate the agreement. This may impose the burden of re-negotiation on small incumbent LECs, which may require legal, accounting, and economic skills. In addition, pending the successful completion of negotiation or arbitration, symmetrical reciprocal compensation shall apply, which may have the effect of raising the amount small incumbent LECs currently pay CMRS providers to terminate LEC-originated traffic. This may have the effect of increasing small incumbent LECs' costs. Finally, a state commission may impose bill-and-keep arrangements between carriers if the state commission determines that the amount of local telecommunications traffic from one network to the other is approximately equal to the amount of local telecommunications traffic flowing in the opposite directions, and is expected to remain thus. This could have the effect of reducing small incumbent LECs' revenues and decreasing the expenses of small entities. It also might place a burden on small entities and small incumbent LECs of establishing that traffic volumes are imbalanced, which might require accounting, economic, and legal skills.

1414. We require paging companies seeking to recover fees for terminating local calls to demonstrate to the state the costs of terminating such calls. (Section XI.A. - Reciprocal Compensation for Transport and Termination of Traffic.) Consequently, small entity paging companies and possibly small incumbent LECs may be required to use legal, economic, and possibly accounting skills.

1415. *Steps Taken to Minimize Significant Economic Impact on Small Entities and Small Incumbent LECs, and Alternatives Considered.* Our adoption of national default price ceilings and ranges for transportation and termination of local traffic being arbitrated by the states should

provide all parties, including small incumbent LECs and many new entrant small entities, with a clear understanding of the terms and conditions that will govern should they fail to reach an agreement. This should minimize regulatory burdens and economic impacts for those companies, in part by reducing the transaction costs of arbitration. (Section XI.A.3.c.(4) - Default Proxies.) Permitting CMRS providers with non-reciprocal agreements to renegotiate their agreements, and imposing symmetrical reciprocal compensation pending completion of negotiation or arbitration, will provide all parties with certainty as to applicable rates as of the date of this order, and minimize litigation and regulatory costs. We believe this decision is consistent with the pro-competitive goals of the 1996 Act.

1416. We define transport and termination as separate functions -- each with its own cost calculation for the purposes of sections 251 and 252. This definition may permit interconnecting carriers, including small entities, to obtain transport and termination services at lower rates and avoid paying above-cost rates or rates for unneeded services. (Section XI.A.2 - Definition of Transport and Termination of Telecommunications.) We also conclude that a LEC may not charge a CMRS provider or other carrier, which may be a small entity, for receiving and terminating LEC-originated traffic. (Section XI.A.4 - Symmetry.) We do not permit interexchange carriers to use transport and termination services to avoid the obligation to pay access charges for terminating interexchange traffic with incumbent LECs. (Section XI.A.2 - Definition of Transport and Termination of Telecommunications.)

1417. Our decision to permit new entrants to base reciprocal compensation arrangements on incumbent LECs' cost studies may reduce barriers to entry by permitting competing LECs to avoid performing their own forward-looking, economic cost studies, which may be expected to reduce the overall burdens and minimize the economic impact of regulation on these small entities. (Section XI.A.4 - Symmetry.) The ability of state commissions to impose bill and keep arrangements where the costs of terminating traffic are nearly symmetrical, traffic volume is roughly balanced, and both are expected to remain so, may allow small entities and small incumbent LECs to avoid the cost of measuring traffic exchange. (Section XI.A.5 - Bill and Keep.) For the reasons set forth in Section XI.A.5 above, we reject the proposed alternative of permitting states to adopt bill-and-keep arrangements for the transport and termination of traffic where the cost of terminating traffic is not nearly symmetrical.

1418. By requiring that rates for transport and termination be cost based, we believe that all parties in telecommunications markets, including small incumbent LECs and small entities, may benefit from increased opportunities to compete effectively in local exchange markets. (Section XI.A.3 - Pricing Methodology.) In addition, we conclude that termination rates for LECs, including small incumbent LECs, should include an allocation of forward-looking common costs, but not an element for the recovery of lost contributions. These decisions may be expected to minimize the economic impact of our decisions on small incumbent LECs and small entities.

1419. This Order eliminates certain charges paging companies may now be assessed by LECs and enables paging companies to claim new revenues from LECs for terminating paging calls. (Section XI.A - Reciprocal Compensation for Transport and Termination of Traffic.) Paging companies, including small entities, may thereby incur lower costs. Such entities also may increase their revenues, depending on the outcome of any proceedings concerning their termination costs. For the reasons set forth in Section XI.A.3 above, we cannot conclude, at this time, that a LEC's forward looking costs may be used as a reasonable proxy for the costs of call termination by paging providers. We further conclude that the default price for termination of traffic from the end office that we adopt in this proceeding in Section XI.A.3 above does not apply to termination of traffic by paging providers. This default price is based on estimates in the record of the costs to LECs of termination from the end office or end-office switching.

B. Access to Rights-of-Way

1420. *Summary of Projected Reporting, Recordkeeping, and Other Compliance Requirements.* Small incumbent LECs that meet the definition of a utility[3276] and own poles, ducts, conduits and rights-of-way where access was not previously mandated are now required to provide access to requesting telecommunications carriers (other than incumbent LECs and cable television systems) which may require the use of legal, engineering, and accounting resources for evaluation and processing of attachment requests. (Section XI.B.2 - Section 224(f): Non-discriminatory Access.) This may also require small incumbent LECs and small entities to employ technical personnel to modify pole attachment arrangements.

1421. A complaint of unjustified denial of access must be supported by a written request for access, the utility's response, and information supporting the complainant's position. This will likely impose some recordkeeping requirements on small incumbent LECs and small entities seeking access to rights-of-way. Our requirements may also impose administrative requirements, including legal and engineering expertise, on small governmental jurisdictions[3277] that resolve disputes arising under section 224 of the Communications Act. (Section XI.B.5 - Dispute Resolution.) In addition, small governmental jurisdictions that have established rules and regulations for access to poles, ducts and conduits specifically, and interconnection generally, are also likely to have some level of reporting and recordkeeping requirements for competing telecommunications carriers that use the poles, some of which may be small entities. (Section XI.B.6 - Reverse Preemption.)

[3276] The Act defines "utility" as "any person who is a local exchange carrier or an electric, gas, water, steam, or other public utility, and who owns or controls poles, ducts, conduits, or rights-of-way used, in whole or in part, for any wire communication." 47 U.S.C. § 224(a)(1).

[3277] Under the Regulatory Flexibility Act, a "small governmental jurisdiction" is one type of "small entity," and is defined as the "governments of cities, counties, towns, townships, villages, school districts, or special districts with a population of less than fifty thousand . . . ." 5 U.S.C. § 601(5).

1422. *Steps Taken to Minimize Significant Economic Impact on Small Entities and Small Incumbent LECs, and Alternatives Considered.* In placing the burden of proof on the denying utility with respect to the propriety of a denial of access, we recognize that new entrants, which may be small entities, are not likely to have access to such information without cooperation from the utilities. Complaints should not be dismissed where the petitioner was unable to obtain a written response from the denying utility, or where the utility also denied the petitioner any relevant information needed to establish a prima facie case. These provisions should allow an entrant to pursue a claim without the need for expensive discovery, and should not preclude or discourage entities with limited resources from seeking redress where access is denied. (Section XI.B.5 - Dispute Resolution.) For the reasons set forth in Section XI.B.5, we reject the recommendation that an applicant be allowed to seek injunctive relief in federal court and select federal jurisdiction for enforcement or appeal of any matter regarding pole attachments. Our conclusion that state and local pole attachment requirements are presumed reasonable may minimize burdens on small governmental jurisdictions by preserving existing rules and procedures, and the local government's expertise with its own rules. (Section XI.B.2.c.2. - Specific Rules.) In reaching this result, we reject the alternative of invalidating such state regulations in favor of federal rules for the reasons stated in Section XI.B.2. Our determination not to prescribe numerous specific rules in this area recognizes the varying technologies and facilities deployed by incumbent LECs, including small incumbent LECs. For example, we recognize that utilities, including small incumbent LECs, normally have their own operating standards that dictate conditions of access. Thus, we leave in place such conditions of access. For the reasons set forth in Section XI.B., we reject the alternative of prescribing a comprehensive set of substantive engineering standards governing access to rights-of-way.

1423. When an attaching entity modifies poles for its use, it will be entitled to recover a share of its expenses from any later-attaching entities. (Section XI.B.4 - Modifications.) This should permit attaching entities that modify poles, some of which may be small entities, to bear only their proportionate costs and prevent them from effectively subsidizing their later-entering competitors. The requirement that utilities provide attaching entities with 60 days' notice prior to commencing modifications to any pole, duct or conduit should provide attaching entities, some of which may be small entities, with sufficient time to evaluate the impact of the proposed modification on their interests and to plan and coordinate any modifications to their own attachments. (*Id.*)

C. Imposing Additional Obligations on LECs

1424. *Summary of Projected Reporting, Recordkeeping and Other Compliance Requirements.* Our decisions in this section of the Order do not subject any small entities to reporting, recordkeeping or other compliance requirements.

1425. *Steps Taken to Minimize Significant Economic Impact on Small Entities and Small Incumbent LECs, and Alternatives Considered.* The determination that the 1996 Act does not

permit the particular obligations for incumbent LECs set forth in section 251(c) to be imposed on non-incumbent carriers, absent a finding by the Commission under section 251(h)(2), should limit potential burdens on new entrants, including small entities. (Section XI.C - Imposing Obligations on LECs.)

Summary Analysis of Section XII
EXEMPTIONS, SUSPENSIONS AND MODIFICATIONS OF SECTION 251 REQUIREMENTS

1426. *Summary of Projected Reporting, Recordkeeping and Other Compliance Requirements.* Section 251(f)(1) grants rural telephone companies, which may be small incumbent LECs, an exemption from the requirements of section 251(c) (which only apply to incumbent LECs) until the rural telephone company has received a bona fide request for interconnection, services, or network elements, and the state determines that the exemption should be terminated. Section 251(f)(2) provides that LECs with fewer than two percent of the nation's subscriber lines may petition a state commission for a suspension or modification of any requirements of sections 251(b) and 251(c). The latter provision, section 251(f)(2), is available to all LECs including competitive LECs, which may be small entities.

1427. After a carrier has made a bona fide request under Section 251, a rural telephone company, which may be a small incumbent LEC, seeking to retain its exemption under section 251(f)(1) must prove to the state commission that it should retain its exemption. To remove the exemption, a state commission must find that the bona fide interconnection request is not unduly economically burdensome, is technically feasible, and is consistent with section 254. The parties involved in such a proceeding may need to use legal, accounting, economic and/or engineering services. A small incumbent LEC or a competitive LEC, which may be a small entity, seeking under 251(f)(2) to modify or suspend the national interconnection requirements imposed by section 251(b) or 251(c) bears the burden of proving that interconnection would: (1) create a significant adverse economic impact on telecommunications users; (2) be unduly economically burdensome; or (3) be technically infeasible.

1428. *Steps Taken to Minimize Significant Economic Impact on Small Entities and Small Incumbent LECs, and Alternatives Considered.* As set forth in Section XII above, the determination whether a section 251(f) exemption, suspension, or modification should be continued or granted lies primarily with the relevant state commission. By largely leaving this determination to the states, our decisions permit this fact-specific inquiry to be administered in a manner that minimizes regulatory burdens and the economic impact on small entities and small incumbent LECs. However, to further minimize regulatory burdens and minimize the economic impact of our decision, we adopt several rules as set forth in Section XII above, which may facilitate the efficient resolution of such inquiries, provide guidance, and minimize uncertainty. As set forth in Section XII above, we find that the rural LEC or smaller LEC must prove to the state commission that the financial harm shown to justify an exemption, suspension, or

modification would be greater than the harm that might typically be expected as a result of competition. Finally, we conclude that section 251(f) adequately provides for varying treatment for smaller or rural LECs where such variances are justified. As a result, we expect that section 251(f) will significantly minimize regulatory burdens and economic impacts from the rules adopted in this Order.

Summary Analysis of Section XIII
ADVANCED TELECOMMUNICATIONS CAPABILITIES

1429. *Summary of Projected Reporting, Recordkeeping and Other Compliance Requirements.* Our decision to defer consideration of rules in this section of the Order does not subject any small entities or small incumbent LECs to reporting, recordkeeping or other compliance requirements.

1430. *Steps Taken to Minimize Significant Economic Impact on Small Entities and Small Incumbent LECs, and Alternatives Considered.* We do not anticipate that our decision to defer consideration of rules in this section of the Order will have any economic impact on small entities or small incumbent LECs.

Summary Analysis of Section XIV
PROVISIONS OF SECTION 252

A. Section 252(e)(5)

1431. *Summary of Projected Reporting, Recordkeeping, and Other Compliance Requirements.* Pursuant to section 252(b)(1), a party to negotiation may petition a state commission to arbitrate any open issues. Small entities and small incumbent LECs negotiating interconnection agreements may, therefore, participate in state arbitration in order to obtain an interconnection agreement, which may impose significant legal costs. (Section XIV.A - Section 252(e)(5).) Section 252(e)(5) requires the Commission to assume the state's responsibility under section 252 if the state "fails to act to carry out its responsibility" under the section. We require an aggrieved party, which may be a small entity or a small incumbent LEC, to notify the FCC that a state commission has failed to act under section 252 by filing a detailed written petition, backed by affidavit. As set forth above in Section XIV.A, if the Commission, following a notice and comment period, determines that the state has failed to act, the Commission will assume authority under section 252(e)(5) and mediate or arbitrate the dispute. This process may also entail significant legal expertise.

1432. *Steps Taken to Minimize Significant Economic Impact on Small Entities and Small Incumbent LECs, and Alternatives Considered.* In this Order, the Commission adopts a minimum set of rules that will provide notice of the standards and procedures that the Commission will use if it has to assume the responsibility of a state commission under section 252(e)(5). These rules

should benefit small entities and small incumbent LECs by limiting uncertainty and minimizing transaction costs associated with the arbitration process. (Section XIV.A - 252(e)(5).)

1433. The Commission concludes that, if it arbitrates agreements, it will use a "final offer" arbitration method, whereby each party to the arbitration proposes its best and final offer, and the arbitrator chooses between the proposals. The arbitrator may choose either proposal in its entirety, or could choose different parties' proposals on an issue-by-issue basis. This method of arbitration should minimize the economic impact on small entities and small incumbent LECs by reducing the transaction costs associated with arbitration. Our rules should also encourage parties, to negotiate after offers are submitted which should provide additional flexibility for parties including small entities and small incumbent LECs, to agree to a resolution tailored to their interests. (Section XIV.A - 252(e)(5).)

1434. For the reasons set forth above in Section XIV.A, we reject the alternative of adopting national rules governing state arbitration procedures. We believe the states are in a better position to develop mediation and arbitration rules that support the objectives of the 1996 Act. States may develop specific measures that best address the concerns of small entities and small incumbent LECs participating in mediation or arbitration.

1435. As set forth above in Section XIV.A, we reject the suggestion that the Commission return jurisdiction over an arbitration to the state commission. We further reject the argument that, once the Commission has mediated or arbitrated an agreement, the agreement must be submitted to the state commission for approval under state law. We decline to adopt the alternative suggested by some parties that, if the Commission steps into the state commission role, it is bound by state laws and standards that would have applied to the state commission. (Section XIV.A - 252(e)(5)).

1436. As explained above in Section XIV.A, we also reject the alternative that an arbitrated agreement not be binding on the parties. Finally, we reject the alternative of opening the arbitration process to all third parties, which should minimize the costs involved in such proceedings.

B. Requirements of Section 252(i)

1437. *Summary of Projected Reporting, Recordkeeping and Other Compliance Requirements.* Our decisions in this section of the Order do not subject any small entities to reporting, recordkeeping or other compliance requirements. Incumbent LECs, including small incumbent LECs, are required to file with state commissions all interconnection agreements entered into with other carriers, including adjacent incumbent LECs. Incumbent LECs must also permit third parties to obtain any individual interconnection, service or network element arrangement on the same terms and conditions as those contained in any agreement approved under section 252. Moreover, incumbent LECs must prove with specificity that terms and

conditions contained in filed agreements are legitimately related to the purchase of the individual element or service being sought. Incumbent LECs must provide "most favored nation" status with regard to subsequent carriers regardless of whether they include "most favored nation" clauses in their agreements. Complying with these requirements may require small incumbent LECs and requesting small entities to use legal and negotiation skills.

1438. *Steps Taken to Minimize Significant Economic Impact on Small Entities and Small Incumbent LECs, and Alternatives Considered.* Our decision to adopt national standards to implement section 252(i) should minimize the economic impact of our decision on both small entities and small incumbent LECs by expediting the resolution of disputes, thereby reducing transaction costs associated with interconnection. Our decision that section 252(i) permits requesting carriers to choose among individual provisions contained in publicly-filed interconnection agreements should minimize the economic impact for small new entrants by permitting them to obtain the provisions they desire without having to adopt entire agreements that would not reflect their costs or the specific technical characteristics of their networks. (Section XIV.B - Requirements of Section 252(i).) Moreover, small entities may be able to obtain the same terms and conditions of agreements reached by larger carriers that possess greater bargaining power without having to incur the costs of negotiation and/or arbitration.

1439. We also determine that publicly-filed agreements need only be made available to carriers who cause incumbent LECs to incur no greater costs than did the original carrier, which should minimize the economic impact on small incumbent LECs. We also minimize the regulatory burden for small entities and small incumbent LECs by finding that a new entrant seeking interconnection, network elements, or services pursuant to section 252(i) need not make such requests pursuant to the procedures for initial section 251 requests, but shall be permitted to obtain access to agreements on an expedited basis.

1440. As set forth above, we conclude that section 252(i) permits differential treatment of carriers based on differences in the costs of serving those carriers, but does not permit incumbent LECs to limit the availability of interconnection, services, or network elements only to those requesting carriers serving a comparable class of subscribers or providing the same service as the original party to the agreement. (Section XIV.B. - Requirements of Section 252(i).) These decisions should minimize the impact on small entities by preventing discrimination and enabling them to obtain the same terms and conditions as larger carriers that possess greater bargaining power. For the reasons set forth in Section XIV.B., we reject the interpretation favored by commenters arguing that new entrants should not be able to choose among provisions of interconnection agreements filed with state commissions.

E. Report to Congress

1441. The Commission shall send a copy of this FRFA, along with this Order, in a report to Congress pursuant to the Small Business Regulatory Enforcement Fairness Act of 1996, 5

U.S.C. § 801(a)(1)(A). A copy of this FRFA will also be published in the Federal Register.

XVI. ORDERING CLAUSES

1442. Accordingly, IT IS ORDERED that, pursuant to Sections 1-4, 201-209, 214, 218, 224, 251, 252, and 303(r) of the Communications Act of 1934, as amended, and Section 601 of the Telecommunications Act of 1996, 47 U.S.C. §§ 151-154, 201-209, 214, 218, 224, 251, 252, 303(r), the REPORT AND ORDER IS ADOPTED, effective 30 days after publication of a summary in the Federal Register. The collections of information contained within are contingent upon approval by the Office of Management and Budget.

1443. IT IS FURTHER ORDERED that Part 51 of the Commission's rules, 47 C.F.R. § 51 is ADDED as set forth in Appendix B hereto.

1444. IT IS FURTHER ORDERED that, to the extent issues from CC Docket No. 95-185, *In the Matter of Interconnection Between Local Exchange Carriers and Commercial Mobile Service Providers*, are resolved here, we incorporate the relevant portions of the record in that docket.

1445. IT IS FURTHER ORDERED that, to the extent issues from CC Docket No. 91-346, *In the Matter of Intelligent Networks*, are resolved here, we incorporate the relevant portions of the record in that docket.

1446. IT IS FURTHER ORDERED, in light of the United States Court of Appeals for the District of Columbia Circuit in *Pacific Bell v. FCC*, 81 F.3d 1147 (D.C. Cir. 1996) (table) and the Telecommunications Act of 1996, that the rules and policies adopted in *Expanded Interconnection with Local Telephone Company Facilities*, CC Docket No. 91-141, 9 FCC Rcd 5154 (1994), shall remain in effect.

APPENDIX B - Final Rules

AMENDMENTS TO THE CODE OF FEDERAL REGULATIONS

1. Part 1 of Title 47 of the Code of Federal Regulations (C.F.R.) is amended as follows:

PART 1 -- PRACTICE AND PROCEDURE

2. The table of contents of part 1 is revised to read as follows:

* * * * *

Subpart J - Pole Attachment Complaint Procedures

1.1401	**Purpose.**
1.1402	**Definitions.**
1.1403	**Duty to provide access; modifications; notice of removal, increase or modification; petition for temporary stay.**
1.1404	**Complaint.**
1.1405	**File numbers.**
1.1406	**Dismissal of complaints.**
1.1407	**Response and reply.**
1.1408	**Number of copies and form of pleadings.**
1.1409	**Commission consideration of the complaint.**
1.1410	**Remedies.**
1.1411	**Meetings and hearings.**
1.1412	**Enforcement.**
1.1413	**Forfeiture.**
1.1414	**State certification.**
1.1415	**Other orders.**
1.1416	**Imputation of rates; modification costs.**

* * * * *

3. The authority citation for part 1 is revised to read as follows:

AUTHORITY: 47 U.S.C. 151, 154, 251, 252, 303, and 309(j) unless otherwise noted.

4. Section 1.1401 is revised to read as follows:

§ 1.1401 Purpose.

The rules and regulations contained in subpart J of this part provide complaint and enforcement procedures to ensure that telecommunications carriers and cable system operators have nondiscriminatory access to utility poles, ducts, conduits, and rights-of-way on rates, terms,

and conditions that are just and reasonable.

5. Section 1.1402 is amended by revising paragraph (d) to read as follows:

§ 1.1402 Definitions.

• • • • •

(d) The term *complaint* means a filing by a cable television system operator, a cable television system association, a utility, an association of utilities, a telecommunications carrier, or an association of telecommunications carriers alleging that it has been denied access to a utility pole, duct, conduit, or right-of-way in violation of this subpart and/or that a rate, term, or condition for a pole attachment is not just and reasonable.

• • • • •

6. Section 1.1403 is amended by retitling the section, by amending paragraphs (a) and (b) and redesignating them as paragraphs (c) and (d), respectively, and by adding new paragraphs (a) and (b) to read as follows:

§ 1.1403 Duty to provide access; modifications; notice of removal, increase or modification; petition for temporary stay.

(a) A utility shall provide a cable television system or any telecommunications carrier with nondiscriminatory access to any pole, duct, conduit, or right-of-way owned or controlled by it. Notwithstanding this obligation, a utility may deny a cable television system or any telecommunications carrier access to its poles, ducts, conduits, or rights-of-way, on a non-discriminatory basis where there is insufficient capacity or for reasons of safety, reliability and generally applicable engineering purposes.

(b) Requests for access to a utility's poles, ducts, conduits or rights-of-way by a telecommunications carrier or cable operator must be in writing. If access is not granted within 45 days of the request for access, the utility must confirm the denial in writing by the 45th day. The utility's denial of access shall be specific, shall include all relevant evidence and information supporting its denial, and shall explain how such evidence and information relate to a denial of access for reasons of lack of capacity, safety, reliability or engineering standards.

(c) A utility shall provide a cable television system operator or telecommunications carrier no less than 60 days written notice prior to: (1) removal of facilities or termination of any service to those facilities, such removal or termination arising out of a rate, term or condition of the cable television system operator's of telecommunications carrier's pole attachment agreement, or (2) any increase in pole attachment rates; or (3) any modification of facilities other than routine maintenance or modification in response to emergencies.

(d) A cable television system operator or telecommunications carrier may file a

"Petition for Temporary Stay" of the action contained in a notice received pursuant to paragraph (c) of this section within 15 days of receipt of such notice. Such submission shall not be considered unless it includes, in concise terms, the relief sought, the reasons for such relief, including a showing of irreparable harm and likely cessation of cable television service or telecommunication service, a copy of the notice, and certification of service as required by § 1.1404(b) of this subpart. The named respondent may file an answer within 7 days of the date the Petition for Temporary Stay was filed. No further filings under this section will be considered unless requested or authorized by the Commission and no extensions of time will be granted unless justified pursuant to § 1.46.

7. Section 1.1404 is amended by revising paragraphs (b) and (c) and by adding new paragraph (k) to read as follows:

§ 1.1404 Complaint.

* * * * *

(b) The complaint shall be accompanied by a certification of service on the named respondent, and each of the Federal, State, and local governmental agencies that regulate any aspect of the services provided by the complainant or respondent.

(c) In a case where it is claimed that a rate, term, or condition is unjust or unreasonable, the complaint shall contain a statement that the State has not certified to the Commission that it regulates the rates, terms and conditions for pole attachments. The complaint shall include a statement that the utility is not owned by any railroad, any person who is cooperatively organized or any person owned by the Federal Government or any State.

* * * * *

(k) In a case where a cable television system operator or telecommunications carrier claims that it has been denied access to a pole, duct, conduit or right-of-way despite a request made pursuant to section 47 U.S.C. § 224(f), the complaint shall be filed within 30 days of such denial. In addition to meeting the other requirements of this section, the complaint shall include the data and information necessary to support the claim, including:

(1) The reasons given for the denial of access to the utility's poles, ducts, conduits and rights-of-way;

(2) The basis for the complainant's claim that the denial of access is improper;

(3) The remedy sought by the complainant;

(4) A copy of the written request to the utility for access to its poles, ducts, conduits or rights-of-way;

(5) A copy of the utility's response to the written request including all information given by the utility to support its denial of access. A complaint alleging improper denial of access will not be dismissed if the complainant is unable to obtain a utility's written response, or if the utility denies the complainant any other information needed to establish a

prima facie case.

8. Section 1.1409 is amended by revising paragraphs (b) and (d) to read as follows:

§ 1.1409 Commission consideration of the complaint.

* * * * *

(b) The complainant shall have the burden of establishing a *prima facie* case that the rate, term, or condition is not just and reasonable or that the denial of access violates 47 U.S.C. § 224(f). If, however, a utility argues that the proposed rate is lower than its incremental costs, the utility has the burden of establishing that such rate is below the statutory minimum just and reasonable rate. In a case involving a denial of access, the utility shall have the burden of proving that the denial was lawful, once a *prima facie* case is established by the complainant.

* * * * *

(d) The Commission shall deny the complaint if it determines that the complainant has not established a *prima facie* case, or that the rate, term or condition is just and reasonable, or that the denial of access was lawful.

* * * * *

9. Section 1.1416 is amended by retitling the section and by amending paragraph (b) to read as follows:

§ 1.1416 Imputation of rates; modification costs.

* * * * *

(b) The costs of modifying a facility shall be borne by all parties that obtain access to the facility as a result of the modification and by all parties that directly benefit from the modification. Each party described in the preceding sentence shall share proportionately in the cost of the modification. A party with a preexisting attachment to the modified facility shall be deemed to directly benefit from a modification if, after receiving notification of such modification as provided in subpart J of this part, it adds to or modifies its attachment. Notwithstanding the foregoing, a party with a preexisting attachment to a pole, conduit, duct or right-of-way shall not be required to bear any of the costs of rearranging or replacing its attachment if such rearrangement or replacement is necessitated solely as a result of an additional attachment or the modification of an existing attachment sought by another party. If a party makes an attachment to the facility after the completion of the modification, such party shall share proportionately in the cost of the modification if such modification rendered possible the added attachment.

10. Part 20 of Title 47 of the Code of Federal Regulations (C.F.R.) is amended as follows:

PART 20 -- COMMERCIAL MOBILE RADIO SERVICES

11. The authority citation for part 20 is revised to read as follows:

AUTHORITY: Secs. 4, 251-2, 303, and 332, 48 Stat. 1066, 1062, as amended; 47 U.S.C. 154, 251-4, 303, and 332 unless otherwise noted.

12. Section 20.11 is amended by adding paragraph (c) to read as follows:

§ 20.11 Interconnection to facilities of local exchange carriers.

* * * * *

(c) Local exchange carriers and commercial mobile radio service providers shall also comply with applicable provisions of part 51 of this chapter.

13. Part 51 of Title 47 of the Code of Federal Regulations (C.F.R.) is added to read as follows:

PART 51 -- INTERCONNECTION

Subpart A - General information

Sec.

51.1 Basis and purpose.
51.3 Applicability to negotiated agreements.
51.5 Terms and definitions.

Subpart B - Telecommunications carriers

51.100 General duty.

Subpart C - Obligations of all local exchange carriers

51.201 Resale.
51.203 Number portability.
51.219 Access to rights of way.
51.221 Reciprocal compensation.
51.223 Application of additional requirements.

Subpart D - Additional obligations of incumbent local exchange carriers

51.301 Duty to negotiate.
51.303 Preexisting agreements.
51.305 Interconnection.

51.307 Duty to provide access on an unbundled basis to network elements.
51.309 Use of unbundled network elements.
51.311 Nondiscriminatory access to unbundled network elements.
51.313 Just, reasonable and nondiscriminatory terms and conditions for the provision of unbundled network elements.
51.315 Combination of unbundled network elements.
51.317 Standards for identifying network elements to be made available.
51.319 Specific unbundling requirements.
51.321 Methods of obtaining interconnection and access to unbundled elements under section 251 of the Act.
51.323 Standards for physical collocation and virtual collocation.

Subpart E - Exemptions, suspensions, and modifications of requirements of section251 of the Act.

51.401 State authority.
51.403 Carriers eligible for suspension or modification under section 251(f)(2) of the Act.
51.405 Burden of proof.

Subpart F - Pricing of interconnection and unbundled elements

51.501 Scope.
51.503 General pricing standard.
51.505 Forward-looking economic cost.
51.507 General rate structure standard.
51.509 Rate structure standards for specific elements.
51.511 Forward-looking economic cost per unit.
51.513 Proxies for forward-looking economic cost.
51.515 Application of access charges.

Subpart G - Resale

51.601 Scope of resale rules.
51.603 Resale obligation of all local exchange carriers.
51.605 Additional obligations of incumbent local exchange carriers.
51.607 Wholesale pricing standard.
51.609 Determination of avoided retail costs.
51.611 Interim wholesale rates.
51.613 Restrictions on resale.
51.615 Withdrawal of services.
51.617 Assessment of end user common line charge on resellers.

Subpart H - Reciprocal compensation for transport and termination of local telecommunications traffic

51.701 Scope of transport and termination pricing rules.
51.703 Reciprocal compensation obligation of LECs.
51.705 Incumbent LECs' rates for transport and termination.
51.707 Default proxies for incumbent LECs' transport and termination rates.
51.709 Rate structure for transport and termination.
51.711 Symmetrical reciprocal compensation.
51.713 Bill-and-keep arrangements for reciprocal compensation.
51.715 Interim transport and termination pricing.
51.717 Renegotiation of existing non-reciprocal arrangements.

Subpart I - Procedures for implementation of section 252 of the Act.

51.801 Commission action upon a state commission's failure to act to carry out its responsibility under section 252 of the Act.
51.803 Procedures for Commission notification of a state commission's failure to act.
51.805 The Commission's authority over proceedings and matters.
51.807 Arbitration and mediation of agreements by the Commission pursuant to section 252(e)(5) of the Act.
51.809 Availability of provisions of agreements to other telecommunications carriers under section 252(i) of the Act.

AUTHORITY: Sections 1-5, 7, 201-05, 218, 225-27, 251-54, 271, 48 Stat. 1070, as amended, 1077; 47 U.S.C. 151-55, 157, 201-05, 218, 225-27, 251-54, 271, unless otherwise noted.

Subpart A - General Information.

§ 51.1 Basis and purpose.

(a) *Basis*. These rules are issued pursuant to the Communications Act of 1934, as amended.

(b) *Purpose*. The purpose of these rules is to implement sections 251 and 252 of the Communications Act of 1934, as amended, 47 U.S.C. 251 and 252.

§ 51.3 Applicability to negotiated agreements.

To the extent provided in section 252(e)(2)(A) of the Act, a state commission shall have authority to approve an interconnection agreement adopted by negotiation even if the terms of the agreement do not comply with the requirements of this part.

§ 51.5 Terms and definitions.

Terms used in this part have the following meanings:

Act. The Communications Act of 1934, as amended.

Advanced intelligent network. "Advanced Intelligent Network" is a telecommunications network architecture in which call processing, call routing, and network management are provided by means of centralized databases located at points in an incumbent local exchange carrier's network.

Arbitration, final offer. "Final offer arbitration" is a procedure under which each party submits a final offer concerning the issues subject to arbitration, and the arbitrator selects, without modification, one of the final offers by the parties to the arbitration or portions of both such offers. "Entire package final offer arbitration," is a procedure under which the arbitrator must select, without modification, the entire proposal submitted by one of the parties to the arbitration. "Issue-by-issue final offer arbitration," is a procedure under which the arbitrator must select, without modification, on an issue-by-issue basis, one of the proposals submitted by the parties to the arbitration.

Billing. "Billing" involves the provision of appropriate usage data by one telecommunications carrier to another to facilitate customer billing with attendant acknowledgements and status reports. It also involves the exchange of information between telecommunications carriers to process claims and adjustments.

Commercial Mobile Radio Service (CMRS). "CMRS" has the same meaning as that term is defined in § 20.3 of this chapter.

Commission. "Commission" refers to the Federal Communications Commission.

Directory assistance service. "Directory assistance service" includes, but is not limited to, making available to customers, upon request, information contained in directory listings.

Directory listings. "Directory listings" are any information: (1) identifying the listed names of subscribers of a telecommunications carrier and such subscriber's telephone numbers, addresses, or primary advertising classifications (as such classifications are assigned at the time of the establishment of such service), or any combination of such listed names, numbers, addresses or classifications; and (2) that the telecommunications carrier or an affiliate has published, caused to be published, or accepted for publication in any directory format.

Downstream database. A "downstream database" is a database owned and operated by an individual carrier for the purpose of providing number portability in conjunction with other functions and services.

Equipment necessary for interconnection or access to unbundled network elements. For

purposes of section 251(c)(2) of the Act, the equipment used to interconnect with an incumbent local exchange carrier's network for the transmission and routing of telephone exchange service, exchange access service, or both. For the purposes of section 251(c)(3) of the Act, the equipment used to gain access to an incumbent local exchange carrier's unbundled network elements for the provision of a telecommunications service.

Incumbent Local Exchange Carrier (Incumbent LEC). With respect to an area, the local exchange carrier that: (1) on February 8, 1996, provided telephone exchange service in such area; and (2) (i) on February 8, 1996, was deemed to be a member of the exchange carrier association pursuant to § 69.601(b) of this chapter; or (ii) is a person or entity that, on or after February 8, 1996, became a successor or assign of a member described in clause (i) of this paragraph.

Interconnection. "Interconnection" is the linking of two networks for the mutual exchange of traffic. This term does not include the transport and termination of traffic.

Local Exchange Carrier (LEC). A "LEC" is any person that is engaged in the provision of telephone exchange service or exchange access. Such term does not include a person insofar as such person is engaged in the provision of a commercial mobile service under section 332(c) of the Act, except to the extent that the Commission finds that such service should be included in the definition of the such term.

Maintenance and repair. "Maintenance and repair" involves the exchange of information between telecommunications carriers where one initiates a request for maintenance or repair of existing products and services or unbundled network elements or combination thereof from the other with attendant acknowledgements and status reports.

Meet point. A "meet point" is a point of interconnection between two networks, designated by two telecommunications carriers, at which one carrier's responsibility for service begins and the other carrier's responsibility ends.

Meet point interconnection arrangement. A "meet point interconnection arrangement" is an arrangement by which each telecommunications carrier builds and maintains its network to a meet point.

Network element. A "network element" is a facility or equipment used in the provision of a telecommunications service. Such term also includes, but is not limited to, features, functions, and capabilities that are provided by means of such facility or equipment, including but not limited to, subscriber numbers, databases, signaling systems, and information sufficient for billing and collection or used in the transmission, routing, or other provision of a telecommunications service.

Operator services. "Operator services" are any automatic or live assistance to a consumer to arrange for billing or completion of a telephone call. Such services include, but are not limited to, busy line verification, emergency interrupt, and operator-assisted directory assistance services.

Physical collocation. "Physical collocation" is an offering by an incumbent LEC that enables a requesting telecommunications carrier to:

(1) place its own equipment to be used for interconnection or access to unbundled network elements within or upon an incumbent LEC's premises;

(2) use such equipment to interconnect with an incumbent LEC's network facilities for the transmission and routing of telephone exchange service, exchange access service, or both, or to gain access to an incumbent LEC's unbundled network elements for the provision of a telecommunications service;

(3) enter those premises, subject to reasonable terms and conditions, to install, maintain, and repair equipment necessary for interconnection or access to unbundled elements; and

(4) obtain reasonable amounts of space in an incumbent LEC's premises, as provided in this part, for the equipment necessary for interconnection or access to unbundled elements, allocated on a first-come, first-served basis.

Premises. "Premises" refers to an incumbent LEC's central offices and serving wire centers, as well as all buildings or similar structures owned or leased by an incumbent LEC that house its network facilities, and all structures that house incumbent LEC facilities on public rights-of-way, including but not limited to vaults containing loop concentrators or similar structures.

Pre-ordering and ordering. "Pre-ordering and ordering" includes the exchange of information between telecommunications carriers about current or proposed customer products and services or unbundled network elements or some combination thereof.

Provisioning. "Provisioning" involves the exchange of information between telecommunications carriers where one executes a request for a set of products and services or unbundled network elements or combination thereof from the other with attendant acknowledgements and status reports.

Rural telephone company. A "rural telephone company" is a LEC operating entity to the extent that such entity:

(1) provides common carrier service to any local exchange carrier study area that does not include either:

(i) any incorporated place of 10,000 inhabitants or more, or any part thereof, based on the most recently available population statistics of the Bureau of the Census; or

(ii) any territory, incorporated or unincorporated, included in an urbanized area, as defined by the Bureau of the Census as of August 10, 1993;

(2) provides telephone exchange service, including exchange access, to fewer than 50,000 access lines;

(3) provides telephone exchange service to any local exchange carrier study area with fewer than 100,000 access lines; or

(4) has less than 15 percent of its access lines in communities of more than 50,000

on February 8, 1996.

Service control point. A "service control point" is a computer database in the public switched network which contains information and call processing instructions needed to process and complete a telephone call.

Service creation environment. A "service creation environment" is a computer containing generic call processing software that can be programmed to create new advanced intelligent network call processing services.

Signal transfer point. A "signal transfer point" is a packet switch that acts as a routing hub for a signaling network and transfers messages between various points in and among signaling networks.

State commission. A "state commission" means the commission, board, or official (by whatever name designated) which under the laws of any State has regulatory jurisdiction with respect to intrastate operations of carriers. As referenced in this part, this term may include the Commission if it assumes the responsibility of the state commission, pursuant to section 252(e)(5) of the Act. This term shall also include any person or persons to whom the state commission has delegated its authority under section 251 and 252 of the Act.

State proceeding. A "state proceeding" is any administrative proceeding in which a state commission may approve or prescribe rates, terms, and conditions including, but not limited to, compulsory arbitration pursuant to section 252(b) of the Act, review of a Bell operating company statement of generally available terms pursuant section 252(f) of the Act, and a proceeding to determine whether to approve or reject an agreement adopted by arbitration pursuant to section 252(e) of the Act.

Technically feasible. Interconnection, access to unbundled network elements, collocation, and other methods of achieving interconnection or access to unbundled network elements at a point in the network shall be deemed technically feasible absent technical or operational concerns that prevent the fulfillment of a request by a telecommunications carrier for such interconnection, access, or methods. A determination of technical feasibility does not include consideration of economic, accounting, billing, space, or site concerns, except that space and site concerns may be considered in circumstances where there is no possibility of expanding the space available. The fact that an incumbent LEC must modify its facilities or equipment to respond to such request does not determine whether satisfying such request is technically feasible. An incumbent LEC that claims that it cannot satisfy such request because of adverse network reliability impacts must prove to the state commission by clear and convincing evidence that such interconnection, access, or methods would result in specific and significant adverse network reliability impacts.

Telecommunications carrier. A "telecommunications carrier" is any provider of telecommunications services, except that such term does not include aggregators of telecommunications services (as defined in section 226 of the Act). A telecommunications carrier shall be treated as a common carrier under the Act only to the extent that it is engaged in

providing telecommunications services, except that the Commission shall determine whether the provision of fixed and mobile satellite service shall be treated as common carriage. This definition includes CMRS providers, interexchange carriers (IXCs) and, to the extent they are acting as telecommunications carriers, companies that provide both telecommunications and information services. Private Mobile Radio Service providers are telecommunications carriers to the extent they provide domestic or international telecommunications for a fee directly to the public.

Virtual collocation. "Virtual collocation" is an offering by an incumbent LEC that enables a requesting telecommunications carrier to:

(1) designate or specify equipment to be used for interconnection or access to unbundled network elements to be located within or upon an incumbent LEC's premises, and dedicated to such telecommunications carrier's use;

(2) use such equipment to interconnect with an incumbent LEC's network facilities for the transmission and routing of telephone exchange service, exchange access service, or both, or for access to an incumbent LEC's unbundled network elements for the provision of a telecommunications service; and

(3) electronically monitor and control its communications channels terminating in such equipment.

Subpart B - Telecommunications Carriers.

§ 51.100 General duty.

(a) Each telecommunications carrier has the duty:

(1) to interconnect directly or indirectly with the facilities and equipment of other telecommunications carriers; and

(2) to not install network features, functions, or capabilities that do not comply with the guidelines and standards as provided in the Commission's rules or section 255 or 256 of the Act.

(b) A telecommunication carrier that has interconnected or gained access under sections 251(a)(1), 251(c)(2), or 251(c)(3) of the Act, may offer information services through the same arrangement, so long as it is offering telecommunications services through the same arrangement as well.

Subpart C - Obligations of All Local Exchange Carriers.

§ 51.201 Resale.

The rules governing resale of services by an incumbent LEC are set forth in subpart G of this part.

§ 51.203 Number portability.

The rules governing number portability are set forth in part 52, subpart C of this chapter.

§ 51.219 Access to rights of way.

The rules governing access to rights of way are set forth in part 1, subpart J of this chapter.

§ 51.221 Reciprocal compensation.

The rules governing reciprocal compensation are set forth in subpart H of this part.

§ 51.223 Application of additional requirements.

(a) A state may not impose the obligations set forth in section 251(c) of the Act on a LEC that is not classified as an incumbent LEC as defined in section 251(h)(1) of the Act, unless the Commission issues an order declaring that such LECs or classes or categories of LECs should be treated as incumbent LECs.

(b) A state commission, or any other interested party, may request that the Commission issue an order declaring that a particular LEC be treated as an incumbent LEC, or that a class or category of LECs be treated as incumbent LECs, pursuant to section 251(h)(2) of the Act.

Subpart D - Additional Obligations of Incumbent Local Exchange Carriers.

§ 51.301 Duty to negotiate.

(a) An incumbent LEC shall negotiate in good faith the terms and conditions of agreements to fulfill the duties established by sections 251(b) and (c) of the Act.

(b) A requesting telecommunications carrier shall negotiate in good faith the terms and conditions of agreements described in paragraph (a) of this section.

(c) If proven to the Commission, an appropriate state commission, or a court of competent jurisdiction, the following actions or practices, among others, violate the duty to negotiate in good faith:

(1) demanding that another party sign a nondisclosure agreement that precludes such party from providing information requested by the Commission, or a state commission, or in support of a request for arbitration under section 252(b)(2)(B) of the Act;

(2) demanding that a requesting telecommunications carrier attest that an agreement complies with all provisions of the Act, federal regulations, or state law;

(3) refusing to include in an arbitrated or negotiated agreement a provision that permits the agreement to be amended in the future to take into account changes in Commission or state rules;

(4) conditioning negotiation on a requesting telecommunications carrier first obtaining state certifications;

(5) intentionally misleading or coercing another party into reaching an agreement that it would not otherwise have made;

(6) intentionally obstructing or delaying negotiations or resolutions of disputes;

(7) refusing throughout the negotiation process to designate a representative with authority to make binding representations, if such refusal significantly delays resolution of issues; and

(8) refusing to provide information necessary to reach agreement. Such refusal includes, but is not limited to:

(i) refusal by an incumbent LEC to furnish information about its network that a requesting telecommunications carrier reasonably requires to identify the network elements that it needs in order to serve a particular customer; and

(ii) refusal by a requesting telecommunications carrier to furnish cost data that would be relevant to setting rates if the parties were in arbitration.

§ 51.303 Preexisting agreements.

(a) All interconnection agreements between an incumbent LEC and a telecommunications carrier, including those negotiated before February 8, 1996, shall be submitted by the parties to the appropriate state commission for approval pursuant to section 252(e) of the Act.

(b) Interconnection agreements negotiated before February 8, 1996, between Class A carriers, as defined by § 32.11(a)(1) of this chapter, shall be filed by the parties with the appropriate state commission no later than June 30, 1997, or such earlier date as the state commission may require.

(c) If a state commission approves a preexisting agreement, it shall be made available to other parties in accordance with section 252(i) of the Act and § 51.809 of this part. A state commission may reject a preexisting agreement on the grounds that it is inconsistent with the public interest, or for other reasons set forth in section 252(e)(2)(A) of the Act.

§ 51.305 Interconnection.

(a) An incumbent LEC shall provide, for the facilities and equipment of any requesting telecommunications carrier, interconnection with the incumbent LEC's network:

(1) for the transmission and routing of telephone exchange traffic, exchange access traffic, or both;

(2) at any technically feasible point within the incumbent LEC's network including, at a minimum:

(i) the line-side of a local switch;

(ii) the trunk-side of a local switch;

(iii) the trunk interconnection points for a tandem switch;

(iv) central office cross-connect points;

(v) out-of-band signaling transfer points necessary to exchange traffic at these points and access call-related databases; and

(vi) the points of access to unbundled network elements as described in § 51.319 of this part;

(3) that is at a level of quality that is equal to that which the incumbent LEC provides itself, a subsidiary, an affiliate, or any other party, except as provided in paragraph (4) of this section. At a minimum, this requires an incumbent LEC to design interconnection facilities to meet the same technical criteria and service standards that are used within the incumbent LEC's network. This obligation is not limited to a consideration of service quality as perceived by end users, and includes, but is not limited to, service quality as perceived by the requesting telecommunications carrier;

(4) that, if so requested by a telecommunications carrier and to the extent technically feasible, is superior in quality to that provided by the incumbent LEC to itself or to any subsidiary, affiliate, or any other party to which the incumbent LEC provides interconnection. Nothing in this section prohibits an incumbent LEC from providing interconnection that is lesser in quality at the sole request of the requesting telecommunications carrier; and

(5) on terms and conditions that are just, reasonable, and nondiscriminatory in accordance with the terms and conditions of any agreement, the requirements of sections 251 and 252 of the Act, and the Commission's rules including, but not limited to, offering such terms and conditions equally to all requesting telecommunications carriers, and offering such terms and conditions that are no less favorable than the terms and conditions upon which the incumbent LEC provides such interconnection to itself. This includes, but is not limited to, the time within which the incumbent LEC provides such interconnection.

(b) A carrier that requests interconnection solely for the purpose of originating or terminating its interexchange traffic on an incumbent LEC's network and not for the purpose of providing to others telephone exchange service, exchange access service, or both, is not entitled to receive interconnection pursuant to section 251(c)(2) of the Act.

(c) Previous successful interconnection at a particular point in a network, using particular facilities, constitutes substantial evidence that interconnection is technically feasible at that point, or at substantially similar points, in networks employing substantially similar

facilities. Adherence to the same interface or protocol standards shall constitute evidence of the substantial similarity of network facilities.

(d) Previous successful interconnection at a particular point in a network at a particular level of quality constitutes substantial evidence that interconnection is technically feasible at that point, or at substantially similar points, at that level of quality.

(e) An incumbent LEC that denies a request for interconnection at a particular point must prove to the state commission that interconnection at that point is not technically feasible.

(f) If technically feasible, an incumbent LEC shall provide two-way trunking upon request.

§ 51.307 Duty to provide access on an unbundled basis to network elements.

(a) An incumbent LEC shall provide, to a requesting telecommunications carrier for the provision of a telecommunications service, nondiscriminatory access to network elements on an unbundled basis at any technically feasible point on terms and conditions that are just, reasonable, and nondiscriminatory in accordance with the terms and conditions of any agreement, the requirements of sections 251 and 252 of the Act, and the Commission's rules.

(b) The duty to provide access to unbundled network elements pursuant to section 251(c)(3) of the Act includes a duty to provide a connection to an unbundled network element independent of any duty to provide interconnection pursuant to this part and section 251(c)(2) of the Act.

(c) An incumbent LEC shall provide a requesting telecommunications carrier access to an unbundled network element, along with all of the unbundled network element's features, functions, and capabilities, in a manner that allows the requesting telecommunications carrier to provide any telecommunications service that can be offered by means of that network element.

(d) An incumbent LEC shall provide a requesting telecommunications carrier access to the facility or functionality of a requested network element separate from access to the facility or functionality of other network elements, for a separate charge.

§ 51.309 Use of unbundled network elements.

(a) An incumbent LEC shall not impose limitations, restrictions, or requirements on requests for, or the use of, unbundled network elements that would impair the ability of a requesting telecommunications carrier to offer a telecommunications service in the manner the requesting telecommunications carrier intends.

(b) A telecommunications carrier purchasing access to an unbundled network element may use such network element to provide exchange access services to itself in order to provide

interexchange services to subscribers.

(c) A telecommunications carrier purchasing access to an unbundled network facility is entitled to exclusive use of that facility for a period of time, or when purchasing access to a feature, function, or capability of a facility, a telecommunications carrier is entitled to use of that feature, function, or capability for a period of time. A telecommunications carrier's purchase of access to an unbundled network element does not relieve the incumbent LEC of the duty to maintain, repair, or replace the unbundled network element.

§ 51.311 Nondiscriminatory access to unbundled network elements.

(a) The quality of an unbundled network element, as well as the quality of the access to the unbundled network element, that an incumbent LEC provides to a requesting telecommunications carrier shall be the same for all telecommunications carriers requesting access to that network element, except as provided in paragraph (c) of this section.

(b) Except as provided in paragraph (c) of this section, to the extent technically feasible, the quality of an unbundled network element, as well as the quality of the access to such unbundled network element, that an incumbent LEC provides to a requesting telecommunications carrier shall be at least equal in quality to that which the incumbent LEC provides to itself. If an incumbent LEC fails to meet this requirement, the incumbent LEC must prove to the state commission that it is not technically feasible to provide the requested unbundled network element, or to provide access to the requested unbundled network element, at a level of quality that is equal to that which the incumbent LEC provides to itself.

(c) To the extent technically feasible, the quality of an unbundled network element, as well as the quality of the access to such unbundled network element, that an incumbent LEC provides to a requesting telecommunications carrier shall, upon request, be superior in quality to that which the incumbent LEC provides to itself. If an incumbent LEC fails to meet this requirement, the incumbent LEC must prove to the state commission that it is not technically feasible to provide the requested unbundled network element or access to such unbundled network element at the requested level of quality that is superior to that which the incumbent LEC provides to itself. Nothing in this section prohibits an incumbent LEC from providing interconnection that is lesser in quality at the sole request of the requesting telecommunications carrier.

(d) Previous successful access to an unbundled element at a particular point in a network, using particular facilities, is substantial evidence that access is technically feasible at that point, or at substantially similar points, in networks employing substantially similar facilities. Adherence to the same interface or protocol standards shall constitute evidence of the substantial similarity of network facilities.

(e) Previous successful provision of access to an unbundled element at a particular point in a network at a particular level of quality is substantial evidence that access is technically feasible at that point, or at substantially similar points, at that level of quality.

§ 51.313 Just, reasonable and nondiscriminatory terms and conditions for the provision of unbundled network elements.

(a) The terms and conditions pursuant to which an incumbent LEC provides access to unbundled network elements shall be offered equally to all requesting telecommunications carriers.

(b) Where applicable, the terms and conditions pursuant to which an incumbent LEC offers to provide access to unbundled network elements, including but not limited to, the time within which the incumbent LEC provisions such access to unbundled network elements, shall, at a minimum, be no less favorable to the requesting carrier than the terms and conditions under which the incumbent LEC provides such elements to itself.

(c) An incumbent LEC must provide a carrier purchasing access to unbundled network elements with the pre-ordering, ordering, provisioning, maintenance and repair, and billing functions of the incumbent LEC's operations support systems.

§ 51.315 Combination of unbundled network elements.

(a) An incumbent LEC shall provide unbundled network elements in a manner that allows requesting telecommunications carriers to combine such network elements in order to provide a telecommunications service.

(b) Except upon request, an incumbent LEC shall not separate requested network elements that the incumbent LEC currently combines.

(c) Upon request, an incumbent LEC shall perform the functions necessary to combine unbundled network elements in any manner, even if those elements are not ordinarily combined in the incumbent LEC's network, provided that such combination is:

(1) technically feasible; and

(2) would not impair the ability of other carriers to obtain access to unbundled network elements or to interconnect with the incumbent LEC's network.

(d) Upon request, an incumbent LEC shall perform the functions necessary to combine unbundled network elements with elements possessed by the requesting telecommunications carrier in any technically feasible manner.

(e) An incumbent LEC that denies a request to combine elements pursuant to paragraph (c)(1) or paragraph (d) of this section must prove to the state commission that the requested combination is not technically feasible.

(f) An incumbent LEC that denies a request to combine elements pursuant to paragraph (c)(2) of this section must prove to the state commission that the requested combination would impair the ability of other carriers to obtain access to unbundled network elements or to interconnect with the incumbent LEC's network.

§ 51.317 Standards for identifying network elements to be made available.

(a) In determining what network elements should be made available for purposes of section 251(c)(3) of the Act beyond those identified in § 51.319 of this part, a state commission shall first determine whether it is technically feasible for the incumbent LEC to provide access to a network element on an unbundled basis.

(b) If the state commission determines that it is technically feasible for the incumbent LEC to provide access to the network element on an unbundled basis, the state commission may decline to require unbundling of the network element only if:

(1) the state commission concludes that:

(i) the network element is proprietary, or contains proprietary information that will be revealed if the network element is provided on an unbundled basis; and

(ii) a requesting telecommunications carrier could offer the same proposed telecommunications service through the use of other, nonproprietary unbundled network elements within the incumbent LEC's network; or

(2) the state commission concludes that the failure of the incumbent LEC to provide access to the network element would not decrease the quality of, and would not increase the financial or administrative cost of, the telecommunications service a requesting telecommunications carrier seeks to offer, compared with providing that service over other unbundled network elements in the incumbent LEC's network.

§ 51.319 Specific unbundling requirements.

An incumbent LEC shall provide nondiscriminatory access in accordance with § 51.311 of this part and section 251(c)(3) of the Act to the following network elements on an unbundled basis to any requesting telecommunications carrier for the provision of a telecommunications service:

(a) *Local Loop*. The local loop network element is defined as a transmission facility between a distribution frame (or its equivalent) in an incumbent LEC central office and an end user customer premises;

(b) *Network Interface Device*.

(1) The network interface device network element is defined as a cross-connect device used to connect loop facilities to inside wiring.

(2) An incumbent LEC shall permit a requesting telecommunications carrier to connect its own local loops to the inside wiring of premises through the incumbent LEC's network interface device. The requesting telecommunications carrier shall establish this connection through an adjoining network interface device deployed by such telecommunications carrier;

(c) *Switching Capability*.

(1) Local Switching Capability.

(i) The local switching capability network element is defined as:

(A) line-side facilities, which include, but are not limited to, the connection between a loop termination at a main distribution frame and a switch line card;

(B) trunk-side facilities, which include, but are not limited to, the connection between trunk termination at a trunk-side cross-connect panel and a switch trunk card; and

(C) all features, functions, and capabilities of the switch, which include, but are not limited to:

(*1*) the basic switching function of connecting lines to lines, lines to trunks, trunks to lines, and trunks to trunks, as well as the same basic capabilities made available to the incumbent LEC's customers, such as a telephone number, white page listing, and dial tone; and

(*2*) all other features that the switch is capable of providing, including but not limited to custom calling, custom local area signaling service features, and Centrex, as well as any technically feasible customized routing functions provided by the switch.

(ii) An incumbent LEC shall transfer a customer's local service to a competing carrier within a time period no greater than the interval within which the incumbent LEC currently transfers end users between interexchange carriers, if such transfer requires only a change in the incumbent LEC's software;

(2) Tandem Switching Capability. The tandem switching capability network element is defined as:

(i) trunk-connect facilities, including but not limited to the connection between trunk termination at a cross-connect panel and a switch trunk card;

(ii) the basic switching function of connecting trunks to trunks; and

(iii) the functions that are centralized in tandem switches (as distinguished from separate end-office switches), including but not limited to call recording, the routing of calls to operator services, and signaling conversion features;

(d) *Interoffice Transmission Facilities*.

(1) Interoffice transmission facilities are defined as incumbent LEC transmission facilities dedicated to a particular customer or carrier, or shared by more than one customer or carrier, that provide telecommunications between wire centers owned by incumbent LECs or

requesting telecommunications carriers, or between switches owned by incumbent LECs or requesting telecommunications carriers.

(2) The incumbent LEC shall:

(i) provide a requesting telecommunications carrier exclusive use of interoffice transmission facilities dedicated to a particular customer or carrier, or use of the features, functions, and capabilities of interoffice transmission facilities shared by more than one customer or carrier;

(ii) provide all technically feasible transmission facilities, features, functions, and capabilities that the requesting telecommunications carrier could use to provide telecommunications services;

(iii) permit, to the extent technically feasible, a requesting telecommunications carrier to connect such interoffice facilities to equipment designated by the requesting telecommunications carrier, including, but not limited to, the requesting telecommunications carrier's collocated facilities; and

(iv) permit, to the extent technically feasible, a requesting telecommunications carrier to obtain the functionality provided by the incumbent LEC's digital cross-connect systems in the same manner that the incumbent LEC provides such functionality to interexchange carriers;

(e) *Signaling Networks and Call-Related Databases*.

(1) Signaling Networks.

(i) Signaling networks include, but are not limited to, signaling links and signaling transfer points.

(ii) When a requesting telecommunications carrier purchases unbundled switching capability from an incumbent LEC, the incumbent LEC shall provide access to its signaling network from that switch in the same manner in which it obtains such access itself.

(iii) An incumbent LEC shall provide a requesting telecommunications carrier with its own switching facilities access to the incumbent LEC's signaling network for each of the requesting telecommunications carrier's switches. This connection shall be made in the same manner as an incumbent LEC connects one of its own switches to a signal transfer point.

(iv) Under this paragraph, an incumbent LEC is not required to unbundle those signaling links that connect service control points to switching transfer points or to permit a requesting telecommunications carrier to link its own signal transfer points directly to the incumbent LEC's switch or call-related databases;

(2) Call-Related Databases.

(i) Call-related databases are defined as databases, other than operations support systems, that are used in signaling networks for billing and collection or the transmission, routing, or other provision of a telecommunications service.

(ii) For purposes of switch query and database response through a signaling network, an incumbent LEC shall provide access to its call-related databases, including, but not limited to, the Line Information Database, Toll Free Calling database, downstream number portability databases, and Advanced Intelligent Network databases, by means of physical access at the signaling transfer point linked to the unbundled database.

(iii) An incumbent LEC shall allow a requesting telecommunications carrier that has purchased an incumbent LEC's local switching capability to use the incumbent LEC's service control point element in the same manner, and via the same signaling links, as the incumbent LEC itself.

(iv) An incumbent LEC shall allow a requesting telecommunications carrier that has deployed its own switch, and has linked that switch to an incumbent LEC's signaling system, to gain access to the incumbent LEC's service control point in a manner that allows the requesting carrier to provide any call-related, database-supported services to customers served by the requesting telecommunications carrier's switch.

(v) A state commission shall consider whether mechanisms mediating access to an incumbent LEC's Advanced Intelligent Network service control points are necessary, and if so, whether they will adequately safeguard against intentional or unintentional misuse of the incumbent LEC's Advanced Intelligent Network facilities.

(vi) An incumbent LEC shall provide a requesting telecommunications carrier with access to call-related databases in a manner that complies with section 222 of the Act;

(3) Service Management Systems.

(A) A service management system is defined as a computer database or system not part of the public switched network that, among other things:

(1) interconnects to the service control point and sends to that service control point the information and call processing instructions needed for a network switch to process and complete a telephone call; and

(2) provides telecommunications carriers with the capability of entering and storing data regarding the processing and completing of a telephone call.

(B) An incumbent LEC shall provide a requesting telecommunications carrier with the information necessary to enter correctly, or format for entry, the information relevant for input into the particular incumbent LEC service management system.

(C) An incumbent LEC shall provide a requesting telecommunications carrier the same access to design, create, test, and deploy Advanced Intelligent Network-based services at the service management system, through a service creation environment, that the incumbent LEC provides to itself.

(D) A state commission shall consider whether mechanisms mediating access to Advanced Intelligent Network service management systems and service creation environments are necessary, and if so, whether they will adequately safeguard against intentional or unintentional misuse of the incumbent LEC's Advanced Intelligent Network facilities.

(E) An incumbent LEC shall provide a requesting telecommunications carrier access to service management systems in a manner that complies with section 222 of the Act;

(f) *Operations Support Systems Functions*.

(1) Operations support systems functions consist of pre-ordering, ordering, provisioning, maintenance and repair, and billing functions supported by an incumbent LEC's databases and information.

(2) An incumbent LEC that does not currently comply with this requirement shall do so as expeditiously as possible, but, in any event, no later than January 1, 1997; and

(g) *Operator Services and Directory Assistance*. An incumbent LEC shall provide access to operator service and directory assistance facilities where technically feasible.

§ 51.321 Methods of obtaining interconnection and access to unbundled elements under section 251 of the Act.

(a) Except as provided in paragraph (e) of this section, an incumbent LEC shall provide, on terms and conditions that are just, reasonable, and nondiscriminatory in accordance with the requirements of this part, any technically feasible method of obtaining interconnection or access to unbundled network elements at a particular point upon a request by a telecommunications carrier.

(b) Technically feasible methods of obtaining interconnection or access to unbundled network elements include, but are not limited to:

(1) physical collocation and virtual collocation at the premises of an incumbent LEC; and

(2) meet point interconnection arrangements.

(c) A previously successful method of obtaining interconnection or access to unbundled network elements at a particular premises or point on an incumbent LEC's network is substantial evidence that such method is technically feasible in the case of substantially similar network premises or points.

(d) An incumbent LEC that denies a request for a particular method of obtaining interconnection or access to unbundled network elements on the incumbent LEC's network must prove to the state commission that the requested method of obtaining interconnection or access to unbundled network elements at that point is not technically feasible.

(e) An incumbent LEC shall not be required to provide for physical collocation of equipment necessary for interconnection or access to unbundled network elements at the incumbent LEC's premises if it demonstrates to the state commission that physical collocation is not practical for technical reasons or because of space limitations. In such cases, the incumbent LEC shall be required to provide virtual collocation, except at points where the incumbent LEC proves to the state commission that virtual collocation is not technically feasible. If virtual collocation is not technically feasible, the incumbent LEC shall provide other methods of interconnection and access to unbundled network elements to the extent technically feasible.

(f) An incumbent LEC shall submit to the state commission detailed floor plans or diagrams of any premises where the incumbent LEC claims that physical collocation is not practical because of space limitations.

(g) An incumbent LEC that is classified as a Class A company under § 32.11 of this chapter and that is not a National Exchange Carrier Association interstate tariff participant as provided in part 69, subpart G, shall continue to provide expanded interconnection service pursuant to interstate tariff in accordance with §§ 64.1401, 64.1402, 69.121 of this chapter, and the Commission's other requirements.

§ 51.323 Standards for physical collocation and virtual collocation.

(a) An incumbent LEC shall provide physical collocation and virtual collocation to requesting telecommunications carriers.

(b) An incumbent LEC shall permit the collocation of any type of equipment used for interconnection or access to unbundled network elements. Whenever an incumbent LEC objects to collocation of equipment by a requesting telecommunications carrier for purposes within the scope of section 251(c)(6) of the Act, the incumbent LEC shall prove to the state commission that the equipment will not be actually used by the telecommunications carrier for the purpose of obtaining interconnection or access to unbundled network elements. Equipment used for interconnection and access to unbundled network elements includes, but is not limited to:

(1) transmission equipment including, but not limited to, optical terminating equipment and multiplexers; and

(2) equipment being collocated to terminate basic transmission facilities pursuant to §§ 64.1401 and 64.1402 of this chapter as of August 1, 1996.

(c) Nothing in this section requires an incumbent LEC to permit collocation of switching equipment or equipment used to provide enhanced services.

(d) When an incumbent LEC provides physical collocation, virtual collocation, or both,

the incumbent LEC shall:

(1) provide an interconnection point or points, physically accessible by both the incumbent LEC and the collocating telecommunications carrier, at which the fiber optic cable carrying an interconnector's circuits can enter the incumbent LEC's premises, provided that the incumbent LEC shall designate interconnection points as close as reasonably possible to its premises;

(2) provide at least two such interconnection points at each incumbent LEC premises at which there are at least two entry points for the incumbent LEC's cable facilities, and at which space is available for new facilities in at least two of those entry points;

(3) permit interconnection of copper or coaxial cable if such interconnection is first approved by the state commission; and

(4) permit physical collocation of microwave transmission facilities except where such collocation is not practical for technical reasons or because of space limitations, in which case virtual collocation of such facilities is required where technically feasible.

(e) When providing virtual collocation, an incumbent LEC shall, at a minimum, install, maintain, and repair collocated equipment identified in paragraph (b) of this section within the same time periods and with failure rates that are no greater than those that apply to the performance of similar functions for comparable equipment of the incumbent LEC itself.

(f) An incumbent LEC shall allocate space for the collocation of the equipment identified in paragraph (b) of this section in accordance with the following requirements:

(1) an incumbent LEC shall make space available within or on its premises to requesting telecommunications carriers on a first-come, first-served basis, provided, however, that the incumbent LEC shall not be required to lease or construct additional space to provide for physical collocation when existing space has been exhausted;

(2) to the extent possible, an incumbent LEC shall make contiguous space available to requesting telecommunications carriers that seek to expand their existing collocation space;

(3) when planning renovations of existing facilities or constructing or leasing new facilities, an incumbent LEC shall take into account projected demand for collocation of equipment;

(4) an incumbent LEC may retain a limited amount of floor space for its own specific future uses, provided, however, that the incumbent LEC may not reserve space for future use on terms more favorable than those that apply to other telecommunications carriers seeking to reserve collocation space for their own future use;

(5) an incumbent LEC shall relinquish any space held for future use before denying a request for virtual collocation on the grounds of space limitations, unless the incumbent LEC proves to the state commission that virtual collocation at that point is not technically feasible; and

(6) an incumbent LEC may impose reasonable restrictions on the warehousing of unused space by collocating telecommunications carriers, provided, however, that the incumbent LEC shall not set maximum space limitations applicable to such carriers unless the incumbent LEC proves to the state commission that space constraints make such restrictions necessary.

(g) An incumbent LEC shall permit collocating telecommunications carriers to collocate equipment and connect such equipment to unbundled network transmission elements obtained from the incumbent LEC, and shall not require such telecommunications carriers to bring their own transmission facilities to the incumbent LEC's premises in which they seek to collocate equipment.

(h) An incumbent LEC shall permit a collocating telecommunications carrier to interconnect its network with that of another collocating telecommunications carrier at the incumbent LEC's premises and to connect its collocated equipment to the collocated equipment of another telecommunications carrier within the same premises provided that the collocated equipment is also used for interconnection with the incumbent LEC or for access to the incumbent LEC's unbundled network elements.

(1) An incumbent LEC shall provide the connection between the equipment in the collocated spaces of two or more telecommunications carriers, unless the incumbent LEC permits one or more of the collocating parties to provide this connection for themselves; and

(2) An incumbent LEC is not required to permit collocating telecommunications carriers to place their own connecting transmission facilities within the incumbent LEC's premises outside of the actual physical collocation space.

(i) An incumbent LEC may require reasonable security arrangements to separate a collocating telecommunications carrier's space from the incumbent LEC's facilities.

(j) An incumbent LEC shall permit a collocating telecommunications carrier to subcontract the construction of physical collocation arrangements with contractors approved by the incumbent LEC, provided, however, that the incumbent LEC shall not unreasonably withhold approval of contractors. Approval by an incumbent LEC shall be based on the same criteria it uses in approving contractors for its own purposes.

Subpart E - Exemptions, Suspensions, and Modifications of Requirements of Section 251 of the Act.

§ 51.401 State authority.

A state commission shall determine whether a telephone company is entitled, pursuant to section 251(f) of the Act, to exemption from, or suspension or modification of, the requirements of section 251 of the Act. Such determinations shall be made on a case-by-case basis.

§ 51.403 Carriers eligible for suspension or modification under section 251(f)(2) of the Act.

A LEC is not eligible for a suspension or modification of the requirements of section 251(b) or section 251(c) of the Act pursuant to section 251(f)(2) of the Act if such LEC, at the holding company level, has two percent or more of the subscriber lines installed in the aggregate nationwide.

§ 51.405 Burden of proof.

(a) Upon receipt of a bona fide request for interconnection, services, or access to unbundled network elements, a rural telephone company must prove to the state commission that the rural telephone company should be entitled, pursuant to section 251(f)(1) of the Act, to continued exemption from the requirements of section 251(c) of the Act.

(b) A LEC with fewer than two percent of the nation's subscriber lines installed in the aggregate nationwide must prove to the state commission, pursuant to section 251(f)(2) of the Act, that it is entitled to a suspension or modification of the application of a requirement or requirements of section 251(b) or 251(c) of the Act.

(c) In order to justify continued exemption under section 251(f)(1) of the Act once a bona fide request has been made, an incumbent LEC must offer evidence that the application of the requirements of section 251(c) of the Act would be likely to cause undue economic burden beyond the economic burden that is typically associated with efficient competitive entry.

(d) In order to justify a suspension or modification under section 251(f)(2) of the Act, a LEC must offer evidence that the application of section 251(b) or section 251(c) of the Act would be likely to cause undue economic burden beyond the economic burden that is typically associated with efficient competitive entry.

Subpart F - Pricing of Elements.

§ 51.501 Scope.

(a) The rules in this subpart apply to the pricing of network elements, interconnection, and methods of obtaining access to unbundled elements, including physical collocation and virtual collocation.

(b) As used in this subpart, the term "element" includes network elements, interconnection, and methods of obtaining interconnection and access to unbundled elements.

§ 51.503 General pricing standard.

(a) An incumbent LEC shall offer elements to requesting telecommunications carriers at rates, terms, and conditions that are just, reasonable, and nondiscriminatory.

(b) An incumbent LEC's rates for each element it offers shall comply with the rate structure rules set forth in §§ 51.507 and 51.509 of this part, and shall be established, at the election of the state commission--

(1) pursuant to the forward-looking economic cost-based pricing methodology set forth in §§ 51.505 and 51.511 of this part; or

(2) consistent with the proxy ceilings and ranges set forth in § 51.513 of this

part.

(c) The rates that an incumbent LEC assesses for elements shall not vary on the basis of the class of customers served by the requesting carrier, or on the type of services that the requesting carrier purchasing such elements uses them to provide.

§ 51.505 Forward-looking economic cost.

(a) *In general*. The forward-looking economic cost of an element equals the sum of:

(1) the total element long-run incremental cost of the element, as described in paragraph (b); and

(2) a reasonable allocation of forward-looking common costs, as described in paragraph (c).

(b) *Total element long-run incremental cost*. The total element long-run incremental cost of an element is the forward-looking cost over the long run of the total quantity of the facilities and functions that are directly attributable to, or reasonably identifiable as incremental to, such element, calculated taking as a given the incumbent LEC's provision of other elements.

(1) *Efficient network configuration*. The total element long-run incremental cost of an element should be measured based on the use of the most efficient telecommunications technology currently available and the lowest cost network configuration, given the existing location of the incumbent LEC's wire centers.

(2) *Forward-looking cost of capital*. The forward-looking cost of capital shall be used in calculating the total element long-run incremental cost of an element.

(3) *Depreciation rates*. The depreciation rates used in calculating forward-looking economic costs of elements shall be economic depreciation rates.

(c) *Reasonable allocation of forward-looking common costs*.

(1) *Forward-looking common costs*. Forward-looking common costs are economic costs efficiently incurred in providing a group of elements or services (which may include all elements or services provided by the incumbent LEC) that cannot be attributed directly to individual elements or services.

(2) *Reasonable allocation*.

(A) The sum of a reasonable allocation of forward-looking common costs and the total element long-run incremental cost of an element shall not exceed the stand-alone costs associated with the element. In this context, stand-alone costs are the total forward-looking costs, including corporate costs, that would be incurred to produce a given element if that element were provided by an efficient firm that produced nothing but the given element.

(B) The sum of the allocation of forward-looking common costs for all elements and services shall equal the total forward-looking common costs, exclusive of retail costs, attributable to operating the incumbent LEC's total network, so as to provide all the elements and services offered.

(d) *Factors that may not be considered*. The following factors shall not be considered in a calculation of the forward-looking economic cost of an element:

(1) *Embedded costs*. Embedded costs are the costs that the incumbent LEC incurred in the past and that are recorded in the incumbent LEC's books of accounts.

(2) *Retail costs*. Retail costs include the costs of marketing, billing, collection, and other costs associated with offering retail telecommunications services to subscribers who are not telecommunications carriers, described in § 51.609 of this part.

(3) *Opportunity costs*. Opportunity costs include the revenues that the incumbent LEC would have received for the sale of telecommunications services, in the absence of competition from telecommunications carrier that purchase elements.

(4) *Revenues to subsidize other services*. Revenues to subsidize other services include revenues associated with elements or telecommunications service offerings other than the element for which a rate is being established.

(e) *Cost study requirements*. An incumbent LEC must prove to the state commission that the rates for each element it offers do not exceed the forward-looking economic cost per unit of providing the element, using a cost study that complies with the methodology set forth in this section and § 51.511 of this part.

(1) A state commission may set a rate outside the proxy ranges or above the proxy ceilings described in § 51.513 of this part only if that commission has given full and fair effect to the economic cost based pricing methodology described in this section and § 51.511 of this part in a state proceeding that meets the requirements of paragraph (e)(2) of this section.

(2) Any state proceeding conducted pursuant to this section shall provide notice and an opportunity for comment to affected parties and shall result in the creation of a written factual record that is sufficient for purposes of review. The record of any state proceeding in which a state commission considers a cost study for purposes of establishing rates under this section shall include any such cost study.

§ 51.507 General rate structure standard.

(a) Element rates shall be structured consistently with the manner in which the costs of providing the elements are incurred.

(b) The costs of dedicated facilities shall be recovered through flat-rated charges.

(c) The costs of shared facilities shall be recovered in a manner that efficiently apportions costs among users. Costs of shared facilities may be apportioned either through usage-sensitive charges or capacity-based flat-rated charges, if the state commission finds that such rates reasonably reflect the costs imposed by the various users.

(d) Recurring costs shall be recovered through recurring charges, unless an incumbent LEC proves to a state commission that such recurring costs are de minimis. Recurring costs shall be considered de minimis when the costs of administering the recurring charge would be excessive in relation to the amount of the recurring costs.

(e) State commissions may, where reasonable, require incumbent LECs to recover nonrecurring costs through recurring charges over a reasonable period of time. Nonrecurring

charges shall be allocated efficiently among requesting telecommunications carriers, and shall not permit an incumbent LEC to recover more than the total forward-looking economic cost of providing the applicable element.

(f) State commissions shall establish different rates for elements in at least three defined geographic areas within the state to reflect geographic cost differences.

(1) To establish geographically-deaveraged rates, state commissions may use existing density-related zone pricing plans described in § 69.123 of this chapter, or other such cost-related zone plans established pursuant to state law.

(2) In states not using such existing plans, state commissions must create a minimum of three cost-related rate zones.

§ 51.509 Rate structure standards for specific elements.

In addition to the general rules set forth in § 51.507 of this part, rates for specific elements shall comply with the following rate structure rules.

(a) *Local loops*. Loop costs shall be recovered through flat-rated charges.

(b) *Local switching*. Local switching costs shall be recovered through a combination of a flat-rated charge for line ports and one or more flat-rated or per-minute usage charges for the switching matrix and for trunk ports.

(c) *Dedicated transmission links*. Dedicated transmission link costs shall be recovered through flat-rated charges.

(d) *Shared transmission facilities between tandem switches and end offices*. The costs of shared transmission facilities between tandem switches and end offices may be recovered through usage-sensitive charges, or in another manner consistent with the manner that the incumbent LEC incurs those costs.

(e) *Tandem switching*. Tandem switching costs may be recovered through usage-sensitive charges, or in another manner consistent with the manner that the incumbent LEC incurs those costs.

(f) *Signaling and call-related database services*. Signaling and call-related database service costs shall be usage-sensitive, based on either the number of queries or the number of messages, with the exception of the dedicated circuits known as signaling links, the cost of which shall be recovered through flat-rated charges.

(g) *Collocation*. Collocation costs shall be recovered consistent with the rate structure policies established in the *Expanded Interconnection* proceeding, CC Docket No. 91-141.

§ 51.511 Forward-looking economic cost per unit.

(a) The forward-looking economic cost per unit of an element equals the forward-looking economic cost of the element, as defined in § 51.505 of this part, divided by a reasonable projection of the sum of the total number of units of the element that the incumbent LEC is likely to provide to requesting telecommunications carriers and the total number of units of the element that the incumbent LEC is likely to use in offering its own services, during a reasonable measuring period.

(b) (1) With respect to elements that an incumbent LEC offers on a flat-rate basis, the number of units is defined as the discrete number of elements (*e.g.*, local loops or local switch ports) that the incumbent LEC uses or provides.

(2) With respect to elements that an incumbent LEC offers on a usage-sensitive basis, the number of units is defined as the unit of measurement of the usage (*e.g.*, minutes of use or call-related database queries) of the element.

§ 51.513 Proxies for forward-looking economic cost.

(a) A state commission may determine that the cost information available to it with respect to one or more elements does not support the adoption of a rate or rates that are consistent with the requirements set forth in §§ 51.505 and 51.511 of this part. In that event, the state commission may establish a rate for an element that is consistent with the proxies specified in this section, provided that:

(1) any rate established through use of such proxies shall be superseded once the state commission has completed review of a cost study that complies with the forward-looking economic cost based pricing methodology described in §§ 51.505 and 51.511 of this part, and has concluded that such study is a reasonable basis for establishing element rates; and

(2) the state commission sets forth in writing a reasonable basis for its selection of a particular rate for the element.

(b) The constraints on proxy-based rates described in this section apply on a geographically averaged basis. For purposes of determining whether geographically deaveraged rates for elements comply with the provisions of this section, a geographically averaged proxy-based rate shall be computed based on the weighted average of the actual, geographically deaveraged rates that apply in separate geographic areas in a state.

(c) *Proxies for specific elements*.

(1) *Local loops*. For each state listed below, the proxy-based monthly rate for unbundled local loops, on a statewide weighted average basis, shall be no greater than the figures listed in the table below. (The Commission has not established a default proxy ceiling for loop rates in Alaska).

TABLE A

State	Proxy Ceiling	State	Proxy Ceiling
Alabama	$17.25	Nebraska	$18.05
Arizona	$12.85	Nevada	$18.95
Arkansas	$21.18	New Hampshire	$16.00
California	$11.10	New Jersey	$12.47
Colorado	$14.97	New Mexico	$18.66
Connecticut	$13.23	New York	$11.75
Delaware	$13.24	North Carolina	$16.71
District of Columbia	$10.81	North Dakota	$25.36
Florida	$13.68	Ohio	$15.73
Georgia	$16.09	Oklahoma	$17.63
Hawaii	$15.27	Oregon	$15.44
Idaho	$20.16	Pennsylvania	$12.30
Illinois	$13.12	Puerto Rico	$12.47
Indiana	$13.29	Rhode Island	$11.48
Iowa	$15.94	South Carolina	$17.07
Kansas	$19.85	South Dakota	$25.33
Kentucky	$16.70	Tennessee	$17.41
Louisiana	$16.98	Texas	$15.49
Maine	$18.69	Utah	$15.12
Maryland	$13.36	Vermont	$20.13
Massachusetts	$9.83	Virginia	$14.13
Michigan	$15.27	Washington	$13.37
Minnesota	$14.81	West Virginia	$19.25
Mississippi	$21.97	Wisconsin	$15.94
Missouri	$18.32	Wyoming	$25.11
Montana	$25.18		

(2) *Local switching*. The blended proxy-based rate for unbundled local switching shall be no greater than 0.4 cents ($0.004) per minute, and no less than 0.2 cents ($0.002) per minute, except that, where a state commission has, before August 8, 1996, established a rate less than or equal to 0.5 cents ($0.005) per minute, that rate may be retained pending completion of a forward-looking economic cost study. The blended rate for unbundled local switching shall be calculated as the sum of the following:

(A) the applicable flat-rated charges for subelements associated with unbundled local switching, such as line ports, divided by the projected average minutes of use per flat-rated subelement; and

(B) the applicable usage-sensitive charges for subelements associated with unbundled local switching, such as switching and trunk ports. A weighted average of such charges shall be used in appropriate circumstances, such as when peak and off-peak charges are used.

(3) *Dedicated transmission links*. The proxy-based rates for dedicated transmission links shall be no greater than the incumbent LEC's tariffed interstate charges for comparable entrance facilities or direct-trunked transport offerings, as described in §§ 69.110 and 69.112 of this chapter.

(4) *Shared transmission facilities between tandem switches and end offices*. The proxy-based rates for shared transmission facilities between tandem switches and end offices shall be no greater than the weighted per-minute equivalent of DS1 and DS3 interoffice dedicated transmission link rates that reflects the relative number of DS1 and DS3 circuits used in the tandem to end office links (or a surrogate based on the proportion of copper and fiber facilities in the interoffice network), calculated using a loading factor of 9,000 minutes per month per voice-grade circuit, as described in § 69.112 of this chapter.

(5) *Tandem switching*. The proxy-based rate for tandem switching shall be no greater than 0.15 cents ($0.0015) per minute of use.

(6) *Collocation*. To the extent that the incumbent LEC offers a comparable form of collocation in its interstate expanded interconnection tariffs, as described in §§ 64.1401 and 69.121 of this chapter, the proxy-based rates for collocation shall be no greater than the effective rates for equivalent services in the interstate expanded interconnection tariff. To the extent that the incumbent LEC does not offer a comparable form of collocation in its interstate expanded interconnection tariffs, a state commission may, in its discretion, establish a proxy-based rate, provided that the state commission sets forth in writing a reasonable basis for concluding that its rate would approximate the result of a forward-looking economic cost study, as described in § 51.505 of this part.

(7) *Signaling, call-related database, and other elements*. To the extent that the incumbent LEC has established rates for offerings comparable to other elements in its interstate access tariffs, and has provided cost support for those rates pursuant to § 61.49(h) of this chapter, the proxy-based rates for those elements shall be no greater than the effective rates for equivalent services in the interstate access tariffs. In other cases, the proxy-based rate shall be no greater than a rate based on direct costs plus a reasonable allocation of overhead loadings, pursuant to § 61.49(h) of this chapter.

§ 51.515 Application of access charges.

(a) Neither the interstate access charges described in part 69 nor comparable intrastate access charges shall be assessed by an incumbent LEC on purchasers of elements that offer telephone exchange or exchange access services.

(b) Notwithstanding §§ 51.505, 51.511, and 51.513(d)(2) of this part and paragraph (a) of this section, an incumbent LEC may assess upon telecommunications carriers that purchase unbundled local switching elements, as described in § 51.319(c)(1) of this part, for interstate minutes of use traversing such unbundled local switching elements, the carrier common line charge described in § 69.105 of this chapter, and a charge equal to 75% of the interconnection

charge described in § 69 124 of this chapter, only until the earliest of the following, and not thereafter:

(1) June 30, 1997;

(2) the later of the effective date of a final Commission decision in CC Docket No. 96-45, *Federal-State Joint Board on Universal Service*, or the effective date of a final Commission decision in a proceeding to consider reform of the interstate access charges described in part 69; or

(3) with respect to a Bell operating company only, the date on which that company is authorized to offer in-region interLATA service in a state pursuant to section 271 of the Act. The end date for Bell operating companies that are authorized to offer interLATA service shall apply only to the recovery of access charges in those states in which the Bell operating company is authorized to offer such service.

(c) Notwithstanding §§ 51.505, 51.511, and 51.513(d)(2) of this part and paragraph (a) of this section, an incumbent LEC may assess upon telecommunications carriers that purchase unbundled local switching elements, as described in § 51.319(c)(1) of this part, for intrastate toll minutes of use traversing such unbundled local switching elements, intrastate access charges comparable to those listed in paragraph (b) and any explicit intrastate universal service mechanism based on access charges, only until the earliest of the following, and not thereafter:

(1) June 30, 1997;

(2) the effective date of a state commission decision that an incumbent LEC may not assess such charges; or

(3) with respect to a Bell operating company only, the date on which that company is authorized to offer in-region interLATA service in the state pursuant to section 271 of the Act. The end date for Bell operating companies that are authorized to offer interLATA service shall apply only to the recovery of access charges in those states in which the Bell operating company is authorized to offer such service.

Subpart G - Resale.

§ 51.601 Scope of resale rules.

The provisions of this subpart govern the terms and conditions under which LECs offer telecommunications services to requesting telecommunications carriers for resale.

§ 51.603 Resale obligation of all local exchange carriers.

(a) A LEC shall make its telecommunications services available for resale to requesting telecommunications carriers on terms and conditions that are reasonable and non-discriminatory.

(b) A LEC must provide services to requesting telecommunications carriers for resale that are equal in quality, subject to the same conditions, and provided within the same provisioning time intervals that the LEC provides these services to others, including end users.

§ 51.605 Additional obligations of incumbent local exchange carriers.

(a) An incumbent LEC shall offer to any requesting telecommunications carrier any telecommunications service that the incumbent LEC offers on a retail basis to subscribers that are not telecommunications carriers for resale at wholesale rates that are at the election of the state commission–

(1) consistent with the avoided cost methodology described in §§ 51.607 and 51.609 of this part; or

(2) interim wholesale rates, pursuant to § 51.611 of this part,

(b) Except as provided in § 51.613 of this part, an incumbent LEC shall not impose restrictions on the resale by a requesting carrier of telecommunications services offered by the incumbent LEC.

§ 51.607 Wholesale pricing standard.

(a) The wholesale rate that an incumbent LEC may charge for a telecommunications service provided for resale to other telecommunications carriers shall equal the incumbent LEC's existing retail rate for the telecommunications service, less avoided retail costs, as described in § 51.609 of this part.

(b) For purposes of this subpart, exchange access services, as defined in section 3 of the Act, shall not be considered to be telecommunications services that incumbent LECs must make available for resale at wholesale rates to requesting telecommunications carriers.

§ 51.609 Determination of avoided retail costs.

(a) Except as provided in § 51.611 of this part, the amount of avoided retail costs shall be determined on the basis of a cost study that complies with the requirements of this section.

(b) Avoided retail costs shall be those costs that reasonably can be avoided when an incumbent LEC provides a telecommunications service for resale at wholesale rates to a requesting carrier.

(c) For incumbent LECs that are designated as Class A companies under § 32.11 of this chapter, except as provided in paragraph (d), avoided retail costs shall:

(1) include, as direct costs, the costs recorded in USOA accounts 6611 (product management), 6612 (sales), 6613 (product advertising), 6621 (call completion services), 6622 (number services), and 6623 (customer services) (§§ 32.6611, 32.6612, 32.6613, 32.6621, 32.6622, and 32.6623);

(2) include, as indirect costs, a portion of the costs recorded in USOA accounts 6121-6124 (general support expenses), 6711, 6712, 6721-6728 (corporate operations expenses), and 5301 (telecommunications uncollectibles) (§§ 32.6121-32.6124, 32.6711, 32.6712, 32.6721-32.6728, and 32.5301); and

(3) not include plant-specific expenses and plant non-specific expenses, other than

general support expenses (§§ 32.6110-32.6116, 32.6210-32.6565).

(d) Costs included in accounts 6611-6613 and 6621-6623 described in paragraph (c) (§§ 32.6611-32.6613 and 32.6621-32.6623) may be included in wholesale rates only to the extent that the incumbent LEC proves to a state commission that specific costs in these accounts will be incurred and are not avoidable with respect to services sold at wholesale, or that specific costs in these accounts are not included in the retail prices of resold services. Costs included in accounts 6110-6116 and 6210-6565 described in paragraph (c) (§§ 32.6110-32.6116, 32.6210-32.6565) may be treated as avoided retail costs, and excluded from wholesale rates, only to the extent that a party proves to a state commission that specific costs in these accounts can reasonably be avoided when an incumbent LEC provides a telecommunications service for resale to a requesting carrier.

(e) For incumbent LECs that are designated as Class B companies under § 32.11 of this chapter and that record information in summary accounts instead of specific USOA accounts, the entire relevant summary accounts may be used in lieu of the specific USOA accounts listed in paragraphs (c) and (d).

§ 51.611 Interim wholesale rates.

(a) If a state commission cannot, based on the information available to it, establish a wholesale rate using the methodology prescribed in § 51.609 of this part, then the state commission may elect to establish an interim wholesale rate as described in paragraph (b) of this section.

(b) The state commission may establish interim wholesale rates that are at least 17 percent, and no more than 25 percent, below the incumbent LEC's existing retail rates, and shall articulate the basis for selecting a particular discount rate. The same discount percentage rate shall be used to establish interim wholesale rates for each telecommunications service.

(c) A state commission that establishes interim wholesale rates shall, within a reasonable period of time thereafter, establish wholesale rates on the basis of an avoided retail cost study that complies with § 51.609 of this part.

§ 51.613 Restrictions on resale.

(a) Notwithstanding § 51.605(b) of this part, the following types of restrictions on resale may be imposed:

(1) *Cross-class selling*. A state commission may permit an incumbent LEC to prohibit a requesting telecommunications carrier that purchases at wholesale rates for resale, telecommunications services that the incumbent LEC makes available only to residential customers or to a limited class of residential customers, from offering such services to classes of customers that are not eligible to subscribe to such services from the incumbent LEC.

(2) *Short term promotions*. An incumbent LEC shall apply the wholesale discount to the ordinary rate for a retail service rather than a special promotional rate only if

(A) such promotions involve rates that will be in effect for no more than 90 days; and

(B) the incumbent LEC does not use such promotional offerings to evade the wholesale rate obligation, for example by making available a sequential series of 90-day promotional rates.

(b) With respect to any restrictions on resale not permitted under paragraph (a), an incumbent LEC may impose a restriction only if it proves to the state commission that the restriction is reasonable and nondiscriminatory.

(c) *Branding*. Where operator, call completion, or directory assistance service is part of the service or service package an incumbent LEC offers for resale, failure by an incumbent LEC to comply with reseller unbranding or rebranding requests shall constitute a restriction on resale.

(1) An incumbent LEC may impose such a restriction only if it proves to the state commission that the restriction is reasonable and nondiscriminatory, such as by proving to a state commission that the incumbent LEC lacks the capability to comply with unbranding or rebranding requests.

(2) For purposes of this subpart, unbranding or rebranding shall mean that operator, call completion, or directory assistance services are offered in such a manner that an incumbent LEC's brand name or other identifying information is not identified to subscribers, or that such services are offered in such a manner that identifies to subscribers the requesting carrier's brand name or other identifying information.

§ 51.615 Withdrawal of services.

When an incumbent LEC makes a telecommunications service available only to a limited group of customers that have purchased such a service in the past, the incumbent LEC must also make such a service available at wholesale rates to requesting carriers to offer on a resale basis to the same limited group of customers that have purchased such a service in the past.

§ 51.617 Assessment of end user common line charge on resellers.

(a) Notwithstanding the provision in § 69.104(a) of this chapter that the end user common line charge be assessed upon end users, an incumbent LEC shall assess this charge, and the charge for changing the designated primary interexchange carrier, upon requesting carriers that purchase telephone exchange service for resale. The specific end user common line charge to be assessed will depend upon the identity of the end user served by the requesting carrier.

(b) When an incumbent LEC provides telephone exchange service to a requesting carrier at wholesale rates for resale, the incumbent LEC shall continue to assess the interstate access

charges provided in part 69, other than the end user common line charge, upon interexchange carriers that use the incumbent LEC's facilities to provide interstate or international telecommunications services to the interexchange carriers' subscribers.

Subpart H - Reciprocal Compensation for Transport and Termination of Local Telecommunications Traffic.

§ 51.701 Scope of transport and termination pricing rules.

(a) The provisions of this subpart apply to reciprocal compensation for transport and termination of local telecommunications traffic between LECs and other telecommunications carriers.

(b) *Local telecommunications traffic*. For purposes of this subpart, local telecommunications traffic means:

(1) telecommunications traffic between a LEC and a telecommunications carrier other than a CMRS provider that originates and terminates within a local service area established by the state commission; or

(2) telecommunications traffic between a LEC and a CMRS provider that, at the beginning of the call, originates and terminates within the same Major Trading Area, as defined in § 24.202(a) of this chapter.

(c) *Transport*. For purposes of this subpart, transport is the transmission and any necessary tandem switching of local telecommunications traffic subject to section 251(b)(5) of the Act from the interconnection point between the two carriers to the terminating carrier's end office switch that directly serves the called party, or equivalent facility provided by a carrier other than an incumbent LEC.

(d) *Termination*. For purposes of this subpart, termination is the switching of local telecommunications traffic at the terminating carrier's end office switch, or equivalent facility, and delivery of such traffic to the called party's premises.

(e) *Reciprocal compensation*. For purposes of this subpart, a reciprocal compensation arrangement between two carriers is one in which each of the two carriers receives compensation from the other carrier for the transport and termination on each carrier's network facilities of local telecommunications traffic that originates on the network facilities of the other carrier.

§ 51.703 Reciprocal compensation obligation of LECs.

(a) Each LEC shall establish reciprocal compensation arrangements for transport and termination of local telecommunications traffic with any requesting telecommunications carrier.

(b) A LEC may not assess charges on any other telecommunications carrier for local telecommunications traffic that originates on the LEC's network.

§ 51.705 Incumbent LECs' rates for transport and termination.

(a) An incumbent LEC's rates for transport and termination of local telecommunications traffic shall be established, at the election of the state commission, on the basis of:

(1) the forward-looking economic costs of such offerings, using a cost study pursuant to §§ 51.505 and 51.511 of this part;

(2) default proxies, as provided in § 51.707 of this part; or

(3) a bill-and-keep arrangement, as provided in § 51.713 of this part.

(b) In cases where both carriers in a reciprocal compensation arrangement are incumbent LECs, state commissions shall establish the rates of the smaller carrier on the basis of the larger carrier's forward-looking costs, pursuant to § 51.711 of this part.

§ 51.707 Default proxies for incumbent LECs' transport and termination rates.

(a) A state commission may determine that the cost information available to it with respect to transport and termination of local telecommunications traffic does not support the adoption of a rate or rates for an incumbent LEC that are consistent with the requirements of §§ 51.505 and 51.511 of this part. In that event, the state commission may establish rates for transport and termination of local telecommunications traffic, or for specific components included therein, that are consistent with the proxies specified in this section, provided that:

(1) any rate established through use of such proxies is superseded once that state commission establishes rates for transport and termination pursuant to §§ 51.705(a)(1) or 51.705(a)(3) of this part; and

(2) the state commission sets forth in writing a reasonable basis for its selection of a particular proxy for transport and termination of local telecommunications traffic, or for specific components included within transport and termination.

(b) If a state commission establishes rates for transport and termination of local telecommunications traffic on the basis of default proxies, such rates must meet the following requirements:

(1) *Termination*. The incumbent LEC's rates for the termination of local telecommunications traffic shall be no greater than 0.4 cents ($0.004) per minute, and no less than 0.2 cents ($0.002) per minute, except that, if a state commission has, before August 8, 1996, established a rate less than or equal to 0.5 cents ($0.005) per minute for such calls, that rate may be retained pending completion of a forward-looking economic cost study.

(2) *Transport*. The incumbent LEC's rates for the transport of local telecommunications traffic, under this section, shall comply with the proxies described in § 51.513(d)(3), (4), and (5) of this part that apply to the analogous unbundled network elements used in transporting a call to the end office that serves the called party.

§ 51.709 Rate structure for transport and termination.

(a) In state proceedings, a state commission shall establish rates for the transport and termination of local telecommunications traffic that are structured consistently with the manner

that carriers incur those costs, and consistently with the principles in §§ 51.507 and 51.509 of this part.

(b) The rate of a carrier providing transmission facilities dedicated to the transmission of traffic between two carriers' networks shall recover only the costs of the proportion of that trunk capacity used by an interconnecting carrier to send traffic that will terminate on the providing carrier's network. Such proportions may be measured during peak periods.

§ 51.711 Symmetrical reciprocal compensation.

(a) Rates for transport and termination of local telecommunications traffic shall be symmetrical, except as provided in paragraphs (b) and (c).

(1) For purposes of this subpart, symmetrical rates are rates that a carrier other than an incumbent LEC assesses upon an incumbent LEC for transport and termination of local telecommunications traffic equal to those that the incumbent LEC assesses upon the other carrier for the same services.

(2) In cases where both parties are incumbent LECs, or neither party is an incumbent LEC, a state commission shall establish the symmetrical rates for transport and termination based on the larger carrier's forward-looking costs.

(3) Where the switch of a carrier other than an incumbent LEC serves a geographic area comparable to the area served by the incumbent LEC's tandem switch, the appropriate rate for the carrier other than an incumbent LEC is the incumbent LEC's tandem interconnection rate.

(b) A state commission may establish asymmetrical rates for transport and termination of local telecommunications traffic only if the carrier other than the incumbent LEC (or the smaller of two incumbent LECs) proves to the state commission on the basis of a cost study using the forward-looking economic cost based pricing methodology described in §§ 51.505 and 51.511 of this part, that the forward-looking costs for a network efficiently configured and operated by the carrier other than the incumbent LEC (or the smaller of two incumbent LECs), exceed the costs incurred by the incumbent LEC (or the larger incumbent LEC), and, consequently, that such that a higher rate is justified.

(c) Pending further proceedings before the Commission, a state commission shall establish the rates that licensees in the Paging and Radiotelephone Service (defined in part 22, subpart E of this chapter), Narrowband Personal Communications Services (defined in part 24, subpart D of this chapter), and Paging Operations in the Private Land Mobile Radio Services (defined in part 90, subpart P of this chapter) may assess upon other carriers for the transport and termination of local telecommunications traffic based on the forward-looking costs that such licensees incur in providing such services, pursuant to §§ 51.505 and 51.511 of this part. Such licensees' rates shall not be set based on the default proxies described in § 51.707 of this part.

§ 51.713 Bill-and-keep arrangements for reciprocal compensation.

(a) For purposes of this subpart, bill-and-keep arrangements are those in which neither

of the two interconnecting carriers charges the other for the termination of local telecommunications traffic that originates on the other carrier's network.

(b) A state commission may impose bill-and-keep arrangements if the state commission determines that the amount of local telecommunications traffic from one network to the other is roughly balanced with the amount of local telecommunications traffic flowing in the opposite direction, and is expected to remain so, and no showing has been made pursuant to § 51.711(b) of this part.

(c) Nothing in this section precludes a state commission from presuming that the amount of local telecommunications traffic from one network to the other is roughly balanced with the amount of local telecommunications traffic flowing in the opposite direction and is expected to remain so, unless a party rebuts such a presumption.

§ 51.715 Interim transport and termination pricing.

(a) Upon request from a telecommunications carrier without an existing interconnection arrangement with an incumbent LEC, the incumbent LEC shall provide transport and termination of local telecommunications traffic immediately under an interim arrangement, pending resolution of negotiation or arbitration regarding transport and termination rates and approval of such rates by a state commission under sections 251 and 252 of the Act.

(1) This requirement shall not apply when the requesting carrier has an existing interconnection arrangement that provides for the transport and termination of local telecommunications traffic by the incumbent LEC.

(2) A telecommunications carrier may take advantage of such an interim arrangement only after it has requested negotiation with the incumbent LEC pursuant to § 51.301 of this part.

(b) Upon receipt of a request as described in paragraph (a), an incumbent LEC must, without unreasonable delay, establish an interim arrangement for transport and termination of local telecommunications traffic at symmetrical rates.

(1) In a state in which the state commission has established transport and termination rates based on forward-looking economic cost studies, an incumbent LEC shall use these state-determined rates as interim transport and termination rates.

(2) In a state in which the state commission has established transport and termination rates consistent with the default price ranges and ceilings described in § 51.707 of this part, an incumbent LEC shall use these state-determined rates as interim rates.

(3) In a state in which the state commission has neither established transport and termination rates based on forward-looking economic cost studies nor established transport and termination rates consistent with the default price ranges described in § 51.707 of this part, an incumbent LEC shall set interim transport and termination rates at the default ceilings for end-office switching (0.4 cents per minute of use), tandem switching (0.15 cents per minute of use), and transport (as described in § 51.707(b)(2) of this part).

(c) An interim arrangement shall cease to be in effect when one of the following occurs

with respect to rates for transport and termination of local telecommunications traffic subject to the interim arrangement.

(1) a voluntary agreement has been negotiated and approved by a state commission;

(2) an agreement has been arbitrated and approved by a state commission; or

(3) the period for requesting arbitration has passed with no such request.

(d) If the rates for transport and termination of local telecommunications traffic in an interim arrangement differ from the rates established by a state commission pursuant to § 51.705 of this part, the state commission shall require carriers to make adjustments to past compensation. Such adjustments to past compensation shall allow each carrier to receive the level of compensation it would have received had the rates in the interim arrangement equalled the rates later established by the state commission pursuant to § 51.705 of this part.

§ 51.717 Renegotiation of existing non-reciprocal arrangements.

(a) Any CMRS provider that operates under an arrangement with an incumbent LEC that was established before August 8, 1996 and that provides for non-reciprocal compensation for transport and termination of local telecommunications traffic is entitled to renegotiate these arrangements with no termination liability or other contract penalties.

(b) From the date that a CMRS provider makes a request under paragraph (a) until a new agreement has been either arbitrated or negotiated and has been approved by a state commission, the CMRS provider shall be entitled to assess upon the incumbent LEC the same rates for the transport and termination of local telecommunications traffic that the incumbent LEC assesses upon the CMRS provider pursuant to the pre-existing arrangement.

Subpart I - Procedures for Implementation of Section 252 of the Act.

§ 51.801 Commission action upon a state commission's failure to act to carry out its responsibility under section 252 of the Act.

(a) If a state commission fails to act to carry out its responsibility under section 252 of the Act in any proceeding or other matter under section 252 of the Act, the Commission shall issue an order preempting the state commission's jurisdiction of that proceeding or matter within 90 days after being notified (or taking notice) of such failure, and shall assume the responsibility of the state commission under section 252 of the Act with respect to the proceeding or matter and shall act for the state commission.

(b) For purposes of this part, a state commission fails to act if the state commission fails to respond, within a reasonable time, to a request for mediation, as provided for in section 252(a)(2) of the Act, or for a request for arbitration, as provided for in section 252(b) of the Act, or fails to complete an arbitration within the time limits established in section 252(b)(4)(C) of the Act.

(c) A state shall not be deemed to have failed to act for purposes of section 252(e)(5) of the Act if an agreement is deemed approved under section 252(e)(4) of the Act.

§ 51.803 Procedures for Commission notification of a state commission's failure to act.

(a) Any party seeking preemption of a state commission's jurisdiction, based on the state commission's failure to act, shall notify the Commission in accordance with following procedures:

(1) such party shall file with the Secretary of the Commission a petition, supported by an affidavit, that states with specificity the basis for the petition and any information that supports the claim that the state has failed to act, including, but not limited to, the applicable provisions of the Act and the factual circumstances supporting a finding that the state commission has failed to act;

(2) such party shall ensure that the state commission and the other parties to the proceeding or matter for which preemption is sought are served with the petition required in paragraph (a)(1) of this section on the same date that the petitioning party serves the petition on the Commission; and

(3) within fifteen days from the date of service of the petition required in paragraph (a)(1) of this section, the applicable state commission and parties to the proceeding may file with the Commission a response to the petition.

(b) The party seeking preemption must prove that the state has failed to act to carry out its responsibilities under section 252 of the Act.

(c) The Commission, pursuant to section 252(e)(5) of the Act, may take notice upon its own motion that a state commission has failed to act. In such a case, the Commission shall issue a public notice that the Commission has taken notice of a state commission's failure to act. The applicable state commission and the parties to a proceeding or matter in which the Commission has taken notice of the state commission's failure to act may file, within fifteen days of the issuance of the public notice, comments on whether the Commission is required to assume the responsibility of the state commission under section 252 of the Act with respect to the proceeding or matter.

(d) The Commission shall issue an order determining whether it is required to preempt the state commission's jurisdiction of a proceeding or matter within 90 days after being notified under paragraph (a) of this section or taking notice under paragraph (c) of this section of a state commission's failure to carry out its responsibilities under section 252 of the Act.

§ 51.805 The Commission's authority over proceedings and matters.

(a) If the Commission assumes responsibility for a proceeding or matter pursuant to section 252(e)(5) of the Act, the Commission shall retain jurisdiction over such proceeding or matter. At a minimum, the Commission shall approve or reject any interconnection agreement adopted by negotiation, mediation or arbitration for which the Commission, pursuant to section

252(e)(5) of the Act, has assumed the state's commission's responsibilities.

(b) Agreements reached pursuant to mediation or arbitration by the Commission pursuant to section 252(e)(5) of the Act are not required to be submitted to the state commission for approval or rejection.

§ 51.807 Arbitration and mediation of agreements by the Commission pursuant to section 252(e)(5) of the Act.

(a) The rules established in this section shall apply only to instances in which the Commission assumes jurisdiction under section 252(e)(5) of the Act.

(b) When the Commission assumes responsibility for a proceeding or matter pursuant to section 252(e)(5) of the Act, it shall not be bound by state laws and standards that would have applied to the state commission in such proceeding or matter.

(c) In resolving, by arbitration under section 252(b) of the Act, any open issues and in imposing conditions upon the parties to the agreement, the Commission shall:

(1) ensure that such resolution and conditions meet the requirements of section 251 of the Act, including the rules prescribed by the Commission pursuant to that section;

(2) establish any rates for interconnection, services, or network elements according to section 252(d) of the Act, including the rules prescribed by the Commission pursuant to that section; and

(3) provide a schedule for implementation of the terms and conditions by the parties to the agreement.

(d) An arbitrator, acting pursuant to the Commission's authority under section 252(e)(5) of the Act, shall use final offer arbitration, except as otherwise provided in this section:

(1) at the discretion of the arbitrator, final offer arbitration may take the form of either entire package final offer arbitration or issue-by-issue final offer arbitration.

(2) negotiations among the parties may continue, with or without the assistance of the arbitrator, after final arbitration offers are submitted. Parties may submit subsequent final offers following such negotiations.

(3) to provide an opportunity for final post-offer negotiations, the arbitrator will not issue a decision for at least fifteen days after submission to the arbitrator of the final offers by the parties.

(e) Final offers submitted by the parties to the arbitrator shall be consistent with section 251 of the Act, including the rules prescribed by the Commission pursuant to that section.

(f) Each final offer shall:

(1) meet the requirements of section 251, including the rules prescribed by the Commission pursuant to that section;

(2) establish rates for interconnection, services, or access to unbundled network elements according to section 252(d) of the Act, including the rules prescribed by the

Commission pursuant to that section, and

(3) provide a schedule for implementation of the terms and conditions by the parties to the agreement. If a final offer submitted by one or more parties fails to comply with the requirements of this section, the arbitrator has discretion to take steps designed to result in an arbitrated agreement that satisfies the requirements of section 252(c) of the Act, including requiring parties to submit new final offers within a time frame specified by the arbitrator, or adopting a result not submitted by any party that is consistent with the requirements of section 252(c) of the Act, and the rules prescribed by the Commission pursuant to that section.

(g) Participation in the arbitration proceeding will be limited to the requesting telecommunications carrier and the incumbent LEC, except that the Commission will consider requests by third parties to file written pleadings.

(h) Absent mutual consent of the parties to change any terms and conditions adopted by the arbitrator, the decision of the arbitrator shall be binding on the parties.

§ 51.809 Availability of provisions of agreements to other telecommunications carriers under section 252(i) of the Act.

(a) An incumbent LEC shall make available without unreasonable delay to any requesting telecommunications carrier any individual interconnection, service, or network element arrangement contained in any agreement to which it is a party that is approved by a state commission pursuant to section 252 of the Act, upon the same rates, terms, and conditions as those provided in the agreement. An incumbent LEC may not limit the availability of any individual interconnection, service, or network element only to those requesting carriers serving a comparable class of subscribers or providing the same service (*i.e.*, local, access, or interexchange) as the original party to the agreement.

(b) The obligations of paragraph (a) of this section shall not apply where the incumbent LEC proves to the state commission that:

(1) the costs of providing a particular interconnection, service, or element to the requesting telecommunications carrier are greater than the costs of providing it to the telecommunications carrier that originally negotiated the agreement, or

(2) the provision of a particular interconnection, service, or element to the requesting carrier is not technically feasible.

(c) Individual interconnection, service, or network element arrangements shall remain available for use by telecommunications carriers pursuant to this section for a reasonable period of time after the approved agreement is available for public inspection under section 252(f) of the Act.

14. Part 90 of Title 47 of the Code of Federal Regulations (C.F.R.) is amended as follows:

PART 90 - PRIVATE LAND MOBILE RADIO SERVICES

15. The authority citation for Part 90 is revised to read as follows:

AUTHORITY: Secs. 4, 251-2, 303, 309, and 332, 48 Stat. 1066, 1082, as amended; 47 U.S.C. 154, 251-2, 303, 309 and 332, unless otherwise noted.

16. Section 90.5 is amended by adding paragraph (k) and renumbering the remaining paragraphs to read as follows:

*****

(k) Part 51 contains rules relating to interconnection.

In the Matter of
Implementation of the Local Competition Provisions in
the Telecommunications Act of 1996 (CC Docket No. 96-98)
and
Interconnection between Local Exchange Carriers and
Commercial Mobile Radio Service Providers (CC Docket No. 95-185)

Separate Statement of Chairman Reed E. Hundt

This order is the most pro-competitive action of government since the break-up of the Standard Oil Trust. I hope the whole country will join in common acknowledgement of all those who made this possible.

The private sector was ably represented, and provided us with much useful information and suggestions.

I specifically acknowledge and thank my colleagues, Commissioners Quello, Ness and Chong, and their staffs, all of whom contributed greatly throughout this process.

I would also especially thank Cheryl Parrino, President of the National Association of Regulatory Utility Commissioners. Her advice and counsel have been invaluable. Thanks also go to the two individuals who served as Chair of NARUC's Communications Committee during this period, Ken McClure and Lisa Rosenblum. I also thank the many other state commissioners from around the country who took time to discuss these matters with us, and who sent their staffs here for extended meetings on all these issues. I would also especially thank Chairman Dan Miller of the Illinois Commerce Committee who detailed one of his staff members, Augie Ros, to the FCC.

I owe a special debt of gratitude and respect to John Nakahata, my Senior Legal Adviser. John's brilliant, indefatigable, incisive and comprehensive work was essential to the triumph of analysis and policy that is in this order.

The highest commendations, however, go to the FCC staff, superbly led by Regina Keeney and Richard Metzger. I would like specifically to recognize each of the dedicated members of the Commission's staff who contributed to this effort, and I apologize if I have inadvertently omitted anyone:

STATEMENT OF
COMMISSIONER JAMES H. QUELLO

August 8, 1996

Re: Interconnection Report and Order

Today marks the end of the pre-competitive era in local telephone service. By our vote today the Commission implements rules that will introduce competition into this last monopoly telecommunications market.

Our Report and Order refers to these rules as the first part of a trilogy that also includes future universal service and access charge reform. This is, to be sure, true. But I must confess that I also see today's action as not the first, but rather the third and final part, of a different trilogy -- one whose first two parts were the introduction of competition into the long-distance telephone market and the divestiture of the Bell Operating Companies from AT&T. These first two events made local telephone competition inevitable; today we usher it in.

Any Commissioner would be privileged to have served during one of these events. I have been lucky enough to have seen all three. From this perspective, then, I would offer several thoughts to the parties most immediately affected by today's decision.

First, to the public, I would say: unparalleled changes in the array of telecommunications services available to you, as well as in the companies that provide them, are going to occur. As competition proliferates and prices fall, economic growth will also occur, and that too will benefit all of us. This is the vision of the 1996 Act, and it is the goal of the rules we adopt today.

To those companies that seek to offer competitive local telephone service, I would say: the rules we adopt today attempt to provide the regulatory assistance you need to enter a market in which your competitor not only possesses a monopoly, but also controls the facilities upon which you must depend to compete. But even so, our rules are pro-competition, not pro-competitor. They are intended to make it possible for you to enter the market on fair and equitable terms, but not to so alter the market that entry occurs even where it otherwise might not. We have opened the door, but we have not paved the way.

To the wireless communications providers, I would say: we have heard and understand your concerns regarding the differences in your technical and market configurations and have, therefore, expressly reserved federal jurisdiction under Section 332. Nevertheless, it is important that our decisions implementing competition be technology-neutral and

provide an opportunity for negotiations under the comprehensive interconnection regime embodied by Congress in Section 251. We will presume good faith negotiations by all but stand ever vigilant to consider and resolve instances of discriminatory treatment.

To our state commission counterparts, I would say: with today's action, we effectively pass you the pen. It is now your responsibility to write the rules and set the prices and terms that will make Congress's vision of competition a reality. To provide added flexibility and to make this process administratively easier, we have also provided ranges of proxy prices that can be used until, or even instead of, state-specific rates are set. Our decision today borrows from and builds on the experience of those of you who are grappling with statewide competition issues. This has, in sum, been a collaborative process. It must continue to be a collaborative process if we are collectively to succeed.

To small telephone companies, I would say: our Report and Order relies largely on state commissions to implement the provisions of the law that ensure that competition will be introduced in a way that is sensitive to your unique circumstances. We cannot, and indeed would not want to, perpetuate what one small company has called a "reasonable, investment-backed expectation to hold competitive advantages over new market entrants." But while we will not guarantee your current profit margins, we are also confident that state decisions will assure that competition in your service areas will take hold in a reasonable manner.

To the Bell Operating Companies and other large independent local telcos, I would say: these rules will bring about competition. You will open your markets to competitors, and in return you will become competitors in other markets. The rules we adopt today will enable you to do both things. What they will not enable you to do is avoid the first, but obtain the second. These rules will bring change, not catastrophe; they will bring opportunity, not oblivion. It will be a different world, but one in which you will continue to play a vital role.

Finally, I must acknowledge that this day would not have come without the tireless dedication and tremendous talents of Gina Keeney and her gifted Common Carrier Bureau staff. The Chairman will, I am sure, commend each of you at length, and I will leave that privilege to him. For my part I want to express my thanks to the entire CCB "Dream Team," and especially to its captain, Richard Metzger. This job could literally not have been done this well in such short time without you, and for that you have my profound respect and appreciation.

August 8, 1996

SEPARATE STATEMENT
OF
COMMISSIONER SUSAN NESS

Re: Implementation of the Local Competition Provisions of the Telecommunications Act of 1996

Today we are fulfilling one of the most important responsibilities assigned to us by the Telecommunications Act of 1996 -- writing the rules that will achieve Congress's vision of fair and robust competition in all telecommunications markets. We are doing so with utmost fidelity to the letter and the spirit of the statute.

At the heart of the legislation is a bold commitment to supplant monopoly with competition. Based on the abundant benefits that have flowed to consumers as a result of competition in the provision of long distance services, information services, and customer-premises equipment, Congress decreed that the opportunity for competition be extended to the local telephone market. It ordered that barriers to entry be swept aside -- and that pathways to competitive entry be opened.

Sections 251 and 252 of the 1996 Act establish the foundation for this competition. On this foundation must be built radically different relationships than those that have previously existed -- between incumbent local exchange carriers and new entrants, between state and federal regulators, and between regulators and industry.

Congress recognizes that, to effectuate a new policy of local competition for markets that have traditionally been protected monopolies, a national policy framework is essential. But it also recognizes the need for flexibility. This balance is reflected in the 1996 Act, which sets forth the key principles in the statute, instructs this Commission to formulate implementing regulations, and assigns many of the duties pertaining to specific carriers and agreements to the state commissions.

At the same time, Congress encouraged voluntary negotiations between incumbent local exchange carriers and new entrants. Although voluntary agreements are not subject to Section 251 and our implementing regulations, we are aware that the negotiations may be influenced by the legislative and regulatory regime for arbitrated agreements. The "backdrop" of our rules should encourage, not impede, the successful negotiation of voluntary agreements.

The 1996 Act intends that the benefits of competition be available in all 50 states, not some lesser number. Congress recognized that some states were already making progress in the introduction of local competition, and it sought to permit that progress to continue. Consistent with the statute, the rules we promulgate today will enable those states in the vanguard to continue on their procompetitive course. Other states are being given the tools necessary to accelerate their progress. All states will have considerable responsibility for effectuating the transition to competition within their own borders.

Our decisions in this proceeding are the product of extensive discussions with state regulators concerning a wide variety of legal, economic, policy, and practical issues. The insights that have been shared with us by state regulators have guided us throughout our deliberations. Maintaining a successful partnership between state and federal regulators will be essential to fulfill the legislative expectations underlying the new structure set out in Sections 251 and 252 of the 1996 Act.

Out duty is to establish rules that are procompetition, not pro-competitor. Competitive access providers, cable companies, interexchange carriers, wireless companies, and others will all bring unique skills and strategies to the new competitive arena. Today's ruling, and the decisions that will follow from the state commissions, will enable all of these entities to compete robustly, and without hindrance based on other entities' entrenched market power.

In today's order, we are also facilitating new entry by identifying a core set of unbundled network elements that new entrants may obtain, singly or in combination, from incumbent LECs, to create new and innovative services. We send correct economic signals to potential entrants by requiring the use of forward-looking pricing principles. We promote voluntary negotiations by establishing minimal rules regarding the duty to bargain in good faith. We are providing immediate relief from CMRS-LEC interconnection agreements that violate fair play and flout our existing rules. In these and other respects, we act forcefully to bring to the local telephone market the dramatic change Congress intended.

Yet we also maintain fair treatment to the incumbent local exchange carriers. They are entitled to fair prices for the services and elements they offer, and our pricing principles accordingly reject costing methods that ignore the LECs' current network architecture or deny recovery of reasonable joint and common costs. The special needs of smaller incumbents, especially rural telcos, must be addressed with extra care, and just as Congress intended, we safeguard them today.

Some have expressed concern about the effect on universal service of flash-cut changes in market rules and pricing principles. We have listened -- and responded. With an abundance of caution, we have established an access charge transition of limited duration that will reduce the exposure of incumbent local exchange carriers to the sudden loss of access charge revenues. But we have also established for the long-term the principle that prices for network elements, transport and termination, and collocation must be based on costs -- not hidden subsidies that distort market forces.

We have committed to expeditious completion of the universal service proceeding, where we must make subsidies explicit and both eligibility and funding must become competitively neutral. On a parallel track, we must complete reform of access charges, to eliminate uneconomic incentives that distort investment decisions. A rational economic structure for all services and elements is vital to sustainable competition.

Only when the universal service, access reform, and interconnection rules are all in effect will local telephone subscribers really begin to see the full benefits of marketplace competition: lower prices, new services, and more choices. As market power wanes, the role of government will diminish as well.

Competition will take time to emerge. Expectations are high, but the reality will inevitably lag behind. As the process unfolds over the coming months and years, there are bound to be unforeseen circumstances, unintended consequences, and efforts to game the process. We will remain vigilant, and will reevaluate and refine our rules as necessary to promote competition that is both robust and fair.

Following the mandate of the Telecommunications Act of 1996, this Commission will not shrink from taking the steps necessary to enable the benefits of competition to reach consumers throughout the nation.

August 8, 1996

Separate Statement of

Commissioner Rachelle B. Chong

Re: In the Matter of Implementation of the Local Competition Provisions in the Telecommunications Act of 1996, CC Docket No. 96-98; Interconnection between Local Exchange Carriers and Commercial Mobile Radio Service Providers, CC Docket No. 95-185; Implementation of Sections 3(n) and 332 of the Communications Act, GN Docket No. 93-252.

The passage of the Telecommunications Act of 1996[1] marked the end of more than sixty years of monopoly style regulation. The changes wrought by the 1996 Act on the telephone industry are dramatic and comprehensive. I write separately to emphasize my strong belief that the pro-competitive path we have unanimously chosen in this interconnection order is the right one.

On the day the 1996 Act became law, the Commission embarked on a challenging journey to help implement the new statute. Our final destination has been clearly delineated by Congress. We are "to provide for a pro-competitive, de-regulatory national policy framework designed to accelerate rapidly private sector deployment of advanced telecommunications and information technologies and services to all Americans by opening all telecommunications markets to competition."[2]

True to this charge, we have resolved to act quickly and decisively to open all telecommunications markets to competition, to provide pricing methodologies that will drive rates toward cost, and to provide a national policy framework that will achieve this restructuring of the industry in an orderly and efficient manner. The rules in this item do not favor any particular industry or player over another, but instead free them from outdated regulatory restraints in order to compete with each other.

The 1996 Act opens up the local telephone network to competitors, and provides them with unprecedented access through an interconnection framework.[3] The Act provides three

---

[1] Telecommunications Act of 1996, Pub. L. No. 104-104, 110 Stat. 56 *to be codified at* 47 U.S.C. §§ 151 *et. seq.* (1996 Act).

[2] S. Conf. Rep. No. 104-230, 104th Cong., 2d Sess. 1 (1996).

[3] Interconnection refers to the physical linking of two networks for the mutual exchange of traffic.

methods of entry through which a competitor may enter the local telephone market: (1) full facilities-based entry; (2) purchase of unbundled elements from the incumbent local exchange carrier (LEC), i.e. network "piece parts;" and (3) resale, which gives a competitor the ability to purchase an incumbent LEC's retail service at a wholesale price and repackage it for sale to the competitor's own end user.

Facilities-based Competition. The first entry option -- facilities-based competition -- represents the most dramatic departure from our current bottleneck monopoly structure. A full facilities-based competitor would offer a myriad of distinct services through separate facilities to its subscribers, and thus providing consumers with the benefits of head-to-head competition. As a practical matter, however, we do not expect a market typified by full-fledged facilities-based competition to blossom overnight. These networks or systems must be planned, financed and constructed over time. As a result, the other two entry avenues -- the purchase of unbundled elements and resale -- take on a special importance in the near term to bring swift competition to the local marketplace.

Unbundled Elements. Some new entrants already have some network infrastructure in place, and lack only a few critical components in order to provide local exchange service to consumers. For example, today's cable operators have a coaxial wire that passes over 96.6% of the TV households in America.[4] If a cable operator can access the remaining necessary network elements from the incumbent LEC, the cable operator would be only a step away from providing local telephone service over its upgraded network. This example points out why it is essential for new entrants to obtain access to those network piece parts. In our order, we set forth a minimum list of unbundled network elements that incumbent LECs uniformly must make available to new entrants upon request. The state commissions may expand upon this list. We believe that this action will give new entrants what they need so competition is "jump started."

Resale. Resale is another critically important entry strategy because three types of new entrants stand to benefit. First, facilities-based competitors that want to immediately enter the market prior to completing their own networks can use resale as a transition mechanism. Second, facilities-based competitors whose existing infrastructure does not overlap the incumbent LEC's service area, may choose to use resale to ensure that it can offer a competing local service package within the same service territory as the incumbent LEC. Third, new entrants who do not intend to offer facilities-based competition will be able to compete immediately in the local market by purchasing discounted services of the incumbent LEC. For all of these categories, our decision provides a viable avenue for immediate market entry.

Free Market Negotiations. I highlight that the 1996 Act has made the mechanism for entry a *free market* negotiation process between the incumbent LEC and any potential new

---

[4] Paul Kagan Associates, Inc., *Marketing New Media*, Mar. 18, 1996.

competitor. Under Section 252(a)(1), the Commission's Section 251 rules play no role if an incumbent LEC and a new entrant reach a purely voluntary agreement, and the state commission approves it through the process set forth in Section 252.

Need for Minimum National Baselines. It is only if the carriers are unsuccessful in their voluntary negotiations that government steps in. The Act provides that the state commissions arbitrate the disputes. In today's order, we set forth a baseline of terms and conditions for an arbitrated interconnection agreement. I support this action for three reasons. First, because interconnection matters are very complex and technical, I believe that minimum national guidelines will help parties lower their transaction costs and will help drive them to reach their voluntary agreements much faster. At the outset of their voluntary negotiations, parties will understand what their minimum rights will be in a subsequent state commission arbitration process; it is our hope this may encourage earlier agreement.

Second, a baseline of terms and conditions simplifies the state commission arbitration process. A baseline enables a state commission to quickly approve an agreement and thus rapidly introduce competition. The presence of a baseline minimizes any regulatory delay that might result if a state commission were to establish from scratch its own pricing methodology or conduct a proceeding to identify network elements that must be unbundled.

Third, in establishing some national minimum baselines, we greatly aid new entrants who have national or regional strategies. Without such baselines, these competitors would face a "patchwork quilt" of differing state regulatory requirements that may create a potential entry barrier by increasing their entry costs and causing substantial delay. Thus, it is my view that these baselines promote swift competitive entry, which in turn will lead to the earlier introduction of competitive services to consumers.

Access Charge Transition. Although we take a great leap forward toward competition with this interconnection order, our goal in making local telephone competition a reality will not be complete until we finish universal service reform and restructure our current access charge regime. Our order notes that the Act sets forth a specific time frame by which the Commission must issue final rules as to interconnection (August 1996) and universal service reform (May 1997). Because of the time differential between these dates, and in order to avoid undue disruption of the incumbent LECs' ability to support universal service, I have supported our decision to require new entrants when purchasing unbundled elements to pay a portion of certain access charges until no later than June 30, 1997. My support for the establishment of a short term access charge transition scheme is premised on the Commission's firm commitment to complete universal service and access charge reform by the first half of 1997. I underscore my determination that the interim access charge mechanism proposed herein is of a finite duration. I can foresee no circumstance upon which it would be extended beyond the dates set forth in our order.

Pricing Methodology. Prices of interconnection and unbundled elements, along with prices for transport and termination and resale, are all crucial to any interconnection

agreement. Again, should the parties voluntarily agree on such prices, these agreements will be submitted to the states for approval and there is no government intervention in the process

If carriers cannot agree, however, today's decision makes clear that the FCC will *not* set these prices. The Act provides that the appropriate state commission will step in to set prices. To help guide state commissions as they set prices according to local conditions, we have established methodological pricing principles that are consistent with the Act's cost-based pricing provisions. We have asked the state commissions to use the cost-based pricing methodology described in our order when they conduct an economic cost study to set their state specific rates. A clear benefit of this approach is that such a national framework will encourage the swift establishment of a common, pro-competition understanding of pricing principles among the states.

We also have established certain default proxies that states will use in the interim, if they have not completed a cost study during an arbitration, or if they lack the necessary resources to initiate their own cost study. It is my view that these default proxies, which are either price ceilings or price ranges, will greatly speed competition. For example, in a situation where the state commission has not yet completed a cost study but must render a decision on specific pricing issues in an arbitration pursuant to the deadline imposed by Section 252(e)(4), the default proxies will assist the state commission in resolving the pricing issues quickly and in a way consistent with the Act's cost-based pricing principles.

I emphasize that a state commission has the flexibility to set a specific rate that is either above or below the default proxy ceiling or range if it has conducted its own cost study consistent with the pricing methodology set forth in our order. The default proxy is only an interim mechanism and it may not be relied upon once a state commission has completed its own economic cost study.[5]

CMRS-LEC Interconnection Issues. In our order, I have supported our decision to allow CMRS-LEC interconnection matters to be governed by the Sections 251/252 provisions, while continuing to acknowledge our continuing jurisdiction pursuant to Section 332 over CMRS-LEC interconnection matters. In doing so, we have declined to opine on the precise extent of our Section 332 jurisdiction over CMRS-LEC interconnection matters, however. I emphasize that by opting to use the Section 251/252 framework, we are not repealing our Section 332 jurisdiction by implication or rejecting Section 332 as an alternative basis for jurisdiction.

---

[5] It is unfortunate that we did not have enough of a record in this proceeding to decide what would be an appropriate proxy for paging carriers' termination costs or to set a default proxy. I am committed to moving forward with a further rulemaking proceeding on this issue as quickly as possible.

While we have generally crafted our interconnection rules not to favor any particular industry, player or technology over another, we cannot shut our eyes to inherent differences between some classes of carriers' services that may pose potential problems when we seek to apply our new interconnection rules. I believe that should the need arise in the future, we should not hesitate to adapt some of our general interconnection rules to recognize the unique nature of particular classes of service providers, such as CMRS providers. It is for this reason that I supported the Commission's decision to reserve its right to exercise jurisdiction over LEC-CMRS interconnection under Section 332.

There are several differences that set wireless CMRS providers apart from some of the other telecommunications carriers that will avail themselves of the Sections 251 and 252 interconnection framework. First, when adopting Section 332 in 1993, Congress created a national regulatory framework for CMRS providers, and granted the FCC authority to preempt states from entry and rate regulation. Congress made clear that its intent was to "foster the growth and development of mobile services that, by their nature, operate without regard to state lines as an integral part of the national telecommunications infrastructure."[6] This recognition that CMRS services are uniquely interstate in scope was apt. CMRS service areas, which are established federally, can encompass more than one state jurisdiction.[7] Congress was rightly concerned that imposing multiple state regulatory schemes on CMRS providers may prove unduly burdensome, cause delay, and otherwise inhibit the industry's growth. Notably, Congress did not repeal Section 332 when it provided new Sections 251 and 252 in the 1996 Act.

Second, CMRS providers have suffered past discrimination at the hand of the LECs and by certain state commissions with regard to interconnection matters. Today's record is replete with examples of LECs that have significantly overcharged CMRS providers for past interconnection. Further, in violation of our rules, our record reflects that in some cases, LECs have refused to pay CMRS providers for calls terminated by LECs on the CMRS networks, while other wireline carriers have received such compensation from the LECs. In

---

[6] H.R. Report No. 103-11, 103rd Cong., 1st Sess. 260 (1993).

[7] For example, Personal Communications Service (PCS) providers in the Washington - Baltimore Major Trading Area (MTA) are subject to six jurisdictions -- Pennsylvania, Delaware, Maryland, Virginia, West Virginia and the District of Columbia -- due to the large size and location of the federally set service areas. Should one of these PCS providers need to arbitrate an interconnection agreement pursuant to Section 251 and 252, such PCS provider could be subjected to as many as *six* state arbitration proceedings. This scenario could impose undue burdens, such as increased transaction costs, regulatory delay, and the potential for inconsistent results, for CMRS providers with interstate service areas. For this reason, we reserve our right to in the future to use Section 332 as an alternative basis for jurisdiction over CMRS providers faced with this type of a dilemma.

other instances. LECs have required certain CMRS providers to pay for the traffic the LEC carrier originates and terminates on the systems of the CMRS provider. These problems have been compounded by certain state commissions who have limited access by CMRS providers to more reasonable interconnection rates afforded by LECs to other wireline carriers.

In this order, we have taken a variety of measures to remedy this discrimination and to ensure that CMRS providers are placed on an even footing with other telecommunications carriers when obtaining LEC interconnection. I am particularly pleased that we will allow CMRS providers with current interconnection agreements that provide for non-mutual compensation an opportunity to renegotiate those agreements under the framework of Sections 251/252, without incurring any early termination penalties. In light of the past discrimination CMRS providers have experienced, however, I would have taken two additional steps.

First, I would have extended the "fresh look" opportunity to all CMRS providers -- not just those with non-mutual compensation arrangements. Our decision was to limit relief in this instance to contracts that are clearly unlawful because they violate Section 20.11 of our rules. Section 20.11, however, requires not only that CMRS-LEC interconnection agreements comply with principles of mutual compensation, but also that each carrier pay *reasonable* compensation. I believe that the record in this proceeding clearly demonstrates that the rates the LECs have charged CMRS providers have far exceeded their costs and thus could not fairly be characterized as "reasonable" compensation.

Second, instead of requiring the CMRS providers to continue paying their current interconnection rates, I would have permitted CMRS providers to immediately begin paying the default proxy rate while their interconnection arrangements were being renegotiated.

It is my hope that on a going-forward basis, CMRS providers will be able to obtain fair, reasonable and non-discriminatory interconnection rates under the terms of today's decision. For reasons of simplicity and regulatory parity, it makes sense to me to have a single regulatory scheme pursuant to Sections 251 and 252 apply as to all incumbent LEC interconnection matters. Bearing in mind Congress' concerns about the interstate nature of the CMRS industry, however, I have concerns that the state-by-state arbitration process may pose undue burdens on, or otherwise hinder the growth of, the CMRS industry. If it does, I would not hesitate to invoke our Section 332 jurisdiction if I believe that the framework we impose today is having adverse impacts on the CMRS industry.

List of Parties ..... Appendix A

Rules ..... Appendix B

I. INTRODUCTION AND OVERVIEW

1. In February, 1996, Congress passed and the President signed into law, the Telecommunications Act of 1996 (1996 Act).[1] The 1996 Act erects a "procompetitive, de-regulatory national framework designed to accelerate rapid private sector deployment of advanced telecommunications and information technologies and services to all Americans by opening all telecommunications markets to competition."[2] Section 101 of the 1996 Act adds new section 251 to the Communications Act of 1934. Congress intended that the provisions of this new section would help competition grow in the market for exchange and exchange access and related telecommunications services. It directed the Commission to adopt rules that would implement the requirements of this section no later than August 8, 1996.[3] We note, however, that, under section 251(f), certain rural or small local exchange carriers (LECs) are exempt or may seek relief from the rules we adopt herein.[4]

2. We began this rulemaking proceeding on April 19, 1996.[5] The *First Report and Order*, which addressed issues that were raised in this docket, decided that the Commission should establish national rules implementing section 251.[6] The *First Report and Order* interprets and implements, *inter alia*, section 251(a), (b)(1), (b)(4), (b)(5), (c)(1), (c)(2), (c)(3), (c)(4), and (c)(6). That order promulgates rules to open the local exchange and exchange access markets to competition by eliminating legal and technical barriers to such competition. This *Second Report and Order and Memorandum Opinion and Order* (*Order*) promulgates rules to implement the parts of section 251 that relate to the elimination of certain operational barriers to competition. Specifically, this *Order* addresses local exchange carriers' obligations to provide their competitors with dialing parity and nondiscriminatory access to certain services and functionalities;[7] incumbent local exchange carriers' duty to make

---

Aug. 8, 1996) (hereinafter *First Report and Order*) at section II.

[7] 47 U.S.C. § 251(b)(3).

network information disclosures;[8] and numbering administration.[9] In this *Order* we also deny the Petition for Expedited Declaratory Ruling on the area code relief plan for Dallas and Houston that the Texas Public Utility Commission (Texas Commission) filed with this Commission on May 9, 1996.[10] We also address petitions for clarification or reconsideration in the *Ameritech* and *NANP* proceedings.[11]

3. Dialing parity, nondiscriminatory access, network disclosure, and numbering administration issues are critical issues for the development of local competition. As stated in the *First Report and Order*, incumbent local exchange carriers have little incentive to provide access to potential competitors to their networks. In other words, potential competitors in the local and long distance markets face numerous operational barriers to entry notwithstanding their legal right to enter such markets. The dialing parity, nondiscriminatory access, and network disclosure requirements should remove those barriers to entry. The rules we adopt herein will benefit consumers by making some of the strongest aspects of local exchange carrier incumbency -- the local dialing, telephone numbers, operator services, directory assistance, and directory listing -- available to all competitors on an equal basis.

A. Actions to Implement Section 251(b)(3)

1. Dialing Parity

4. Section 251(b)(3) of the 1996 Act directs each local exchange carrier (LEC)[12] to provide dialing parity to competing providers of telephone exchange and telephone toll

---

[8] 47 U.S.C. § 251(c)(5).

[9] 47 U.S.C. § 251(e)(1).

[10] *In the Matter of Area Code Relief Plan for Dallas and Houston, Ordered by the Public Utility Commission of Texas*, Petition for Expedited Declaratory Ruling filed May 9, 1996.

[11] *See In the Matter of Proposed 708 Relief Plan and 630 Numbering Plan Area Code by Ameritech - Illinois*, IAD File no. 94-102, Declaratory Ruling and Order, 10 FCC Rcd 4596 (1995) (*Ameritech Order*) and *Administration of the North American Numbering Plan*, CC Docket No. 92-237, Report and Order, 11 FCC Rcd 2588, 2591 (1995) (*NANP Order*).

[12] The 1996 Act defines the term "local exchange carrier" as "any person that is engaged in the provision of telephone exchange service or exchange access. Such term does not include a person insofar as such person is engaged in the provision of commercial mobile service under section 332(c), except to the extent that the Commission finds that such provider should be included in the definition of such term." 47 U.S.C. § 153(26). For purposes of the dialing parity and nondiscriminatory access obligations that we impose pursuant to section 251(b)(3), we find that commercial mobile radio service (CMRS) providers are not LECs. *See infra* para. 29.

service.[13] This requirement means that customers of these competitors should not have to dial extra digits to have their calls routed over that LEC's network. To implement this statutory requirement, we adopt broad guidelines and minimum federal standards that build upon the experiences and accomplishments of state commissions. Although the 1996 Act requires a LEC to provide dialing parity only to providers of telephone exchange and toll services, section 251(b)(3) does not limit the type of traffic or service for which dialing parity must be afforded to those providers. We conclude, therefore, that section 251(b)(3) requires LECs to provide dialing parity to providers of telephone exchange or toll service with respect to all telecommunications services that require dialing to route a call and encompasses international, interstate, intrastate, local and toll services.

5. With respect to toll service, we further find that section 251(b)(3) requires, at a minimum, that customers be entitled to choose different presubscribed, or preselected, carriers for both their intraLATA and interLATA toll calls. In states, like Alaska and Hawaii, that have no LATAs,[14] customers must be able to choose different presubscribed carriers for both their intrastate and interstate toll calls. Based on this finding, we adopt a rule requiring all LECs to implement intraLATA and interLATA toll dialing parity, using the "full 2-PIC" presubscription method.[15] The toll dialing parity requirement we adopt is defined by LATA boundaries given that the Bell Operating Companies' (BOCs') operations are likely to be shaped by LATA boundary restrictions for a period of unforeseeable duration. Given that implementation of the 1996 Act over time may diminish the significance of LATA boundaries, however, we permit states to redefine the toll dialing parity requirement based on state, rather than LATA, boundaries where a state deems such a requirement to be pro-competitive and otherwise in the public interest.[16]

---

[13] According to the 1996 Act, the term "dialing parity" means "that a person that is not an affiliate of a local exchange carrier is able to provide telecommunications services in such a manner that customers have the ability to route automatically, without the use of any access code, their telecommunications to the telecommunications services provider of the customer's designation from among 2 or more telecommunications services providers (including such local exchange carrier)." 47 U.S.C. § 153(15).

[14] 47 U.S.C. §153(25). According to the 1996 Act, a LATA is a "local access and transport area." It is a "contiguous geographic area–

(A) established before the date of enactment of the Telecommunications Act of 1996 by a Bell operating company such that no exchange area includes points within more than 1 metropolitan statistical area, consolidated metropolitan statistical area, or State, except as expressly permitted under the AT&T Consent Decree; or

(B) established or modified by a Bell operating company after such date of enactment and approved by the Commission."

[15] We note that the abbreviation "PIC" in the past has stood for the term "primary," or "preferred, interexchange carrier." While we retain the acronym "PIC," we define the term to include any toll carrier for purposes of the presubscription rules that we adopt in this *Order*. For a discussion of the full 2-PIC presubscription methodology, *see infra* section II.B(4).

[16] To illustrate, if the presubscription requirement were based on LATA boundaries, a customer would be entitled to choose a primary carrier for all intraLATA toll calls and a separate, or the same, primary carrier for all interLATA toll calls. If the presubscription requirement were based on state boundaries, a customer would be

6. In order to facilitate the orderly implementation of toll dialing parity, we require each LEC, including a BOC, to submit a plan to the state regulatory commission for each state in which it provides telephone exchange service setting forth the LEC's plan for implementing toll dialing parity, including the methods it proposes to enable customers to select alternative providers. In the event that a state elects not to evaluate such a plan sufficiently in advance of the date on which a LEC is required to implement toll dialing parity, we require the LEC to file its plan with the Commission. The Commission will act upon such a plan within 90 days of the date on which it is filed with the Commission.

7. Under the toll dialing parity implementation schedule we adopt, we require each LEC, including a BOC, to implement toll dialing parity no later than February 8, 1999. In addition, we require a LEC, including a BOC, to provide toll dialing parity throughout a state coincident with its provision of in-region, interLATA or in-region, interstate toll services in that state. LECs, other than BOCs, that are either already offering or plan to begin to provide in-region, interLATA or in-region, interstate toll services before August 8, 1997, must implement toll dialing parity by August 8, 1997. We note that smaller LECs, for which this implementation schedule may be unduly burdensome, may petition their state commission for a suspension or modification of the application of this requirement.[17]

8. Those states desiring to impose more stringent presubscription methodologies, *e.g.*, multi-PIC or smart-PIC,[18] will retain the flexibility to impose such additional requirements. We also announce our intention to issue a Further Notice of Proposed Rulemaking addressing the technical feasibility and nationwide availability of a separate presubscription choice for international calling based on the use of multi-PIC or smart-PIC technologies.

9. Pursuant to the local dialing parity requirements of section 251(b)(3), we require a LEC to permit telephone exchange service customers, within a defined local calling area, to dial the same number of digits to make a local telephone call, notwithstanding the identity of the customer's or the called party's local telephone service provider. We decline at this time to prescribe additional guidelines to address the methods that LECs may use to accomplish local dialing parity given our finding that local dialing parity will be achieved upon implementation of the number portability and interconnection requirements of section 251, as well as the provisions requiring nondiscriminatory access to telephone numbers found in section 251(b)(3).

---

entitled to choose a primary carrier for all intrastate toll calls and a separate, or the same, primary carrier for all interstate toll calls.

[17] 47 U.S.C. § 251(f)(2).

[18] The multi-PIC or smart-PIC presubscription method would enable subscribers to select multiple carriers for various categories of toll traffic. For a discussion of multi-PIC and smart-PIC presubscription methodologies, *see infra* section II.B(4).

10. We also decline to adopt federal consumer education programs or procedures that would inform consumers of the existence of competitive telecommunications providers. Instead, we leave decisions regarding consumer education and carrier selection procedures to the states. We conclude that, in order to ensure that dialing parity is implemented in a pro-competitive manner, national rules are needed for the recovery of dialing parity implementation costs.

11. Section 271 of the 1996 Act requires BOCs to provide intraLATA toll dialing parity throughout a state coincident with the exercise of their authority to offer interLATA services originating within the state.[19] BOC entry into the interLATA market is conditioned upon their offering "nondiscriminatory access to such services or information as are necessary to allow the requesting carrier to implement local dialing parity in accordance with the requirements of Section 251(b)(3)."[20]

2. Nondiscriminatory Access

12. Section 251(b)(3) also requires all LECs to permit competing providers of telephone exchange service and toll service "nondiscriminatory access to telephone numbers, operator services, directory assistance and directory listings."[21] We conclude that "nondiscriminatory access," as used in section 251(b)(3), encompasses both: (1) nondiscrimination between and among carriers in rates, terms and conditions of access; and (2) the ability of competing providers to obtain access that is at least equal in quality to that of the providing LEC. This definition of "nondiscriminatory access" in section 251(b)(3) recognizes the more general application of that section to all LECs, whereas section 251(c) places more specific duties upon incumbent LECs in terms of nondiscriminatory access. We conclude that the term "nondiscriminatory access to telephone numbers" requires all LECs to permit competing providers access to telephone numbers that is identical to the access the LEC provides to itself.

13. We conclude that the term "operator services," for purposes of section 251(b)(3), means any automatic or live assistance to a consumer to arrange for billing or completion, or both, of a telephone call. Such a definition includes busy line verification, emergency assistance, operator-assisted directory assistance, and any other such services used to arrange for the billing and/or completion of telephone calls. We further conclude that any customer of a telephone service provider that provides operator services should be able to obtain these services by dialing "0" or "0-plus the desired telephone number." If a dispute arises regarding

---

[19] 47 U.S.C. § 271(e)(2)(A).

[20] 47 U.S.C. § 271(c)(2)(B)(xii). We decline to address section 271(c)(2)(B) issues in this *Order*. We will consider each BOC's application to enter in-region, interLATA services pursuant to section 271(c)(2)(B) on a case-by-case basis to determine whether the BOC has complied with section 271(c)(2)(B)(xii).

[21] 47 U.S.C. § 251(b)(3).

a competitor's access to operator services, the burden will be upon the providing LEC to demonstrate, with specificity, that it has permitted nondiscriminatory access and that any disparity is not caused by network elements within its control. To the extent that operator services use any information services and adjuncts that are not "telecommunications services," of which resale is required under 251(b)(1), LECs are required to make available such services to competing providers in their entirety as a requirement of nondiscriminatory access under 251(b)(3).[22] Finally, we find that the refusal of a LEC providing nondiscriminatory access to comply with reasonable requests of competing providers to "brand" resold operator services as those of the reseller, or to remove its brand, creates a presumption that the LEC is unlawfully restricting access to operator services.

14. We conclude that the requirement in section 251(b)(3) of nondiscriminatory access to directory assistance means that LECs that provide directory assistance must permit access to this service to competing providers that is at least equal in quality to the access that the LEC provides to itself. We impose obligations upon all LECs to satisfy the requirement of nondiscriminatory access to directory listings. If a LEC provides directory assistance, that LEC must permit competing providers to have access to its directory assistance, so that any customer of a competing provider can access any listed number on a nondiscriminatory basis, notwithstanding the identity of the customer's local service provider. Further, we require LECs to share directory listings with competing service providers, in "readily accessible" tape or electronic formats, upon request, and in a timely manner. To the extent that all or part of directory assistance services are not "telecommunications services," of which resale is required under 251(b)(1), LECs must make available such services in their entirety as part of their obligation to permit nondiscriminatory access to competing providers.[23] This requirement thus extends to any information services and adjuncts used to provide directory assistance. Finally, as with the branding of resold operator services, we find that the refusal of a LEC providing nondiscriminatory access to directory assistance to "brand" resold directory assistance services as those of the reseller, or to remove its brand, creates a presumption that the LEC is unlawfully restricting access to directory assistance.

15. We also conclude that section 251(b)(3)'s requirement of nondiscriminatory access and its prohibition of unreasonable dialing delays applies to both the provision of local and toll dialing parity. We conclude that the dialing delay experienced by customers of a competing provider should not be greater than that experienced by customers of a LEC providing dialing parity or nondiscriminatory access, for identical calls or call types. Finally, we conclude that the statutory obligation to avoid unreasonable dialing delays places a duty on LECs that provide dialing parity, or nondiscriminatory access to operator services or directory assistance, to process all calls from competing providers on the same terms as calls from its own customers.

---

[22] *Id.*

[23] *Id.*

B. Actions to Implement Section 251(c)(5)

16. In addition to the duties imposed by section 251(b)(3) on all LECs, new section 251(c)(5) imposes upon incumbent LECs the duty to "provide reasonable public notice of changes in the information necessary for the transmission and routing of services using that local exchange carrier's facilities or networks, as well as of any other changes that would affect the interoperability of those facilities or networks."[24] We adopt broad guidelines to implement section 251(c)(5). We also specify how public notice must be made whenever an upcoming change may affect the way in which a competing service provider transmits, routes, or otherwise provides its services.

17. We conclude that "information necessary for transmission and routing" in section 251(c)(5) means any information in the incumbent LEC's possession that affects a competing service provider's performance or ability to provide either information or telecommunications services. We define "interoperability" as the ability of two or more facilities, or networks, to be connected, to exchange information, and to use the information that has been exchanged.

C. Actions Taken to Implement Section 251(e)

18. New section 251(e)(1) restates the Commission's authority over matters relating to the administration of numbering resources by giving the Commission "exclusive jurisdiction over those portions of the North American Numbering Plan that pertain to the United States."[25] This section also requires the Commission to "create or designate one or more impartial entities to administer telecommunications numbering and to make such numbers available on an equitable basis."[26] Finally, section 251(e)(2) provides that the cost of establishing telecommunications numbering administration arrangements "shall be borne by all telecommunications carriers on a competitively neutral basis as determined by the Commission."[27] In this *Order*, we address whether further action is required to create or designate an impartial entity to administer telecommunications numbering. We clarify the states' role in number administration, and provide direction to states wishing to use area code overlay plans. We also clarify how cost recovery for numbering administration will occur. We deny the petition for expedited declaratory ruling filed by the Texas Commission based on

---

[24] An incumbent LEC, with respect to an area, is defined under the 1996 Act as "the local exchange carrier that: (A) on the date of enactment of the Telecommunications Act of 1996, provided telephone exchange service in such area; and (B)(i) on such date of enactment, was deemed to be a member of the exchange carrier association pursuant to section 69.601(b) of the Commission's regulations (47 C.F.R. 69.601(b)); or (ii) is a person or entity that, on or after such date of enactment, became a successor or assign of a member described in clause (i)." 47 U.S.C. § 251(h)(1).

[25] 47 U.S.C. § 251(e)(1).

[26] *Id.*

[27] 47 U.S.C. § 251(e)(2).

our finding that the Texas Commission's wireless-only area code overlay plan violates the guidelines set forth in our *Ameritech Order*. We authorize Bellcore and the incumbent LECs to perform number administration functions as they did prior to the enactment of the 1996 Act until such functions are transferred to the new North American Numbering Plan Administrator.

19. We conclude that we have taken appropriate action to designate an impartial number administrator pursuant to section 251(e)(1). We further conclude that the Commission should retain its authority to set policy with respect to all facets of numbering administration to ensure the creation of a nationwide, uniform system of numbering that is essential to the efficient delivery of interstate and international telecommunications services and to the development of a competitive telecommunications services market. While we retain this policy-making authority, we authorize the states to resolve matters involving implementation of new area codes subject to the guidelines set forth in this *Order*.

20. In this *Order*, we also prohibit the use of service-specific or technology-specific area code overlay plans. States may employ all-services overlays only if they also mandate 10-digit dialing for all local calls within the area affected by the area code change and ensure the availability of at least one central office code in the existing area code to every entity authorized to provide local exchange service in that area, including CMRS providers.

21. To fulfill the mandate of section 251(e)(2), we require that (1) only "telecommunications carriers," as defined in Section 3(44) of the 1996 Act, shall contribute to the costs of numbering administration;[28] and (2) that such contributions shall be based on each contributor's gross revenues from its provision of telecommunications services reduced by all payments for telecommunications services and facilities that have been paid to other telecommunications carriers.

II. DIALING PARITY REQUIREMENTS

A. In General

22. With dialing parity a telephone customer can preselect any provider of telephone exchange service or telephone toll service without having to dial extra digits to route a call to that carrier's network. Until now, in most states, telephone customers wishing to have their intraLATA toll calls carried by a carrier other than their current provider of telephone exchange service had to dial a five- or seven-digit prefix or access code before dialing the

---

[28] The term "telecommunications carrier" means "any provider of telecommunications services, except that such term does not include aggregators of telecommunications services (as defined in section 226). A telecommunications carrier shall be treated as a common carrier under this Act only to the extent that it is engaged in providing telecommunications services, except that the Commission shall determine whether the provision of fixed and mobile satellite service shall be treated as common carriage." 47 U.S.C. § 153(44).

called party's telephone number.[29] Presubscription to a carrier other than a customer's telephone exchange service provider has not been an option for *interstate*, intraLATA toll calls or in most states for *intrastate*, intraLATA toll calls.[30] In states where intrastate, intraLATA toll dialing parity is available, a customer may presubscribe to a carrier other than his or her provider of telephone exchange service and have all of that customer's intrastate, intraLATA toll calls carried by that selected carrier simply by dialing "1" plus the area code and telephone number of the called party.[31] The section 251(b)(3) dialing parity obligation will foster vigorous local exchange and long distance competition by ensuring that each customer has the freedom and flexibility to choose among different carriers for different services without the burden of dialing access codes.

1. The Need for Minimum Nationwide Dialing Parity Standards

a. Background and Comments

23. Section 251(b)(3) imposes on all LECs the "duty to provide dialing parity to competing providers of telephone exchange service and telephone toll service."[32] In the *NPRM*, we sought comment on whether the Commission should adopt nationwide dialing parity standards and, if so, what those standards should be.[33]

24. A majority of commenters urge the Commission to adopt uniform nationwide dialing parity guidelines, but commenters differ on how detailed such federal rules should be. For example, the Telecommunications Resellers Association maintains that specific national standards are needed to ensure that competing providers are able to utilize common network designs in multiple markets and to prevent incumbent LECs from "gaming" or "manipulating

---

[29] Sometimes referred to as "10XXX" or "101XXXX" dialing, callers may reach a long distance carrier in states where such dialing arrangements are authorized by dialing a five-digit carrier access code ("10XXX," with "XXX" representing a three-digit carrier identification code) or a seven digit carrier access code ("101XXXX," with "XXXX" representing a carrier identification code).

[30] An "interstate, intraLATA toll call" is a call that: (1) crosses a state boundary but does not cross a LATA boundary; and (2) is subject to a charge. A call from Philadelphia, Pennsylvania to Cherry Hill, New Jersey (currently handled by Bell Atlantic) is an example of such a call.

[31] It is our understanding that some form of intraLATA toll dialing parity is available or has been ordered in Alaska, Arizona, Connecticut, Florida, Georgia, Illinois, Kentucky, Michigan, Minnesota, New Jersey, New York, Ohio, Pennsylvania, West Virginia, Wisconsin and Wyoming. *See Ex parte* letter from Charles D. Cosson, USTA, to William F. Caton, Acting Secretary, Federal Communications Commission, filed in CC Docket No. 96-98, July 10, 1996, at 2.

[32] 47 U.S.C. § 251(b)(3).

[33] *NPRM* at paras. 206, 207, 209-213, 218, 219.

the processes" of the states.[34] Ameritech urges the Commission to adopt "broad rules that afford sufficient flexibility to accommodate local conditions."[35] Other commenters, such as Bell Atlantic, opposing the adoption of federal dialing parity standards, assert that the proponents of such standards have failed to demonstrate how they or consumers have been harmed by "locally tailored implementation" of dialing parity in the intraLATA toll markets. Without such a demonstration, argues Bell Atlantic, the Commission should not interfere with states' activities.[37] Cincinnati Bell Telephone Company (CBT) likewise opposes federal standards, maintaining that so long as a state regulatory commission adopts a toll dialing parity arrangement that "offers consumers a choice from at least two carriers, one of which is the local exchange carrier, the requirements of the 1996 Act have been met."[38]

b. Discussion

25. We conclude that the purpose of the statutory dialing parity requirements -- to facilitate the introduction of competition in the local and toll markets -- is best served by the adoption of broad guidelines and minimum federal standards that build upon the states' experiences. We conclude that such minimum nationwide standards will facilitate competition to the extent that new entrants seeking to offer regional or national services will not be subjected to an array of differing state standards and timetables.[39] We note that our conclusion to adopt nationwide dialing parity standards is consistent with our conclusion in the *First Report and Order* that nationwide standards to implement other section 251 provisions are necessary to facilitate competition by serving as a backdrop against which interconnection negotiations and arbitration can occur.[40] We are persuaded that, contrary to the views of Bell Atlantic, the failure to adopt minimum federal standards would harm both new entrants and consumers by delaying the introduction of competition and imposing additional costs on competitors, including small entities, particularly when different network configurations are required in each market. We conclude that uniform standards -- in some cases minimum, uniform standards -- will speed competitive entry by more promptly opening the local and toll markets to competition.

[38] CBT comments at 5.

[39] We note that section 271(e)(2)(B) precludes most states from requiring a BOC to implement intraLATA toll dialing parity in a state before the BOC has received authority to provide in-region, interLATA services in such state or before three years after enactment of the 1996 Act, whichever is earlier. 47 U.S.C. § 271(e)(2)(B).

[40] *See First Report and Order* at section II.

2. Scope of the Dialing Parity Requirements

a. Background

26. Under section 251(b)(3) a LEC must provide dialing parity only to competing providers of telephone exchange service and telephone toll service.[41] The scope of the obligation to provide dialing parity, however, is not limited to a particular type of traffic or service. Section 251(b)(3) makes no distinction among international, interstate and intrastate traffic for purposes of the dialing parity provisions.[42] The statutory definition of "dialing parity" also contains no such distinctions and, instead, speaks generally in terms of the provision of "telecommunications services" by "a person that is not an affiliate of a local exchange carrier."[43] Based on the absence of any such distinctions in defining the scope of the dialing parity requirements, the *NPRM* tentatively concluded that section 251(b)(3) creates a duty to provide dialing parity to competing providers of telephone exchange service and telephone toll service with respect to all telecommunications services that require dialing to route a call, and encompasses international as well as interstate and intrastate, local and toll services.[44]

b. Comments

27. Numerous parties express support for the Commission's tentative conclusion.[45] Several parties qualify their support for this conclusion, however, by asserting that the duty to provide dialing parity to competing providers of telephone toll service applies to international calls only to the extent that it entitles a customer to route automatically, without the use of an access code, all of the customer's international calls to his or her presubscribed interLATA long distance carrier.[46] These parties maintain that section 251(b)(3) does not require LECs to provide customers a separate presubscription choice for international calling.[47]

---

[41] 47 U.S.C. § 251(b)(3).

[45] *See, e.g.*, MFS comments at 2; California Commission comments at 3.

[46] *See, e.g.*, Sprint comments at 4-5; SBC comments at 5.

[47] *Id.*

28. A broad range of parties also support the tentative conclusion that section 251(b)(3) imposes a duty on the LEC to provide both local and toll dialing parity.[48] Two parties reject this tentative conclusion, arguing that the dialing parity requirements apply only to local calling and do not extend to toll services.[49] Specifically, Lincoln Telephone and the Pennsylvania Commission contend that Congress addressed toll dialing parity only in section 271(e)(2) of the 1996 Act as it relates to the conditions under which a BOC may enter the in-region, interLATA toll business and question the Commission's authority to implement toll dialing parity requirements.[50] U S WEST similarly argues that section 251(b)(3) imposes only a duty to provide local dialing parity and suggests that the only affirmative obligation to provide toll dialing parity is contained in the equal access provisions of section 251(g) of the 1996 Act, which, U S WEST states, applies only to the BOCs and GTE.[51] Lincoln Telephone makes the additional argument that competitive providers wishing to enter the intraLATA toll market should be required to "share responsibility for serving the entire LATA, rather than simply selecting the lowest cost customers from the most profitable exchanges without regard to that practice's effect on other customers."[52] The imposition of such a requirement, according to Lincoln Telephone, would "reflect a commitment to affordable universal service."[53]

c. Discussion

29. We adopt our tentative conclusion that section 251(b)(3) creates a duty to provide dialing parity to competing providers of telephone exchange service and telephone toll service with respect to all telecommunications services that require dialing to route a call, and encompasses international as well as interstate and intrastate, local and toll services.[54] We note that section 251(b)(3) does not limit the types of traffic or services for which dialing parity must be provided to competing providers of telephone exchange and telephone toll service. The reference to these types of providers clearly shows that dialing parity must be provided for exchange service and toll service. Nothing in the statutory language limits the scope of the dialing parity obligation to exchange and toll services or distinguishes among the various types of telecommunications services in imposing the dialing parity obligations. This conclusion is further supported by the statutory definition of dialing parity insofar as it refers

[52] Lincoln Telephone comments at 5.

[53] *Id.* at 6.

[54] *NPRM* at para. 206.

to the provision of "telecommunications services" generally without distinction among various types of telecommunications services.[55] In addition, we are not persuaded that section 251(g) relieves certain LECs of the duty to provide toll dialing parity. That section contains no reference or cross reference to dialing parity or to section 251(b)(3). Section 251(g) preserves the equal access obligations already imposed on the BOCs and GTE, but does not exempt them or other LECs from the toll dialing parity requirements. Finally, we note that CMRS providers are not required to provide dialing parity or nondiscriminatory access under section 251(b)(3) because the Commission has not determined that CMRS providers are LECs and section 332(c) of the Communications Act of 1934 provides that a "person engaged in the provision of commercial mobile services . . . shall not be required to provide equal access to common carriers for the provision of toll services."[56]

30. Finally, concerning Lincoln Telephone's proposal to require competitive providers of intraLATA toll service to serve an entire LATA, rather than merely certain low cost customers within a LATA, we note that Lincoln Telephone, in essence, is asking us to condition a carrier's receipt of dialing parity upon that carrier's assuming the obligation of an "eligible" telecommunications carrier.[57] We find neither the language of section 251(b)(3) nor its legislative history supports the conclusion that Congress intended to condition a carrier's right to receive the benefits of dialing parity upon its assuming the obligations of an eligible telecommunications carrier. The issue of encouraging carriers to provide universal service throughout a service territory is beyond the scope of this proceeding.[58] Also, for the Commission to make LATA-wide or state-wide service a precondition of entry into that LATA or state would be to erect a major legal barrier to entry, particularly for smaller telecommunications services providers, that is contrary to the basic thrust of the 1996 Act.

---

[55] The issue of whether a separate presubscription choice is required for international, interstate, and intrastate toll calls is discussed more fully in section II.B(2) *infra*.

[56] 47 U.S.C. § 332(c)(8).

[57] An eligible telecommunications carrier is a common carrier that offers all services that are supported by federal universal service support mechanisms under section 254(c) and that uses "media of general distribution" to advertise the availability of those services and its charges for them. 47 U.S.C. § 214(e)(1). The issue of which services should receive support from universal service support mechanisms is being addressed by the Commission and the Federal-State Joint Board on universal service, as required by new section 254 of the Communications Act, as amended by the 1996 Act. *See Federal-State Joint Board on Universal Service*, CC Docket No. 96-45, Notice of Proposed Rulemaking and Order Establishing Joint Board, FCC 96-93, (rel. Mar. 8, 1996) (*Universal Service NPRM*) (proposing rules to implement section 254 of the 1996 Act).

[58] *See Universal Service NPRM*.

B. Implementation of the Toll Dialing Parity Requirements

1. Presubscription Method of Achieving Toll Dialing Parity

a. Background

31. The statutory definition of dialing parity provides that the customer must have the ability to choose "from among 2 or more telecommunications services providers (including such local exchange carrier)."[59] The definition also provides that customers must be able to exercise this choice by being able "to route automatically without the use of access codes, their telecommunications to the telecommunications services provider of the customer's designation."[60] Thus, LECs are precluded from relying on access codes as a means of providing dialing parity to competitive service providers.[61] The 1996 Act, however, does not specify what methods should be used to implement dialing parity. The *NPRM* tentatively concluded that presubscription represents the most feasible method of achieving dialing parity in long distance markets consistent with the statutory definition of dialing parity and sought comment as to this tentative conclusion.[62] In this context, the *NPRM* defined "presubscription" as the process by which a customer preselects a carrier to which all of a particular category or categories of calls on the customer's line will be routed automatically.[63]

32. As stated in the *NPRM*, presubscription to a carrier other than the customer's local exchange carrier has not been available for *interstate*, intraLATA toll calls nor has it been available in most states for *intrastate*, intraLATA toll calls.[64] Instead, LECs automatically carry these calls rather than routing them to a presubscribed carrier of the customer's choice. If the state from which the customer is calling has authorized competition, but has not ordered presubscription in the intraLATA toll market, a customer wishing to route an intraLATA toll call to an alternative carrier typically must dial the carrier access code of the alternative carrier.

b. Comments

33. Nearly all parties concur in the Commission's tentative conclusion that presubscription represents the most feasible method of achieving toll dialing parity consistent

---

[59] 47 U.S.C. § 153(15).

[60] *Id.*

[61] *Id.*

[62] *NPRM* at para. 207.

[63] *Id.*

[64] *Id.* at para. 208.

with the statutory definition of dialing parity.[65] PacTel and Lincoln Telephone suggest that presubscription is not required to achieve toll dialing parity so long as customers can reach competing toll carriers through the use of carrier access codes.[66] Finally, BellSouth argues that the toll dialing parity requirement is satisfied by "removing the intraLATA default to the incumbent LEC, thus assuring that no additional digits need to be dialed in order to reach carriers competing with the incumbent LEC for intraLATA toll service."[67] BellSouth further argues that the Commission should confirm that such arrangements are consistent with the statutory dialing parity requirements.[68]

c. Discussion

34. We adopt our tentative conclusion that the dialing parity requirement for toll calling can best be achieved through presubscription because that method would enable customers to route a particular category of traffic to a preselected carrier without having to dial access codes. We note that the use of access codes to route calls among competing providers of telephone toll service is precluded under the statutory definition of dialing parity.[69] Accordingly, we disagree with those parties who contend that toll dialing parity can be achieved through the use of access codes in a manner that is consistent with the statutory definition of dialing parity.[70] We also cannot conclude that the toll dialing parity requirement is satisfied by removing the intraLATA default, as BellSouth maintains.[71] Removing the intraLATA default would not satisfy the toll dialing parity requirement unless the LEC also uses the full 2-PIC presubscription methodology discussed below.[72]

---

[65] *See, e.g.*, Ohio Commission comments at 6; NEXTLINK comments at 9.

[66] *See, e.g.*, PacTel reply at 10 ("Toll dialing parity, on the other hand, should mean that customers can reach competing toll carriers on the same dialing basis, including through the use of carrier access codes, with an equal number of digits."); Lincoln Telephone comments at 2-3.

[67] BellSouth comments at 11 n.23.

[68] *Id.*

[69] *See* 47 U.S.C. § 153(15).

[70] Although the use of access codes to access competing providers of telephone toll service does not constitute dialing parity as defined in 47 U.S.C. § 153(15), we do not intend to preclude their use where a customer wishes to route a call to a carrier other than his or her presubscribed intraLATA toll carrier.

[71] We understand BellSouth's reference to "removing the intraLATA default" to mean that BellSouth would modify its switches so they no longer automatically route all intraLATA toll calls to BellSouth and thus, would permit customers to choose an alternative intraLATA toll carrier.

[72] For a discussion of the full 2-PIC methodology, *see* section II.B(4) *infra*.

2. Categories of Domestic, Long Distance Traffic Subject to Presubscription

a. Background

35. In the *NPRM*, the Commission sought comment as to the categories of long distance traffic (*e.g.*, intrastate, interstate, and international traffic) for which a customer should be entitled to choose presubscribed carriers.[73] The *NPRM* also sought comment on specific alternative methods for implementing local and toll dialing parity, including various forms of presubscription, in the interstate and intrastate long distance and international markets, that are consistent with the statutory requirements set forth in the 1996 Act.[74]

b. Comments

36. Most parties appear to agree that customers should be entitled to presubscribe to two separate carriers for their toll calling.[75] There is a lack of consensus in the record, however, regarding how the Commission should define the presubscription requirement. USTA, for example, argues that "[a]ll telecommunications carriers, including LECs, should be permitted to define the scope of local service and toll service in response to market forces."[76] USTA further argues that the "relevant distinction, for the long term, will be between intrastate and interstate toll traffic."[77] Sprint, on the other hand, argues in favor of maintaining a presubscription requirement based on LATA boundaries and recommends that customers continue to be allowed to choose separate intraLATA and interLATA toll carriers.[78] Sprint urges us to maintain the LATA distinction, asserting that "competition over the past 12

---

[74] *Id.* at para. 209.

[75] *See, e.g.*, Ohio Consumers' Counsel comments at 2; *see also* MCI comments at 3 (recommending that call types subject to presubscription should include: 1-plus/0-plus interexchange, 7-digit interexchange and 1+555-1212 calls); *cf.* GTE comments at 9 (maintaining that decisions regarding appropriate presubscription categories should be left to state regulatory agencies on theory that states are best positioned to balance value of additional carrier choices against higher administrative and network design costs associated with increased number of presubscription choices).

[76] *Ex parte* letter from Charles D. Cosson, USTA, to William F. Caton, Acting Secretary, Federal Communications Commission, filed in CC Docket No. 96-98, June 17, 1996, at 2.

[77] USTA comments at 3 n.2; *see also* MFS reply at 12-13 ("The Commission should recognize that rules for intraLATA presubscription are transitory. At some point, when the BOCs and GTE are authorized to provide both interLATA and intraLATA service, the distinctions between interLATA and intraLATA calls will no longer be meaningful, and the Commission should be prepared to revisit and eliminate these distinctions.").

[78] Sprint comments at 4.

years has developed around the LATA concept, and presubscription has for the most part already occurred along these lines."[79]

c. Discussion

37. With respect to toll service, we conclude that section 251(b)(3) requires, at a minimum, that customers be entitled to choose presubscribed carriers for their intraLATA and interLATA toll calls. Because of the variations that exist among LATA boundaries and toll traffic within, and among, the various states, we have also concluded that each state should have the opportunity to determine whether customers should be able to presubscribe to carriers for intrastate toll service and for interstate toll service in lieu of the intraLATA and interLATA toll presubscription dichotomy that we have established as a minimum nationwide standard at this time. Although toll dialing parity typically has been based on LATA boundaries in multi-LATA states where it has been implemented, we do not impose a requirement that toll dialing parity be based only on LATA boundaries given our expectation that implementation of the 1996 Act eventually will diminish the significance of LATA boundaries.[80] We are aware that BOCs remain subject to certain LATA boundary restrictions for at least the near-term and that some BOCs may find it technically infeasible, or otherwise undesirable, to implement toll dialing parity based on state boundaries.[81] We thus conclude that states should be able to take the relevance of those factors into account, where applicable, and have the flexibility to require that toll dialing parity implementation be based on state boundaries where they determine that implementing toll dialing parity on the basis of state boundaries would be pro-competitive and otherwise in the public interest. In Alaska and Hawaii, states with no LATAs, toll dialing parity will continue to be based on state boundaries.

38. We also direct each LEC to submit to the state regulatory commission for each state in which it provides telephone exchange service the LEC's plan for implementing toll dialing parity. That plan must contain detailed implementation information, including the proposed date for dialing parity implementation for that exchange that the LEC operates in each state, and the method it proposes for enabling customers to select alternative providers of

---

[79] *Id.* At the same time, Sprint asks that we eliminate the intrastate intraLATA/interstate intraLATA distinction and make all intraLATA toll calls (both interstate and intrastate) subject to a single presubscription.

[80] USTA correctly notes that independent exchange carriers have not been subject to the interLATA line of business restrictions that were imposed on the BOCs pursuant to the AT&T Consent Decree. *See United States v. American Telephone and Telegraph Co.*, 552 F. Supp. 226 (D.D.C. 1982). *See* USTA comments at 3 n.2.

[81] For example, where BOCs receive authority to provide in-region, interLATA services, they are required to provide such services through a separate affiliate for at least three years pursuant to section 272 of the 1996 Act. *See* 47 U.S.C. §§ 272(a)(2), (f)(1). Accordingly, it appears that the LATA distinction will remain relevant insofar as it will continue to define the geographic areas in which a BOC must provide toll services through an affiliate and those in which it may provide toll services directly.

telephone toll service. For a LEC, other than a BOC, the plan also must identify the LATA with which the LEC proposes to associate.[82]

39. We find that the states are best able to evaluate implementation plans in a way that will avoid service disruptions for subscribers and promote competition in the intrastate toll market. A LEC must first obtain state approval of its implementation plan before it implements toll dialing parity. If the LEC determines that a state commission elects not to evaluate the LEC's toll dialing parity implementation plan for that state sufficiently in advance of the date on which a LEC is required to implement toll dialing parity pursuant to the Commission's rules, we direct the LEC to file its plan with the Commission.[83] The Commission will release a public notice of any such LEC filings, in order to give interested parties an opportunity to comment. The LEC's plan will be deemed approved on the fifteenth day following release of the Commission's public notice unless, no later than the fourteenth day following the release of the Commission's public notice, either: (1) the Common Carrier Bureau notifies the LEC that its plan will not be deemed approved on the fifteenth day; or (2) an opposition to the plan is filed with the Commission and served on the LEC that filed the plan. The opposition must state specific reasons why the plan does not serve the public interest.

40. If one or more oppositions are filed, the LEC that filed the plan will have seven additional days (*i.e.*, until no later than the twenty-first day following the release of the Commission's public notice) within which to file a reply to the opposition(s) and serve it on all parties that filed oppositions. The response shall: (a) include information responsive to the allegations and concerns identified by the opposing party; and (b) identify possible revisions to the plan that will address the opposing party's concerns. In the case of such contested toll dialing parity plans, the Common Carrier Bureau will act on the plan within ninety days of the date on which the Commission released its public notice.[84] In the event the Bureau fails to act within 90 days, the plan will not go into effect pending Bureau action. If the plan is not contested but did not go into effect on the fifteenth day after the Commission released its public notice, and the Common Carrier Bureau fails to act on the plan within ninety days of the date on which the Commission released its public notice, the plan will be deemed approved without further Commission action on the ninety-first day after the date on which the Commission released its public notice of the plan's filing.

41. A LEC's plan may not accomplish toll dialing parity by automatically assigning toll customers to itself, to a customer's currently presubscribed interLATA or interstate toll

---

[82] States may require a LEC to provide other categories of information in its plan in addition to the information categories stated here.

[83] *See infra* para. 62 , which sets forth the dates by which a dialing parity implementation plan must be filed with the Commission in the event that a state will not be evaluating the plan.

[84] We delegate to the Chief, Common Carrier Bureau, the authority to approve, modify, or require the refiling of each plan that is filed with the Commission pursuant to this requirement.

carrier, or to any other carrier except when, in a state that already has implemented intrastate, intraLATA toll dialing parity, the subscriber has selected the same intraLATA and interLATA presubscribed carrier. Finally, when LATA boundaries encompass parts of two adjacent states, we permit the LEC to implement in each state the procedures that that state approved for implementing toll dialing parity within its borders. If a state commission elects not to evaluate the LEC's intrastate toll dialing parity plan, we direct the LEC to file both its intrastate toll dialing plan and its interstate toll dialing plan with the Commission. The plans will be acted on in accordance with the procedures outlined above.

42. We note that the minimum intraLATA/interLATA toll presubscription requirement that we adopt in this *Order* is necessarily an interim measure. Specifically, we expect that the development of the "multi-PIC" or "smart-PIC" presubscription methodology will enable customers to presubscribe to multiple carriers for various categories of long-distance calling.[85] Thus, in time, we anticipate that service markets, and the presubscription requirement in particular, will be defined by technological, economic and marketing considerations and that LATA or state boundary distinctions will diminish for purposes of the toll dialing parity requirements. As the record before us provides an inadequate basis for adopting more specific requirements now, we intend to monitor developments in this area and issue a Further Notice of Proposed Rulemaking to address these long range considerations so that end users will be able to preselect alternative providers for operator services, directory assistance, international and other services.

3. Separate Presubscription for International Calls

a. Background and Comments

43. The *NPRM* sought comment on whether customers should be entitled to choose a presubscribed carrier for international calls and on what Commission action, if any, is necessary to implement dialing parity for such calls.[86]

---

[85] The terms "smart-PIC" and "multi-PIC" have been defined differently in various contexts. For example, GVNW states that the multi-PIC presubscription method would permit customers to choose up to three different toll carriers, which, GVNW suggests, might include an intraLATA toll, interLATA toll and an international service provider. *See* GVNW comments at 6. GVNW states that the smart-PIC presubscription method would allow customers more than three carrier choices, "as when a fourth PIC for interstate, intraLATA is needed." *Id.* In a recent state commission decision, the terms "multi-PIC" and "smart-PIC," deemed to be synonymous, were defined as the ability to "select multiple carriers for various subdivisions of their interLATA and intraLATA toll calls." *Local Exchange Competition and Other Competitive Issues*, Case No. 95-845-TP-COL, 164 P.U.R.4th 214 (Ohio Pub. Util. Comm'n Sept. 27, 1995).

[86] *NPRM* at para. 210.

44. Most parties maintain that the 1996 Act does not require, and the Commission should not mandate, a separate presubscription choice for international calling.[87] Several parties take the position that the toll dialing parity requirement applies to international calling only to the extent that it entitles a customer to route automatically without the use of an access code the customer's international calls to the customer's presubscribed interLATA carrier.[88] A number of parties contend that the technology required to support a separate presubscription choice for international calling, the so-called multi-PIC or smart-PIC methodology, is not currently available.[89] USTA suggests that the cost of providing a separate presubscription choice for international calling should be weighed against the amount of customer demand for such an option, and the harm to consumers that may result from a potentially greater number of unauthorized carrier changes.[90] AT&T, Ameritech, Sprint and the Indiana Commission urge the Commission to revisit the issue of a separate presubscription choice for international calling only after it is demonstrated to be technically and economically feasible.[91]

b. Discussion

45. While we believe that a separate presubscription choice for international calling is consistent with the intent of the 1996 Act because it could foster additional carrier competition, we recognize that technical limitations preclude our imposing such a nationwide requirement at this time.[92] To the extent that such a capability becomes technically feasible and is ordered in a particular state, we find that the deployment of a separate presubscription choice for international calling is consistent with the 1996 Act. We will address in a further notice at a future date the issue of how soon a separate presubscription choice for international calling will be technically feasible on a nationwide basis.[93]

It is our understanding that GTE Hawaiian Telephone Company has multi-primary interexchange carrier capability that enables customers in Hawaii to select three

4. Full 2-PIC Presubscription Method

a. Background

46. In the *NPRM*, the Commission sought comment as to whether the Commission should adopt a nationwide presubscription methodology for implementing the toll dialing parity requirements.[94] The *NPRM* also noted that states have adopted a variety of intraLATA toll dialing parity requirements and implementation methodologies.[95]

47. Among the presubscription methodologies that states have examined are the "modified 2-PIC," the "full 2-PIC," and the "multi-PIC" or "smart-PIC" methods.[96] The modified 2-PIC method generally allows a customer to presubscribe to a telecommunications carrier for all interLATA toll calls and to presubscribe to either the customer's presubscribed interLATA carrier or the customer's local exchange carrier for all intraLATA toll calls. The full 2-PIC method generally allows customers to presubscribe to a telecommunications carrier for all interLATA toll calls and to presubscribe to another telecommunications carrier (including, but not limited to, the customer's local exchange carrier) for all intraLATA toll calls. The multi-PIC or smart-PIC methods, as known today, would allow customers to presubscribe to multiple carriers, each one of which would be selected to transport a specified component of toll traffic.

---

long-distance carriers, *i.e.*, an intrastate, interstate, and international carrier. *See ex parte* letter from Clarence Clay M. Nagao, Chief Counsel, State of Hawaii Public Utilities Commission, Department of Budget and Finance, to Mr. William F. Caton, Acting Secretary, Federal Communications Commission, filed in CC Docket No. 96-98, July 2, 1996. We note that the arrangement by which GTE Hawaiian Telephone Company provides a third carrier choice for international calling is a unique, interim solution that uses a combination of carrier identification codes and switch routing databases. This solution is not suitable for nationwide deployment because the switch database is too limited in size and the supply of CICs too small to support an adequate number of interLATA/international carrier combinations in many areas of the country. *Ex parte* letter from F.G. Maxson, GTE Service Corporation, to William F. Caton, Acting Secretary, Federal Communications Commission, filed in CC Docket No. 96-98, August 6, 1996.

[94] *NPRM* at para. 210.

[95] *Id.*

[96] *Id.*

b. Comments

48. Nearly all parties favor adoption of the full 2-PIC method.[97] Few parties favor deploying the modified 2-PIC method.[98] Likewise, few commenters favor immediate deployment of the multi-PIC method.[99] Several parties suggest that the multi-PIC or smart-PIC methodology and technology may warrant consideration in the future, but is currently unavailable.[100] Others maintain that the Commission should conclude that the 2-PIC approach is consistent with the 1996 Act based on the theory that the 1996 Act does not require more than a two-PIC capability to achieve toll dialing parity.[101]

c. Discussion

49. We adopt in this *Order* the full 2-PIC method as the minimum presubscription standard. Under our rules and pursuant to section 251(d)(3),[102] however, state commissions may impose more stringent presubscription requirements, such as multi-PIC or smart-PIC.

50. We adopt the full 2-PIC method as the minimum presubscription standard at this time for several reasons. We conclude that, as compared with the modified 2-PIC method, the full 2-PIC method will maximize choice for consumers and open the long-distance telecommunications markets to a greater number of competitive services providers, including smaller providers, and thus is more consistent with the congressional objectives underlying enactment of section 251(b)(3). Second, this method clearly is preferred by the majority of state regulators and telecommunications service providers.[103] Third, as compared with the multi-PIC method, the technology for the full 2-PIC method is widely available and well defined. By contrast, there is no evidence in the record to support a finding that the technical and economic feasibility of the multi-PIC method has been demonstrated on a nationwide

---

[103] *See, e.g.*, Pennsylvania Commission comments at 2; SBC reply at 2; PacTel reply at 10-11.

basis. We conclude that this national standard should speed competitive entry into the intraLATA and intrastate toll markets while providing states that are considering a more stringent presubscription method, *i.e.*, multi-PIC or smart-PIC, flexibility to impose such additional requirements. Until the Commission considers the issue of multi-PIC or smart-PIC methods in a further notice, we believe that the states are best situated to evaluate the technical feasibility and economic impact of such methods on LECs, including smaller LECs, in their jurisdictions.

5. Deployment of Presubscription Software in Each End Office

a. Background

51. With end office equal access, presubscription software is installed at each end office switch within the LEC's service areas. Toll calls are then directly routed at each end office switch to the presubscribed provider of telephone toll service. With centralized equal access, presubscription software is installed at a central tandem switch location. With the latter, toll calls are routed from an end office to a tandem switch for presubscription information.[104] Providers of telephone toll service may connect at the tandem to receive this traffic rather than at each individual end office that is associated with the tandem.

b. Comments

52. MCI raises the issue of whether presubscription software should be deployed in each end office or at a single tandem location and proposes that the Commission require end office equal access rather than centralized equal access.[105] Specifically, MCI argues that end office equal access represents a superior form of access to the extent that it enhances redundancy and reduces post dial delays.[106] Centralized equal access should not be permitted, MCI maintains, insofar as that approach requires that all end offices receive the equal access features from the tandem and any interruption in service from the tandem can affect a larger number of subscribers on the system.[107] In addition, because calls are routed from the end office to the tandem and back, MCI contends that centralized equal access would result in significant post-dial delay.[108] MCI does suggest, however, that in areas that "would not

---

[104] In this context, presubscription information refers to the information that is used by the switch to determine which interconnecting carrier carries and bills for the call.

[105] MCI comments at 5.

[106] *Id.*

[107] *Id.*

[108] *Id.* MCI does not attempt to define or quantify the term "significant."

otherwise convert to interLATA or intraLATA equal access, centralized equal access provides consumers at least a limited form of carrier choice."[109]

53. Two commenters who are centralized equal access providers oppose MCI's position.[110] Specifically, Iowa Network Services and MIEAC counter that centralized equal access is not inferior to end office equal access and repeatedly has been found to serve the public interest by the Commission and numerous state regulatory commissions.[111] MIEAC takes issue with MCI's argument that centralized equal access is inferior to end office equal access, noting that recent technological advances, and the use of SS7 trunk signaling, in particular, have improved call set up times and reduced post dial delay.[112] Iowa Network Services calls the argument that centralized equal access provides less network redundancy a "red herring" and notes its recent installation of a redundant fiber ring facility to connect its participating exchanges, which will allow instant rerouting of traffic in the case of a facilities equipment failure.[113] Iowa Network Services also operates a "diversity access tandem" that provides switch redundancy should its primary tandem fail.[114] MIEAC argues that centralized equal access networks fully comply with the toll dialing parity requirement of section 251(b)(3) insofar as these networks support 2-PIC presubscription.[115] Finally, MIEAC and Iowa Network Services contend that centralized equal access represents an appropriate method of providing equal access in rural areas where it otherwise would not be technically or economically feasible.[116]

c. Discussion

54. The issue of presubscription software deployment was not raised in the *NPRM* and, as a result, few commenters address it. We conclude that the record is not sufficient for us to require LECs, pursuant to section 251(b)(3), to provide end office equal access rather than centralized equal access to competing providers of telephone toll service. No specific information is provided, let alone consensus reached in this record, on such threshold issues as

the technical and economic feasibility of placing the software in one location over another. We note that while MCI and Iowa Network Services disagree generally on the benefits of deployment locations, neither addresses such important implementation issues as whether different switching equipment owned by various companies might provide obstacles to deployment, or the relevant costs associated with one deployment scheme over another. Iowa Network Services, we further note, does not address how its proposal would comport with the Commission's generally prescribed requirement under which most LECs are required to implement equal access at end offices.[117] Based on the reasons stated above, and based on our concern regarding the harm that could come to small telecommunications services providers if we adopt MCI's proposal, we decline to adopt at this time a requirement prescribing the location for deployment of presubscription software under section 251(b)(3).

C. Implementation Schedule for Toll Dialing Parity

1. Background and Comments

i. Timetable for BOCs

55. Section 271(e)(2)(A) requires a BOC to provide intraLATA toll dialing parity throughout a state "coincident with" its exercise of authority to provide in-region, interLATA services in that state.[118] Section 271(e)(2)(B) precludes most states from imposing intraLATA toll dialing parity requirements on a BOC before the earlier of the date on which a BOC is authorized to provide in-region, interLATA services in a state or three years from the date of enactment of the 1996 Act.[119] The *NPRM* sought comment on what implementation schedule should be adopted for all LECs.[120]

56. The BOCs generally argue that section 271(e)(2) establishes the relevant implementation schedule for all BOCs and, thereby, obviates the need for a nationwide implementation schedule for BOCs.[121] For example, Ameritech argues that, except in single-LATA states and where a state has previously ordered intraLATA presubscription, section 271(e)(2) requires a BOC to implement intraLATA toll dialing parity "coincident with its

---

[118] 47 U.S.C. § 271(e)(2)(A).

[119] 47 U.S.C. § 271(e)(2)(B). Exceptions from this requirement are made for single-LATA states and states that issued an order by December 19, 1995, requiring intraLATA toll dialing parity. *Id.*

[120] *NPRM* at para. 212.

[121] *See, e.g.*, Ameritech comments at 19.

exercise of in-region, interLATA authority" or three years after enactment of the 1996 Act.[122] Other parties urge the Commission to require BOCs to implement toll dialing parity in advance of these dates on the theory that only the states, and not the Commission, are constrained by the limitations in section 271(e)(2)(B).[123] Frontier suggests that the Commission mandate that dialing parity be made available immediately for interstate, intraLATA toll calls.[124] AT&T asserts that "except as provided in Section 271(e)(2)(B), the Commission should require all Tier 1 LECs to implement dialing parity, utilizing the Full 2-PIC method, by January 1, 1997."[125] NYNEX maintains that the Commission should recognize and give effect to state orders granting deferrals or waivers of the toll dialing parity requirements.[126]

ii. Timetable for all other LECs

57. For all other LECs, other than BOCs, the 1996 Act provides no timetable for implementing toll dialing parity. The *NPRM* sought comment on what implementation schedule should be adopted for all LECs.[127]

58. USTA argues that there is no need for a uniform implementation schedule and suggests that the Commission permit states to adopt their own timetables.[128] PacTel similarly opposes our adoption of an implementation schedule and advocates that all LECs be permitted to design their own schedules based on "local conditions and state requirements."[129] In contrast, MCI urges the Commission to adopt an implementation schedule based on the concern that incumbent LECs, if permitted to design their own timetables, would delay implementation because they lack incentive to implement dialing parity quickly. TCC proposes that non-BOC incumbent LECs should be required to provide toll dialing parity by no later than January 1, 1997.[130] NECA argues that a LEC's obligation to provide dialing parity should be triggered only upon the receipt of a *bona fide* request from a competitive toll

[130] TCC comments at 4.

provider.[131] Finally, MFS suggests that incumbent LECs be required to implement intraLATA toll dialing parity within a year of the effective date of the rules, or by the date previously ordered by a state commission.[132] MFS also asks the Commission to adopt rules specifying that in any geographic area where a BOC is not required to provide intraLATA presubscription pursuant to section 271(e)(2)(A), no other LEC in that geographic area will be required to provide toll dialing parity until the BOC is required to provide it.[133]

2. Discussion

59. As discussed above, we require all LECs to provide intraLATA and interLATA toll dialing parity no later than February 8, 1999. In addition, we require a LEC, including a BOC, to provide toll dialing parity throughout a state based on LATA boundaries coincident with its provision of in-region, interLATA or in-region, interstate toll services in that state. As discussed below, for non-BOC LECs that currently are providing, or within a year of release of this *Order* begin to provide, in-region, interLATA or in-region, interstate toll service, we provide a grace period during which those LECs will be able to provide such toll service before having to provide toll dialing parity to their customers. Moreover, non-BOC LECs that implement intraLATA and interLATA toll dialing parity may choose whichever LATA within their state that they deem to be most appropriate to define the area within which they will offer intraLATA toll dialing parity. State commissions in ruling upon such a choice of LATA association shall determine whether the proposed LATA association is pro-competitive and otherwise in the public interest. We note, however, as discussed above, that states may redefine the toll dialing parity requirement based on state, rather than LATA, boundaries where a state deems such a requirement to be pro-competitive and otherwise in the public interest.

60. We decline to adopt the recommendations of parties that urge us to require BOCs to provide toll dialing parity in a state before the earlier of the date on which those BOCs receive authority to provide in-region, interLATA services in that state or February 8, 1999. Subject to the requirements of the 1996 Act, we do, however, authorize states to determine whether a more accelerated implementation schedule should be utilized for LECs operating within their jurisdictions.[134] Where a state issued an order by December 19, 1995 requiring a BOC to implement toll dialing parity in advance of the implementation deadlines we establish, we do not intend to extend the toll dialing parity implementation deadline for the BOC beyond the implementation deadline established by that state. In addition, where a state

---

[131] NECA reply at 3-4; *see also* Rural Tel. Coalition comments at 6-7; GVNW comments at 5.

[132] MFS comments at 6.

[133] *Id.*; *cf.* Ohio Commission comments at 9 (new entrant LECs should be required to implement intraLATA toll dialing parity coincident with their offering of local telephone service since new entrants can equip their network switches to provide dialing parity before installation).

[134] *See* 47 U.S.C. § 271(e)(2)(b).

issued an order prior to the release of this *Order* requiring a LEC, other than a BOC, to implement toll dialing parity in advance of the implementation deadlines we establish, we do not intend to extend the toll dialing parity implementation deadline for the LEC beyond the implementation deadline established by that state.

61. We further conclude that LECs, other than BOCs, that begin providing in-region, interLATA or in-region, interstate toll services before August 8, 1997, including LECs that currently offer such services, are not required to implement toll dialing parity until August 8, 1997.[135] We do not mandate compliance with the toll dialing parity requirement by these LECs "coincident with" their provision of in-region, interLATA or in-region, interstate toll services because it would place certain carriers in violation of this order upon its release and would impose an unreasonably short timetable on others. To the extent that a LEC is unable to comply with the August 8, 1997 deadline, that LEC is required to notify the Commission's Common Carrier Bureau by May 8, 1997. The notification must state, in detail, the justification for the LEC's inability to comply by August 8, 1997 and set forth the date by which it will be able to implement toll dialing parity.[136] Finally, we have considered the arguments of LECs that seek to make their toll dialing parity obligation contingent upon the receipt of a *bona fide* request and conclude that special implementation schedules for smaller LECs are unnecessary because these LECs may petition their state commission, pursuant to section 251(f)(2), for a suspension or modification of the application of the dialing parity requirements.[137]

62. In summary, we establish the following toll dialing parity implementation schedule and filing deadlines for all LECs:

(a) Each LEC, including a BOC, must implement intraLATA and interLATA toll dialing parity based on LATA boundaries no later than February 8, 1999. If the state

---

[135] We note that the 1996 Act distinguishes between in-region services, for which BOCs must receive Commission authority to provide under section 271(d)(1), 47 U.S.C. § 271(d)(1), and out-of-region services, which BOCs are currently authorized to provide. *See* 47 U.S.C. § 271(b)(1), (b)(2). We note that for non-BOC LECs, it is the provision of toll services outside of the LEC's study area or the provision of interstate toll services that triggers the duty to provide toll dialing parity. We use the term in-region, interLATA or in-region interstate toll services to include those toll services, the provision of which by a LEC triggers the LEC's duty to provide toll dialing parity.

[136] As recently noted in the context of waiver petitions for certain caller identification rules, the Commission will not hesitate to take enforcement action, including monetary fines and other remedial measures against carriers that are unable to provide a compelling justification for failing to comply with Commission rules, particularly when they have been given a reasonable period within which to comply. *See Rules and Policies Regarding Calling Number Identification Service – Caller ID*, CC Docket No. 91-281, Memorandum Opinion and Order, DA 96-875 (1996).

[137] 47 U.S.C. § 251(f)(2).

commission elects not to evaluate a LEC's toll dialing parity implementation plan,[138] the LEC must file that plan with the Commission not later than 180 days before February 8, 1999.

(b) Except as provided in subparagraph (c) below, a LEC, including a BOC, that begins to provide in-region, interLATA toll services or in-region, interstate toll services in a state before February 8, 1999, must implement intraLATA and interLATA toll dialing parity based on LATA boundaries coincident with its provision of in-region, interLATA or in-region, interstate toll services. If the state commission elects not to evaluate its toll dialing parity implementation plan, the LEC must file such plan with the Commission not later than 180 days before the date on which it begins to provide in-region, interLATA toll services.

(c) A LEC, other than a BOC, that begins to provide in-region, interLATA or in-region, interstate toll services in a state before August 8, 1997, must implement intraLATA and interLATA toll dialing parity based on LATA boundaries by August 8, 1997. If the LEC is unable to comply with this August 8, 1997, implementation deadline, the LEC must notify the Commission's Common Carrier Bureau by May 8, 1997. At that time it must state its justification for noncompliance by August 8, 1997, and set forth the date by which it will be able to implement toll dialing parity. If the state commission elects not to evaluate the LEC's toll dialing parity implementation plan, the LEC must file such plan with the Commission not later than 90 days after publication of this *Order* in the Federal Register.

63. We further conclude that the 1996 Act does not authorize the Commission to give effect to a state order that purports to grant a BOC a deferral, waiver or suspension of the BOC's obligation to implement dialing parity. We note that section 251(f)(2) provides procedures for suspending or modifying application of the dialing parity requirements only for certain LECs, *i.e.*, those "with fewer than 2 percent of the Nation's subscriber lines installed in the aggregate nationwide."[139] Given that section 251 contains no comparable procedures for larger LECs, we are persuaded that Congress intended the dialing parity requirements that we adopt pursuant to section 251(b)(3) to apply, without exception, to all LECs with 2 percent or more of the Nation's subscriber lines.

---

[138] For a discussion of the content of and procedures relating to the toll dialing parity implementation plans, *see* section II.B(2) *supra*.

[139] 47 U.S.C. § 251(f)(2).

D. Implementation of the Local Dialing Parity Requirements

1. In General

a. Background

64. The *NPRM* tentatively concluded that, pursuant to section 251(b)(3), a LEC is required to permit telephone exchange service customers within a defined local calling area to dial the same number of digits to make a local telephone call, notwithstanding the identity of a customer's or the called party's local telephone service provider.[140] The *NPRM* sought comment on this tentative conclusion.[141]

b. Comments

65. Nearly all parties concur with the Commission's proposed interpretation of the local dialing parity requirements of section 251(b)(3).[142] Ameritech contends, however, that the 1996 Act requires only that local calls between competing LECs be dialed without the use of an access code.[143] Ameritech states that, while the Senate version of the dialing parity provision would have required LECs to provide customers with the ability "to dial the same number of digits" when using any carrier providing telephone exchange and exchange access service in the same area, Congress narrowed the dialing parity obligation in the final legislation to require only that calls between competing LECs be dialed without the use of an access code.[144] In response to Ameritech's proposed interpretation of the local dialing parity requirements, the Ohio Consumers' Counsel asserts that it does "not believe that consumers would see any real functional difference between having to dial extra digits and having to dial an access code" and, thus, urges that customers not be required to dial access codes or extra digits when using a competing provider's services.[145]

66. Ameritech also asks the Commission to clarify that "the dialing parity obligation applies only to competing carriers that provide both telephone exchange service *and* telephone

---

[140] *NPRM* at para. 211.

[141] *Id.*

[142] *See, e.g.*, ALTS comments at 4; GTE comments at 8; Ohio Commission comments at 8.

[143] Ameritech comments at 3-4. Notwithstanding its interpretation of the local dialing parity requirements, Ameritech notes that it has exceeded these requirements by establishing interconnection arrangements that allow customers of competing LECs to complete calls by dialing the same number of digits. *Id.* at 4.

[144] *Id.*

[145] Ohio Consumers' Counsel reply at 2.

toll service (*i.e.*, competing LECs)."[146] Finally, USTA urges the Commission to clarify that section 251(b)(3) does not include an obligation to provide dialing parity to CMRS providers.[147] USTA contends that the provision of dialing parity to CMRS providers by LECs would complicate implementation of "sender pays" arrangements that have been adopted in certain states if dialing parity were interpreted to preclude the use of extra digits and/or recorded announcements associated with a "sender pays" arrangement.[148] USTA expresses concern that customers may receive bills for calling CMRS customers without advance notice that they are going to be billed for such calls.[149]

c. Discussion

67. We adopt our tentative conclusion that, pursuant to section 251(b)(3), a LEC is required to permit telephone exchange service customers within a defined local calling area to dial the same number of digits to make a local telephone call, notwithstanding the identity of a customer's or the called party's local telephone service provider. As we stated in the *NPRM*, we believe that this interpretation of the dialing parity requirement as applied to the provision of telephone exchange service would best facilitate the introduction of competition in local markets by ensuring that customers of competitive service providers are not required to dial additional access codes or personal identification numbers in order to make local telephone calls. We disagree with Ameritech's view that Congress intended only to preclude the use of access codes and did not intend to preclude the dialing of extra digits. The fact that Congress ultimately adopted a dialing parity definition that precludes "the use of any access code"[150] does not constrain the Commission from precluding the dialing of extra digits, including access codes. Given that the statute does not define the term "access code," we conclude that our interpretation of the local dialing parity requirement will avoid potential disputes concerning what is and what is not an "access code." We are also persuaded by the argument advanced by the Ohio Consumers' Counsel that consumers would not perceive a functional difference between having to dial extra digits and having to dial an access code when using a competing provider's services.

---

[146] Ameritech comments at 3 n.6 (emphasis in original).

[147] USTA comments at 5.

[148] *Id.* In this context, the term "sender pays" refers to an arrangement under which a customer who originates a call to a CMRS customer pays the cost of airtime for terminating the call. Under a sender pays arrangement, the customer typically receives information regarding the price of the call before the call is placed. Once the customer receives this information, the customer then may decide whether or not to complete the call. Sender pays arrangements are atypical insofar as it is the CMRS customer who generally pays the cost of airtime for terminating calls.

[149] *Id.*

[150] 47 U.S.C. § 153(15).

68. We conclude that Ameritech's additional argument that the dialing parity obligation applies only to competing carriers that provide both telephone exchange service *and* telephone toll service, represents an impermissibly narrow reading of the statute. We find that the phrase "providers of telephone exchange service and telephone toll service" imposes an obligation on LECs to provide dialing parity to providers of solely telephone exchange service, to providers of solely telephone toll service, or to providers of both telephone toll and exchange service. We believe that this interpretation is consistent with both the language of the statute and Congress' intent to encourage the entry of new competitors in both the local and toll markets.[151] We reject USTA's argument that the section 251(b)(3) dialing parity requirements do not include an obligation to provide dialing parity to CMRS providers.[152] To the extent that a CMRS provider offers telephone exchange service, such a provider is entitled to receive the benefits of local dialing parity. Regarding USTA's argument that applying section 251(b)(3) in a way that benefits CMRS providers could complicate implementation of sender pays arrangements in some states, we conclude that the record before us is insufficient to determine whether, or under what circumstances, sender pays arrangements, including those requiring the dialing of extra digits or recorded announcements, are consistent with the 1996 Act. Although we do not intend to preclude the states from lawfully enforcing legitimate consumer protection policies that do not have an anticompetitive impact, we cannot conclude on this record that the arrangements USTA describes would be permissible. Finally, given our expectation that local dialing parity will be achieved through LECs' compliance with other section 251 requirements, we do not adopt a timetable for implementing the local dialing parity requirements.

2. Local Dialing Parity Methodologies

a. Background and Comments

69. In the *NPRM*, we stated our expectation that the local dialing parity obligations would not be achieved through presubscription.[153] Rather, we anticipated that a customer's ability to select a telephone exchange service provider and make local telephone calls without dialing extra digits will be accomplished through the unbundling, number portability and

---

[151] As the U.S. Court of Appeals for the Fifth Circuit stated in *Peacock v. Lubbock Compress Company*, "the word 'and' is not a word with a single meaning, for chameleonlike, it takes its color from its surroundings." The court held that "[i]n the construction of statutes, it is the duty of the Court to ascertain the clear intention of the legislature. In order to do this, Courts are often compelled to construe 'or' as meaning 'and,' and again 'and' as meaning 'or'." *Peacock v. Lubbock Compress Company*, 252 F.2d 892, 893 (5th Cir. 1958) (*citing United States v. Fisk*, 70 U.S. 445, 448 (1865).

[152] *See* section X of the *First Report and Order* for a discussion of the applicability of section 251 to CMRS providers.

[153] *NPRM* at para. 207 n.284.

interconnection requirements of section 251.[154] The *NPRM* sought information and comment as to how the local dialing parity requirement should be implemented.[155]

70. The parties generally agree that local dialing parity will be accomplished through implementation of the unbundling, number portability and interconnection requirements of section 251.[156] Parties add to this list the 1996 Act's equal access requirements.[157] A few parties contend that local dialing parity is assured once competing providers of telephone exchange service are permitted nondiscriminatory access to telephone numbers.[158]

b. Discussion

71. We anticipate that local dialing parity will be achieved upon implementation of the number portability and interconnection requirements of section 251. We also concur with the view that the ability of competing local exchange service providers to receive telephone numbers on a nondiscriminatory basis is critical to the achievement of local dialing parity. We believe that the interconnection requirements that section 251(c)(2) imposes on incumbent local exchange carriers will reduce the likelihood that customers of a competing LEC will have to dial an access code to reach a customer of the incumbent LEC insofar as the two networks are connected. Number portability will ensure that customers switching local service providers will not need to dial additional digits to make local telephone calls. Likewise, allowing every telecommunications carrier authorized to provide local telephone service, exchange access, or paging service in an area code to have at least one NXX in an existing area code also reduces the potential local dialing disparity that may result if competing LECs can only give customers numbers from a new area code. We therefore decline to prescribe now any additional guidelines addressing the methods that LECs may use to accomplish local dialing parity. We also conclude that, contrary to the views expressed by some parties, the provision of nondiscriminatory access to telephone numbers, by itself, does not fulfill the local dialing parity mandate of section 251(b)(3). Given that acquisition of a central office code by a LEC would not necessarily ensure that the LEC's customers would be relieved of an obligation to dial extra digits, access codes or some other special dialing protocol, the provision of nondiscriminatory access to telephone numbers does not by itself ensure local dialing parity. Rather, we find that under section 251(b)(3) each LEC must ensure that its customers within a defined local calling area be able to dial the same number of digits to make a local telephone call notwithstanding the identity of the calling party's or called party's local telephone service provider.

3. Non-Uniform Local Calling Areas

a. Background

72. The *NPRM* tentatively concluded that, pursuant to section 251(b)(3), a LEC is required to permit telephone exchange service customers within a defined local calling area to dial the same number of digits to make a local telephone call, notwithstanding the identity of a customer's or the called party's local telephone service provider.[159] The *NPRM* did not address the potential dialing parity implications of non-uniform local calling areas[160] nor did it address the potential impact of our proposed interpretation of the local dialing parity obligation on local calling area boundaries.[161]

b. Comments

73. A number of parties express concern about the potential interrelationship between our proposed interpretation of the local dialing parity requirements and local calling area boundaries.[162] For example, WinStar cautions the Commission that by requiring that customers "within a defined local calling area" be able to dial the same number of digits to make a local telephone call, certain parties may interpret this to require that a competing provider of local exchange service must define its local calling area to match the local calling area of the incumbent LEC.[163] GSA/DOD maintains that dialing is not truly at parity if different carriers have different definitions of the geographic areas in which calls can be made with seven-digit dialing.[164] To address the potential dialing parity issue that may arise when a new entrant's "network coverage" is more limited than the incumbent LEC's, GSA/DOD

---

[159] *NPRM* at para. 211.

[160] We use the term "non-uniform local calling area" to refer to a situation in which a telephone exchange service provider's local calling area is either larger or smaller than that of another telephone exchange service provider that is providing telephone exchange service in the same geographic area.

[161] Insofar as parties contend that the section 251(b)(3) dialing parity requirements compel the use of a ten-digit dialing plan for local calls within an area code overlay (*see, e.g.*, MFS comments at 3-5), we note that these concerns are addressed more fully below in paragraphs 286 through 287.

[162] *See, e.g.*, WinStar comments at 10-11; GSA/DOD comments at 4-5; Florida Commission comments at 3.

[163] WinStar comments at 10-11 ("The Commission should proceed carefully to ensure that it does not inadvertently limit carriers from experimenting with local calling areas."); *see also*, U S WEST comments at 6 (where dialing parity disputes arise over fact that local calling areas of two competing LECs do not match, states should resolve such disputes since they are familiar with local calling areas and calling patterns in that state).

[164] GSA/DOD comments at 4.

recommends that the Commission adopt rules that ensure that local calling areas are consistently defined for LEC wholesale and retail services.[165]

74. GTE contends that "[s]o long as new entrants have the technical ability to deploy equipment necessary to offer the same seven-digit dialing as the incumbent LEC, dialing parity should be deemed to exist even if one or more of the new entrants ultimately chooses to provide ten-digit dialing."[166] To illustrate its point that all local calls cannot be dialed using the same number of digits, NYNEX notes that in the New York City Metro LATA local calls span three different area codes, with seven-digit dialing within an area code and ten-digit dialing between area codes.[167] Finally, the Florida Commission expresses concern regarding the potential customer confusion that may result if customers in local calling areas are required to dial ten rather than the currently dialed seven digits to make local "Extended Calling Service" calls.[168]

c. Discussion

75. A telephone call requiring seven-digit dialing is not necessarily a local call[169] and a telephone call requiring ten-digit dialing is not necessarily a toll call.[170] Disparity in local dialing plans, by itself, does not contravene our interpretation of the local dialing parity requirements unless such plans are anti-competitive in effect.[171] By requiring that all customers "within a defined local calling area" be able to dial the same number of digits to make a local telephone call, we do not intend to require a competing provider of local exchange service to define its local calling area to match the local calling area of an incumbent LEC. We further do not intend to require a competing provider of telephone exchange service that voluntarily chooses to provide ten-digit as opposed to seven-digit dialing in a local calling area to modify its dialing plan in this instance in order to conform to

---

[165] *Id.* at 5.

[166] GTE comments at 8 n.10.

[167] NYNEX comments at 3 n.6.

[168] Florida Commission comments at 3.

[169] We note that several states permit seven-digit dialing for toll calls. *North American Numbering Plan, Area Codes 1996 Update*, Bellcore (January 1996) at 14. For example, within the 518 area code a call from Clifton Park, New York to Hague, New York is a toll call that can be dialed with seven digits.

[170] Section 3(48) defines "telephone toll service" as "telephone service between stations in different exchange areas for which there is made a separate charge not included in contracts with subscribers for exchange service." 47 U.S.C. § 153(48). By contrast, charges for calls within a local calling area generally are not assessed on a per call basis. Thus, the construct of local calling areas serves as the basis by which carriers price their services.

[171] *See, e.g.*, the discussion at paras. 281-291 regarding the discriminatory and anticompetitive nature of a service-specific or technology-specific overlay in connection with area code relief plans.

the dialing plan of another LEC. No other commenter addressed GSA's proposal that the Commission adopt rules that ensure that local calling areas are consistently defined for LEC wholesale and retail services. Therefore, we conclude that the record is insufficient to permit us to take such action at this time.

E. Consumer Notification and Carrier Selection Procedures

a. Background

76. Section 251(b)(3) does not specifically require that procedures be established to permit consumers to choose among competitive telecommunications providers (*e.g.*, through balloting).[172] The *NPRM* sought comment as to whether the Commission should require LECs to notify consumers about carrier selection procedures or impose any additional consumer education requirements.[173] We also sought comment on an alternative proposal that would make competitive telecommunications providers responsible for notifying customers about carrier choices and selection procedures through their own marketing efforts.[174]

b. Comments

77. Several parties contend that the responsibility for consumer education should be borne, at least in part, by the incumbent LECs[175] and claim that incumbent LECs are uniquely situated to assist in this function.[176] Conversely, others maintain that responsibility for the notification and education of consumers should be imposed on the carriers seeking those customers' business, as part of those carriers' marketing efforts.[177] GSA/DOD favors letting carriers "fight it out among themselves," noting that carriers themselves will have every incentive to make sure that prospective customers are aware of their choices.[178] PacTel suggests that states are in the best position to assess the informational needs of their citizens.[179] Several commenters express concern that any customer notification requirement

[176] *See, e.g.*, Illinois Commission comments at 67; ACSI comments at 10 (incumbent LECs should be required to provide bill inserts to customers alerting them to opportunity to select alternative service provider).

[177] *See, e.g.*, CBT comments at 5; Bell Atlantic comments at 5; Frontier comments at 4; BellSouth reply at 4; GTE reply at 15.

[178] GSA/DOD comments at 6.

[179] PacTel comments at 13.

must recognize that the details of any such notification plan should reflect local circumstances, including local carrier selection options, rates and dialing plans.[180] Ameritech maintains that a "carrier-neutral customer notification of the toll dialing parity selection processes is in the public interest and should be a part of the implementation of any toll dialing parity plan."[181]

78. While several commenters urge the Commission to adopt rules for balloting,[182] the majority of parties urge us to reject this option.[183] Parties that oppose balloting argue that such decisions should be left to the individual states[184] and claim that balloting is confusing to customers,[185] costly,[186] and forces consumers to make selections before they might otherwise choose to do so.[187] Commenters also argue that competition for customers will ensure that carriers notify customers as to how their services can be obtained.[188] In stating its opposition to a balloting requirement, MFS observes that:

> the long-distance market today differs markedly from the situation in the mid-1980's, when non-dominant carriers were virtually unknown to most consumers and balloting was mandated as a way of educating consumers to their ability to choose a carrier. No such education is needed today, because most consumers are well aware of their long-distance choices, and the carriers have readily available means of contacting those who are not.[189]

79. Commenters also raised a number of issues related to consumer notification and carrier selection methods. For example, PacTel asserts that "the default carrier for both existing and new customers who do not actively choose an intraLATA toll provider should be the dial-tone provider."[190] Sprint agrees that "existing customers who are currently obtaining

[190] PacTel comments at 11.

intraLATA toll service from the dial tone provider, and do not indicate a desire to change carriers, should remain with that intraLATA toll provider."[191] Sprint rejects PacTel's proposal, however, "to default new customers who do not choose an intraLATA toll provider to the dial tone provider."[192] Concerning whether customers should be assessed a "PIC change charge" when they select an alternative provider of telephone toll or telephone exchange service, parties propose allowing customers a "grace period" during which they could switch carriers without charge.[193] The Ohio Consumers' Counsel supports a cap on the cost of initiating both local and toll service with a new carrier, noting that a "customer's old carrier should not be able to impose an 'exit fee' upon the customer who switches."[194] Finally, GVNW urges that the Commission's rules, complaint procedures and penalties for "slamming" be applied to any carrier selection procedures that the Commission adopts with respect to local exchange service providers.[195]

c. Discussion

80. We agree with those commenters who observe that competitive providers of telephone exchange and telephone toll service have an incentive to make consumers aware of the choices available, and we perceive no need to prescribe detailed consumer notification or carrier selection procedures at this time. We do believe, however, that states may adopt such procedures. The states are best positioned to determine the consumer education and carrier selection procedures that best meet the needs of consumers and telecommunications services providers in their states. Thus, states may adopt consumer education and carrier selection procedures that will enable consumers to select alternative carriers for their local and toll services. We further agree that a customer notification requirement should take into consideration local circumstances. The states may adopt balloting, consumer education and notification requirements for services originating within their states, that are not anti-competitive in effect. States also may adopt measures to prevent abuse of the customer notification and carrier selection processes. All such procedures, however, must be consistent with the guidelines set forth above with respect to the requisite categories of toll traffic for which consumers must be entitled to presubscribe and the toll presubscription method that we require carriers to implement. We note that the consumer notification requirements already

---

[191] Sprint reply at 5-6 n.8.

[192] *Id.* On a related issue, AT&T urges the Commission to intercede where abuse of the customer notification process occurs, such as when a LEC uses its "provision of exchange service to influence toll PIC choices." AT&T comments at 6 n.9. AT&T adds that the Commission should prohibit LECs from extending interLATA PIC "freezes" to intraLATA traffic. *Id.*

[195] GVNW comments at 7.

imposed by states' intrastate, intral ATA toll dialing parity orders have required LECs to inform customers either once or twice of their opportunity to choose an alternative carrier.[196] We anticipate that any subsequently imposed consumer notification requirements would be no more be burdensome, and, in particular, would not require more than two notifications to consumers of their opportunity to choose alternative carriers to transport their intraLATA toll calls.

81. We conclude that "dial-tone providers" should not be permitted automatically to assign to themselves new customers who do not affirmatively choose a toll provider. New customers of a telephone exchange service provider who fail affirmatively to select a provider of telephone toll service, after being given a reasonable opportunity to do so, should not be assigned automatically to the customer's dial-tone provider or the customer's preselected interLATA toll or interstate toll carrier. Rather, we find that consistent with current practices in the interLATA toll market, such nonselecting customers should dial a carrier access code to route their intraLATA toll or intrastate toll calls to the carrier of their choice until they make a permanent, affirmative selection. This action eliminates the possibility that a LEC could designate itself automatically as a new customer's intraLATA or intrastate toll carrier without notifying the customer of the existence of alternative carrier choices. Finally, notwithstanding our decision to entrust the issues of consumer notification and carrier selection to the states, we emphasize that all telecommunications carriers remain subject to the requirements of section 258 as well as any verification or "anti-slamming"[197] procedures that the Commission may adopt to prevent unauthorized changes in a customer's selection of a provider of telephone exchange or telephone toll service.[198]

---

[196] *See, e.g., Adoption of rules relating to intra-Market Service Area presubscription and changes in dialing arrangements related to the implementation of such presubscription*, Interim Order (Ill. Comm. Comm'n. Apr. 7, 1995).

[197] The Commission has defined slamming as the unauthorized conversion of a customer's interexchange carrier by another interexchange carrier, an interexchange resale carrier, or a subcontractor telemarketer. *Cherry Communications, Inc. Consent Decree* 9 FCC Rcd 2986, 2987 (1994).

[198] Section 258 makes it unlawful for any telecommunications carrier to "submit or execute a change in a subscriber's selection of a provider of telephone exchange service or telephone toll service except in accordance with such verification procedures as the Commission shall prescribe." 47 U.S.C. § 258(a). The section further provides that:

> [a]ny telecommunications carrier that violates the verification procedures described in subsection (a) and that collects charges for telephone exchange service or telephone toll service from a subscriber shall be liable to the carrier previously selected by the subscriber in an amount equal to all charges paid by such subscriber after such violation.

47 U.S.C. § 258(b). Section 258 extends the slamming prohibition to all telecommunications carriers, not just interexchange carriers, as is the case under the Commission's current Part 64 rules. *See* 47 C.F.R. § 64.1100.

F. Cost Recovery

a. Background

82. In the *NPRM*, the Commission noted that the 1996 Act does not specify how LECs will recover the costs associated with providing dialing parity to competing providers.[199] The Commission therefore sought comment on: (1) what, if any, standard should be used for arbitration to determine the dialing parity implementation costs that LECs should be permitted to recover; and (2) how those costs should be recovered.[200]

b. Comments

83. At the outset, we note that there does not appear to be a consensus among commenters as to either of the two cost recovery issues raised in the *NPRM*. The parties are generally divided into two positions: (1) interexchange carriers and competitive carriers prefer a Commission standard under which carriers could recover from competing providers only the specific incremental costs of providing intraLATA toll dialing parity; and (2) incumbent LECs and several states prefer that no national standards be developed, and that cost recovery issues be left either to the states or to intercarrier negotiations.

84. AT&T suggests that carriers only be entitled to recover incremental costs directly associated with the implementation of dialing parity, and states that the Commission should "explicitly exclude (a) recovery of costs intended to reimburse an incumbent carrier for revenues it expects to lose as a result of implementing dialing parity . . . as well as (b) costs associated with network upgrades that are not necessary to implement dialing parity."[201] AT&T further suggests that the Commission mandate an "Equal Access Recovery Charge" on all providers of toll service based on minutes of use subject to dialing parity, and that this charge be tariffed separately from any access charges, approved by the state commission, and amortized over a period not to exceed eight years.[202]

85. MCI appears to agree with AT&T's proposal, stating that "incremental costs incurred to implement dialing parity should be recovered from all carriers that carry intraLATA toll on a presubscribed basis in accordance with cost causative principles."[203] MCI also suggests that dialing parity costs be recovered on a minutes-of-use basis, as an addition to the local switching rate element, which would be separately identified in a tariff, and that

---

[199] *NPRM* at para. 219.

[200] *Id.*

[201] AT&T comments at 7.

[202] *Id.*

[203] MCI comments at 3.

Commission rules for cost recovery be "presumptively correct" (*i.e.*, states can depart from such rules if they can show their mechanism is more effective).[204] Several parties urge the Commission to draw upon its cost recovery paradigms for interLATA equal access, and apply the same basic principles to the intraLATA toll market.[205]

86. Many other competitive providers also advocate various forms of incremental cost recovery, on a per-minutes of use basis, to be assessed against all providers of presubscribed intraLATA toll services; such costs could include, for example, hardware costs, software costs, and consumer education costs.[206] GSA/DOD asks the Commission to "view LEC claims for large cost compensation with considerable skepticism," and suggests that the Commission "distribute any verifiable incremental costs associated with achieving dialing parity as a percentage surcharge on the bills of all carriers, including the incumbent LECs."[207]

87. Taking the opposite view, BOC commenters, together with GTE and USTA, argue that there is essentially no need for the Commission to adopt cost recovery measures for dialing parity, and that cost recovery issues are best left for the states to address.[208] Several state public utility commissions also argue that, given the state-specific nature of intraLATA cost recovery issues, and the omission of a specific cost-recovery standard from Congress in section 251(b)(3), the individual states are in the best position to address these issues.[209] In support of these arguments, some state commenters have provided the Commission with detailed descriptions of their current mechanisms for recovering intraLATA presubscription costs.[210]

88. Ameritech argues that dialing parity costs "should be recovered under normal regulatory principles from the cost-causer," and Bell Atlantic argues that "only carriers who will benefit from intraLATA presubscription should pay the costs. Unless interexchange carriers bear the full costs of implementing intraLATA presubscription, exchange carrier customers who do not switch intraLATA toll carriers and do not benefit from presubscription

would ultimately be required to pay for it."[211] On the other extreme, the Telecommunications Resellers Association states that incumbent LECs should "shoulder the full financial burden of remedying this competitive imbalance [in the intraLATA toll market]."[212]

89. The reply comments reveal substantial disagreement among carriers from the two opposing positions. Interexchange carriers and competitive carriers reject the suggestion that they shoulder the full cost burden for intraLATA dialing parity, and urge that, at a minimum, costs be spread among all service providers that enjoy dialing parity.[213] AT&T states that "the proposal by Ameritech and Bell Atlantic to recover implementation costs exclusively from their competitors underscores the need for explicit national rules. . . . [n]othing could be more. . .harmful to competition, than allowing incumbent LECs to charge a fee for new entrants for the "privilege" of competing with them."[214] GSA/DOD also urges the Commission to "reject" the proposals of Bell Atlantic and SBC.[215] MFS correctly notes that there was "little consensus" on this issue, and states "it is entirely inappropriate in a competitive environment that an individual carrier's costs be recovered from its competitors."[216] The Ohio Consumer's Counsel states that Ameritech's "cost-causer" proposal "ignores the fact that the benefits of dialing parity are network-wide."[217]

90. Incumbent LECs maintain that the Commission should not set national cost recovery standards, and that this matter remains the prerogative of the states.[218] GTE "strongly opposes" AT&T's suggestions, and PacTel states that "LECs cost recovery should not be limited by noncompensatory incremental methodologies or unreasonably long amortization requirements."[219] SBC asserts that the proposals of MCI and AT&T are "examples of regulatory micro-management, are inconsistent with Congressional intent, and

[219] PacTel reply at *iii.*

would also. . .place the major burden of dialing parity cost recovery squarely on the backs of incumbent LECs."[220]

91. GCI states that "costs should be recovered in a competitively neutral manner because all LECs, not just incumbent LECs, must meet this obligation."[221] Western Alliance contends that "costs incurred to achieve dialing parity should be included in the investment recoverable through explicit universal [service] supports."[222] Finally, NECA argues that there is no need for the Commission to prescribe specific cost recovery mechanisms.[223]

c. Discussion

92. We conclude that, in order to ensure that dialing parity is implemented in a pro-competitive manner, national rules are needed for the recovery of dialing parity costs. We further conclude that these costs should be recovered in the same manner as the costs of interim number portability, as mandated in our recent *Number Portability Order*.[224] Our authority to promulgate national cost recovery rules derives from section 251(d) of the 1996 Act and section 4(i) of the 1934 Act. In section 251(d), Congress directed the Commission to take the necessary steps to implement section 251. Section 4(i) of the 1934 Act authorizes us to take any action we consider "necessary and proper" to further the public interest in the regulation of telecommunications. Because we determine that dialing parity is crucial to the development of local exchange competition, we conclude that we should establish pricing principles for the recovery of dialing parity costs. Accordingly, we reject the arguments of incumbent LECs and others who oppose national standards for cost recovery of the network upgrades required to achieve dialing parity.

93. Many of the network upgrades necessary to achieve dialing parity, such as switch software upgrades, are similar to those required for number portability. Moreover, with both dialing parity and number portability, customer inconvenience represents the barrier to effective competition Congress intends to eliminate, whether that inconvenience results from the dialing of extra digits in the case of dialing parity, or notification of family, friends and business contacts when a customer is forced to change his or her number. For these reasons, we determine that our recent *Number Portability Order* provides guidance regarding which costs incumbent LECs should be able to recover in implementing dialing parity, as well as how such costs should be recovered. The rules adopted in the *Number Portability Order*

[224] *Telephone Number Portability*, FCC 96-286, CC Docket No. 95-116 (July 2, 1996) (*Number Portability Order*).

apply only to currently-available number portability mechanisms. We sought further comment on cost recovery for long-term number portability, because long-term number portability will involve a different kind of system than currently available solutions. We tentatively concluded that under section 251(e)(2), the same cost recovery principles should apply to long-term number portability. In the case of dialing parity, there is a similar distinction between currently-available solutions (*i.e.*, full 2-PIC presubscription), and long-term solutions (*i.e.*, multi-PIC or smart-PIC methodologies). Like number portability, we may need to revisit the issue of an appropriate cost recovery standard once other presubscription technologies become available on a nationwide basis.

94. In the *Number Portability Order*, we concluded that costs for number portability should be recovered on a competitively-neutral basis.[225] We also concluded that any recovery mechanism should: (1) not give one service provider an appreciable, incremental cost advantage over another service provider, when competing for a specific subscriber; and (2) not have a disparate effect on the ability of competing service providers to earn a normal return.[226] We therefore reject the arguments of those commenters that assert that only new entrants should bear the costs of implementing dialing parity, because such an approach would not be competitively neutral. We also concluded in the *Number Portability Order* that LECs could only recover the incremental costs of implementing number portability. Because we determine that number portability and dialing parity share significant technical similarities and overcome similar barriers to competition, we conclude that we should impose the same cost standard for dialing parity costs that we have adopted for number portability costs. We therefore agree with AT&T that LECs may not recover from other carriers under a dialing parity cost recovery mechanism any network upgrade costs not related to the provision of dialing parity.

95. In our *Number Portability Order*, we concluded that the costs of long-term number portability that could be recovered through a competitively-neutral mechanism included installation of number portability-specific switch software, implementation of SS7 and IN or AIN capability, and the construction of number portability databases.[227] We determined that states could use several allocators, including gross telecommunications revenues, number of lines, and number of active telephone numbers, to spread number portability costs across all telecommunications carriers.[228] Applying the same cost recovery principles to dialing parity, we conclude that LECs may recover the incremental costs of dialing parity-specific switch software, any necessary hardware and signalling system

---

[225] Section 251(e)(2) of the 1996 Act states that "the cost of establishing ... number portability shall be born by all telecommunications carriers on a competitively neutral basis, as determined by the Commission." This statutory provision does not apply to the dialing parity requirement.

[226] *Number Portability Order* at paras. 121-140.

[227] *Id.* at para. 122.

[228] *Id.* at paras. 134-36.

upgrades, and consumer education costs that are strictly necessary to implement dialing parity. These costs must be recovered from all providers of telephone exchange service and telephone toll service in the area served by a LEC, including that LEC, using a competitively-neutral allocator established by the state.[229] Although, under section 251(e)(2), number portability costs must be recovered from all telecommunications carriers, section 251(b)(3) only requires that dialing parity be provided to providers of telephone exchange service and telephone toll service. Therefore, we conclude that a competitively-neutral recovery mechanism for dialing parity should only allocate costs to this more limited class. States may use any of the allocators described in the *Number Portability Order*, or any other allocator that meets the criteria we have established. States should apply the principles we adopt today, and the other guidelines for recovering costs of currently available number portability measures, in establishing more specific cost recovery requirements for dialing parity.

G. Unreasonable Dialing Delays

96. For a discussion of the section 251(b)(3) prohibition on unreasonable dialing delays, as that section applies to the provision of local and toll dialing parity, see section III(E) below.

III. NONDISCRIMINATORY ACCESS PROVISIONS

A. Definition of the Term "Nondiscriminatory Access"

1. Background

97. Section 251(b)(3) requires all LECs to permit "nondiscriminatory access" to telephone numbers, operator services, directory assistance, and directory listings to competing providers of telephone exchange service, and to competing providers of telephone toll service.[230] In the *NPRM*, we tentatively concluded that "nondiscriminatory access" requires each LEC to permit the same degree of access that the LEC itself receives for the services specified in section 251(b)(3).[231] The Commission also asked for specific comment on whether the nondiscriminatory access provisions of section 251(b)(3) also impose a duty on LECs to resell operator and directory assistance services to competing providers.[232]

---

[229] We recognize that, unlike the case for number portability costs, states would not be able to establish a cost allocator based on numbers of lines because such an allocator could not apportion costs on a competitively neutral basis where dialing parity is provided to a CMRS provider. We expect that states will establish a competitively neutral allocator that can be used to apportion costs among all providers.

[230] 47 U.S.C. § 251(b)(3).

[231] *See NPRM* at para. 214.

[232] *See NPRM* at paras. 216, 217.

2. Comments

98. A number of commenters concur that, as proposed in the *NPRM*, "nondiscriminatory access" should require each LEC to permit the same access to these services that the LEC itself receives.[233] Bell Atlantic argues, however, that access need not be strictly equal, but must "simply be of a type that will permit the other carrier to provide comparable services with no difference in quality perceptible to callers."[234] Bell Atlantic cites the Modification of Final Judgment (MFJ) for the proposition that "equal access" does not require "strict technical equality of services and facilities," but rather it requires that consumers should perceive no qualitative differences.[235] Sprint objects to Bell Atlantic's use of "customer perception" as the nondiscriminatory access standard, arguing that this standard would allow the incumbent LEC to "discriminate against its competitors in ways not visible to the end user."[236]

99. Ameritech requests a clarification that a LEC's duty under section 251(b)(3) is owed only to "providers of telephone exchange and telephone toll service."[237] Ameritech also argues that because Congress did not expressly impose a strict equality standard in section 251(b)(3), as it did in section 251(c)(2)(C) for incumbent LECs, "the only logical interpretation is that LECs are required to provide access . . . that is nondiscriminatory among carriers."[238] The Ohio Consumer's Counsel responds that "Ameritech is claiming that giving all other carriers an equal level of *degraded* access, *i.e.*, inferior to that provided to itself, is 'non-discriminatory.' Surely Congress contemplated nothing of the sort, as is recognized even by other incumbent LECs."[239]

[236] Sprint reply at 9-10.

[237] Ameritech comments at 11.

[238] *Id.* at 12 - 13. Section 251(c)(2)(C) imposes a duty on incumbent LECs to provide interconnection that is "at least equal in quality to that provided by the local exchange carrier to itself or to any subsidiary, affiliate, or any other party to which the carrier provides interconnection." 47 U.S.C. § 251(c)(2)(C).

[239] Ohio Consumers' Counsel reply at 3.

100. As for resale, a number of commenters agree that LECs should make operator and directory assistance services available for resale to competing providers under section 251(b)(3), in order to further nondiscriminatory access to such services.[240] On the other hand, several commenters contend that this provision does not imply any resale requirements.[241] AT&T argues that resale is not required under section 251(b)(3), because "to the extent that a local exchange carrier provides transmission with, or as part of, its operator services, the service must be made available for resale under sections 251(b)(1) and 251(c)(4) of the Act."[242] Bell Atlantic takes a similar approach, arguing that, to the extent that a LEC provides operator and directory assistance services that are "telecommunication services," the service must be made available for resale by LECs under section 251(b)(1), and, if the services are telecommunication services offered to retail customers, incumbent LECs must offer them for resale at wholesale prices under section 251(c)(4).[243]

3. Discussion

101. We conclude that the term "nondiscriminatory access" means that a LEC that provides telephone numbers, operator services, directory assistance, and/or directory listings ("providing LEC")[244] must permit competing providers to have access to those services that is at least equal in quality to the access that the LEC provides to itself. We conclude that "nondiscriminatory access," as used in section 251(b)(3), encompasses both: (1) nondiscrimination between and among carriers in rates, terms and conditions of access; and (2) the ability of competing providers to obtain access that is at least equal in quality to that of the providing LEC.[245] LECs owe the duty to permit nondiscriminatory access to competing providers of telephone exchange service and to providers of telephone toll service, as the plain language of the statute requires. Such competing providers may include, for example, other LECs, small business entities entering the market as resellers, or CMRS providers.

102. Section 251(b)(3) requires that each LEC, to the extent that it provides telephone numbers, operator services, directory assistance, and/or directory listings for its customers,

---

[240] *See, e.g.*, ALTS comments at n.4; MCI reply at 3; MFS reply at 10; and Telecommunications Resellers Association comments at *ii*.

[241] *See, e.g.*, GTE comments at 16; Ameritech comments at n.16; NYNEX comments at 6-7.

[242] AT&T comments at n.13.

[243] Bell Atlantic comments at 8.

[244] We use the term "providing LEC" throughout this section to refer to the LEC that is permitting nondiscriminatory access to its services pursuant to section 251(b)(3). The term "competing provider" refers to a provider of telephone exchange service or a provider of telephone toll service that seeks nondiscriminatory access from a providing LEC.

[245] *See also* corresponding definition of "nondiscriminatory" in the *First Report and Order* at section V for the purposes of section 251(c)(2).

must permit competing providers *nondiscriminatory* access to these services.[246] Any standard that would allow a LEC to permit access that is inferior to the quality of access enjoyed by that LEC itself is not consistent with Congress' goal to establish a pro-competitive policy framework.

103. We are not persuaded by Bell Atlantic's statement that the standard for nondiscriminatory access should focus *only* upon "customer perceptions" of service quality. Such a standard overlooks the potential for a providing LEC to subject its competitors to discriminatory treatment in ways that are not visible to the customer, such as the imposition of disparate conditions between similarly-situated carriers on the pricing and ordering of services covered by Section 251(b)(3). While invisible to the customer, such conditions can severely diminish a competitor's ability to provide exchange and/or toll service on the same terms as the LEC permitting the access.

104. The *MTS and WATS Order (III)* does not preclude us from requiring LECs to permit access that is at least equal in quality to the access the LEC itself receives.[247] In the *MTS and WATS Order (III)*, the Commission simply held that neither "absolute technical equality" nor an "overly quantitative and microscopic" definition of equal access was desirable.[248] We find that the nondiscrimination standard established in this *Order* is consistent with those previous decisions. We do not set forth in this *Order* an overly technical definition of nondiscriminatory access.

105. We conclude that, to the extent all or part of any operator or directory assistance services, and features that are adjunct to such services, are not "telecommunications services" within the meaning of section 3(44)[249] of the Communications Act of 1934, LECs that provide such services must nonetheless make the services and features available under section 251(b)(3). We recognize that resale of operator services and directory assistance is a primary vehicle through which competing providers, especially new entrants and small business entities, can make operator services or directory assistance available to their customers and that providing LECs are a primary source from which competing providers can obtain these services.[250] Operator and directory assistance services, or the portions of such services, that are "telecommunications services" are already subject to resale requirements under: (1) section 251(c)(4)(A), which requires incumbent LECs "to offer for resale at wholesale rates any telecommunications service that the carrier provides at retail to subscribers who are not

---

[246] *See also First Report and Order* at section V.

[247] *MTS and WATS Order (III)*, 100 F.C.C. 2d at 860. *See also supra* n.234.

[248] *MTS and WATS Order (III)*, 100 F.C.C. 2d at 877.

[249] 47 U.S.C. § 153(44).

[250] *See also infra* para. 118, for discussion of the unbundling of operator services and directory assistance under section 251(c)(3).

telecommunications carriers"; and (2) section 251(b)(1), which imposes a duty on all LECs not to prohibit the resale of their telecommunications services, nor to impose unreasonable or discriminatory conditions on the resale of such services.[251] Operator and directory assistance services, however, generally use various adjunct information features, *e.g.*, rating tables or customer information databases.[252] We recognize that without access to such information features, competing providers cannot make full use of such services. Thus, to ensure that competing providers can obtain nondiscriminatory access to operator services and directory assistance, we require LECs to make such services available to competing providers *in their entirety*.[253]

B. Nondiscriminatory Access to Telephone Numbers

1. Definition

106. Currently, the largest LEC in each area code serves as the Central Office (CO) code administrator for that area. In the *NPRM*, this Commission proposed that the term "nondiscriminatory access to telephone numbers" means that all LECs providing telephone numbers must permit access to telephone numbers to competing providers in the same manner that the LECs themselves receive such access.[254] The few commenters who addressed this issue support the extension of our general definition of nondiscriminatory access to cover access to telephone numbers.[255] We conclude, consistent with the general definition of nondiscriminatory access in para. 101, *supra*, that the term "nondiscriminatory access to telephone numbers" requires a LEC providing telephone numbers to permit competing providers access to these numbers that is identical to the access that the LEC provides to

---

[251] 47 U.S.C. § 251(b)(1), (c)(4)(A). Operator services and directory assistance are also unbundled network elements subject to section 251(c)(3). *See First Report and Order* at section V. The 1934 Act, as amended, defines "telecommunications service" as "the offering of telecommunications for a fee directly to the public, or to such classes of users as to be effectively available directly to the public, regardless of the facilities used." 47 U.S.C. § 153(46). "Telecommunications" is defined as "the transmission, between or among points specified by the user, of information of the user's choosing, without change in the form or content of the information as sent and received." 47 U.S.C. § 153(43). "Information service" is defined as "the offering of a capability for generating, acquiring, storing, transforming, processing, retrieving, utilizing, or making available information, via telecommunications . . . ." 47 U.S.C. § 153(20). *See also First Report and Order* at section V.

[252] "Rating tables" are databases that cross-reference area codes, numbers called, and time of day to determine the price to be charged for telephone calls. Directory assistance may use databases that contain customer names, numbers and addresses, and operator services may use databases that contain customer billing information (*e.g.*, whether a customer will accept collect calls or third party billing).

[253] *See infra* paras. 108-151, for further discussion of operator services and directory assistance.

[254] *See NPRM* at para. 215.

[255] *See, e.g.*, Telecommunications Resellers Association reply at 5. *See supra* para. 101, for the general definition of "nondiscriminatory access."

itself. In addition, as discussed in paras. 261-345, *infra*, the delegation of the administration of numbering resources to a neutral administrator will further the statutory objective that all competing providers receive nondiscriminatory access to telephone numbers.

2. Commission Action to Enforce Access to Telephone Numbers

107. In the *NPRM*, we sought comment on what, if any, Commission action is necessary or desirable to implement the requirement under section 251(b)(3) that LECs permit nondiscriminatory access to telephone numbers.[256] Many commenters state that no additional Commission actions, beyond those already required by section 251(e), are necessary.[257] We conclude that issues regarding access to telephone numbers will be addressed by our implementation of section 251(e) herein.[258]

C. Nondiscriminatory Access to Operator Services

1. Definition of "Operator Services"

a. Background and Comments

108. The 1996 Act does not define the term "operator services." In the *NPRM*, the Commission proposed to use the definition of "operator services" in the Telephone Operator Consumer Services Improvement Act (TOCSIA) of 1990.[259] Section 226 (a)(7), which was added to the 1934 Act by TOCSIA, defines operator services as: "any automatic or live assistance to a consumer to arrange for billing or completion, or both, of a telephone call through a method other than: (1) automatic completion with billing to the telephone from which the call originated; or (2) completion through an access code by the consumer, with billing of an account previously established with the telecommunications service provider by the consumer."[260]

109. Bell Atlantic, BellSouth and MCI agree with the proposed definition of "operator services."[261] AT&T, however, expresses concern that this definition should not be used by

---

[256] *NPRM* at para. 215.

[257] *See, e.g.*, Bell Atlantic comments at 6; CBT comments at 6; and U S WEST comments at 8. *See generally infra* paras. 261-308, for a discussion of previous Commission actions in the area of number administration.

[258] *See generally infra* paras. 261-345.

[259] 47 U.S.C. § 226(a)(7); *see NPRM* at para. 294.

[260] *NPRM* at para. 216.

[261] *See, e.g.*, Bell Atlantic comments at 8; BellSouth comments at n.24; and MCI comments at 8.

incumbent LECs to claim that they are then not obligated to make operator services, including transmission of information, available for resale at wholesale rates, pursuant to section 251(c)(4).[262] AT&T thus suggests that the Commission adopt the definition as proposed in the *NPRM*, but explicitly state that the definition is applicable only in the context of section 251(b)(3).[263] AT&T asserts that the traditional functions of "emergency interrupt," "busy line verification," and "operator assisted directory assistance" are within the meaning of "operator services" in this context.[264]

b. Discussion

110. TOCSIA defines operator services to be "any automatic or live assistance to a consumer to arrange for billing or completion, or both, of a telephone call through a method other than: (1) automatic completion with billing to the telephone from which the call originated; or (2) completion through an access code by the consumer, with billing of an account previously established with the telecommunications service provider by the consumer."[265] Based on support in the record and the desirability of having a definition consistent with that in the preexisting statute, we conclude that we should adopt the definition of operator services as used in TOCSIA for purposes of section 251(b)(3), with modifications. For purposes of section 251(b)(3), we do not exempt (1) and (2), above, from the definition of operator services. Accordingly, the term operator services, for purposes of section 251(b)(3), means "any automatic or live assistance to a consumer to arrange for billing or completion, or both, of a telephone call." Although commenters did not focus on this issue, nor suggest that the exemptions be deleted from the TOCSIA definition of "operator services," we conclude that we should adopt a modified definition of operator services for the purpose of implementing section 251(b)(3). When enacted, the TOCSIA definition was intended to address services from an aggregator location, rather than addressing the types of operator services in general that would be essential to competition in telecommunications markets. Operator services are becoming increasingly automated, and thus excluding access to automatic call completion from the obligations imposed by section 251(b)(3) could deny competitors access to a service that is essential to competition in the local exchange market. We conclude that, for the same reason, "completion by an access code by the consumer," a common means of completing calls made from payphones, should also be included in the definition of operator services for section 251(b)(3).

---

[262] *See* AT&T comments at 8. 47 U.S.C. § 251(c)(4), *inter alia*, requires incumbent LECs to offer for resale, at wholesale rates, any telecommunications service that the carrier provides at retail to subscribers who are not telecommunications carriers.

[263] *Id.*

[264] *Id.* at n. 11.

[265] 47 U.S.C. § 226(a)(7).

111. Adopting a national definition of "operator services" based on the TOCSIA definition, as modified above, will allow for consistency and ease of compliance with the statute, specifically with respect to services to which all LECs must permit nondiscriminatory access.[266] We further conclude that we should state explicitly that busy line verification, emergency interrupt, and operator-assisted directory assistance are forms of "operator services," because they assist customers in arranging for the billing or completion (or both) of a telephone call. Thus, if a LEC provides these functions, the LEC must offer them on a nondiscriminatory basis to all providers of telephone exchange and/or toll service. To avoid confusion with the TOCSIA definition at section 226, we state here that this definition *only* applies for purposes of section 251. Finally, unlike the definition of operator services in TOCSIA, we point out that our definition of "operator services" under section 251(b)(3) is applicable to both *interstate* and *intrastate* operator services.[267]

2. Definition of "Nondiscriminatory Access to Operator Services"

a. Background

112. In the *NPRM*, we proposed that the phrase "nondiscriminatory access to operator services" should be interpreted to mean that a telephone service customer, regardless of the identity of his or her local telephone service provider, must be able to connect to a local operator by dialing "0," or "0 plus" the desired telephone number.[268]

b. Comments

113. Several commenters agree with the Commission's interpretation of this phrase as proposed in the *NPRM*.[269] PacTel, however, requests that we clarify that the "0" or "0 plus" requirement does not mean "that a customer must be able to access *every* LEC's operator services or directory assistance using the same dialing scheme, but rather only the services of the carrier selected to provide local service."[270] AT&T requests that operator service connection methods continue to include dialing "00" in order to access the pre-selected long distance carrier operator.[271] CBT asks that we find that the nondiscriminatory access

---

[266] *See also infra* para. 146.

[267] *See First Report and Order* at section V for discussion of application of section 251 to interstate and intrastate matters.

[268] *See NPRM* at para. 216.

[269] *See, e.g.*, AT&T comments at 9; MCI comments at 8; and Telecommunications Resellers Association comments at 6.

[270] *See* PacTel comments at 16.

[271] *See* AT&T comments at 9.

requirements only apply when a competing local service provider is using either a LEC's local exchange services on a resale basis or when the competing provider is using a LEC's unbundled switch ports.[272] GCI states that, in Alaska, LECs currently do not provide "0" or "0 plus" the telephone number; rather, interexchange carriers provide these services. GCI requests that arrangements such as those in Alaska not be precluded.[273] Bell Atlantic, USTA, and PacTel request that we state that, while LECs must offer their operator services to their competitors, there is no duty for a LEC to ensure that the competitors' customers have access to these services.[274] Finally, U S WEST states that "regulatory agencies should not mandate all carriers provide certain adjunct non-essential services, including "0" and "0+" services. Nor should regulatory agencies dictate the manner in which adjunct, non-essential services are accessed."[275]

c. Discussion

114. We adopt the interpretation of "nondiscriminatory access to operator services" that we proposed in the *NPRM*, with the following clarifications. First, LECs are required to permit nondiscriminatory access to operator services by competing providers, and have no duty, apart from factors within their own control, to ensure that a competing provider's customers can in fact access the services. We make this clarification because the statute does not refer to the *customers* of competing providers, and the record does not support such an interpretation of the statutory language. Second, there is no requirement that a LEC must provide call handling methods or different credit card or other alternate billing arrangements different from those it provides to itself or its affiliates. And finally, we find that the duty to permit nondiscriminatory access to operator services applies only to LECs that provide operator services to their own customers.

115. Once a LEC permits a competing provider to have access to operator services, this access may become degraded in the competing provider's network by factors outside the control of the providing LEC.[276] On the other hand, when a LEC unbundles network loop elements, the providing LEC may also retain maintenance and control responsibilities over such elements.[277] We require that, if a dispute arises between a LEC providing access to

---

[272] *See* CBT comments at 6, 7.

[273] *See* GCI reply at 3 n.4.

[274] *See* Bell Atlantic comments at 7; USTA comments at *ii*; PacTel comments at 15.

[275] U S WEST comments at 8-9.

[276] For example, the customers of a competing provider may experience dialing delays or call blockage due to inadequate facilities or poor call management in the competing provider's network.

[277] We note that incumbent LECs have an obligation to offer operator services and directory assistance on an unbundled basis under section 251(c)(3). 47 U.S.C. § 251(c)(3). *See First Report and Order* section V.

operator services and a competing provider regarding the delivery of such access, the initial burden is upon the providing LEC to demonstrate with specificity: (1) that it has provided nondiscriminatory access, and (2) that the degradation of access is not caused by factors within the control of the providing LEC. Our use of the term "factors" is not limited to network facilities, but also includes human and non-facilities elements used in the provision of operator services. A providing LEC must also demonstrate with specificity that any degradation in access by competing providers is not caused by, *inter alia*, the providing LEC's inadequate staffing, poor maintenance or cumbersome ordering procedures.

116. We take into account PacTel's comments in concluding that the nondiscriminatory access requirement of section 251(b)(3) does not require that a customer be able to access *every* LEC's operator services, but only the operator services offered by that customer's chosen local service provider.[278] Furthermore, section 251(b)(3) neither specifically addresses nor precludes arrangements wherein operator services are provided by interexchange carriers, as described by GCI. Section 251(b)(3) requires all LECs, but not interexchange carriers or other service providers, to permit nondiscriminatory access to operator services. Thus, to the extent that an OSP is not within the statutory definition of "local exchange carrier," it is not required by section 251(b)(3) to permit nondiscriminatory access to its operator services.

117. The "00" access method currently allows an end user to connect to the operator services of his or her presubscribed long distance carrier. Consistent with our definition of nondiscriminatory access, we require that, if a LEC allows its customers access to operator services of their presubscribed long distance carriers by dialing "00," it must permit competing providers to have access to any features and functions that are necessary to enable the competing provider to allow its customers likewise to obtain access to such operator services by dialing "00." We find that CBT's proposal to limit a LEC's operator services obligations to only those competitors reselling a LEC's services, or using a LEC's unbundled switch ports, is inconsistent with the statute. The nondiscriminatory access provisions of section 251(b)(3) are not confined to situations in which a competing provider resells a LEC's services, or uses unbundled network elements of a LEC. We do not agree with U S WEST's statement that it would be inappropriate to mandate that all LECs who offer operator services must accommodate "0" and "0 plus" dialing. This service is not, as U S WEST states, an "adjunct, non-essential" service.

118. Finally, we note that in the *First Report and Order* we found that operator services as well as directory assistance are network elements that an incumbent LEC must make available to requesting telecommunications carriers. In the absence of an agreement between the parties, unbundled element rates for operator services and directory assistance are

---

[278] The operator services provided by a customer's local service provider, for example, could be that provider's own operator services, resold operator services of a LEC providing nondiscriminatory access, or operator services provided by an independent OSP.

governed by section 252(d)(1) and our rules thereunder.[279] The obligation of incumbent LECs to provide operator services and directory assistance as unbundled elements is in addition to the duties of all LECs (including incumbent LECs) under section 251(b)(3) and the rules we adopt herein.[280]

3. Commission Action to Ensure Nondiscriminatory Access to Operator Services

a. Background and Comments

119. In the *NPRM*, the Commission sought comment on what, if any, Commission action is necessary or desirable to ensure nondiscriminatory access to operator services under section 251(b)(3).[281] Bell Atlantic, GTE and PacTel assert that there is no need for the Commission to adopt detailed rules in this area.[282] On the other hand, Sprint is "concerned that leaving access to these services to carrier negotiations will result in unreasonable delays and discriminatory terms and conditions as between the incumbent LEC and CLEC."[283] MFS and WinStar support an "unambiguous national policy" of requiring incumbent LECs to make services available to new entrants.[284] MFS justifies this position by noting "some incumbent LECs say they already provide access, some say they are not obligated to offer such offering for resale, some assert that they are included in various unbundled elements or that they should not be unbundled . . . incumbent LECs should not be allowed to unilaterally decide whether, or to what extent to offer access to operator services, directory assistance and directory listings."[285]

120. The Telecommunications Resellers Association states that "[p]rompt and strong Commission response to complaints alleging failures by LECs to provide nondiscriminatory access to operator services is required to ensure compliance with this requirement."[286] Finally,

---

the Florida Commission asserts that "[s]tates should be allowed to ensure compliance with the Act as it relates to these services as defined in the *NPRM*."[287]

b. Discussion

121. We conclude that detailed Commission rules are not required to implement the requirement under section 251(b)(3) that LECs must permit competing providers nondiscriminatory access to operator services. We recognize the need for flexibility in order for maximum access to operator services when networks interconnect, as there may be a variety of technical interconnection methods through which such nondiscriminatory access to operator services can be achieved. We view the definition of "nondiscriminatory access to operator services" set forth in paras. 114-118, *supra*, as the overarching standard to which LECs must adhere under section 251(b)(3). As noted, in part III (C)(2), once a LEC permits nondiscriminatory access to operator services to its competitors, that LEC has no further duty to ensure that the competitor's customers can access those services. To the extent that a dispute arises regarding a competing provider's access to operator services, however, the burden is on the LEC permitting the access to demonstrate with specificity that it has provided nondiscriminatory access, and that any disparity is not caused by factors within its control.

122. Beyond placing the initial burden of proof on the providing LEC, we find that specific enforcement standards for nondiscriminatory access to operator services are not required at this time. Rather, disputes concerning nondiscriminatory access can be addressed under our general enforcement authority pursuant to Titles II and V of the Act.[288] The 1996 Act also directs the Commission to establish such procedures as are necessary for the review and resolution of complaints against the BOCs within the statutory deadlines.[289] This requirement will be addressed in a separate proceeding.

4. "Branding" Requirements for Operator Services

a. Background

123. Section 226(b)(1)(A) of the Act and Part 64 of the Commission's rules require an operator services provider (OSP) to identify itself audibly and distinctly to the consumer at the beginning of each interstate telephone call, before the consumer incurs any charge for that

---

[287] *See* Florida Commission comments at 5.

[288] *See, e.g.*, 47 U.S.C. § 208 [common carrier complaint authority]; *see generally* 47 U.S.C. §§ 501 -510. *See also, First Report and Order* at section II [authority to take enforcement action].

[289] *See* 47 U.S.C. § 271(d)(6)(B).

call.[290] This procedure is commonly referred to as "call branding." In a recent *Report and Order*, the Commission amended its rules to require "branding" to the parties on both ends of a collect call.[291]

124. In using the term "branding requirements" in this context, we do not refer to the section 226 requirements obligating OSPs to identify themselves to consumers; rather, we refer to the obligations beyond section 226, if any, of a LEC to a competing provider that is using the LEC's facilities to provide its own operator services, or is reselling the operator services of the LEC. In these situations, the issue is *whose brand* should be used.

125. The *NPRM* did not ask whether branding of operator services should be required under section 251(b)(3). This issue was raised by several parties, however, in the context of nondiscriminatory access to such services. Specifically, parties raised the question of whether competing providers have the right to have resold operator services of a LEC "branded" in the competing provider's name, in order to ensure nondiscriminatory access and consumer perceptions of seamless service.

b. Comments

126. AT&T states that the Commission should reject claims that LECs may refuse to comply with "reasonable requests to brand resold operator services as those of the reseller," and that the "continued use of the incumbent LEC's own brand with services that are resold to CLEC customers would stifle competition and confuse customers."[292] AT&T further recommends that "equal opportunities for branding" be made available, asserting that if a LEC brands its own operator services, it should ensure that other OSPs have the capability to do the same; and if branding is infeasible for the OSP, the LEC should not brand its service at all.[293] Bell Atlantic and SBC object to AT&T's proposal, because one possible outcome would be that branding would not be performed on interstate calls, which would violate current Federal and state statutes and regulations.[294]

127. USTA states that when there are no technical limitations to branding, each LEC should be responsible for branding its own services, and where multiple brands are infeasible,

---

[290] *See* 47 U.S.C. § 226(b)(1)(A); *see also* 47 C.F.R. § 64.703(a)(1).

[293] *See* AT&T comments at n.12.

[294] *See* Bell Atlantic reply at 5-6; SBC reply at 7.

the branding announcement of the facilities-based carrier should be used by "default."[295] Bell Atlantic and CBT contend that the issue of branding operator services is best left to inter-carrier negotiations, where technical and cost issues can be resolved between the parties.[296] PacTel notes that "in a resale environment, we accommodate the CLEC by not branding our service at all. If a CLEC wants to brand its own operator services, it can establish a facilities-based arrangement and set up its own operator services."[297]

c. Discussion

128. Since these comments are a logical outgrowth of the language in our *NPRM*, we address them herein. We recognize that branding plays a significant role in markets where competing providers are reselling the operator services of the providing LEC. Continued use of the providing LEC's brand with a competing provider's customers clearly advantages the providing LEC. Consistent with the requirements that we imposed on incumbent LECs in the *First Report and Order*, we conclude that a providing LEC's failure to comply with the reasonable, technically feasible request of a competing provider for the providing LEC to rebrand operator services in the competing provider's name, or to remove the providing LEC's brand name, creates a presumption that the providing LEC is unlawfully restricting access to these services by competing providers.[298] This presumption can be rebutted by the providing LEC if it demonstrates that it lacks the capability to comply with the competing provider's request. We note also that the Illinois Commission recently ordered rebranding of operator services as those of the reseller "[t]o the extent that it is technically feasible," and we do not preempt its intrastate branding requirements, nor any similar requirements that other states may have enacted.[299]

129. Any inter-carrier branding arrangements under which an interstate operator services call made from an aggregator location would not be branded would violate Section 226 of the Act and Part 64 of our rules. We therefore caution interconnecting carriers that, in negotiating branding arrangements for operator services, they must insure that such arrangements are consistent with Federal laws and regulations requiring interstate OSPs to identify themselves.

D. Nondiscriminatory Access to Directory Assistance and Directory Listings

1. Definition of "Nondiscriminatory Access to Directory Assistance and Directory Listings"

a. Background

130. In the *NPRM*, the Commission interpreted the phrase "nondiscriminatory access to directory assistance and directory listings" to mean that the customers of all telecommunications service providers should be able to access each LEC's directory assistance service and obtain a directory listing on a nondiscriminatory basis, notwithstanding: (1) the identity of a requesting customer's local telephone service provider; or (2) the identity of the telephone service provider for a customer whose directory listing is requested.[300]

b. Comments

131. A number of commenters agree with our definition of "nondiscriminatory access to directory assistance and directory listings" as proposed in the *NPRM*.[301] Many commenters combine their discussions of what constitutes nondiscriminatory access for both operator services and directory assistance.[302] As with operator services, some commenters assert that a LEC is not obligated to ensure that a competing provider's customers have access to directory assistance and directory listings.[303] Bell Atlantic, for example, argues that "[t]he exchange carrier, naturally, can control only its part of the service, not what the other carrier provides."[304] CBT asks that we find that the nondiscriminatory access requirements only apply when a competing local service provider is using a LEC's local exchange services on a resale basis or when the competing provider is using a LEC's unbundled switch ports.[305]

132. Finally, certain interexchange carriers ask that we require that competing providers have access to the White Pages, Yellow Pages, and "customer guide" sections of directories, in order to satisfy the requirement of nondiscriminatory access to directory

---

[301] *See, e.g.*, AT&T comments at 9-10; SBC reply at 4; and Telecommunications Resellers Association comments at 7.

[302] *See, e.g.*, CBT comments at 6. *See, e.g.*, para. 113, *supra*.

[303] *See* Ameritech comments at 10, USTA comments at 6-7. *See also supra* para. 113.

[304] Bell Atlantic comments at 7.

[305] *See* CBT comments at 6, 7.

assistance and directory listings.[306] Sprint contends that "CLECs should be allowed to insert informational pages containing their business and repair numbers in the incumbent LEC's white and yellow pages directories at cost."[307] SBC strongly disagrees that section 251(b)(3) requires access to Yellow Pages, "customer guides," and informational pages, pointing out that the "competitive checklist" (section 271) provisions only require incumbent LECs to provide access to White Pages listings.[308]

c. Discussion

133. We conclude that we should adopt the definition of nondiscriminatory access to directory assistance services proposed in the *NPRM*, with the following modifications. Consistent with our conclusion in para. 101, *supra*, we have modified this definition to reflect that this duty is owed to competing providers of telephone exchange service and/or telephone toll service, and not to "all telecommunications carriers."[309] This duty does not apply if a LEC chooses not to offer directory assistance to its own customers.[310]

134. We agree that once a LEC permits a competitor nondiscriminatory access to directory assistance and directory listings, the LEC permitting the access is not responsible for ensuring that the competitor's customers are able to access these services. As with operator services, when a dispute arises as to the adequacy of the access received by the competitor's customers, the burden is on the LEC permitting access to the service to demonstrate with specificity: (1) that it is permitting nondiscriminatory access to directory assistance and directory listings; and (2) that the disparity in access is not caused by factors within its control. As in paragraph 114, *supra*, we conclude that the term "factors" is not confined to physical facilities, but also includes human and non-facilities elements such as staffing, maintenance and ordering.

135. The requirements for nondiscriminatory access to directory assistance and directory listings are intertwined. Requiring "nondiscriminatory access to directory listings" means that, if a competing provider offers directory assistance, any customer of that competing provider should be able to access any listed number on a nondiscriminatory basis, notwithstanding the identity of the customer's local service provider, or the identity of the

---

[306] *See, e.g.*, AT&T comments at n.14.

[307] Sprint comments at 9-10.

[308] *See* SBC reply at 6-7 (citing 47 U.S.C. § 271(c)(2)(B)(vii)).

[309] *See supra* para. 101.

[310] *But see infra* paras. 141-145, wherein we require all LECs, regardless of whether or not they provide directory assistance to their customers, to share subscriber listings, in readily accessible formats, as an element of nondiscriminatory access.

telephone service provider for the customer whose directory listing is requested.[311] We conclude that the obligation to permit access to directory assistance and directory listings does not require LECs to permit access to unlisted telephone numbers, or other information that a LEC's customer has specifically asked the LEC not to make available.[312] In previous orders, such as those addressing nondiscriminatory access by interexchange carriers to Billing Name and Address (BNA) information, we have taken action to ensure that customer privacy is protected.[313] In this *Order*, we require that in permitting access to directory assistance, LECs bear the burden of ensuring that access is permitted only to the same information that is available to their own directory assistance customers, and that the inadvertent release of unlisted names or numbers does not occur.[314]

136. We find, as we did in paragraph 117, *supra*, that CBT's proposal to limit the application of section 251(b)(3) to competing providers of exchange and/or toll service who are providing services on a resale basis, or using an incumbent LEC's unbundled switch ports is unacceptable. We also take into account PacTel's comments in concluding that section 251(b)(3) does not require that a customer be able to access any LEC's directory assistance services, but only those services provided through its chosen service provider. When a customer contacts his or her provider's directory assistance services, the customer's provider can obtain access to the directory listings of other carriers; thus, the customer should be able to obtain any directory listing (other than listings that are protected or not available, such as unlisted numbers). We conclude, however, that a LEC that does not provide directory assistance to its own customers does not have to provide nondiscriminatory access to directory assistance to competing providers.

137. On the basis of the record before us, we conclude that there is no need for this Commission to state that the term "directory assistance and directory listings" includes the White Pages, Yellow Pages, "customer guides," and informational pages. As a minimum

---

[311] *See infra* para. 141.

[312] *Cf.* 47 U.S.C. § 222(f)(3) [definition of "subscriber list information"], which is limited to *the listed names* of subscribers of a carrier.

[313] *See, e.g., Policies and Rules Concerning Local Exchange Carrier Validation and Billing Information for Joint Use Calling Cards*, Third Order on Reconsideration, CC Docket No. 91-115, 11 FCC Rcd 6835 (1996); *see also Policies and Rules Concerning Local Exchange Carrier Validation and Billing Information for Joint Use Calling Cards*, Second Report and Order, CC Docket No. 91-115, 8 FCC Rcd 4478 (1993).

[314] *See also Implementation of the Telecommunications Act of 1996: Telecommunications Carriers' Use of Customer Proprietary Network Information and Other Customer Information*, Notice of Proposed Rulemaking, CC Docket No. 96-115, FCC 96-221, (May 17, 1996).

standard, we find that the term "directory listing" as used in section 251(b)(3) is synonymous with the definition of "subscriber list information" in section 222(f)(3).[315]

2. Commission Action to Implement Nondiscriminatory Access to Directory Assistance and Directory Listings

a. Background and Comments

138. In the *NPRM*, the Commission sought comment on what action, if any, is necessary or desirable to implement the nondiscriminatory access to directory assistance and directory listings requirements of section 251(b)(3).[316] Several parties assert that there is no need for the Commission to adopt detailed rules addressing this issue.[317] In its comments, NYNEX described its current arrangements for making its directory assistance and directory listing services available to facilities-based and non-facilities-based carriers.[318]

139. Sprint and MFS urge the Commission to establish national rules requiring nondiscriminatory access to directory assistance and directory listings for all local service providers.[319] Furthermore, MCI recommends that the Commission establish requirements that ensure that "each provider of local service has access to directory listings of other providers, and that these directory listings are made available in readily usable format," and that these listings be provided "via tape or other electronic means, as is frequently the practice today between incumbent LECs whose service areas join."[320] PacTel and GTE urge the Commission to refrain from mandating access to underlying directory assistance databases.[321] GTE cites "serious technical and security concerns," while PacTel argues that (1) the plain language of section 251(b)(3) does not require access to the underlying databases, and (2) LECs are prohibited from disseminating certain directory listing information without customers'

---

[315] The term "subscriber list information" at section 222(f)(3) means any information: (A) identifying the listed names of subscribers of a carrier and such subscribers' telephone numbers, addresses, or primary advertising classifications (as such classifications are assigned at the time of the establishment of such service), or any combination of such listed names, numbers, addresses or classifications; and (B) that the carrier or an affiliate has published, caused to be published, or accepted for publication in any directory format. 47 U.S.C. § 222(f)(3)(A), (B).

[316] *See NPRM* at para. 217.

[317] *See, e.g.*, Bell Atlantic comments at 6; GTE reply at 18; PacTel comments at 16.

[318] *See* NYNEX comments at 7-8.

[319] *See, e.g.*, MFS reply at 10; Sprint reply at 8.

[320] *See* MCI comments at 3, 9; *see also* MCI reply at 3.

[321] *See* GTE reply at 19; PacTel reply at 15.

permission in California and Nevada.[322] PacTel maintains that the intent of section 251(b)(3) is not to permit "unfettered access to all information on record."[323]

140. The Telecommunications Resellers Association states that "prompt and strong" Commission action is required to ensure compliance with nondiscriminatory access to directory assistance and directory listings.[324] The Florida Commission asserts that "[s]tates should be allowed to ensure compliance with the Act as it relates to these services as defined in the *NPRM*."[325]

b. Discussion

141. We conclude that section 251(b)(3) requires LECs to share subscriber listing information with their competitors, in "readily accessible" tape or electronic formats, and that such data be provided in a timely fashion upon request. The purpose of requiring "readily accessible" formats is to ensure that no LEC, either inadvertently or intentionally, provides subscriber listings in formats that would require the receiving carrier to expend significant resources to enter the information into its systems. We agree with MCI that "by requiring the exchange of directory listings, the Commission will foster competition in the directory services market and foster new and enhanced services in the voice and electronic directory services market."[326] Consistent with the definition of "subscriber list information" in section 222(f)(3), we do not require access to unlisted names or numbers.[327] Rather, we require the LEC providing the listing to share listings in a format that is consistent with what that LEC provides in its own directory.

142. We conclude that the fact that many LECs offer directory assistance and listings for purchase or resale to competitors, as NYNEX describes, does not obviate the need for any requirements in this area. Under the general definition of "nondiscriminatory access," competing providers must be able to obtain at least the same quality of access to these services that a LEC itself enjoys. Merely offering directory assistance and directory listing services for resale or purchase would not, in and of itself, satisfy this requirement, if the LEC,

---

[322] *See* GTE reply at 19; PacTel reply at 15.

[323] PacTel reply at 15.

[324] *See* Telecommunications Resellers Association comments at 7.

[325] *See* Florida Commission comments at 5.

[326] MCI comments at 9.

[327] *See* 47 U.S.C. § 222(f)(3) for the definition of "subscriber list information."

for example, only permits a "degraded" level of access to directory assistance and directory listings.[328]

143. We further find that a highly effective way to accomplish nondiscriminatory access to directory assistance, apart from resale, is to allow competing providers to obtain read-only access to the directory assistance databases of the LEC providing access. Access to such databases will promote seamless access to directory assistance in a competitive local exchange market. We note also that incumbent LECs must provide more robust access to databases as unbundled network elements under section 251(c)(3).[329]

144. We do not agree with PacTel's contention that certain state laws restricting the types of information that LECs can disseminate preclude us from requiring access to directory assistance databases. It is not possible to achieve seamless and nondiscriminatory access to directory assistance without requiring access to the underlying databases. Consistent with our definition of nondiscriminatory access, the providing LEC must offer its competitors access of at least equal quality to that it receives itself. Competitors who access such LEC databases will be held to the same standards as the database owner, in terms of the types of information that they can legally release to directory assistance callers. The LEC that owns the database can take the necessary safeguards to protect the integrity of its database and any proprietary information, or carriers can agree that such databases will be administered by a third party. We note also that our holding does not preclude states from continuing to limit how LECs can use accessed directory information, *e.g.*, prohibiting the sale of customer information to telemarketers.[330] Rather, we conclude only that section 251(b)(3) precludes states from discriminating among LECs by imposing different access restrictions on competing providers, thereby allowing certain LECs to enjoy greater access to information than others.[331]

---

[328] *See supra* paras. 101-105.

[329] *See supra* para. 118, for a discussion of the relationship between section 251(b)(3) and the requirements adopted in the *First Report and Order* mandating unbundled access to operator and directory assistance services.

[330] *But see* section 222(d)(3), which permits customer information to be used for telemarketing to the customer "...for the duration of the call, if such call was initiated by the customer and the customer approves of the use of such information to provide such service." 47 U.S.C. § 222(d)(3). *See also* our proceeding to clarify the obligations of carriers with regard to section 222(c) and 222(d). *Implementation of the Telecommunications Act of 1996: Telecommunications Carriers' Use of Customer Proprietary Network Information and other Customer Information*, CC Docket, No. 96-115, FCC 96-221 (May 17, 1996).

[331] *Cf.* 47 U.S.C. § 222(e), which requires telephone exchange service providers to "provide subscriber list information gathered in its capacity as a provider of such service on a timely and unbundled basis, under nondiscriminatory and reasonable rates, terms, and conditions, to any person upon request for the purpose of publishing directories in any format." *See* 47 U.S.C. § 222(f)(3) for the definition of "subscriber list information."

Accordingly, states may not impose rules that would allow a LEC to discriminate against competing providers.[332]

145. We are not adopting specific enforcement standards at this time. Disputes regarding nondiscriminatory access will be addressed under our Title II and Title V enforcement authority.[333]

3. Branding of Directory Assistance

a. Background and Comments

146. To the extent that interstate directory assistance services are within the definition of "operator services" in section 226(a)(7) of the Act,[334] the service provider is required to identify itself to consumers at the beginning of a call.[335] Parties raised the issue of whether the competing provider has the right to have resold directory assistance services of the LEC "branded" in its name, as an element of nondiscriminatory access under section 251(b)(3). Thus this issue is similar to that of branding of operator services in paras. 123-129, *supra*. The *NPRM* did not ask whether the branding of directory assistance should be required under 251(b)(3) but commenters raised this issue.

147. AT&T suggests adding a requirement that if an incumbent LEC brands its own directory services, the incumbent should ensure that other directory assistance service providers can also brand their services.[336] CBT argues that branding is impractical and should be left to intercarrier negotiations, stating that "call branding can be provided, though not without considerable added effort and expense, to facilities-based providers who route traffic from their networks to the incumbent LEC's network by trunk group. Providing branding for resold services at the line number level is extremely difficult within the limits of the public switched network. When dealing with multiple resellers, there is no simple method for the

[333] *See supra* para. 122. *See also* 47 U.S.C. § 208 [common carrier complaint authority] and 47 U.S.C. §§ 501 -510.

[334] 47 U.S.C. § 226(a)(7).

[335] *See* 47 U.S.C. § 226(a)(7), (b)(1). *See generally supra* paras. 123-129.

[336] *See* AT&T comments at n.12.

incumbent LEC to determine by individual line number which brand should be applied."[337] Bell Atlantic also suggests that this issue be left to carrier negotiations.[338]

b. Discussion

148. The record shows that this issue is a logical outgrowth of the issues related to nondiscriminatory access to directory assistance raised in the *NPRM* and thus should be addressed in this *Order*. As with operator services, we recognize the major role that branding can play in an environment where competing providers are reselling the directory assistance services of the providing LEC. Consistent with the requirements that we imposed on incumbent LECs in the *First Report and Order*, therefore, we conclude that a providing LEC's failure to comply with the reasonable, technically feasible request of a competing provider for the providing LEC to rebrand directory assistance services in the competing provider's name, or to remove the providing LEC's brand name, creates a presumption that the providing LEC is unlawfully restricting access to these services by competing providers.[339] This presumption can be rebutted by the providing LEC demonstrating that it lacks the capability to comply with the request of the competing provider.[340] Finally, as with operator services, we do not preempt any branding requirements that state commissions may have enacted for directory assistance services.

4. Alternative Dialing Arrangements for Directory Assistance

a. Background and Comments

149. In the *NPRM*, the Commission sought comment on whether the customers of competing providers of exchange and/or toll service would be able to access directory assistance by dialing '411' or '555-1212,' which are nationally-recognized numbers for directory assistance, or whether alternative dialing arrangements would be necessary.

150. No commenters recommended that we require different arrangements for dialing directory assistance. AT&T states that while alternative protocols may be permitted, no carrier should be required to use them.[341] Bell Atlantic states that "[n]o dialing arrangements for directory assistance other than 411 and 555-1212 are necessary. A facilities-based provider will be able to use these numbers and route its customers' calls in whatever way it

---

[337] CBT reply at 5.

[338] *See* Bell Atlantic reply at 5.

[339] As with operator services, *supra*, we note that carriers must comply with the branding requirements of section 226, to the extent that their services are within the section 226 definitions. *See* 47 U.S.C. § 226.

[340] *See First Report and Order* at section VIII.

[341] *See* AT&T comments at 10.

chooses (to its own directory assistance, to that of the incumbent exchange carrier or to that or any other provider). When a non-facilities-based provider buys exchange service from the incumbent under section 251(c)(4), its customers get exactly what the incumbent's receive, 411 and 555-1212 access to directory assistance."[342]

b. Discussion

151. With respect to the ability of customers to reach directory assistance services through 411 or 555-1212 arrangements, we conclude that no Commission action is required now. No commenter has proposed that we require an alternative dialing arrangement. The record before us indicates that permitting nondiscriminatory access to 411 and 555-1212 dialing arrangements is technically feasible, and there is no evidence in the record that these dialing arrangements will cease.

E. Unreasonable Dialing Delay

1. Definition and Appropriate Measurement Methods

a. Background and Comments

152. Section 251(b)(3) prohibits unreasonable dialing delays.[343] The *NPRM* sought comment on what constitutes an unreasonable dialing delay for purposes of section 251(b)(3) and on appropriate methods for measuring and recording such delay.[344]

153. U S WEST contends that the phrase "unreasonable dialing delay," as it appears in section 251(b)(3), applies only to the provision of nondiscriminatory access to operator and directory assistance services.[345] GCI, on the other hand, asserts that the unreasonable dialing delay provision applies to both the dialing parity and nondiscriminatory access provisions of section 251(b)(3).[346] MFS, NYNEX and Sprint recommend that we define "dialing delay" to cover the period from when a user completes dialing to when the call is "handed off" to a connecting LEC, whenever multiple LECs are involved in call completion.[347] ALTS,

---

[342] Bell Atlantic comments at 8-9.

[343] 47 U.S.C. § 251(b)(3).

[344] *See NPRM* at para. 218.

[345] U S WEST comments at 11.

[346] GCI reply at 2.

[347] *See* Sprint comments at 10; MFS reply at 8; NYNEX comments at 9.

however, suggests that we define "dialing delay" to cover the period from when the end user completes dialing to the point where a network response is first received.[348]

154. Several parties contend, however, that we should not adopt a definition of "dialing delay."[349] Bell Atlantic states that there is "no need to try to develop a definition of what constitutes 'unreasonable dialing delays.' To the extent that this ever becomes an issue, it is best handled with a specific factual record."[350]

155. Several parties recommend defining "unreasonable" as any delay that exceeds that of the providing LEC.[351] ACSI suggests that the Commission "declare a delay 'unreasonable' if the average access time for competing providers exceeds the average access time for the LEC itself," and that ". . . the LEC and competing providers should get equal priority in LEC call processing systems, which would result in identical dialing delays, on average, for LECs and competing providers."[352] Other parties argue that LECs should not be held responsible for unreasonable dialing delays that are not caused by their networks or are not within their control.[353]

b. Discussion

156. We conclude that section 251(b)(3) prohibits "unreasonable dialing delays" for local and toll dialing parity, and for nondiscriminatory access to operator services and directory assistance. The reference to "unreasonable dialing delay" is ambiguous because it is in a prepositional phrase at the end of section 251(b)(3), following references both to the duty to provide dialing parity and the duty to permit nondiscriminatory access to telephone numbers, operator services, directory assistance, and directory listings. In light of this ambiguity, and the absence of legislative history, we look to the purpose of section 251 and to the record to interpret the "unreasonable dialing delay" provision. Examining the statutory language in light of the plainly pro-competitive thrust of these section 251 requirements, we conclude that Congress intended the dialing delay prohibition to apply to both the obligation to provide dialing parity and the obligation to permit nondiscriminatory access to operator

[353] *See, e.g.*, GTE comments at 19; USTA reply at 6-7.

services and directory assistance.[354] Further, commenters did not distinguish between dialing delay in dialing parity and nondiscriminatory access contexts.

157. We conclude that a "comparative" standard for identifying "unreasonable dialing delay" is necessary in order to ensure that, when competing providers obtain dialing parity and nondiscriminatory access to operator services and directory assistance, such access does not come with unreasonable dialing delays. We conclude, therefore, that the dialing delay experienced by the customers of a competing provider should not be greater than that experienced by customers of the LEC providing dialing parity, or nondiscriminatory access, for identical calls or call types. For the reasons stated below, we conclude that this "comparative standard" is more appropriate in this context than a specific technical standard.[355]

158. In our *Number Portability Order*,[356] we indicated that "at a minimum, when a customer switches carriers, that customer must not experience a greater dialing delay or call set up time . . . due to number portability, compared to when the customer was with the original carrier."[357] The standard that we are adopting for "unreasonable dialing delay" under section 251(b)(3) is consistent with the standard we adopted in the *Number Portability Order*.

159. We conclude that the statutory language on unreasonable dialing delays places a duty upon LECs providing dialing parity or nondiscriminatory access to operator services and directory assistance to process all calls from competing providers, including calls to the LEC's operator services and directory assistance, on an equal basis as calls originating from customers of the providing LEC. In other words, calls from a competing provider must receive treatment in the providing LEC's network that is equal in quality to the treatment the LEC provides to calls from its own customers. We recognize that LECs may have the technical ability to identify whether a call is originating from a competing provider (*e.g.*, by cross-referencing the Automatic Number Identification (ANI), or by identifying the connecting trunk group). Thus there may exist on the part of the providing LEC the ability to discriminate and to degrade service quality for a competing provider's customers by introducing unreasonable dialing delays.

160. For operator services and directory assistance calls, such dialing delay can be measured by identifying the time a call spends in queue until the providing LEC processes the call. We recognize that the time of arrival of a telephone call can be recorded (1) at the originating LEC's switch; (2) upon entering the operator services or directory assistance

---

[357] *Id.* at para. 56.

queue; and (3) at the time of answering by the providing LEC's operators for such services. We believe that it is possible to compare the treatment of calls placed by customers of the competing provider with those of calls originating from the providing LEC's customers, and thus determine if unreasonable dialing delays are occurring. Such a comparison would hold all LECs responsible only for delays within their control.

161. In the event that a dispute arises between a competing provider and a providing LEC as to dialing delay, we conclude that the burden is on the providing LEC to demonstrate with specificity that it has processed the call on terms equal to that of similar calls originating from its own customers. Such "terms" include the amount of time a providing LEC takes to process incoming calls, the priority a LEC assigns to calls, and might also take into account the number of calls abandoned by the caller of the competing provider. Furthermore, to the extent that states have adopted specific performance standards for dialing delay between competing providers, we do not preempt such standards, and states may enact more detailed standards.

162. We do not believe that measuring "unreasonable dialing delay" from the period beginning when a caller completes dialing a call and ending when the call is delivered (or "handed off") by the LEC to another service provider is practical with respect to dialing parity or nondiscriminatory access. While we understand that such a measurement can be made, and is fully within the control of one LEC, prohibiting a providing LEC from introducing dialing delay in the originating segment of calls under its control benefits only the customers of the providing LEC. The providing LEC already has sufficient motivation to provide efficient service to its own customers. Finally, we conclude that the proposal to measure dialing delay from the completion of dialing to a network response (*e.g.*, when a caller receives busy-tone signalling information from the called line) is unsatisfactory, because it fails to isolate the segments of a call within an individual LEC's control.

2. Specific Technical Standard for Dialing Delay

a. Background and Comments

163. In the *NPRM*, the Commission asked commenters to identify a specific period of time that would constitute an "unreasonable dialing delay." NYNEX was the sole commenter proposing a quantitative measurement. In this regard, however, NYNEX recommends that the Commission should issue a *recommended* maximum period of delay rather than a mandatory standard.[358] NYNEX states that "an appropriate recommendation for this time period is that it should not exceed 5 seconds."[359] The majority of commenters urge the Commission not to

---

[358] *See* NYNEX comments at 9-10.

[359] *Id.*

impose a specific technical dialing delay standard at this time.[360] For example, GTE states that "[n]umber portability, dialing parity and other newly required actions will undoubtedly affect network performance, including dialing delay, at least during a transition period. Any current determination of an unreasonable delay will be based on network designs that will bear little resemblance to the network structures of tomorrow."[361] Finally, the Illinois Commission states that it is currently studying the same issue for number portability in Chicago, and suggests that the Commission may wish to adopt the Illinois Commission's standard upon completion of its study.[362]

b. Discussion

164. We conclude that the record does not provide an adequate basis for determining a specific technical standard for measuring unreasonable dialing delays. Commenters do not address separately the dialing delay prohibition as it applies to each of the services covered by section 251(b)(3): local and toll dialing parity, and nondiscriminatory access to operator services and directory assistance. We thus conclude that, until dialing delay can be reliably measured after dialing parity is a reality, the "comparative" standard adopted in paragraph 157, *supra*, will provide a workable national rule for the industry. We intend to revisit the issue at a future date if we should find that our "comparative" standard is inadequate to ensure fair competition.

IV. NETWORK DISCLOSURE

165. Section 251(c)(5) of the 1996 Act requires incumbent LECs to "provide reasonable public notice of changes in the information necessary for the transmission and routing of services using that local exchange carrier's facilities or networks, as well as of any other changes that would affect the interoperability of those facilities or networks."

---

[360] *See, e.g.*, Bell Atlantic comments at 9; MFS reply at 8.

[361] GTE comments at 19.

[362] *See* Illinois Commission comments at 70.

A. Scope of Public Notice

1. Definition of "Information Necessary for Transmission and Routing"

a. Background and Comments

166. In our *NPRM*, we tentatively concluded that "information necessary for transmission and routing" should be defined "as any information in the incumbent LEC's possession that affects interconnectors' performance or ability to provide services."[363]

167. Most commenters support the tentative conclusion in the *NPRM*.[364] For example, MFS asserts that our definition would "minimize the risk that an incumbent LEC could take actions inconsistent with [interconnection and interoperability]" and that the term "should be applied as broadly as possible."[365] MCI states that a broad definition is "necessary for new entrants to receive notice of technical changes."[366] Time Warner also asserts that "this broad-based definition . . . is critical to ensuring that [incumbent local exchange carriers] fulfill all of the obligations imposed upon them by Section 251(c)."[367]

168. Some, mostly smaller, incumbent LECs disagree with our proposed standard, stating that it is "too broad," "an onerous burden," "not necessary," and "may not be possible."[368] Other incumbent LECs claim that network disclosure requirements should be limited to "changes that affect the interconnection or interoperability of the network."[369] Their overarching concern is that the proposed definition's reference to "any information" would be interpreted so broadly that virtually any network-related information would fall within the ambit of the disclosure requirement.[370] Some incumbent LECs also express the fear that a broad interpretation of the statute "might expose [them] to unintended liability for giving

---

information that the local exchange carrier is not qualified to provide" or that the [local exchange carrier] might be held liable for results of decisions that the interconnector made based upon this information."[371] These incumbent LECs claim that competing providers' informational needs would be fulfilled even if public disclosure were limited to "relevant interfaces or protocols."[372] USTA suggests an alternate definition: "all changes in information necessary for the transmission and routing of services using the local exchange carrier's facilities, or that affects interoperability."

169. According to some competing providers, narrowing the scope of information that must be publicly disclosed would preserve the information advantage that incumbent LECs possessed before the passage of the 1996 Act.[373] Also, AT&T notes that a narrowly constructed disclosure requirement would contradict the language of the statute that specifically identifies "changes that would affect the interoperability of those facilities or networks."[374] AT&T states that some information "is both necessary for proper transmission and routing and can affect the network's interoperability" although it is not directly relevant to the interconnection point.[375] AT&T presents five examples of technical changes that do not directly relate to the interconnection point but that nevertheless could have "profound" implications for competing service providers. These changes include those that (1) alter the timing of call processing; (2) require competing service providers to install new equipment, such as echo cancelers; (3) affect recognition of messages from translation nodes; (4) alter loop impedance levels, which could cause service disruptions; and (5) could disable a competing service provider's loop testing facilities.[376]

170. Some incumbent LECs suggest that network disclosure requirements should also apply to competing service providers.[377] MCI and MFS contend, however, that the plain language of the statute requires imposition of public disclosure requirements only upon incumbent LECs. MFS states that the duty to disclose change information was imposed upon incumbent local exchange carriers because they have sufficient "control over network standards to harm competition" and the "requisite size and market power to change their

---

[371] GVNW comments at 1-2.

[372] Nortel states that the incumbent local exchange carrier should only "provide the interface information," and the competing service provider should then "perform its own 'reverse engineering' in developing its own products so as to be compatible with the interface." Nortel comments at 5.

[377] Ameritech comments at 29; BellSouth comments at 2; NYNEX comments at 15-16; Rural Tel. Coalition comments at n.4.

networks in a manner that stymies competition."[378] MFS argues that imposing notification requirements on competing service providers would be an "empty exercise" because "new entrants . . . can do little, if anything,to change their networks in a manner that adversely impacts the [incumbent LECs]."[379] MFS also argues that competing service providers have "powerful economic incentives" for maintaining compatibility with incumbent local exchange networks.[380]

b. Discussion

171. Section 251(c)(5) requires that information about network changes must be disclosed if it affects competing service providers' performance or ability to provide service. Requiring disclosure about network changes promotes open and vigorous competition contemplated by the 1996 Act. We find that additional qualifiers that restrict the types of information that must be disclosed, such as "*relevant* information or protocols," would create uncertainty in application and appear inconsistent with the statutory language. Timely disclosure of changes reduces the possibility that incumbent LECs could make network changes in a manner that inhibits competition. In addition, notice of changes to ordering, billing and other secondary systems is required if such changes will have an effect on the operations of competing service providers, because the proper operation of such systems is essential to the provision of telecommunications services.

172. We agree with MCI and MFS that the plain language of the statute requires imposition of public disclosure requirements only upon incumbent LECs.[381] In addition, we conclude that imposing this requirement upon competing service providers would not enhance competition or network reliability. While competing service providers must respond to incumbent LEC network changes, competing service providers, in general, are not in a position to make unilateral changes to their networks because they must rely so heavily on their connection to the incumbent LEC's network in order to provide ubiquitous service. Accordingly, competing service providers already face sufficient incentives to ensure compatibility of their planned changes with the incumbent LEC's network. In addition, if an incumbent LEC were permitted to obtain such information from a competing service provider, the incumbent LEC might be able to obtain the competing service provider's business plans and thereby stifle competition.[382]

---

[378] MFS reply at 26.

[379] MFS reply at 26-27.

[380] *Id.*

[381] MCI reply at 7; MFS reply at 25, 26.

[382] NCTA asserts that incumbent LECs are "entirely capable of providing adequate notice of their network changes without 'full disclosure of competing service provider's operations and future plans.'" NCTA reply at 12.

173. We conclude that our disclosure standard is consistent not only with section 251(c)(5), but also with the requirements of the "all carrier rule"[383] and the scope of the *Computer III*[384] disclosure requirement, both of which have been applied to incumbent LEC activities for some time. In light of these preexisting requirements, we find that the standard we proposed in the NPRM is not burdensome but reasonable, providing sufficient disclosure to insure against anti-competitive acts as well as to ensure certain and consistent disclosure requirements.

174. We have considered the impact of our rules in this section on small incumbent LECs, including Rural Tel. Coalition's and GVNW's requests for a less inclusive definition of "information necessary for transmission and routing."[385] We do not adopt these proposals because we are unable to grant such leniency to small businesses and simultaneously ensure adequate information disclosure to facilitate the development of a pro-competitive environment for every market participant, including other small businesses. We note, however, that under section 251(f)(1) certain small incumbent LECs are exempt from our rules until (1) they receive a *bona fide* request for interconnection, services, or network elements; and (2) their state commission determines that the request is not unduly economically burdensome, is technically feasible, and is consistent with the relevant portions

---

[383] Unless clearly specified otherwise, in this *Order*, we use the term "all carrier rule" to refer to the Commission's network disclosure rule contained in 47 C.F.R. § 64.702, as interpreted in the *Second Computer Inquiry*. The all carrier rule obligates "all carriers owning basic transmission facilities [to release] all information relating to network design . . . to all interested parties on the same terms and conditions, insofar as such information affects either intercarrier interconnection or the manner in which interconnected [customer-premises equipment] operates." *Amendment of Section 64.702 of the Commission's Rules and Regulations (Second Computer Inquiry), Memorandum Opinion and Order on Reconsideration*, 84 F.C.C.2d 50, 82-83 (1980), *further recon.*, 88 FCC 2d 512 (1981), *aff'd sub nom. Computer and Communications Indus. Ass'n v. FCC*, 693 F.2d 198 (D.C. Cir. 1982), *cert. denied*, 461 U.S. 938 (1983). The all carrier rule also requires that "[w]hen such information is disclosed to the separate corporation it shall be disclosed and be available to any member of the public on the same terms and conditions." *See* 47 C.F.R. § 64.702; *Application of The Southern New England Tel. Co.*, 10 FCC Rcd 4558, 4559 n.23 (1995); *Competition in the Interstate Interexchange Marketplace*, Report and Order, 6 FCC Rcd 5880, 5911 n.270 (1991) (The all carrier rule obligates "all carriers to disclose, reasonably in advance of implementation, information regarding any new service or change in the network."); *Competition in the Interstate Interexchange Marketplace*, Report and Order, 6 FCC Rcd. 5880, 5911 n.270. (1991).

Another of the Commission's rules, 47 C.F.R. § 68.110(b), requires similar disclosure to customers of network changes "if such changes can be reasonably expected to render any customer's terminal equipment incompatible with telephone company communications facilities, or require modification or alteration of such terminal equipment, or otherwise materially affect its use or performance." We will refer to this rule specifically by number where necessary.

[384] *See infra* para. 204 and n.449.

[385] Rural Tel. Coalition comments at 2; GVNW comments at 1.

of section 254. In addition, certain small incumbent LECs may seek relief from our rules under section 251(f)(2).[386]

2. Definition of "Services"

a. Background and Comments

175. Commenters, including incumbent LECs, interexchange carriers, and industry organizations, unanimously support our tentative conclusion that the term "services," as used in section 251(c)(5), includes both telecommunications services and information services, as defined in sections 3(46) and 3(20), respectively.[387] Parties agree that it is reasonable to require that providers of both telecommunications and information services receive this information. ALTS points out that exclusion of information services or telecommunications services from our definition would be "needlessly restrictive."[388] BellSouth also notes that the inclusion of information services for public notice purposes should not vest information service providers with substantive rights under Section 251, except where they are also operating as a telecommunications carrier under the 1996 Act.[389]

b. Discussion

176. We conclude that the term "services" includes both telecommunications services and information services, as defined in sections 3(46) and 3(20) of the Act, respectively. Providers of both telecommunications services and information services may make significant use of the incumbent LEC's network in making these offerings. Accordingly, exclusion of either information services providers or telecommunications services providers would be needlessly restrictive. We also affirm that the inclusion of information services for public notice purposes does not vest information service providers with substantive rights under other provisions within section 251, except to the extent that they are also operating as telecommunications carriers.

---

[386] For a discussion of the implications and operation of section 251(f), *see First Report and Order* at section XII.

[388] ALTS comments at 2.

[389] BellSouth comments at 3.

3. Definition of "Interoperability"

a. Background and Comments

177. The Commission tentatively concluded that the term "interoperability," as used in section 251(c)(5), should be defined as "the ability of two or more facilities, or networks, to be connected, to exchange information, and to use the information that has been exchanged."[390] This definition of "interoperability" was taken from the *IEEE Standard Dictionary of Electrical and Electronics Terms*.[391] Commenters, including incumbent LECs, interexchange carriers, state commissions, and industry associations, are unanimous in their support for our tentative conclusion.[392] The Ohio Commission also suggests that we expand our definition of "interoperability" to "recognize that the exchange of traffic between an [incumbent local exchange carrier] and an interconnector must be seamless and transparent to both parties' end users."[393] No alternative definitions for the term "interoperability" were proposed by commenting parties.

b. Discussion

178. We define the term "interoperability" as "the ability of two or more facilities, or networks, to be connected, to exchange information, and to use the information that has been exchanged." As this definition of "interoperability" was taken from the *IEEE Standard Dictionary of Electrical and Electronics Terms*, we believe that this well established and widely accepted industry standard can be applied easily and consistently. We find that the concepts of seamlessness and transparency are already adequately incorporated into this definition's specific interoperability criteria, and that further exposition of these concepts is not necessary.

4. Changes that Trigger the Public Notice Requirement

a. Background and Comments

179. In the *NPRM*, we noted that "public notice is critical to the uniform implementation of network disclosure, particularly for entities operating networks in numerous locations across a variety of states."[394] We requested comment as to what changes should trigger the notice requirement.

180. Several commenters suggest that timely notice should be provided whenever an upcoming change in the incumbent LEC's network may affect the way in which a competing provider offers its service.[395] Examples of such changes include, but are not limited to, changes in transmission, signalling standards, call routing, network configuration and logical elements.[396] Also, commenters assert that public notice should be required when a change will affect the electronic interfaces, data elements, or transactions that support ordering, provisioning, maintenance and billing of the network facilities.[397] The Illinois Commission notes, however, that the types of changes that trigger public notice should not be "micro-defined" because overly specific trigger requirements could create situations in which carriers would not be required to provide public notice if a particular change has not been clearly identified.[398] ALTS also supports a broadly defined class of changes that trigger network disclosure requirements, asserting that some changes, such as those affecting provisioning and billing for a carrier's service, might not otherwise be reported adequately, resulting in service disruptions.[399]

181. Ameritech claims that disclosure obligations should only be triggered by a new or "substantially changed" network interface, or a change that "otherwise affects the routing or termination of traffic delivered to or from the incumbent LEC's network."[400] Ameritech also claims that changes "that do not impact interconnection and interoperability . . . do not need

[400] Ameritech comments at 26, 27.

to be disclosed at all."[401] AT&T observes, however, that public notice requirements should also apply to some changes that do not directly relate to the interconnect point.[402]

b. Discussion

182. We conclude that an incumbent LEC must provide public notice in accordance with the rules and schedules we adopt in this proceeding, once the incumbent LEC makes a decision to implement a change that either (1) affects competing service providers' performance or ability to provide service; or (2) otherwise affects the ability of the incumbent LEC's and a competing service provider's facilities or network to connect, to exchange information, or to use the information exchanged. We believe that a broad standard is appropriate, to reduce the possibility that incumbent LECs may fail to disclose information a competing service provider may need in order to maintain adequate interconnectivity and interoperability in response to incumbent LEC network changes. Examples of network changes that would trigger public disclosure obligations include, but are not limited to, changes that affect: transmission; signalling standards; call routing; network configuration; logical elements; electronic interfaces; data elements; and transactions that support ordering, provisioning, maintenance and billing. This list is not exclusive but exemplary; incumbent LECs are not exempted from public notice requirements for a particular change that is not included among these examples.

5. Types of Information to be Disclosed

a. Background

183. In the *NPRM*, we tentatively concluded that incumbent LECs should be required to "disclose all information relating to network design and technical standards, and information concerning changes to the network that affect interconnection."[403] We also tentatively concluded that incumbent LECs specifically must provide: (1) the date changes are to occur; (2) where changes are to be made or to occur; (3) the type of changes; and (4) the potential impact of changes; and that these four categories represented the "minimum information that a potential competitor would need in order to achieve and maintain efficient interconnection."[404]

---

[401] *Id.*

[402] AT&T reply at 26 n.56.

[403] *NPRM* at para. 190. We referred, as an example, to the "All Carrier Rule," which requires public disclosure of "all information relating to network design and technical standards . . . [affecting] interconnection . . . prior to implementation and with reasonable advance notification." *See* note 383, *supra*.

[404] *NPRM* at para. 190.

b. Comments

184. A number of commenters agree with our tentative conclusions regarding the breadth of information that must be reported, as well as our minimum reporting requirements.[405] Ameritech, however, claims that our requirement is "too broad" and would "impose an onerous burden" on incumbent LECs, exceeding the statutory requirements of section 251(c)(5).[406] Ameritech asserts that "excessive exchange of information between competitors is inconsistent with . . . a competitive marketplace" and could spur "allegations of collusion and concerted action."[407] Cox and Time Warner, however, state that uniform public notice of sufficient information can attenuate anticompetitive behavior. ALTS, AT&T and MCI suggest that the information that must be disclosed should include, but should not be limited to, technical specifications and references to standards regarding transmission, signaling, routing and facility assignment as well as references to technical standards that are applicable to any new technologies or equipment, or which may otherwise affect interconnection.

185. A significant cross-section of commenters specifically advocates disclosure of the potential impact of changes.[408] For example, Cox notes that disclosure should, at a minimum, enable a competing service provider to understand: "(1) how its existing technical interconnection arrangements will be affected; and (2) how the form and content of the information passed between the interconnected networks will change."[409] ACSI clearly states that "the content of the notice should specifically identify . . . the impact of the change on current interconnection or access arrangements."[410]

186. Some incumbent LECs, however, take exception to our tentative conclusion to impose on them an obligation to make public disclosure of the potential impact of network

changes.[411] They argue that this obligation would require incumbent LECs to become "experts on the operations of other carriers," or impose a "duty to know what [an] interconnector's service performance abilities are."[412] Specifically, USTA expresses concern that this requirement "could be misconstrued as a duty to predict what the precise impact might be, or to educate a competitor on how to re-engineer their network."[413] Ameritech claims that this requirement is "unfair," and "of little or no value," and implies that this requirement creates a "general duty for [incumbent LECs] to operate their competitor's businesses or help them market their services."[414] BellSouth asserts that "the better approach would be to [disclose] information from which an interconnecting carrier would be able to determine for itself whether its service performance or abilities might be affected."[415] NYNEX alleges that "[s]uch proposals are over-broad and unnecessary to ensure . . . network interconnection/interoperability."[416] NYNEX rejects responsibility for evaluating the effect that changes it would make might have upon competing service providers and asserts that "there is no basis for changing the traditional responsibility of each carrier to maintain its own network and respond to technological and market changes."[417] NYNEX also claims that while it has the ability to "make an assessment of the likely impact of a technical change at the interface with a competitor's network," it would require "detailed knowledge of a competitor's network architecture" in order to calculate the impact a change may have on a competing service provider's performance.[418]

187. MCI and TCC suggest that an incumbent LEC should also be required to designate a contact for additional information in its public notice. PacTel argues, in response, that such a requirement would be "impossible to fulfill" because it would require an incumbent LEC to designate a "single omniscient individual."[419] MFS states that the public notice should also include: "(a) the charges that the incumbent LEC anticipates will apply to the carrier for the change; (b) the specific number of circuits affected if the change occurs at

the time of the notification; (c) the projected minimum, maximum, and average down times per affected circuit; (d) alternatives available to the interconnector;[420] and (e) any other information necessary to evaluate alternatives and effectuate necessary changes or challenges."[421] The Ohio Commission, in contrast, claims that information relating to network design should be excepted from public disclosure, and that incumbent LECs should only be obliged to disclose information regarding changes to existing interconnection arrangements.[422]

c. Discussion

188. We conclude that we should adopt a requirement of uniform public notice of sufficient information to deter anticompetitive behavior and that, at a minimum, incumbent LECs should give competing service providers complete information about network design, technical standards and planned changes to the network. Specifically, public notice of changes shall consist of: (1) the date changes are to occur; (2) the location at which changes are to occur; (3) types of changes; (4) the reasonably foreseeable impact of changes to be implemented, and (5) a contact person who may supply additional information regarding the changes. Information provided in these categories must include, as applicable, but should not be limited to, references to technical specifications, protocols, and standards regarding transmission, signaling, routing and facility assignment as well as references to technical standards that would be applicable to any new technologies or equipment, or that may otherwise affect interconnection.

189. We find that making available a contact person will simplify the public notification process and reduce the risk that the notifications will be misunderstood or misconstrued. Commenters have requested that public notices include a variety of specific information categories, some of which may not be covered by the specific categories identified in the *NPRM*. Such specific information, however, may be inapplicable, unnecessary or proprietary in some circumstances and inadequate or confusing in others. Accordingly, we require instead that incumbent LECs identify a contact person. Such a contact need not be "omniscient," but rather should be able to serve as an initial contact point for the sharing of information regarding the planned network changes.

190. Providing notice of the reasonably foreseeable potential impact of changes does not require incumbent LECs to educate a competitor on how to re-engineer its network, or to be experts on the operations of other carriers, or impose a duty to know the competing service provider's service performance or abilities. Rather, we intend that incumbent LECs perform

---

[420] Although MFS does not elaborate on this requirement, we interpret this suggestion as a request that an incumbent LEC identify in its public notice a range of proposed competing service provider responses to the planned change that will maintain interconnectivity and interoperability of the carriers' networks.

[421] MFS comments at 14.

[422] Ohio Commission comments at 5.

at least rudimentary analysis of the network changes sufficient to include in its notice (where appropriate) language reasonably intended to alert those likely to be affected by a change of anticipated effects. We find that such cautionary language will be a valuable, but not burdensome, element of reasonable public notice.

191. We do not limit network disclosure to information pertinent to those changes in incumbent LEC network design or technical standards that will affect existing interconnection arrangements, as requested by the Ohio Commission. Such a limitation is neither consistent with the obligations imposed by section 251(c)(5) nor consistent with the development of competition. In formulating interconnection and service plans, both actual and potential competing service providers need information concerning network changes that potentially could affect anticipated interconnection, not just those changes that actually affect existing interconnection arrangements.

B. How Public Notice Should be Provided

1. Dissemination of Public Notice Through Industry Fora and Publications

a. Background

192. Section 251(c)(5) requires incumbent LECs to provide "reasonable public notice" of relevant network changes. In the *NPRM*, the Commission requested comment on how this notice should be provided. The Commission tentatively concluded that "full disclosure of the required technical information should be provided through industry fora or in industry publications."[423] The Commission stated that "this approach would build on a voluntary practice that now exists in the industry and would result in broad availability of the information."[424] The Commission sought comment on this tentative conclusion. The Commission also requested comment on whether a reference to information on network changes should be filed with the Commission and, if so, where that information should be located.

---

[423] The Commission gave as examples the Network Operations Forum (NOF) and the Interconnection Carrier Compatibility Forum (ICCF). *NPRM* at para. 191.

[424] *NPRM* at para. 191.

b. Comments

193. Most commenters agree with our tentative conclusion in the *NPRM* that existing industry fora and publications are appropriate vehicles for public notice of network changes.[425] Bell Atlantic notes that "industry participants with an interest in new interfaces routinely monitor publications and announcements for disclosures."[426] Some incumbent LECs support the use of industry fora and publications because they are well established, already in place, reach the targeted audience, have worked effectively for a number of years, or allow for widespread dissemination.[427] USTA states that "voluntary practices can serve as a platform from which to implement this act."[428]

194. Several commenters, however, caution that industry fora and publications should not be the only vehicles used for the public dissemination of network change information[429] and request flexible disclosure methods.[430] Although MCI does not object to utilizing industry fora and publications, MCI cautions against over reliance on these vehicles because it "do[es] not believe that . . . parties affected by technical changes [will] receive information in sufficient detail, objectivity, and timeliness."[431] Many commenters indicate that additional disclosure vehicles are required because not all carriers participate in these fora on a regular basis (partly as a result of limited resources)[432] or because the BOCs, in the past, have used industry fora to limit competitors' access to full and timely information in order to put them at a competitive disadvantage.[433] Several commenters have noted the potential of the Internet

[433] MCI comments at 17-18, reply at 7. Bell Atlantic refutes this allegation. Bell Atlantic reply at 10.

as a vehicle for providing public notice of network changes.[434] Others specifically suggest that incumbent LECs should be required to file technical change information with the Commission "in order to ensure a complete, reliable, and consistent body of information that all parties may utilize."[435] Some incumbent LECs, however, disagree, arguing that the Commission need not become a repository of disclosure notices because such Commission filings would be "redundant with existing industry functions and contrary to the Commission's current initiative to eliminate unnecessary filings."[436]

195. Bell Atlantic suggests that "direct disclosure to a mailing list of interconnectors should also be allowed."[437] MFS proposes extending direct mail notification to "any other carrier . . . who specifically requests such notice."[438] PacTel, however, claims that imposing these sorts of requirements would "impose excessive and unnecessary costs on [incumbent] LECs."[439]

196. BellSouth argues that no Commission rule is necessary because current voluntary practices are "sufficient to ensure that this information is broadly available."[440] Similarly, GVNW suggests that information should only be passed to competing service providers "case by case . . . as required."[441] Several commenters, however, disagree. Time Warner, for example, contends that "the Commission must adopt a uniform . . . rule which prescribes a specific method by which notification and disclosure must be provided" and that will allow interested parties to gain ready access to the information they require.[442]

[442] Time Warner comments at 9. *See also* AT&T reply at 27 n.58. (arguing that the very existence of such broad disagreement on this issue itself bespeaks the need for a uniform national rule and that the absence of a uniform public disclosure requirement would lead to "disparate application of a uniform federal statutory duty, unduly narrow interpretations of that duty by [independent local exchange carriers] . . . and competitive harm to new entrants").

197. The District of Columbia Commission asserts that state commissions may also require information to be filed at the state level, and may need the same information in order to comply with section 252. As such, state commissions could also be used to make information available to small competing service providers. AT&T, however, argues that there are no specific differences among the various states that are "material" to our network disclosure requirements.[443]

c. Discussion

198. We conclude that incumbent LECs may fulfill their network disclosure obligations either (1) by providing public notice through industry fora, industry publications, or on their own publicly accessible Internet sites; or (2) by filing public notice with the Commission's Common Carrier Bureau, Network Services Division, in accordance with the format and method requirements of the rules we are adopting in this proceeding. In either case, the public notice must contain the minimum information categories identified in paragraph 188, above. Incumbent LECs using public notice methods other than Commission filings must file a certification with the Common Carrier Bureau, Network Services Division, identifying the proposed change(s), stating that public notice has been given in compliance with this Order, identifying the location of the information describing the change and stating how the information can be obtained by interested parties. This certification must also comply with the rules we adopt in this proceeding.

199. As discussed above, we conclude that industry fora, industry publications, and the Internet may be used to make public disclosure of network changes and required technical information. We affirm our belief that "this approach would build on a voluntary practice that now exists in the industry and would result in broad availability of the information."[444] Reliance solely on voluntary participation in industry fora and publications, however, may inhibit the ability of some small carriers to disseminate or receive this information. Because of their more limited resources, some smaller incumbent LECs and competing service providers do not participate in these fora on a regular basis; nevertheless, all carriers, competing service providers, and potential competitors must have equal opportunities to provide and to receive change information on a national scale. We believe that wide availability of pertinent network change information effectively removes potential barriers to entry, which could otherwise frustrate the efforts of new competitors. As a consequence, we conclude that the Commission should function as a "backstop" source of information for other interested parties. Accordingly, in lieu of disclosure in industry fora, publications, or the Internet, an incumbent LEC may file network change information directly with the Commission. In the alternative, if an incumbent LEC chooses to provide public notice through one or more industry fora or publications, or the Internet, we require that it also file a certification with the Commission containing the information outlined above. We are

---

[443] AT&T reply at n.59.

[444] *NPRM* at para. 191.

confident that even small incumbent LECs with limited resources will be able to use one of these alternatives to give public notice of network changes.

200. An incumbent LEC must maintain both the information disclosed in its public notice and any nondisclosed supporting information that is nevertheless relevant to the planned change, until the change is implemented. As discussed in paragraph 235, *infra*, once a change is implemented in the incumbent LEC's network, information on the change must be disclosed under the general interconnection obligations imposed by section 251(c)(2).

201. We find that information filed with the Commission under section 251(c)(5) should eventually be made available on the FCC Home Page or through other online access vehicles, such as "LISTSERV" subscription mailings or others, and we intend to explore this option fully for the future. In addition, we will explore vigorously the possibility that hypertext links from the Commission Home Page to incumbent LEC Internet sites could both facilitate public notice and centralize access to change information. We find that direct mail notification alone does not comport with our interpretation of "public notice" as used in this proceeding, because such direct mailings do not provide notice to the "public," but rather provide individual notice to a selected group of recipients. Such mailings could, however, supplement other methods of notification.

202. We also address the impact on small incumbent LECs. We agree with GVNW[445] and Rural Tel. Coalition[446] that we can mitigate the impact of our rules on small incumbent LECs by allowing public notice to be given at several alternative locations. Because many of these carriers lack the resources to participate in industry fora, we have also provided low cost alternatives, including Internet postings or Commission filings. We expect that our requirement that either public notice or certification be filed with the Commission will allow small entities, both incumbent LECs and new entrants, to locate network change information quickly and inexpensively. In any event, under section 251(f)(1), certain small incumbent LECs are exempt from our rules until (1) they receive a *bona fide* request for interconnection, services, or network elements; and (2) their state commission determines that the request is not unduly economically burdensome, is technically feasible, and is consistent with the relevant portions of section 254. In addition, certain small incumbent LECs may seek relief from our rules under section 251(f)(2).[447]

2. When Should Public Notice of Changes Be Provided?

a. Background

203. Section 251(c)(5) requires an incumbent LEC to provide "reasonable public notice" of certain changes to its network. In the *NPRM*, we tentatively concluded that this statutory language requires incumbent LECs: (1) to provide notice of these changes within a "reasonable" time in advance of implementation; and (2) to make the information available within a "reasonable" time if responding to an individual request.[448] We sought comment on what constitutes a reasonable time in each of these situations, and on whether the Commission should adopt a specific timetable for disclosure of technical information.

204. In the *NPRM*, we specifically sought comment on whether we should adopt a disclosure timetable similar to that adopted by the Commission in the *Computer III* proceeding.[449] In Phase II of that proceeding, the Commission required AT&T and the BOCs to disclose information about network changes or new network services that affect the interconnection of enhanced services with the network at two points in time.[450] First, these carriers were required to disclose such information at the "make/buy" point -- that is, when the carrier decides to make itself, or to procure from an unaffiliated entity, any product the design of which affects or relies on the network interface.[451] Second, carriers were required to release publicly all technical information at least twelve months prior to the introduction of a new service or network change that would affect enhanced service interconnection with the network.[452] If a carrier could introduce a new service between six and twelve months of the

[450] *Phase II Recon. Order*, 3 FCC Rcd at 1164. Although the Ninth Circuit vacated the *Phase II Recon. Order*, the Commission reimposed the network disclosure requirements on remand. *See BOC Safeguards Order*, 6 FCC Rcd at 7602-7604.

[451] *Phase II Recon. Order*, 3 FCC Rcd at 1164.

[452] *Id.* at 1164-65.

make/buy point, public disclosure was permitted at the make/buy point, but in no event could the carrier introduce the service earlier than six months after the public disclosure.[453]

205. The disclosure obligations imposed by section 251(c)(5) are broader than those adopted in the *Computer III* proceeding. While *Computer III* applies only to the BOCs and to AT&T, section 251(c)(5) imposes disclosure requirements on all incumbent LECs. Furthermore, while the *Computer III* disclosure requirements apply only to technical information related to new or modified network services affecting the interconnection *of enhanced services* to the BOC networks, section 251(c)(5) mandates disclosure of a much broader spectrum of information.[454] Accordingly, we sought comment in the *NPRM* on whether the Commission should adopt a timetable comparable to that imposed in *Computer III* for section 251(c)(5) network disclosure purposes and, if so, how such a timetable should be implemented.

b. Comments

206. Most commenters express support for our tentative conclusion that section 251(c)(5) requires incumbent LECs to disclose publicly information on network changes within a reasonable time in advance of implementation.[455] No commenters suggest that the timing of disclosure is not governed by section 251(c)(5)'s "reasonableness" standard, although at least two commenters appear to indicate that it would be reasonable to implement network changes immediately upon disclosure.[456] Commenters also support our tentative conclusion that an incumbent LEC must make this information available within a "reasonable" time if responding to an individual request.[457] Time Warner requests a concrete standard in this area and suggests that the Commission should indicate that, once an incumbent LEC has released a public notice of change under section 251(c)(5), it must respond to individual requests for detailed, technical information concerning network changes under section 251(c)(5) within ten business days of receiving the request.[458]

[457] *See, e.g.*, MCI comments at 15.

[458] Time Warner comments at 11.

207. Commenters were split on whether we should adopt a specific disclosure timetable for section 251(c)(5) purposes. Several commenters[459] oppose the adoption of a specific timetable, primarily arguing that: (1) any regulations adopted under section 251(c)(5) should define only minimum guidelines, allowing the states flexibility under section 251(d)(3) to adopt more stringent disclosure requirements dictated by local conditions; (2) a fixed disclosure timetable will needlessly or arbitrarily delay the introduction of new services or technical advances; (3) overly long advance disclosure periods will put the incumbent LECs at a competitive disadvantage because competitors will be able to bring planned services to market more quickly; (4) the industry already has in place detailed disclosure guidelines that are widely followed on a voluntary basis and that obviate the need for independent Commission examination of this issue; and (5) the Commission's existing "all carrier" rule, which contains a flexible standard, adequately addresses the obligations imposed by section 251(c)(5).[460] GVNW warns that the interval from the make/buy decision to in-service for small LECs is often less than twelve months and states that the Commission should not require technology to be implemented at a slower pace than is technically feasible merely to satisfy a notice requirement.[461] Commenters also argue that carriers already face powerful incentives to ensure that their networks interconnect properly because the reputation of both the incumbent LEC and the interconnecting LEC are at stake if service fails.[462] In addition, BellSouth claims that section 251(c)(5) is "self-effectuating and needs no interpretive regulations."[463]

208. Several other commenters argue that, while a disclosure timetable may be necessary, the *Computer III* requirements are too rigid. The District of Columbia Commission notes that any eventual disclosure timetable must balance "the need to ensure the earliest possible disclosure of information needed by competitors [against] the need to impose the least administrative burden on" incumbent LECs.[464] Accordingly, the District of Columbia Commission maintains that state commissions should be afforded flexibility to set timetables that are appropriate in light of local conditions.[465] Several commenters note existing industry notification timing standards adopted and issued by the Industry Carriers Compatibility Forum

[465] *Id.*

("ICCF")[466] and argue that widespread industry use of these standards has obviated the need for an additional Commission-imposed timetable.[467] MCI, however, cautions that these existing industry guidelines are inadequate because industry fora, in general, have historically been controlled by the RBOCs.[468] U S WEST supports disclosure at the "make/buy" point, but argues that additional notice should not be required for deployment of standard interfaces and services.[469] While MCI supports adoption of the *Computer III* timetable in this proceeding, it requests that, in addition: (1) we impose a mandatory 6-month disclosure period for network changes that can be implemented within 6 months of the "make/buy" point; and (2) we clarify that incumbent LECs must disclose relevant information they discover after services have been introduced, if such information would have been subject to prior disclosure.[470] AT&T also supports the general parameters of the *Computer III* timetable, but requests that we specifically impose a one year minimum advance disclosure obligation on changes to network elements or operations support system technology.[471] Similarly, while ACSI notes that the *Computer III* timetable is a "useful starting place," it argues for a minimum one-year notice period for modification of the physical form of interconnection, with an additional 6 month period in which use of the changes by a competing service provider is permissive only.[472]

209. Cox argues that disclosure should be made at the "earliest possible time" and, in particular, at the time the decision is made internally to implement a change, with the "make/buy" point being considered the "absolute latest date" on which disclosure is permitted.[473] In addition, Cox requests that we obligate incumbent LECs to disclose any unimplemented network changes that are subject to the section 251(c)(5) notice requirement at the outset of interconnection negotiations.[474]

[473] Cox comments at 10-11.

[474] *Id.* at 11.

210. MFS proposes a tripartite scheme, loosely based on the *Computer III* timetable, that classifies certain changes as "major," "location," or "minor."[475] "Major" changes, would be defined as those "introducing any change in network equipment, facilities, specifications, protocols, or interfaces that will require other parties to make any modification to hardware or software in order to maintain interoperability." Major changes would be subject to 18 months advance notice. "Location" changes would be defined as those "that require changes in the geographic location to which traffic is routed, or at which unbundled network elements can be obtained, but [that] do not otherwise change the manner of interconnection or of access"; such changes could be implemented on 12 months notice. "Minor" changes, including those in "numbering, routing instructions, signalling codes, or other information necessary for the exchange of traffic that do not require construction of new facilities or changes in hardware or software" could be made upon notice in accord with the time intervals prescribed by the ICCF.[476]

211. Many commenters recognize the need for a concrete disclosure timetable. AT&T argues that the broad disagreement among commenters itself is evidence that section 251(c)(5) is not self-effectuating.[477] AT&T opposes the state-by-state approach advocated by the District of Columbia Commission, as well as the case-by-case approach advocated by Rural Tel. Coalition, because these approaches could lead to the disparate application of the uniform statutory duty imposed by section 251(c)(5). AT&T notes that the record does not reflect any material conditions that vary among states or justify differing rules. In addition, AT&T disputes the applicability of the ICCF timetable, since that document sets forth only guidelines to be used by the independent LECs in notifying the BOCs of network changes.[478]

212. Of the commenters supporting concrete federal standards, most support the adoption of the *Computer III* disclosure timetable.[479] PacTel notes that existing Commission disclosure requirements are familiar to the industry and adequate to meet the requirements of section 251(c)(5); accordingly it supports the establishment of "safe harbor" rules based on *Computer III* and the disclosure requirements contained in our existing rules.[480] As discussed above, although it advocates certain revisions, U S WEST agrees that "disclosure pursuant to the Computer [III] Rules would seem to satisfy the requirements of the [1996] Act."[481] GTE

[481] U S WEST comments at 12-13.

notes that the "make/buy" point is an appropriate disclosure trigger because it ensures both the delivery of timely information to parties that use the networks and the promotion of carriers' development efforts to support network innovation.[482]

213. Several commenters urge us to adopt rules prohibiting an incumbent LEC from disclosing network changes to certain preferred entities, including long distance or equipment manufacturing affiliates, prior to public disclosure.[483]

c. Discussion

214. We find that it would be unreasonable to expect other telecommunications carriers or information services providers to be able to react immediately to network changes that the incumbent LEC may have spent months or more planning and implementing; accordingly we reject requests to permit incumbent LECs to implement changes immediately on disclosure. In order to clarify incumbent LECs' obligations to disclose these changes a "reasonable time in advance of implementation," we adopt a disclosure timetable based on that developed in the *Computer III* proceeding. Under this timetable, incumbent LECs will be required to disclose planned changes, subject to the section 251(c)(5) disclosure requirements, at the "make/buy" point,[484] but a minimum of twelve months before implementation. If the planned changes can be implemented within twelve months of the make/buy point, then public notice must be given at the make/buy point, but at least six months before implementation.

215. With respect to changes that can be implemented within six months of the make/buy point, incumbent LECs may wish to provide less than six months notice. In such a case, the incumbent LEC's certification or public notice filed with the Commission, as applicable, must also include a certificate of service: (1) certifying that a copy of the incumbent LEC's public notice was served on each provider of telephone exchange service that interconnects directly with the incumbent LEC's network a minimum of five business days in advance of the filing; and (2) providing the name and address of all such providers of local exchange service upon which the notice was served. The Commission will issue public notice of such short-term filings. Such short term notices will be deemed final on the tenth business day after the release of the Commission's public notice unless a provider of information services or telecommunications services that directly interconnects with the incumbent LEC's network files an objection to the change with the Commission and serves it on the incumbent LEC no later than the ninth business day following the release of the Commission's public notice. If such an objection is filed, the incumbent LEC will have the opportunity to respond within an additional five business days and the Common Carrier

[483] *See, e.g.*, Time Warner comments at 8; NCTA reply at 12; Ohio Consumer's Council reply at 5-6.

[484] The definition of the "make/buy" point for section 251(c)(5) purposes is discussed *infra* at paras. 216-217.

Bureau, Network Services Division, will issue, if necessary, an order determining the reasonable public notice period.

i. The Section 251(c)(5) Timetable

216. Without adequate notice of changes to an incumbent LEC's network that affect the "information necessary for the transmission and routing" of traffic, a competing service provider may be unable to maintain an adequately high level of interoperability between its network and that of the incumbent LEC. This inability could degrade the quality of transmission between the two networks or, in a worse case, could interrupt service between the two service providers.[485] Under the rules we adopt today, incumbent LECs must disclose changes subject to section 251(c)(5) at the "make/buy" point, *i.e.*, the time at which the incumbent LEC decides to make for itself, or procure from another entity, any product the design of which affects or relies on a new or changed network interface,[486] but at least twelve months in advance of implementation of a network change. In *Computer III*, the Commission defined "product" in the enhanced services context to be "any hardware or software for use in the network that might affect the compatibility of enhanced services with the existing telephone network, or with any new basic services or capabilities."[487] We believe that this definition can be used to craft a definition of "product" for purposes of section 251(c)(5). Accordingly, for purposes of network disclosure under section 251(c)(5), we define "product" to be "any hardware or software for use in an incumbent LEC's network or in conjunction with an incumbent LEC's facilities that, when installed, could affect the compatibility of the network, facilities or services of an interconnected provider of telecommunications or information services with the incumbent LEC's network, facilities or services."

217. We recognize that some network changes that affect interconnection, *e.g.*, some location changes, may not require an incumbent LEC to make or buy any products. Disclosure of such changes, however, may be required under section 251(c)(5). For purposes of section 251(c)(5), therefore, we clarify that the "make/buy" point includes the point at which the incumbent LEC makes a definite decision to implement a network change in order to begin offering a new service or change the way in which it provides an existing service. Such a "definite decision" requires the incumbent LEC to move beyond exploration of the

---

[485] Because the incumbent LECs control the vast majority of both facilities and customers in most markets, the impact of such difficulties, at least at present, would be felt most acutely by a competing service provider.

[486] *BOC Safeguards Order*, 6 FCC Rcd at 7603. The Commission has stated that, "make/buy applies not only to a carrier's decision to make or buy products to implement a change in the network, but also to any decision to make or buy products that would rely on such changes." *Phase II Order*, 2 FCC Rcd at 3087. The precise definition of the "make/buy" point has been clarified in some detail. *See, e.g., id.*; *Phase I Order*, 104 F.C.C.2d at 1080-86; *Computer and Business Equip. Mfrs. Assoc. Petition for Declaratory Ruling Regarding Section 64.702(d)(2) of the Commission's Rules and the Policies of the Second Computer Inquiry*, Report and Order ("*CBEMA Order*"), 93 F.C.C.2d 1226, 1243-44 (1983).

[487] *Phase I Order*, 104 F.C.C.2d at 1084.

costs and benefits of a change or the feasibility of a change. Instead, a "definite decision" is reached when the incumbent LEC determines that the change is warranted, establishes a timetable for anticipated implementation, and takes the first step toward implementation of the change within its network.[488]

218. We recognize that many changes to an incumbent LEC's network that are subject to disclosure under section 251(c)(5) can be fully implemented less than twelve months after the make/buy point. Accordingly, if the service using the network changes can be initiated within twelve months after the make/buy date, public notice must be given on the make/buy date, but at least six months before implementation of the planned changes.

219. We agree with several commenters that competing service providers should not require a full six months to respond to some categories of relatively minor network changes and that we would needlessly slow the pace of technical advance were we to require a full six months notice in such a case. As evidence of this fact, several commenters have submitted or referred us to industry guidelines developed by ICCF, which detail recommended notice periods of 45 days to six months for certain network changes.[489] Based on the record before us, we agree that six months may be too long a minimum in some circumstances. We conclude, however, that neither the ICCF guidelines nor any other categorization scheme adequately encompasses every potential change affecting interconnection that an incumbent LEC may wish to make to its network. In addition, for changes that can be implemented in less than six months, the length of time required for notice to be considered "reasonable" may vary considerably based on advances in technology, the specific implementation plan developed by an incumbent LEC, the particular capabilities of interconnecting carriers to adapt, and the willingness of the incumbent LEC to be forthcoming with information. Based on these considerations, we find that a fixed timetable for such short-term notices would not be appropriate.

220. Accordingly, with respect to changes subject to section 251(c)(5) disclosure that the incumbent LEC wishes to implement on less than six months' notice, we require that the incumbent LEC's Commission filing, whether certification or public notice, also include a certificate of service: (1) certifying that a copy of the incumbent LEC's public notice was served on each provider of telephone exchange service that interconnects directly with the incumbent LEC's network a minimum of five business days in advance of the filing; and (2) providing the name and address of all such providers of local exchange service upon which the notice was served. Such filings must be clearly titled "Short Term Public Notice (or Certification of Short-Term Public Notice) Pursuant to Rule 51.333(a)."

221. The Commission will issue a public notice of such short-term filings separate from its public notice of other section 251(c)(5) filings. Unlike six-month or twelve-month

---

[488] *Cf. Phase II Order*, 2 FCC Rcd at 3087.

[489] ICCF *Recommended Notification Procedures*. *See supra* note 466.

notices, certain interested parties will have an opportunity to file objections to such short-term public notices. Specifically, short term notices will be deemed final on the tenth business day after the release of the Commission's public notice unless a provider of information services or telecommunications services that directly interconnects with the incumbent LEC's network files an objection to the change with the Commission and serves it on the incumbent LEC no later than the ninth business day following the release of the Commission's public notice. Such an objection must state: (1) specific reasons why the objector is unable to implement adjustments to accommodate the incumbent LEC's changes by the date the incumbent LEC has specified, including specific technical information, questions, or other assistance required that would allow the objector to accommodate those changes; (2) specific steps the objector is taking to implement changes to accommodate the incumbent LEC's changes on an expedited basis; (3) the earliest possible date by which the objector anticipates that it can accommodate the incumbent LEC's changes, assuming it receives the assistance requested in item (1) (not to exceed six months from the date the incumbent LEC gave its original public notice); (4) the affidavit of the objector's president, chief executive officer, or other corporate officer or official with suitable authority to bind the corporation and knowledge of details of the objector's inability to adjust its network on a timely basis that he or she has read the objection, that the statements contained in it are true, that there is good ground to support the objection, and that it is not interposed for purposes of delay; and (5) any other information relevant to the objection. Because the power to interpose such objections could vest competing service providers with extensive power to delay implementation of changes, we caution competing service providers that we will not hesitate to intervene where necessary to ensure that objections are not posed merely to delay implementation of incumbent LEC network changes and that abuse of the Commission's processes for such a purpose would expose a competing service provider to sanctions.[490]

222. If one or more objections are filed, the incumbent LEC will have five additional business days (*i.e.*, until no later than the fourteenth business day following the release of the Commission's public notice) within which to file a response to the objection(s) and serve it on all objectors. Such a response shall: (1) include information responsive to the allegations and concerns identified by objectors; (2) state whether the implementation date(s) proposed by the objector(s) would be acceptable; (3) indicate any specific technical assistance that the incumbent LEC is willing to give to the objector(s); and (4) state any other information relevant to the incumbent LEC's response. In the case of such contested short-term public notices, the Common Carrier Bureau will issue an Order fixing a reasonable public notice period. In the alternative, if the incumbent LEC does not file a response within the five-day time period allotted, or if the response accepts the latest date stated by an objector in response to item (3) of its objection, then the incumbent LEC's public notice shall be deemed amended to specify implementation on the latest date stated by an objector in item (3) of its objection without further Commission action.

---

[490] *See* 47 C.F.R. §§ 1.17, 1.52.

223. At the make/buy point, incumbent LEC plans should be sufficiently developed that the incumbent LEC could provide adequate and useful information to competing service providers. At earlier stages of the planning process, options are still being explored and alternatives weighed. Disclosure at such an early stage could cause interconnecting carriers to waste resources in an effort to respond to network changes that may not occur or that occur ultimately in a significantly different way. As the process of implementing the planned changes into the network goes forward, specific information may also require revision. Accordingly, we require an incumbent LEC to keep its public notice information complete, accurate, and up-to-date in whatever forum it has chosen for disclosure.

224. We agree with several commenters that incumbent LECs should not make preferential disclosure to selected entities prior to disclosure at the make/buy point. Accordingly, we prohibit disclosure to separate affiliates, separated affiliates,[491] or unaffiliated entities (including actual or potential competing service providers), until the time of public notice.

ii. Other Disclosure Proposals

225. We find that section 251(d)(3) does not require the Commission to preserve state authority over the timing of public notice of changes to the "information necessary for the transmission and routing" of traffic. Section 251(d)(3) prevents the Commission from "preclud[ing] the enforcement of any [state commission] regulation, order or policy," to the extent that such regulation, order or policy "establishes [LEC] access and interconnection obligations,"[492] is "consistent with the requirements of [section 251]"[493] and does not "substantially prevent implementation of this section and the purposes of this part."[494]

226. Public notice requirements that varied widely from state to state could subject both incumbent LECs and potential competing service providers to burdensome, duplicative, and potentially inconsistent obligations that would impermissibly hamper the achievement of the goals of section 251. Such varied filings requirements would obligate incumbent LECs to file in, and potential interconnecting carriers to canvass, a multitude of state-level fora in order to glean information concerning network changes. Incumbent LECs that operate in multiple states could be required to disclose a single network-wide change piecemeal in a variety of state filings; interconnecting carriers would then need to retrieve the information, also piecemeal, from many different locations. Neither section 251(c)(5) nor a fixed disclosure timetable limits the range of network changes an incumbent LEC might make;

---

[491] 47 U.S.C. § 274.

[492] 47 U.S.C. § 251(d)(3)(A).

[493] 47 U.S.C. § 251(d)(3)(B).

[494] 47 U.S.C. § 251(d)(3)(C).

rather incumbent LECs remain free to make any otherwise permissible change upon appropriate notice. Accordingly, particularly with respect to entities whose operations span several states, clear, national rules are essential to the uniform implementation of network disclosure.[495]

227. Several commenters argue that a fixed disclosure timetable will needlessly or arbitrarily delay the introduction of technical advances or new services. It is our intention in this proceeding, however, to develop disclosure rules that minimize unnecessary delay by providing competing service providers with adequate, but not excessive, time to respond to changes to an incumbent LEC's network that affect interconnection. The primary concern reflected in section 251(c)(5) is continued interconnection and interoperability. If proper planning occurs, however, the delay associated with this goal should be minimal.

228. At least one commenter argues that, because incumbent LECs and competing service providers have a common interest in ensuring that their networks function together properly -- an interest that removes incentives to withhold vital interconnection information and obviates the need for fixed, enforceable advance disclosure obligations[496] -- any fixed timetables for disclosure should be negotiated between carriers as part of individual interconnection agreements. We disagree. The mere fact that interconnection failures can adversely affect both an incumbent LEC and a competing service provider does not remove the incumbent LEC's incentives to delay release of information concerning network changes solely in order to inconvenience its competitors. The impact of such failures would fall disproportionately on the competing service provider because, at least in the near term, the incumbent LEC's network will connect most of the customers in its service area directly, without using any facilities of a competing service provider. Indeed, we believe that this is the reason that Congress chose to place this obligation on incumbent LECs only and not on all LECs. In addition, notice of network changes provided to an interconnecting carrier, pursuant to a privately negotiated agreement, will not necessarily be provided to members of the *public* who are not parties to the specific agreement.[497] Accordingly, while carriers may negotiate individual notice arrangements (consistent with the preferential disclosure prohibitions discussed in paragraph 224, above) as part of private interconnection agreements, we are unable to rely on such private notice to satisfy section 251(c)(5)'s duty to provide reasonable *public* notice.

229. Although advance disclosure periods will place competing service providers on notice of certain products and services the incumbent LECs intend to bring to market, we do

---

[495] *See* NCTA comments at 12.

[496] Ameritech comments at 30, reply at 17.

[497] Although the contents of privately negotiated interconnection agreements themselves must be disclosed to the public through state level filings, *see* 47 U.S.C. § 252(h), information exchanged pursuant to the terms of such an interconnection agreement might not be provided at all to this Commission, state commissions or the public.

not believe that this information will automatically translate into a competitive advantage for the competing service providers. The incumbent LEC's network disclosure obligations are intended to allow competing service providers to make required changes to their own networks in order to maintain interoperability and uninterrupted, high quality service to the public. These obligations are designed to prevent incumbent LECs from using their currently substantial percentages of subscribers and highly developed networks anticompetitively to prevent the entry of potential competitors.

230. Several commenters have argued that existing practices under industry issued, ICCF guidelines[498] or the Commission's "all carrier" rule,[499] satisfy the requirements of section 251(c)(5) and that no further Commission action is necessary. We disagree. The guidelines that commenters bring to our attention are neither compulsory nor enforceable at the Commission. We cannot rely on continued goodwill among carriers that soon may be locked in competition to assure timely disclosure of network changes. Similarly, we cannot trust in the "mutually satisfactory arrangements for timely information exchange" that GVNW alleges IXCs and small LECs reached to ease the conversion to equal access.[500] Our new rules, and the new market dynamics, may not produce such agreements.

231. While we are aware of no specific complaints concerning the functioning of the "all carrier rule," the advent of competition for basic telephone service in the local market will require rules that are specific, easily enforced and very clear. In this respect, we believe that the all carrier rule standard lacks adequate specificity to function efficiently in the section 251 context. Requiring carriers to litigate the meaning of "reasonable" notice through our complaint process on a case-by-case basis might slow the introduction and implementation of new technology and services, and burden both carriers and the Commission with potentially lengthy, fact-specific enforcement proceedings. A fixed timetable will create a clear, specific standard that will be more easily and quickly enforceable and that will better facilitate the development of competition and serve the public interest.

232. At least one commenter urges us to adopt the *Computer III* timetable merely as a "safe harbor" provision.[501] If we were to do so, however, we would open the notice process to many of the same risks that lead us to reject the all carrier rule. Under "safe harbor" rules, competing service providers' notice complaints could become bifurcated into an initial inquiry as to whether an incumbent LEC met the safe harbor provisions of the timetable. If the answer were in the negative, a second, fact-specific inquiry as to whether notice was nevertheless reasonable, would then follow. The delay in resolving such disputes would not

---

[498] ICCF *Recommended Notification Procedures*. *See supra* note 466.

[499] *See supra* n.383.

[500] GVNW comments at 5.

[501] PacTel comments at 6.

serve the public interest. We believe the better course is to adopt a binding, fixed standard applicable to notice by all incumbent LECs.

233. MFS's proposed regulatory structure based on a tripartite scheme, classifying changes as "major," "location," or "minor," subject to advance disclosure of 18 months, 12 months, and according to industry standards, respectively, is flawed in several respects. Initially, section 251(c)(5) disclosure applies to a broad spectrum of potential network changes and we are not confident that MFS's definitions, or any similar definitions, could adequately capture and clarify every potential alteration affecting interconnection that an incumbent LEC could make to its network. Categorization debates would inevitably arise among carriers concerning the status of specific, planned changes. Reasonable public notice is a function of the length of time an incumbent LEC will take to implement a change and the length of time an interconnecting carrier will need to respond. Fixed 18-month and 12-month disclosure periods will not be flexible enough to take advantage of advances in technology that may permit increasingly rapid implementation of and reaction to network changes. Also, we find that the extended notice periods MFS proposes are too long. MFS provides no evidence or explanation to support its assertion that competing service providers will need a minimum of 18 months notice of major changes,[502] and the record contains broad support for the 12 month notice period from *Computer III*.[503] While we intend that competing service providers have adequate notice of planned network changes, we acknowledge the valid concerns of some commenters that overextended advance notification intervals could needlessly delay the introduction of new services, provide the interconnecting carrier with an unfair competitive advantage, or slow the pace of technical innovation.[504]

iii. Application to Network Changes in Progress

234. On the effective date of the rules implementing incumbent LECs' network disclosure obligations under section 251(c)(5), some incumbent LECs may be implementing network changes that the new rules otherwise would have required them to disclose. With respect to these changes, we do not perceive a need to delay implementation, and no commenter has requested that we do so. We do require, however, that incumbent LECs give public notice of such changes as soon as it is practical, and that notice in accordance with the section 251(c)(5) network disclosure rules be given: (1) before the incumbent LEC begins

---

[502] *Cf.* NYNEX reply at 10-11 (Such a long notice period would "hamstring technological progress and deny customer benefits"); U S WEST reply at 2-3.

[503] *See, e.g.*, AT&T comments at 24-25 (Noting that the time periods from *Computer III* are familiar to incumbent LECs and a one-year minimum for certain changes would be sufficient advance notice to alternative LECs); MCI comments at 16 (agreeing 12 months advance notice is sufficient); Cox comments at 11 ("The proposal in the [*NPRM*] represents the minimum possible standard for disclosure").

[504] *Cf. Phase II Order*, 2 FCC Rcd at 3087 ("[W]hile we believe enhanced service providers are entitled to receive network information on a timely basis, we are also concerned that premature disclosure of this information could impair carriers' development efforts and inhibit network innovation").

offering service using the changes to its network: and (2) no later than 30 days after the effective date of the rules adopted in this Order.

235. We similarly find no need to adopt rules obligating incumbent LECs to make any formal, initial public disclosure of comprehensive information concerning their networks to provide background information against which connecting carriers could then evaluate changes. In the *First Report and Order*, we have concluded that, under section 251(c)(2), incumbent LECs are under an obligation to provide, interconnection for purposes of transmitting and routing telephone exchange traffic alone. exchange access traffic alone, or both.[505] Implicit in this obligation under section 251(c)(2) is the obligation to make available to requesting carriers information indicating the location and technical characteristics of incumbent LEC network facilities. Accordingly, actual or potential competing service providers needing this type of baseline information may request it from the incumbent LEC under section 251(c)(2); subsequent changes to this information will be addressed by the section 251(c)(5) rules we adopt today.

iv. Small Business Considerations

236. We have considered the impact of our rules on small incumbent LECs. We agree with GVNW that many network changes may not require twelve months advance disclosure. Accordingly, we have provided for six month, or shorter, notice periods, when such changes can be accomplished quickly. In addition, we note that, under section 251(f)(1), certain small incumbent LECs are exempt from our rules until (1) they receive a *bona fide* request for interconnection, services, or network elements; and (2) their state commission determines that the request is not unduly economically burdensome, is technically feasible, and is consistent with the relevant portions of section 254. In addition, certain small incumbent LECs may seek relief from our rules under section 251(f)(2).[506]

C. Relationship with other Public Notice Requirements and Practices.

1. Relationship of Sections 273(c)(1) and 273(c)(4) with Section 251(c)(5).

a. Background

237. Section 273(c)(1) requires each BOC to maintain and file with the Commission "full and complete information with respect to the protocols and technical requirements for connection with and use of its telephone exchange facilities," in accordance with Commission

---

[505] *First Report and Order* at section IV.

[506] For a discussion of the implications and operation of section 251(f), *see First Report and Order*, section XII.

rules.[507] Section 273(c)(4) obligates the BOCs to provide timely information on the planned deployment of telecommunications equipment to interconnecting carriers providing telephone exchange service.[508] We sought comment in the *NPRM* on the relationship between these sections and the network disclosure obligations contained in section 251(c)(5).[509]

b. Comments

238. Ameritech states that the requirements of section 251(c)(5) "should be reconciled with [the] related obligations" set forth in section 273(c)(1) and 273(c)(4)."[510] Bell Atlantic suggests that sections 251(c)(5) and 273(c)(1) cover the same type of technical information.[511] Bell Atlantic further recommends that we find that "timely" release of the information covered by section 273(c)(4) means that the information should be made available "a sufficient time in advance that the competing service providers may make any necessary changes to their networks."[512] SBC comments that the disclosure obligations imposed by sections 251(c)(5), 273(c)(1), and 273(c)(4) are "substantially similar."[513] MCI argues that section 273(c)(1) imposes on the RBOCs substantially the same information disclosure obligations that 251(c)(5) imposes on the incumbent LECs in general, with the exception that 273(c)(1) explicitly obligates the RBOCs to file the information with the Commission.[514] MCI further argues that section 273(c)(4)'s "timely" disclosure requirement goes beyond that contained in section 251(c)(5).[515]

239. USTA suggests that "there is no basis to impose different requirements on the BOCs for purposes of compliance with section 273(c)(1) than those they are required to follow for section 251(c)(5). This is in fact one area in which uniformity would provide a benefit to the industry and would be administratively simple."[516] In contrast, the Rural Tel.

---

[507] 47 U.S.C. § 273(c)(1). The Commission will address section 273 in a separate rulemaking proceeding.

[508] 47 U.S.C. § 273(c)(4).

[509] *NPRM* at para. 193.

[510] Ameritech comments at 31.

[511] Bell Atlantic comments at 12.

[512] *Id.* Bell Atlantic advocates the same "reasonable advance notice" standard for use in connection with section 251(c)(5).

[513] SBC comments at 13-14.

[514] MCI comments at 19.

[515] *Id.*

[516] USTA comments at 13.

Coalition argues that the requirements of section 273 apply only to the BOCs and "are not expected to correlate with the requirements of 251(c)(5) that apply to all incumbent LECs."[517] The Rural Tel. Coalition states that the Commission should fashion flexible notice requirements under these sections, recognizing differences in size, market power, and ability to impact competing service providers' operations that exist among the BOCs and independent LECs, and competing service providers.[518] AT&T also disagrees with USTA, arguing that the Commission filing contemplated by section 273(c)(1) is more detailed than the disclosure mandated in section 251(c)(5).[519]

c. Discussion

240. Because the BOCs clearly meet the 1996 Act's definition of an "incumbent LEC,"[520] the minimum disclosure requirements of section 251(c)(5) apply to the BOCs. We will address the specific implications of section 273, including the question whether section 273 imposes additional disclosure requirements on the BOCs, in a separate rulemaking proceeding.

2. Relationship of Sections 251(a) and 251(c)(5) with Section 256.

a. Background

241. Section 251(a) sets forth general duties of telecommunications carriers, including the duty to interconnect directly or indirectly with the facilities and equipment of other telecommunications carriers, and the duty not to install network features, functions or capabilities that do not comply with the guidelines and standards established pursuant to section 255[521] and 256.[522] Section 251(c)(5) sets forth the duty of all incumbent LECs to provide reasonable public notice of changes in the information necessary for the transmission and routing of services using the incumbent LEC's network.[523] The goal of section 256, entitled "Coordination for Interconnectivity," is "to promote nondiscriminatory accessibility by the broadest number of users and vendors of communications products and services to public telecommunications networks used to provide telecommunications service" and defines the

---

[517] Rural Tel. Coalition comments at 4.

[518] *Id.* at 4-5.

[519] AT&T comments at 24, reply at 28.

[520] 47 U.S.C. § 251(h).

[521] Section 255, "Access by Persons with Disabilities," will be addressed in a separate rulemaking proceeding.

[522] 47 U.S.C. § 251(a).

[523] 47 U.S.C. § 251(c)(5).

Commission's role in achieving this goal.[524] In the *NPRM*, we sought comment on the relationship of sections 251(a) and 251(c)(5) with section 256.[525]

b. Comments

242. We received few comments on this issue. USTA states that, "in developing oversight procedures for public telecommunications network interconnectivity standards under Section 256, the Commission can assist in alerting the industry to general types of technology changes which may lead to specific upgrades or modifications by individual carriers."[526] In addition, USTA notes that all telecommunications carriers are obligated by section 251(a)(2) to comply with standards prescribed under sections 255 and 256 and, accordingly, cautions that the section 256 process should be conducted with carriers' section 251(a)(2) obligations in mind.[527] USTA therefore suggests the possibility that an industry group could develop a set of uniform guidelines for use by all carriers in providing notice of changes that could affect interconnection or interoperability.[528]

243. Ameritech comments that section 251(c)(5) is only one part of the overall regulatory structure for coordinating network planning by the industry and facilitating interconnection and interoperability.[529] Based on this analysis, Ameritech argues that the notification obligations section 251(c)(5) imposes should be extended to all LECs under section 256.[530]

c. Discussion

244. Section 251(a)(2) imposes a duty on all telecommunications carriers to act in ways that are not inconsistent with any guidelines and standards established under section 256. Section 251(c)(5) imposes network disclosure obligations on incumbent LECs that are related to the goals of section 256, inasmuch as section 251(c)(5) sets forth one specific procedure to promote interconnectivity. We do not decide here whether compliance with section 251(c)(5) is sufficient to satisfy section 256, however. The Network Reliability and Interoperability Council will develop recommendations to the Commission on the implementation of section

256.[531] We intend to address carrier and Commission obligations under section 256 in a future rulemaking proceeding.

D. Enforcement and Safeguards

1. Enforcement Mechanisms

a. Background and Comments

245. In the *NPRM*, we sought comment on what enforcement mechanism, if any, we should use to ensure compliance with the section 251(c)(5) public notice requirement.[532] Bell Atlantic, in conjunction with its advocacy of a flexible disclosure standard based on "reasonableness," suggests that the Commission review complaints of premature implementation on a case-by-case basis and, where necessary, issue cease-and-desist orders.[533] Ameritech and GTE argue that no specific, additional enforcement mechanisms are necessary, because there is no evidence that existing industry practices are producing network conflicts or hardships, or are otherwise not working.[534] U S WEST suggests that, if carriers fail to make timely disclosure, additional enforcement options can be considered in the future.[535] In contrast, NCTA states that we must adopt meaningful sanctions to enforce our new network disclosure rules, including significant monetary sanctions whenever a competitor's service is disrupted because of an incumbent LEC's failure to comply with the notice requirements.[536] Cox argues that any incumbent LEC found to violate section 251(c)(5)'s disclosure requirements should be required to inform all affected customers of interconnecting carriers that the incumbent LEC's actions caused any adverse effects attributable to the improperly disclosed network changes.[537]

246. MFS states that the Commission should adopt rules that would: (1) require each incumbent LEC to respond to Commission questions regarding the information previously

---

[531] At its meeting on July 15, 1996, the Network Reliability and Interoperability Council discussed (1) barriers to interconnectivity; (2) how the FCC most efficiently can oversee network planning to assure interoperability; (3) need for standards-setting; and (4) the overall reliability of networks. *See Communications Daily*, June 11, 1996 (announcing July 15 meeting); *Public Notice, NYNEX CEO Seidenberg to Head New Network Reliability and Interoperability Council*, 1996 WL 185795 (F.C.C. Apr. 18, 1996).

made available regarding any network changes within the scope of section 251(c)(5), and to supplement the information if requested by the Commission; (2) establish a procedure for temporarily blocking any proposed network change until the Commission has time to investigate any alleged violations, with respect to either provision of notice, or the nature of the network change; and (3) allow the Commission, for good cause, to issue an order, without prior notice or hearing, requiring an incumbent LEC to cease and desist from making any specified changes for a period of up to 60 days to permit Commission investigation of alleged violations.[538] Time Warner suggests that any failure to comply with the rules we establish should be addressed through our existing section 208 complaint process.[539]

b. Discussion

247. It is essential to the development of local competition that incumbent LECs comply with the network disclosure obligations of section 251(c)(5). Even if a competing provider of local exchange service had made significant inroads into the incumbent LEC's customer base, it would have to transmit a substantial number of its customers' calls to the incumbent LEC's network for termination. If these calls cannot be terminated reliably, customers will be more reluctant to use the competing provider's services.

248. We recognize the importance of compliance with our network disclosure rules, and note that many of the specific enforcement sanctions offered by commenters may have merit. The commenters' suggestions indicate a belief that the Commission should delay or prohibit the implementation of changes if we receive sufficiently credible allegations of notice violations. Our existing enforcement authority would permit us to impose such a sanction and we will not hesitate to do so in appropriate circumstances. The Commission, however, also has a range of other penalties it could impose to ensure incumbent LEC compliance with the network disclosure rules. The record currently before us does not reveal a need for us to mandate specific enforcement procedures in the section 251(c)(5) context. Rather, we will intervene in appropriate ways if necessary to ensure adequate disclosure of public notice information, should sanctions become necessary to encourage full compliance with our network disclosure rules.[540] In addition, we intend to explore how we can increase the efficiency of the current section 208 formal complaint process in a separate rulemaking proceeding.

---

[538] MFS comments at 16. MFS does not explain what type of network change might require Commission investigation or what type or level of allegations we should considered sufficient in issuing cease and desist orders.

[539] Time Warner comments at 11.

[540] *See, e.g.*, 47 U.S.C. §§ 154(i), 154(j), 206-209, 218; 47 C.F.R. §§ 0.91, 0.291.

2. Protection of Proprietary Information, Network and National Security

a. Background and Comments

249. In the *NPRM*, we sought comment on the extent to which safeguards may be necessary to ensure that information regarding network security, national security and the proprietary interests of manufacturers and others is not compromised by the section 251(c)(5) network disclosure process.[541]

250. BellSouth states that, to address these concerns, the Commission should permit disclosing incumbent LECs to require the recipient of such information to execute a confidentiality agreement, which could be drafted to include liquidated damages, indemnification, or other appropriate remedial provisions.[542] In addition, BellSouth requests that the Commission confirm that incumbent LECs are not obligated to disclose proprietary information of third parties, but may instead require competing service providers to negotiate directly with the third party for access.[543]

251. GVNW suggests that we limit incumbent LEC disclosure only to references to industry and manufacturers' specifications that are widely available, and to other information required to interconnect at the interface, which would reduce the amount of proprietary or sensitive information that would be subject to disclosure.[544] In addition, GVNW and the Rural Tel. Coalition state that an incumbent LEC should not be obligated to disclose the specific location of physical plant facilities except under strict nondisclosure agreements, in order to preserve the LEC's competitive position and protect against potential terrorist disruptions.[545]

252. Noting that the telecommunications equipment market is competitive, Nortel states that a manufacturer would be seriously disadvantaged if its proprietary information were disclosed to competitors.[546] In addition, Nortel argues that, in such a case, manufacturers

---

[546] Nortel comments at 3; Motorola, Inc. reply at 5. Citing similar concerns, GTE urges us to strike a balance between the information necessary to ensure seamless interconnection and the protection of proprietary information. GTE comments at 6.

would face substantially reduced incentives to develop advanced products.[547] Motorola, Inc., expresses its agreement with both BellSouth and Nortel[548] and comments that disclosure of proprietary information may undermine the competitive position of U.S. manufacturers in the global market.[549] Motorola, Inc., also asks us to clarify that no disclosure is required of technical information at "testing" or "trial" stages,[550] where typically a carrier is evaluating new technology in the field.[551]

253. Sprint, in *ex parte* comments, states that nondisclosure agreements related to the marketing of new services that will be available from both carriers may be appropriate.[552] Sprint also notes, however, that many routine network upgrades, such as establishment of new central offices, remote offices, or tandems, elimination of tandem locations, changes in the incumbent LEC's SS 7 network, and basic software upgrades, may not require the use of nondisclosure agreements.[553] While agreeing that network and national security issues deserve the highest attention, Teleport expresses concern that proprietary interest claims could be used to keep essential network interconnection information from potential competitors.[554]

b. Discussion

254. Having reviewed the record, we conclude that the judicious use of nondisclosure agreements will help protect incentives to develop innovative network improvements, and will also protect against potential threats to both national and network security by limiting the flow of detailed information concerning the operation of the national telecommunications network.[555] Accordingly, we will permit the use of nondisclosure agreements, subject to certain restrictions.

255. Incumbent LECs have a statutory obligation to provide "reasonable public notice of changes in the information necessary for the transmission and routing of services using that

[554] Teleport comments at 12.

[555] Should these agreements prove inadequate for this purpose, we would revisit this issue.

[incumbent LEC's] facilities or network, as well as of any other changes that would affect the interoperability of those facilities and networks,"[556] as defined in this proceeding. Under another provision of the 1996 Act, however, the BOCs and any entities that they own or otherwise control must protect "the proprietary information submitted for procurement decisions from release not specifically authorized by the owner of such information."[557] Thus a rule requiring a BOC to provide change information publicly, without any provision for the use of a nondisclosure agreement, could place a BOC in the position of having to choose between compliance with the Commission's rule and compliance with section 273(e)(5). We also find that requiring disclosure to the public of competitively sensitive, proprietary, or trade secret information without allowing for the possible use of nondisclosure agreements would be inconsistent with section 251(c)(5)'s requirement that incumbent LECs provide "*reasonable* public notice" (emphasis added). It would not be "reasonable" to require such disclosures because they have significant implications with respect to network and national security, as well as the development of competition and innovative network improvements. Accordingly, we find that section 251(c)(5) requires incumbent LECs to provide notice of planned changes to the public sufficient to allow an interested party to assess the possible ramifications of the change and evaluate whether it needs to seek disclosure of additional information. The five categories of information disclosure we mandate here will meet this standard.

256. We do not anticipate that the minimum public notice requirements we are adopting will obligate carriers to disclose competitively sensitive, proprietary, or trade secret information in the public arena. In addition, despite the concerns of Motorola, Inc., Nortel, and others, we do not anticipate that the level of information required by a competing service provider either to transmit and to route services, or to maintain interoperability will, in the ordinary case, include proprietary information. In the event that such information is required, however, an incumbent LEC's public notice must nevertheless identify the type of change planned in sufficient detail to place interested persons on notice that they may potentially be affected, and must state that the incumbent LEC will make further information available to persons signing a nondisclosure agreement. We believe that suitably fashioned nondisclosure agreements can appropriately balance the competing service provider's need for knowledge of network changes with the interests of the incumbent LEC and equipment manufacturers in retaining control of proprietary information.

257. Accordingly, to the extent that otherwise proprietary or confidential information of an incumbent LEC falls within the scope of the network disclosure obligation of section 251(c)(5), it must be provided by that incumbent LEC on a timely basis. If an interconnecting carrier or information service provider requires genuinely proprietary information belonging to a third party in order to maintain interconnection and interoperation with the incumbent LEC's network, the incumbent LEC is permitted to refer the competing service provider to the owner of the information to negotiate directly for its release. While

---

[556] 47 U.S.C. § 251(c)(5).

[557] 47 U.S.C. § 273(e)(5).

the incumbent LEC might represent the most expedient source of the required information, third parties would be less able to protect themselves from misuse of their proprietary information and preserve potential remedies if the incumbent LEC were to disclose directly a third party's proprietary information directly in response to a request.

258. We are concerned that protracted negotiation periods over the terms of a suitable nondisclosure agreement, or the payment of fees or royalties, could consume a significant portion of a competing service provider's notice period. The rules we adopt today require that, except under short-term public notice procedures, an incumbent LEC must give public notice of network changes a minimum of either six months or twelve months in advance of implementation. We find that these periods will provide adequate notice to interconnecting carriers and information service providers, to ensure that a high level of interconnectivity and interoperability can be maintained between networks. These periods, however, are not excessive and will not allow excessive time for the negotiation of the terms of nondisclosure agreements. Because section 251(c)(5) places an affirmative obligation on the incumbent LEC to ensure reasonable public notice of changes to its network, we require that disclosure of information designated by the incumbent LEC as proprietary, whether owned by the incumbent LEC or a third party, be accomplished on appropriate terms as soon as possible after an actual or potential competing service provider makes a request to the information owner for disclosure. Specifically, upon receipt by the incumbent LEC of a competing service provider's request for disclosure of confidential or proprietary information, the applicable public notice period will be tolled to allow the interested parties to agree on suitable terms for a nondisclosure agreement. This tolling is consistent with the incumbent LEC's public notice obligations and will preserve the competing service provider's ability to implement required changes in its own network to accommodate those planned by the incumbent LEC. In accordance with its obligation to keep the public notice information complete, accurate, and up-to-date, the incumbent LEC must, if necessary, amend its public notice: (1) on the date it receives a request from a competing service provider for disclosure of confidential or proprietary information, to state that the notice period is tolled; and (2) on the date the nondisclosure agreement is finalized, to specify a new implementation date.

259. Given these incentives, we conclude that it is unnecessary either to adopt a precise definition of "competitively sensitive" or "proprietary" information, or to mandate the terms of nondisclosure agreements. The *Computer III* rules, upon which we have modeled the disclosure timetable for use in the section 251(c)(5) context, explicitly permit the use of nondisclosure agreements in connection with carrier disclosure of planned changes to the enhanced services industry at the "make/buy" point.[558] In that proceeding also, the Commission explicitly rejected requests to prescribe a specific type of agreement, instead holding that:

> we do not think it necessary or helpful for us to dictate the terms of these private agreements. Nondisclosure agreements are widely used in

---

[558] *Phase II Order*, 2 FCC Rcd at 3092.

telecommunications, as well as in other fields. We believe it better to leave the exact specifications of the terms of such agreement to the parties. We would of course be prepared to intervene should parties bring to our attention evidence of noncompliance with the requirements established in this proceeding.[559]

Although we recognize that legitimate concerns exist regarding the security of proprietary information, the potential exists for some incumbent LECs to use such concerns as either a shield against the entry of competitors into their markets, or a sword to hamper the competitor's business operations. We emphasize that incumbent LECs are required to provide adequate access to even proprietary information if a competing service provider needs that information to make adjustments to its network to maintain interconnection and interoperation.

260. We agree with Motorola, Inc., that market and technical trials are not subject to disclosure under section 251(c)(5). Trials are not considered regular service and, because the validity of the incumbent LEC's trial results rests, in part, on successful interconnection, the incumbent LEC has sufficient incentives ensure that competing service providers receive adequate information. Notice of trials may be given, as needed, on a private, contractual basis.

V. NUMBERING ADMINISTRATION

261. The Commission has repeatedly recognized that access to telephone numbering resources is crucial for entities wanting to provide telecommunications services because telephone numbers are the means by which telecommunications users gain access to and benefit from the public switched telephone network.[560] In enacting the 1996 Act, Congress also recognized that ensuring fair and impartial access to numbering resources is a critical component of encouraging a robustly competitive telecommunications market in the United States. Congress has required the Commission to designate an impartial administrator of telecommunications numbering and has conferred upon the Commission exclusive jurisdiction over those portions of the North American Numbering Plan (NANP) that pertain to the United States.[561]

---

[559] *Id.* at 3092-93.

[560] *See Administration of the North American Numbering Plan*, CC Docket No. 92-237, Report and Order, 11 FCC Rcd 2588, 2591 (1995) (*NANP Order*).

[561] 47 U.S.C. § 251(e)(1).

A. Designation of an Impartial Number Administrator

1. Background

262. Section 251(e)(1) requires the Commission to "create or designate one or more impartial entities to administer telecommunications numbering and to make such numbers available on an equitable basis."[562] In the *NPRM*, we tentatively concluded that action taken by the Commission in its July 1995 *NANP Order* satisfied this requirement.[563] In that *Order*, the Commission directed that functions associated with NANP administration be transferred to a new administrator of the NANP, unaligned with any particular segment of the telecommunications industry. In the *NPRM*, we sought comment on whether this action satisfied the Section 251(e)(1) requirement that we designate an impartial administrator.

2. Comments

263. There is nearly unanimous agreement that action taken by the Commission in the *NANP Order* satisfies the requirement of Section 251(e)(1).[564] GTE states that the *NANP Order* "will ensure that numbering mechanisms are applied in a carrier-neutral fashion, consistent with the objectives of the 1996 Act."[565] Parties, contending that number administration now performed by Bellcore potentially disadvantages non-BOC providers of telecommunications services by delay or denial of numbering resources to them, nevertheless urge the Commission to move quickly to implement the *NANP Order* fully.[566] Moreover, some argue that to give the *NANP Order* full effect, the North American Numbering Council (NANC) must be convened promptly.[567] CTIA states that until that time, "contentious numbering issues will either go unresolved, leading to additional pressure on already burdened numbering resources, or these issues will be resolved by the remnant of a monopoly era

---

[562] *Id.*

[563] *See NANP Order*. The *NANP Order* was initiated in response to Bellcore's stated desire to relinquish its role as NANP administrator. *See* Letter from G. Heilmeier, President and CEO, Bellcore to the Commission (Aug. 19, 1993). Bellcore, however, will continue performing its NANP Administration functions until those functions are transferred to a new NANP administrator pursuant to the *NANP Order*.

[564] *See, e.g.*, Ameritech comments at 22; District of Columbia Commission comments at 1; GCI comments at 5; NYNEX comments at 18; AT&T reply at 2-3.

[565] *See, e.g.*, GTE reply at 34.

[566] *See, e.g.*, CTIA comments at 4; MCI comments at 10.

[567] *See, e.g.*, AT&T comments at 11. The North American Numbering Council (NANC) is a Federal Advisory Committee created for the purpose of addressing and advising the Commission on policy matters relating to administration of the NANP. NANC will provide the Commission advice reached through consensus to foster efficient and impartial number administration.

system."[568] One commenter, Beehive, argues that the *NANP Order* does not meet the requirements of Section 251(e)(1) because it does not address toll free number administration.[569]

3. Discussion

264. We conclude that the action taken in the *NANP Order* satisfies the section 251(e)(1) requirement that the Commission create or designate an impartial numbering administrator. The *NANP Order* requires that functions associated with NANP administration be transferred to a new NANP administrator. In the *NANP Order*, the Commission articulated its intention to undertake the necessary procedural steps to create the NANC.[570] Additionally, it directed the NANC to select as NANP administrator an independent, non-government entity that is not closely associated with any particular industry segment.[571] These actions satisfy section 251(e)(1).

265. Commenters' arguments that we have not fulfilled our duty pursuant to section 251(e)(1) because the NANC has not been convened and has not selected a new NANP administrator are not persuasive. In the *NANP Order*, we required that there be a new, impartial number administrator and established the model for how that administrator will be chosen. We thus have taken "action necessary to establish regulations" leading to the designation of an impartial number administrator as required by section 251(e)(1).

266. We disagree with Beehive's contention that the *NANP Order* does not meet the requirements of section 251(e)(1) because it does not address toll free number administration. In the *NANP Order*, we directed the NANC to provide recommendations on the following question: "What number resources, beyond those currently administered by the NANP Administrator should the NANP Administrator administer?"[572] Our purpose in directing NANC to address this question was to develop a record with respect to commenters' suggestions that the new administrator assume additional responsibilities beyond those of the current NANP administrator, if necessary, to facilitate competition in telecommunications services. By asking this question and seeking recommendations from the NANC, we set into motion a process designed to foster competition in *all* telecommunications services, including toll free, through neutral numbering administration. While the *NANP Order* outlines broad objectives for number administration for all telecommunications services, the specific details

---

[568] *See, e.g.*, CTIA comments at 4.

[569] Beehive comments at 2-4.

[570] *NANP Order*, 11 FCC Rcd at 2608.

[572] *Id.* at 2610.

of implementation for toll free services are addressed in the ongoing toll free proceeding, CC Docket No. 95-155.

B. Delegation of Numbering Administration Functions

267. In this section, we address the role of state public utility commissions in numbering administration. We authorize states to perform the task of implementing new area codes subject to our numbering administration guidelines contained in the *Ameritech Order* and further clarified in this *Order*. We also incorporate the petition for declaratory ruling, the application for review, and the record in that proceeding and address the Texas Commission's pleadings regarding its plan for area code relief in Dallas and Houston which includes wireless overlays. We view prompt examination of the Texas Commission's plan as necessary because the area codes currently assigned to these cities have already reached exhaust.[573]

1. Delegation of Matters Related to Implementation of New Area Codes

a. Background

268. Section 251(e)(1) confers upon the Commission "exclusive jurisdiction over those portions of the North American Numbering Plan that pertain to the United States," but states that "[n]othing in this paragraph shall preclude the Commission from delegating to state commissions or other entities all or any portion of such jurisdiction."[574] In response to this provision, the Commission tentatively concluded in the *NPRM* that it should authorize state commissions to address matters involving the implementation of new area codes so long as they act consistently with the Commission's numbering administration guidelines.[575]

b. Comments

269. Most parties contend that the Commission should "retain [its] plenary authority over all facets of [numbering] administration with delegation to states of only certain limited

---

[573] Area code exhaust occurs when nearly all of the NXXs in a given numbering plan area (NPA) have been consumed. Area code exhaust is a subset of number exhaust, which describes the situation in which numbers used for any purpose to support telecommunications services are consumed. NPAs are known commonly as area codes. The second three digits of a telephone number are known as the NXX code or Central Office code (CO code). Typically there are 792 NXX codes available for assignment in an area code (every possible combination of three digits excluding numbers beginning with a 0 or 1 and numbers ending with 11).

[574] 47 U.S.C. § 251(e)(1).

[575] *NPRM* at para. 256.

functions."[576] PageNet urges that any delegation "should be clearly defined as to scope, review standards, and decision time limits."[577] Similarly, Time Warner recommends that any such delegation be accomplished in conformity with the Commission's guidelines.[578] Bell Atlantic/NYNEX Mobile, while stating that states may be in the best position to implement area code relief tailored to the particular needs of their residents, warns that the Commission must intervene promptly when any state "departs from federal numbering policies prohibiting discrimination against any type of carrier."[579]

270. While some commenters argue that the *Ameritech Order* strikes a "proper jurisdictional balance," permitting state commissions to make initial determinations regarding area code administration, subject to Commission review," others request further clarification of the federal and state role in numbering.[580] The Texas Commission specifically requests that the "FCC clarify the states' roles in number administration by expanding on statements in the *Ameritech Order* and elsewhere regarding the balance of authority between the FCC and the states."[581]

c. Discussion

271. We retain our authority to set policy with respect to all facets of numbering administration in the United States. By retaining authority to set broad policy on numbering administration matters, we preserve our ability to act flexibly and expeditiously on broad policy issues and to resolve any dispute related to numbering administration pursuant to the 1996 Act. While we retain this authority, we note that the numbering administration model established in the *NANP Order* will allow interested parties to contribute to important policy recommendations.

272. We authorize the states to resolve matters involving the implementation of new area codes. State commissions are uniquely positioned to understand local conditions and what effect new area codes will have on those conditions. Each state's implementation method is, of course, subject to our guidelines for numbering administration, including the guidelines enumerated in the *Ameritech Order* and in this *Order* as detailed below. We note

[581] Texas Commission comments at 6.

that this authorization for states to resolve matters involving implementation of new area codes is effective immediately. Because of the need to avoid disruption in numbering administration, there is good cause for this action pursuant to 5 U.S.C. 553 § (d)(3). Some states have implemented new area codes prior to our release of this order. We ratify their actions insofar as they are consistent with these guidelines.

2. Area Code Implementation Guidelines

a. Background

273. When almost all of the central office (CO) codes in an area code are consumed, a new area code must be assigned to relieve the unmet demand for telephone numbers. Prior to the enactment of the 1996 Act, state commissions approved plans developed and proposed by the LECs, as CO code administrators, for implementing new area codes. New area codes can be implemented in three ways. Traditionally, states have preferred to implement new area codes through a geographic split, in which the geographic area using an existing area code is split into two parts, and roughly half of the telephone customers continue to be served through the existing area code and half must change to a new area code. States can, however, simply require a rearrangement of existing area code boundaries to accommodate local needs. The third method available to them is called an area code overlay, in which the new area code covers the same geographic area as an existing area code; customers in that area may thus be served through either code.

274. In the *Ameritech Order*, the Commission recognized the states' role in area code relief, attempted to clarify the balance of jurisdiction over numbering administration between the Commission and the states, and enumerated guidelines governing number administration. Additionally, the *Ameritech Order* declared that Ameritech's proposed wireless-only area code overlay would be unreasonably discriminatory and anti-competitive in violation of the Commission's guidelines and the Communications Act of 1934. The *NPRM* sought comment on whether the Commission should reassess the jurisdictional balance between the Commission and the states that was crafted in the *Ameritech Order* in light of Congress' grant to the Commission of exclusive jurisdiction over numbering administration, with permission to assign to the states any portion of that authority.[582] The *NPRM* also sought comment on what action the Commission should take when a state appears to be acting inconsistently with the Commission's numbering administration guidelines.[583]

---

[582] *See* 47 U.S.C. § 251(e)(1).

[583] *NPRM* at para. 257.

b. Comments

275. Several commenters request that we clarify the *Ameritech Order* to prohibit service-specific overlays.[584] Others request clarification about all area code overlays, not just service-specific overlays. NCTA, for example, argues that all overlays deter the development of local competition. If competitors are relegated to new area codes, it says, potential customers will be forced to change their telephone numbers to obtain service from competitors.[585] NCTA adds that a customer is unlikely to trade a familiar code for a number that may appear to involve a toll charge, or to purchase additional lines from a competitor if those lines receive a different area code than other lines in their home or business.[586] Customers who do change to competing LECs, it claims, will have to dial ten or eleven digits to place local calls to incumbent LEC customers in the same local calling area. By contrast, NCTA maintains that incumbent LEC customers will be able to reach most other local customers through traditional seven-digit dialing.[587] Sprint agrees that all overlays are anticompetitive and argues that the industry should adopt a geographic split approach.[588]

276. MCI urges the Commission to allow an overlay only when it is the only practical alternative, and suggests that such circumstances might include: (a) exhaust in a small metropolitan area; (b) multiple nearly-simultaneous area code exhausts; or (c) when exhaust is so imminent that a split cannot be implemented quickly enough.[589] Numerous commenters suggest that the Commission should clarify the *Ameritech Order* by imposing conditions on the adoption of area code overlays.[590] Suggested conditions include: (a) mandatory ten-digit dialing for all calls within the overlay area;[591] (b) permanent service provider local number

portability;[592] and (c) the reservation for each competing LEC authorized to operate within a numbering plan area (NPA) of at least one NXX code from the original area code.[593]

277. Cox asserts that area code overlays should be prohibited until the competitive concerns they raise are addressed by the implementation of number portability.[594] Similarly, PageNet asserts that number portability may render the concept of an area code meaningless; once location portability is feasible, numbers will be ported from one area code to another.[595] When this happens, it says, public preference for a particular area code will disappear.[596]

278. In the view of some, the *Ameritech Order* does not prohibit all area code overlays and they request clarification that overlays are an appropriate response to area code exhaust.[597] In Bell Atlantic/NYNEX Mobile's view, for example, the Commission should not prohibit overlays when they may be the best solution to area code exhaust.[598] PacTel agrees that overlays are valuable and, in some metropolitan areas, are preferable to geographic splits because: (1) overlays do not require existing customers to change their numbers; (2) overlays maintain existing communities of interest in their existing geographical area code boundaries; (3) overlays do not change the boundaries of existing area codes; and (4) overlays take less time to implement than a split.[599] These are significant considerations for states facing number exhaust at an accelerated pace, it says.[600]

279. According to some commenters, issues pertaining to area code relief plans should be addressed in the first instance by state commissions, with the understanding that the

[600] *Id.*

Commission can intervene if necessary.[601] Similarly, the Texas Commission argues that the *Ameritech Order* can and should be interpreted to allow for "innovative" means of area code relief crafted to balance the interests, benefits, and burdens for all interested parties. Should the Commission determine that the *Ameritech Order* does not permit such an interpretation, the Texas Commission requests that the *Ameritech Order* be overruled.[602] By contrast, Vanguard warns against allowing states too much latitude in interpreting the *Ameritech Order*. It argues that, if the Commission does not set boundaries for state action, the Commission's procompetitive objectives will remain unrealized as state regulators deprive Commission initiatives of their effect.[603]

280. Bell Atlantic/NYNEX Mobile states that, if states act inconsistently with Commission guidance on numbering policies, the Commission should intervene promptly.[604] The District of Columbia Commission urges that "on a showing that a particular state is acting in violation of FCC guidelines, the FCC may revoke its delegation of jurisdiction to that state."[605] PageNet says the Commission should impose a strict time limit on state commission review of relief plans.[606] Sprint advises that any party "retains the right to appeal any detrimental state commission mandate to the FCC, and . . . the FCC will act promptly on such appeals."[607]

c. Discussion.

281. In this *Order*, we are authorizing the states to continue the task of overseeing the introduction of new area codes subject to the Commission's numbering administration guidelines.[608] We are reiterating the guidelines enumerated in the *Ameritech Order* and clarifying the *Ameritech Order* to prohibit all service-specific or technology-specific overlays, and to impose conditions on the adoption of an all-services overlay. Existing Commission guidelines, which were originally enumerated in the *Ameritech Order*, state that numbering administration should: (1) seek to facilitate entry into the communications marketplace by making numbering resources available on an efficient and timely basis; (2) not unduly favor

[608] *See* para. 272, *supra*.

or disadvantage any particular industry segment or group of consumers; and (3) not unduly favor one technology over another.[609] The Commission's conclusion in the *Ameritech Order* that Ameritech's proposed wireless-only overlay plan would be unreasonably discriminatory and anticompetitive in violation of Sections 201(b) and 202(a) of the Communications Act of 1934 has also provided guidance to local central office code administrators and state commissions implementing area code relief.[610] We find that the guidelines and the reasoning enumerated in that decision should continue to guide the states and other entities participating in the administration of numbers because these guidelines are consistent with Congress' intent to encourage vigorous competition in the telecommunications marketplace. In addition, we codify in this *Order* the directives of the *NANP Order* that ensure fair and impartial numbering administration.[611]

282. We disagree with the suggestion of some parties that we prohibit or severely restrict the states' right to choose overlay plans. For example, PageNet urges the Commission to impose specific time constraints on states and to require default area code plans if states do not take action within those time constraints. Such restrictions would not be consistent with our dual objectives of encouraging competition through fair numbering administration while at the same time delegating to the states the right to implement area codes.

283. As we note above, states are uniquely situated to determine what type of area code relief is best suited to local circumstances. Certain localities may have circumstances that would support the use of area code overlays. Most significantly, area code overlays do not require any existing customers to change their telephone number, in contrast to geographic splits. Additionally, in some metropolitan areas continuously splitting area codes will result in area codes not covering even single neighborhoods, a situation that can only be avoided by implementing overlays. Finally, area code overlays can be implemented quickly. States may make decisions regarding the relative merits of area code splits and overlays so long as they act consistently with the Commission's guidelines. We emphasize that the burdens created by area code overlays will be greatest during the transition to a competitive marketplace. As competition in telecommunications services takes root, consumers will become more accustomed to ten-digit dialing and to area code overlays and the states will face less resistance in their efforts to implement new area codes than they will in the near term.

284. Nevertheless, we find that it is necessary to clarify the Commission's numbering administration guidelines as they apply to area code relief. Recent action taken by the Texas

---

[609] *Ameritech Order*, 10 FCC Rcd at 4604.

[610] *Id.* at 4608, 4610-12.

[611] *See generally NANP Order*. Although we resolve specific issues relating to area code implementation in this *Order*, many other important numbering administration issues will be addressed in other proceedings. For example, the use of N11 codes, (*e.g.*, 211, 311, 411, 511, 611, 711, 811, 911) will be addressed in *The Use of N11 Codes and Other Abbreviated Dialing Arrangements*, CC Docket No. 92-105.

Commission has demonstrated that state commissions might interpret our existing guidelines in a manner that is inconsistent with those guidelines.[612] Thus, while we conclude that geographic area code splits and boundary realignments are presumptively consistent with the Commission's numbering administration guidelines, we clarify our guidelines with respect to how area code overlays can be lawfully implemented.

285. First, we conclude that any overlay that would segregate only particular types of telecommunications services or particular types of telecommunications technologies in discrete area codes would be unreasonably discriminatory and would unduly inhibit competition. We therefore clarify the *Ameritech Order* by explicitly prohibiting all service-specific or technology-specific area code overlays because every service-specific or technology-specific overlay plan would exclude certain carriers or services from the existing area code and segregate them in a new area code. Among other things, the implementation of a service or technology specific overlay requires that only existing customers of, or customers changing to, that service or technology change their numbers. Exclusion and segregation were specific elements of Ameritech's proposed plan, each of which the Commission held violated the Communications Act of 1934.

286. To ensure that competitors, including small entities, do not suffer competitive disadvantages, we also conclude that, if a state commission chooses to implement an all-services area code overlay, it may do so subject to two conditions. Specifically, we will permit all-services overlay plans only when they include: (1) mandatory 10-digit local dialing by all customers between and within area codes in the area covered by the new code; and (2) availability to every existing telecommunications carrier, including CMRS providers, authorized to provide telephone exchange service, exchange access, or paging service in the affected area code 90 days before the introduction of a new overlay area code, of at least one NXX in the existing area code, to be assigned during the 90-day period preceding the introduction of the overlay.[613] Clarifying the conditions that must exist in order to implement an area code overlay will reduce the likelihood that states will act inconsistently with the Commission's guidelines and the consequent need for the Commission to review area code relief plans.

287. We are requiring mandatory 10-digit dialing for all local calls in areas served by overlays to ensure that competition will not be deterred in overlay area codes as a result of dialing disparity. Local dialing disparity would occur absent mandatory 10-digit dialing, because all existing telephone users would remain in the old area code and dial 7-digits to call others with numbers in that area code, while new users with the overlay code would have to

---

[612] As discussed at paras. 304-308 *infra*, we find that the Texas Commission's Order addressing area code relief in Dallas and Houston is inconsistent with the *Ameritech Order*.

[613] One NXX will give each carrier the ability to give at least some of its customers numbers in a familiar area code. Guaranteeing more than one NXX in this situation is difficult because by the time the need for the overlay becomes imminent, few NXX codes remain unassigned in the familiar area code.

dial 10-digits to reach any customers in the old code. When a new overlay code is first assigned, there could be nearly 8 million numbers assigned in the old code, with just a few thousand customers using the new overlay code. If most telephone calls would be to customers in the original area code, but only those in the new code must dial ten-digits, there would exist a dialing disparity, which would increase customer confusion. Customers would find it less attractive to switch carriers because competing exchange service providers, most of which will be new entrants to the market, would have to assign their customers numbers in the new overlay area code, which would require those customers to dial 10-digits much more often than the incumbent's customers, and would require people calling the competing exchange service provider's customer to dial 10-digits when they would only have to dial 7-digits for most of their other calls. Requiring 10-digit dialing for all local calls avoids the potentially anti-competitive effect of all-services area code overlays.

288. Allowing every telecommunications carrier authorized to provide telephone exchange service, exchange access, or paging service in an area code to have at least one NXX in the existing NPA will also reduce the potential anti-competitive effect of an area code overlay. This requirement would reduce the problems competitors face in giving their customers numbers drawn from only the new "undesirable" area codes while the incumbent carriers continue to assign numbers in the "desirable" old area code to their own customers.[614]

289. Incumbent LECs have an advantage over new entrants when a new code is about to be introduced, because they can warehouse NXXs in the old NPA.[615] Incumbents also have an advantage when telephone numbers within NXXs in the existing area code are returned to them as their customers move or change carriers. Thus, to advance competition, we require that, when an area code overlay is implemented, each provider of telephone exchange service, exchange access, and paging service must be assigned at least one NXX in the old NPA.

290. A number of commenters suggested that the Commission permit area code overlays only if permanent number portability has been implemented in the applicable NPA.[616]

---

[614] The new overlay area code may be considered less desirable by customers during the beginning of its life because it is less recognizable. For example, business users that have a telephone number in the overlay area code because they have switched carriers or obtained new telephone lines might be thought to be in a distant location due to the "unrecognized" area code. Thus, incumbent carriers would have a competitive advantage because most of their customers would remain in the old, more recognizable code. This effect would persist until customers become accustomed to the new overlay code.

[615] *See supra* n.573.

[616] Teleport Communications Group, Inc. (TCG) has raised this issue in a petition for declaratory ruling filed with the Commission on July 12, 1996. TCG's petition for declaratory ruling asks the Commission to: (1) require that overlay area code plans may not be implemented unless permanent number portability and mandatory 10-digit dialing exist, and that geographic area code splits must be used absent these conditions; (2) require the implementation of TCG's "Number Crunch" proposal, which would permit NXX assignments across multiple rate centers in blocks of one thousand numbers; and (3) require as part of a BOC's application to provide in-region interLATA services pursuant to section 271 of the 1996 Act a demonstration that numbering resources are

We decline to do so. We recognize that the implementation of permanent service provider number portability will reduce the anticompetitive impact of overlays by allowing end users to keep their telephone numbers when they change carriers. Requiring the existence of permanent service provider number portability in an area before an overlay area code may be implemented, however, would effectively deny state commissions the option of implementing any all-services overlays while many area codes are facing exhaust. While permanent number portability is being implemented, end users will be allowed to keep their telephone numbers when they change carriers, under the Commission's mandate of interim number portability.[617]

291. If a state acts inconsistently with federal numbering guidelines designed to ensure the fair and timely availability of numbering resources to all telecommunications carriers, parties wishing to dispute a proposed area code plan may file a petition for declaratory ruling, rulemaking, or other appropriate action with the Commission. Pursuant to section 5(c)(1) of the Communications Act of 1934, as amended,[618] authority is delegated to the Common Carrier Bureau to act on such petitions. We expect that with the clarifications we provide in this *Order*, there will be a reduced need for such petitions. Unless it becomes necessary to do so, we decline to follow the recommendations of parties urging that we enumerate more specific procedures to be invoked if states fail to follow our numbering guidelines. We expect that the need for our review of any state commissions' actions with respect to area code relief should diminish as states gain more experience with the area code relief process generally and with area code overlays in particular, particularly as states become more familiar with the Commission's guidelines in this area.

292. Finally, we address petitions for clarification or reconsideration that were filed in the *Ameritech* and *NANP* proceedings. On February 22, 1995, Comcast Corporation filed a Petition for Clarification or Reconsideration of the *Ameritech Order* regarding the Commission's jurisdiction over numbering administration.[619] In its petition, Comcast seeks clarification of the *Ameritech Order* to the extent that it implies the Commission does not have broad statutory authority over the assignment of numbering resources, and seeks reconsideration of any implication in the *Ameritech Order* that the Commission's authority is

---

available to competing local carriers. We will address TCG's petition in a separate proceeding. *See Petition for Declaratory Ruling to Impose Competitively Neutral Guidelines for Numbering Plan Administration*, filed by Teleport Communications Group, Inc. (July 12, 1996).

[617] *See Number Portability Order*.

[618] 47 U.S.C. § 155(c)(1).

[619] *See Petition for Clarification or Reconsideration*, filed by Comcast Corporation (February 22, 1995). PageNet and Nextel Communications, Inc. ("Nextel") filed Comments in support of Comcast's petition.

limited by or subordinate to state interests.[620] Because section 251(e)(1) gives the Commission exclusive jurisdiction over numbering matters in the United States, any uncertainty about the Commission's and the states' jurisdiction over numbering administration that may have existed prior to the 1996 Act has now been eliminated. In light of the enactment of section 251(e)(1), Comcast's request that the Commission reconsider its conclusion in the *Ameritech Order* that the Commission does not retain plenary jurisdiction over numbering issues in the United States is moot. Accordingly, we dismiss Comcast's petition.

293. In the *NANP Order* the Commission discussed the states' authority over area code changes and central office code administration. In response the National Association of Regulatory Utility Commissioners filed a Request for Clarification and the Pennsylvania Public Utility Commission filed a Petition for Limited Clarification and/or Reconsideration.[621] NARUC and the Pennsylvania Commission have asked the Commission to clarify that, while the Commission intended in the *NANP Order* to transfer the incumbent LEC functions associated with CO code assignment and area code exhaust to the new NANP Administrator, the Commission did not intend to alter the role of the States in overseeing those functions.[622] Because section 251(e)(1) gives the Commission exclusive jurisdiction over numbering matters in the United States, and because we clarify the role of the states in numbering administration in this *Order*,[623] we dismiss the petitions of NARUC and the Pennsylvania Commission as moot.

---

[620] Comcast Petition at 1. According to Comcast, footnote 18 of the *Ameritech Order* explicitly overruled *dicta* in a prior Commission decision that stated that the Commission had plenary jurisdiction over CO code allocation. *Id.* at 3.

[621] *See Request for Clarification*, filed by the National Association of Regulatory Utility Commissioners (NARUC Petition) (August 28,1995); *Petition for Limited Clarification and/or Reconsideration*, filed by the Pennsylvania Commission (Pennsylvania Commission Petition) (August 28, 1995). Nextel filed Comments in response to the petitions.

[622] *See* NARUC Petition at 5; Pennsylvania Commission Petition at 3. The Pennsylvania Commission also seeks clarification or reconsideration of the Commission's *NANP Order* to the extent that it suggests the Commission would interfere with or preempt a state's ability to address local number portability. *Id.* at 3-4. We do not address the states' role with respect to number portability here because this issue has already been addressed by the Commission. *See Number Portability Order* at para. 5.

[623] *See supra* paras. 281-291, and *infra* paras. 309-322.

3. Texas Public Utility Commission's Area Code Relief Order for Dallas and Houston

a. Background

294. On May 9, 1996, the Texas Commission filed two substantively identical pleadings: (1) a petition for expedited declaratory ruling pursuant to 47 CFR § 1.2; and (2) an application for expedited review pursuant to 47 CFR § 1.115.[624] The Texas Commission states that in July 1995, MCI petitioned it for an investigation into numbering practices of Southwestern Bell Telephone Company (SWB)[625] related to exhaustion of telephone numbers in the 214 area code serving the Dallas metropolitan area.[626] SWB proposed to relieve numbering exhaustion by implementing all-services overlays, which would require ten-digit local dialing within Houston and Dallas metropolitan areas.[627] In October 1995, an administrative law judge heard evidence regarding numbering relief plans and issued a written proposal for decision in November 1995. In December 1995, the Texas Commission determined that public comment on the matter was necessary; in January 1996 it conducted public forums in both Dallas and Houston.[628] In March 1996, the Texas Commission issued an Order setting out an area code relief plan.[629] On May 17, 1996, we released a public notice establishing a pleading cycle for comments on the Texas Commission's pleadings.[630]

---

[624] The Texas Commission explains that it is filing both pleadings simultaneously, hoping that the Commission will find one or the other an appropriate vehicle by which to determine expeditiously whether a Texas Commission order (*PUCT Order*) pertaining to a proposed area code relief plan is acceptable. For ease of reference, all citations will be to the Texas Commission petition (PUCT petition) unless citations to both pleadings are needed for clarification. In this order, we are ruling on the PUCT petition. Therefore, action on the Texas Commission's application, a procedurally distinct but substantively identical pleading, is unnecessary.

[625] We note that, although SWB was the LEC proposing the originally disputed area code relief plan, SBC filed comments on the Texas Commission's proposed plan. SWB is a subsidiary of SBC.

[626] PUCT petition at 2. The Texas Office of Public Utility Council filed a similar petition in August 1995 regarding SWB's numbering practices related to the exhaustion of telephone numbers in the 713 area code in Houston. The Texas Commission consolidated the petitions into Texas Public Utilities Commission Docket No. 14447 because similar issues were presented.

[627] *Id.*

[628] *Id.*

[629] *Id.*

[630] *See Pleading Cycle Established for Comments on Public Utility Commission of Texas' Petition for Expedited Declaratory Ruling and Application for Expedited Review of Area Code Plan for Dallas and Houston*, Public Notice, DA 96-794 (rel. May 17, 1996). Comments were due June 6, 1996, and reply comments were due June 21, 1996. Nineteen parties filed comments, and twelve parties filed replies, in response to the Texas Commission's petitions.

b. Petition and Comments

295. The Texas Commission ordered a plan that combines an immediate landline geographic split with a prospective wireless overlay in the Dallas and Houston metropolitan areas.[631] In its pleadings to the FCC, the Texas Commission alleges that it specifically considered the *Ameritech Order* in crafting its plan.[632] The Texas Commission's Order required SWB to request new area codes from the NANP administrator (Bellcore) for the prospective wireless overlays. Bellcore refused to supply the new area codes unless ordered to do so by the FCC.[633] According to the Texas Commission, Bellcore incorrectly relied on the *Ameritech Order* to support a position that wireless overlays are, *per se*, invalid and wasteful.[634]

296. On March 21, 1996, Bellcore sent a letter to the Network Services Division of the Common Carrier Bureau, FCC, explaining its view that the Texas Commission plan violated the *Ameritech Order*.[635] In that letter, Bellcore asserts that the *Ameritech Order* is controlling precedent because § 251(e)(1) confers exclusive jurisdiction over numbering administration on the Commission. Bellcore further opposes use of NPAs for service-specific overlays, because such assignments, it says, are inefficient, wasteful, and potentially discriminatory.[636] The Network Services Division responded to the letter on April 11, 1996, agreeing that the *Ameritech Order* forbids service-specific overlays such as those ordered by the Texas Commission and supporting Bellcore's decision, as acting NANP Administrator, not to make the requested NPA assignments for use in Dallas and Houston as a wireless-specific overlay.[637]

---

[631] PUCT petition at 2-3.

[632] *Id.* at 3. In the *Ameritech Order*, the Commission held that three elements of a proposed wireless-only overlay each violated the prohibition in section 202(a) of the Communications Act of 1934 against unjust or unreasonable discrimination, and also represented unjust and unreasonable practices under section 201(b). Those objectionable elements were: (1) Ameritech's proposal to continue assigning NPA 708 codes (the old codes) to wireline carriers, while excluding paging and cellular carriers from such assignments (the "exclusion" proposal); (2) Ameritech's proposal to require only paging and cellular carriers to take back from their subscribers and return to Ameritech all 708 telephone numbers previously assigned to them, while wireline carriers would not be required to do so (the "take back" proposal); and (3) Ameritech's proposal to assign all numbers from the new NPA (630) to paging and cellular carriers exclusively (the "segregation" proposal). *See Ameritech Order*, 10 FCC Rcd at 4608, 4611.

[633] PUCT petition at 3.

[634] *Id.*

[635] PUCT petition, Attachment B.

[636] *Id.*

[637] PUCT petition at 3-4.

297. The Texas Commission acknowledges that the FCC has exclusive jurisdiction over numbering pursuant to § 251(e)(1) of the 1996 Act.[638] The Texas Commission states that the *NPRM* might provide additional clarification on these issues, but that, currently, it is uncertain whether the FCC intended to preempt the Texas Order, and asks that the Commission consider the specific facts of this matter.[639] It contends that it carefully deliberated the issues and made a balanced and equitable decision that is consistent with the *Ameritech Order*. Therefore, it insists, any preemption is unwarranted.[640]

298. According to the Texas Commission, the *Ameritech Order* does not, on its face, prohibit all service-specific overlays.[641] Instead, it says, the *Ameritech Order* requires a fact-specific examination of each situation to determine whether the proposed numbering plan violates the statutory prohibition of unreasonable and unjust discrimination.[642] Further, in the Texas Commission's view, its Order "strikes the optimal balance" and is "evenhanded" in its effect on carriers and customers.[643] The Texas Commission alleges that it weighed different proposals offered by several parties, and that, although a geographic split was found superior

---

[638] *Id.* at 5.

[639] The Texas Commission argues that the April 11, 1996, letter did not rule directly on the validity of its Order. Moreover, noting that, in the *NPRM*, the Commission references the April 11 Common Carrier Bureau letter, Texas says that the *NPRM* states that the Commission (rather than the Network Services Division) agreed with Bellcore's decision not to make the area code assignments requested by SWB. *NPRM* at para. 257, n.358. Therefore, in Texas' view, the Common Carrier Bureau letter is an action taken pursuant to delegated authority that affirmatively adopts Bellcore's decision and preempts its order. The Texas Commission argues that this action should be reviewed by the Commission. PUCT petition at 4.

[640] PUCT petition at 5. In its petition for declaratory ruling, the Texas Commission requests that we declare: (1) that the refusal of the Chief, Network Services Division, Common Carrier Bureau, to direct the NANP administrator to assign area codes to SWB for use as wireless overlays in Dallas and Houston was erroneous; (2) that the NANP administrator is directed to assign such codes to SWB; and (3) that the Texas Commission's March 13, 1996 Order directing a combination wireline area code split and wireless overlay in Dallas and Houston is lawful. *Id.* at 10. In its application for expedited review, it requests that we: (1) review and reverse the Network Services Division's action in its letter to the NANP administrator; (2) order the NANP administrator to assign the requested area codes for use as wireless overlays in Dallas and Houston; and (3) uphold the Texas Commission's Order pursuant to analysis of Commission precedent. PUCT application at 10.

[641] PUCT petition at 5-6.

[642] *Id.* at 6.

[643] *Id.* at 6-9. In the *Ameritech Order*, we stated that any area code relief plan that becomes effective should strike an optimal balance among three objectives Ameritech had identified: (1) an optimal dialing plan for customers; (2) as minimal a burden as feasible; and (3) an uninterrupted supply of codes and numbers. We further found that the optimal balance must assure that any burden associated with the introduction of the new numbering code falls in as evenhanded a way as possible upon all carriers and customers affected by its introduction. *Ameritech Order*, 10 FCC Rcd at 4611.

'o an all-services overlay, neither plan alone was found to be the best solution.[644] For this 'eason, it chose a two-step, integrated relief plan involving a landline geographic split and a prospective wireless overlay.[645] The Texas Commission argues that its plan permits intra-NPA seven-digit dialing, unlike an all-services overlay, which would have required ten-digit intra-NPA dialing. Also, it says that its plan will reduce customer confusion and provide greater competitive fairness to service providers.[646]

299. Many parties contend that the Texas Commission's plan violates Commission policy as outlined in the *Ameritech Order* and request its clarification.[647] Still others argue that the plan violates § 201(b) or § 202(a),[648] as well as § 251(e)(1), which confers exclusive jurisdiction over numbering administration on the Commission that we have not assigned to any other entity.[649] Still others argue that the plan violates § 253, which provides that no state requirement may prohibit or have the effect of prohibiting the ability of any entity to provide any telecommunications service.[650]

300. In Sprint Spectrum's view, for example, the proposed wireless overlays will undermine the ability of telecommunications carriers to provide service because they allow existing customers of wireless incumbents to retain 7-digit dialing for most calls if they do not switch to a new entrant. Similarly, it says, current customers of wireline incumbents will retain 7-digit dialing to businesses and residences in either the suburban or metropolitan area, unless they switch to a new wireless provider.[651] Sprint Spectrum maintains that, by creating a distinction between services offered by incumbent providers and those seeking entry into the market using wireless technology, the Texas Commission has created a disincentive for new

wireless providers to seek entry into these telecommunications markets.[652] Similarly, PageNet argues that this interference with customer choice, and the inhibition of wireline/wireless competition, are contrary to the objectives stated in the *Ameritech Order*, and urges the Commission to expressly declare the Texas Commission's plan prohibited.[653]

301. Twelve reply comments were received. The Texas Commission contends that it had jurisdiction to issue its order containing its proposed area code relief plan, and the 1996 Act does not deprive the Texas Commission of that jurisdiction.[654] The Texas Commission argues that the exclusion, segregation, and take-back facets of the wireless-only overlay proposal should not be considered separate and independent grounds for finding an NPA relief plan unlawful.[655] The Texas Commission maintains that we should not order an alternative form of relief such as an all-services overlay,[656] and that we should not find unlawful the Texas Commission's proposed consideration of take-back of wireless numbers during the geographic split if the wireless overlays are deemed unlawful.[657]

302. The Texas Public Utility Counsel filed reply comments in support of the Texas Commission's proposed area code relief plan. The Texas Public Utility Counsel maintains that the proposed wireless-only overlay is neither discriminatory nor unreasonable under sections 202(a) and 201(b) of the Communications Act of 1934.[658] Further, the Texas Public Utility Counsel claims that the wireless carriers' interpretation of the *Ameritech Order* is unreasonably strict and would preclude all forms of area code relief.[659]

---

[652] *Id.* at 12.

[654] Texas Commission reply at 2-7.

[655] *Id.* at 7-8.

[656] *Id.* at 9-10.

[657] *Id.* at 10-11.

[658] Texas Public Utility Counsel reply at 9-11.

[659] *Id.* at 12-15.

303. In reply, several parties continue to maintain that the Texas Commission's proposed prospective wireless-only overlay is unlawful.[660] Most of these commenters contend that an all-services overlay can be an appropriate method of area code relief.[661]

c. Discussion

304. We conclude that the Texas Commission's wireless-only overlay violates our *Ameritech Order* on its face. It is also inconsistent with our clarification of the *Ameritech Order* contained in this *Order*, wherein we specifically prohibit wireless-only overlays.

305. The Texas Commission itself admits to the presence of exclusion and segregation in its plan.[662] In the *Ameritech Order*, we clearly indicated that the presence of any one of the following elements including: (1) exclusion; (2) segregation; or (3) take-back, renders a service-specific overlay plan unacceptable and violative of the Communications Act.[663] Texas' plan features all these elements. Like the plan proposed in the *Ameritech Order*, the Texas Commission's plan would unreasonably discriminate against wireless carriers. It is thus unreasonably discriminatory under section 202(a) and would constitute an unreasonable practice in violation of section 201(b) of the Communications Act of 1934. Moreover, in this *Order*, we have clarified the *Ameritech Order* by prohibiting all service-specific and technology-specific area code overlays. Service-specific and technology-specific overlays do not further the federal policy objectives of the NANP. They hinder entry into the telecommunications marketplace by failing to make numbering resources available on an efficient, timely basis to telecommunications services providers. As we describe in detail above, service-specific overlays would provide particular industry segments and groups of

---

[660] *See, e.g.*, CTIA reply at 2-3; Vanguard reply at 1-4; MCI reply at 3-5; ProNet reply at 1; Sprint reply at 1-2. SBC states that the Texas Commission overlays are unlawful, and argues that we should expressly state that service-specific overlays are *per se* unlawful. SBC reply at 1.

[661] ProNet reply at 2-4; BellSouth reply at 2-6; U S WEST reply at 1-6; SBC reply at 2-4.

[662] The record also indicates that the plan also calls for some take-back of existing wireless numbers. The Texas Commission states that two groups of wireless customers will experience take back due to the geographic split. Those with Type 1 cellular and Type 1-like paging connections will experience take-back for "technical and practical implementation-related reasons. *PUCT Order* at 12 n.9. In addition, the Texas Commission envisions that after the date on which NXX codes are activated for the prospective wireless overlay, wireless carriers holding NXX codes from the prior area codes will not be allowed to assign any additional numbers from those prior area codes, regardless of the fill factor of the NXX codes. Remaining unused numbers in those NXX codes will be returned to the NPA administrator. *PUCT Order* at 6.

[663] *See Ameritech Order*, 10 FCC Rcd at 4608. "[W]e find as a matter of law that *each* of these three Ameritech proposals violates the prohibition in the Act against unjust or unreasonable discrimination." (Emphasis added). *See also id.* at 4611. In discussing whether Ameritech's plan constituted an unjust or unreasonable practice and therefore violated § 201(b) of the Act, we stated that three facets of Ameritech's plan – its exclusion, segregation, and take-back proposals – would *each* impose significant competitive disadvantages on the wireless carriers, while giving certain advantages to wireline carriers.

consumers an unfair advantage. We have also stated that administration of the NANP should be technology neutral; service-specific overlays that deny particular carriers access to numbering resources because of the technology they use to provide their services are not technology neutral.

306. We find the Texas Commission's arguments in support of its proposed wireless-only overlay unpersuasive. It argues, for example, that the wireless overlay will extend the life span for the area code relief plan. What extends the life span of a relief plan, however, is not so much the wireless overlay as the introduction of a new NPA with its 792 additional NXXs. This being the case, the Texas Commission provides no compelling reason for isolating a particular technology in the new NPA. The Texas Commission also states that there will be less confusion regarding NPA assignments, but a plan calling for overlay for one service and a split for another is likely to lead to increased customer confusion regarding NPA assignments, because parties making calls would have to be aware of what type of service the party being called has in order to know whether to dial the ten-digit number or just the last seven digits. The Texas Commission also argues that its plan allows for continued seven-digit dialing for intra-NPA calls, but we note that the same would be true if a geographic split for all services and technologies was imposed. Although an all-services overlay would have required ten-digit intra-NPA dialing, there would not be discrimination based on technology.

307. Several parties raise concerns about dialing disparity resulting from the implementation of the Texas Commission's plan. It is these concerns about dialing disparity in the context of an overlay that have led us to require mandatory ten-digit dialing as part of any all services overlay plan.

308. Some parties also advance concerns about the Texas Commission's statements that, if the proposed wireless-only overlay were found to be unlawful, it would consider a mandatory pro-rata take-back of wireless numbers under the geographic split plan in order to balance the remaining burdens of inconvenience and confusion caused by the number changes necessitated by a split. We do not take action here to prevent the Texas Commission from taking back some wireless numbers in the course of introducing a geographic split plan. In a geographic split, roughly half of the customers in the existing NPA, including wireless customers, will have to change their telephone numbers. We recognize that wireless customers may need to have their equipment reprogrammed to change their telephone number, and that this will inconvenience wireless customers to some extent. This illustrates the fact that geographic splits also have burdensome aspects. Our goal is to have technology-blind area code relief that does not burden or favor a particular technology. Requiring approximately half of the wireless customers and wireline customers to change telephone numbers in a geographic split is an equitable distribution of burdens. This is the kind of implementation detail that is best left to the states.

4. Delegation of Additional Numbering Administration Functions

a. Background

309. In the *NANP Order*, we transferred CO code administration to the new NANP administrator. We stated that a "requirement that CO code administration be centralized in the NANP administrator simply transfers the functions of developing and proposing NPA relief plans from the various LEC administrators to the new NANP Administrator" and that "[s]tate regulators will continue to hold hearings and adopt the final NPA relief plans as they see fit."[664]

310. In the *NPRM*, we tentatively concluded that, pursuant to Section 251(e)(1), the Commission should authorize states to address matters related to implementation of new area codes, and we are doing so in this *Order*. In the *NPRM*, we also sought comment on whether the Commission should authorize states or other entities to address any additional number administration functions. We address this issue here.

b. Comments

311. Some commenters raise issues about the proper role of the states in number administration both before and after transfer of number administration functions to the NANP. BellSouth, for example, argues that we should authorize states to address additional number administration functions until their transfer to the NANP. Specifically, BellSouth recommends that states should take active oversight in CO code implementation activities, including the power to allow for cost recovery.[665]

312. SBC expresses concern regarding the expeditious transfer and centralization of CO code administration into the new NANP. In SBC's view, such transfer is appropriate, but before it can take place, all relevant issues must first be fully addressed and resolved. SBC states that code administrators need local knowledge of authorized carriers, service areas, and toll and local calling areas for the transfer to be effective. SBC asserts that, because CO code administration has significant impacts on local areas in terms of relief plans and dialing plans, state regulatory commissions should be included in any decision.[666] In reply, MFS, stating that the Commission should not "be swayed" by SBC's singular concerns about the complexity of CO code assignments and the need for state involvement, argues against any potential delay in the transfer of numbering responsibilities.[667] Similarly, WinStar, stating that

[664] *NANP Order*, 11 FCC Rcd at 2622.

[665] BellSouth comments at 20.

[666] SBC comments at 11-13.

[667] MFS reply at 4.

such delay would be contrary to the letter and spirit of the 1996 Act, argues against any delay in transferring numbering administration from the LECs to the NANP administrator.[668]

313. Some parties argue that. when the new NANP administrator is established, the Commission should allow state commissions to handle the current functions of the LEC, including development of area code relief plans and assignment of CO codes.[669] According to the Florida Commission, if the state commissions do not decide to handle these functions, the NANP administrator should be responsible for these processes.[670] Cox, however, does not support delegation of CO code assignment responsibility to the states and contends that if the Commission does authorize the states to perform this function, it should adopt specific policies for CO code assignment requiring that such assignments be made on a non-discriminatory basis.[671] The Pennsylvania Commission states that, after the new NANP administrator assumes LEC administrative responsibilities, the Commission should allow states to continue their regulatory oversight role. Specifically, the Pennsylvania Commission asserts that the Commission should delegate to state commissions regulatory oversight of CO code assignment, including local number portability and local dialing parity measures.[672]

314. In the Indiana Commission Staff's view, we should authorize state commissions to make decisions regarding the implementation or changing of dialing patterns consistent with non-discriminatory and competitive guidelines, and changes in dialing patterns should be incorporated into the area code relief planning process. The Indiana Commission Staff asserts that states are in a better position to determine what impact changes in dialing will have on the local area.[673] Conversely, Vanguard argues the Commission should satisfy its Congressional mandate by establishing national numbering and dialing parity guidelines.[674]

---

[668] WinStar reply at 15-16.

[669] See, e.g., Florida Commission comments at 6-7; Indiana Commission Staff comments at 6.

[670] Florida Commission comments at 6-7.

[671] Cox states that the policies should state that carriers and states currently administering CO codes are not permitted to deny codes to new entrants, and are not permitted to levy "code opening" charges to avoid imposing barriers on the entry and expansion of new competitors. Cox comments 8-9. In its reply, Cox notes that incumbent LECs have argued that there is no need for Commission intervention in the assignment of CO codes. Cox argues that, in practice, despite the existence of "neutral" CO code assignment guidelines, significant potential for discriminating against new entrants remains. Until an impartial entity is responsible for assigning CO codes, Cox contends, there is a need for specific Commission rules preventing discrimination. Cox would prefer that CO codes be administered by a neutral administrator, and believes that the possibility that a neutral administrator will lack some local knowledge does not form an insurmountable barrier to a swift transition from the current regime. Cox reply at 10-11.

[672] Pennsylvania Commission comments at 7.

[673] Indiana Commission Staff comments at 7.

[674] Vanguard reply at 2-3.

c. Discussion

315. We conclude that the states may continue to implement or change local dialing patterns subject to any future decision by the Commission regarding whether to require uniform nationwide dialing patterns.[675] The Commission will retain broad policy-making jurisdiction over numbering. We further conclude that states that wish to be responsible for initiating area code relief planning, a function currently performed by the LECs as CO code administrators, may do so now and after transfer of CO code administration from the LECs to the new NANP administrator. Again, because of the need to avoid disruption in numbering administration, we find good cause to make this authorization effective immediately pursuant to 5 U.S.C. § 553(d)(3). We decline, however, to delegate to the states on a permanent basis oversight of CO code administration. Finally, we decline to authorize states to handle CO code assignment functions.

316. Currently, state commissions are responsible for determining the number of digits that must be dialed for intra-NPA toll calls and inter-NPA local calls.[676] For example, while most states require 1 plus 10-digit dialing for all intra-NPA toll calls, California and New Jersey permit such toll calls to be completed with 7-digit dialing. Illinois requires 7-digit dialing for all intra-NPA calls, whether local or toll. Similarly, a number of states, including the District of Columbia, Maryland, and parts of Virginia require 10-digit dialing for all inter-NPA local calls and permit 10-digit or 1 plus 10-digit dialing for all intra-NPA local calls.

317. States are in the best position at this time to determine dialing patterns because of their familiarity with local circumstances and customs regarding telephone usage. For example, one state commission might want to allow its residents to dial 7-digits for all intra-NPA calls, whether toll or local, whereas another state commission might wish to require 10-digit dialing for intra-NPA calls to ensure that its residents recognize that they are making a toll call rather than a local call. Therefore, states may continue to implement appropriate local dialing patterns, subject to the Commission's numbering administration guidelines, including the Commission's requirement in this *Order* of 10-digit dialing for all calls within and between NPAs in any area where an area code overlay has been implemented.

318. Two state commissions specifically ask the Commission to authorize states to perform functions associated with initiating and planning area code relief, as distinct from

---

[675] Uniform nationwide dialing, which would require uniform dialing patterns throughout the United States, was raised in the *NANP NPRM*, Docket No. 92-237, 9 FCC Rcd 2068, 2075 (1994), but was not addressed in the *NANP Order* and remains unaddressed by the Commission.

[676] In every state, intra-NPA local calls can be dialed using 7-digits, while all inter-NPA calls require 1 plus 10-digit dialing. For a list of standard and permissible dialing patterns in each state, see *North American Numbering Plan, Numbering Plan Area Codes 1996 Update*, Bellcore (January 1996) at 11-16.

adopting final area code relief plans.[677] We agree that states should be authorized to initiate and plan area code relief. Currently, when an incumbent LEC in its role as CO code administrator predicts that NPA exhaust is imminent, it initiates the NPA relief planning process by holding industry meetings, developing an appropriate area code relief plan or plans, and proposing that plan or several alternative plans for the state commission's consideration and adoption.[678] Thus, state commissions do not initiate and develop area code relief plans,[679] but states adopt, codify or reject the final plan.[680]

319. We conclude that states wishing to become responsible for initiating area code relief planning, a function currently performed by the LECs as CO code administrators, may do so, even after transfer of CO code administration from the LECs to the new NANP administrator. We find that enabling states to initiate and develop area code relief plans is generally consistent with our previous delegation of new area code implementation matters to the state commissions based on their unique familiarity with local circumstances. We make this delegation, however, only to those states wishing to perform area code relief initiation and development. We recognize that many state commissions may not wish to perform these functions because, *inter alia*, the initiation and development of area code relief can require specialized expertise and staff resources that some state commissions may not have. Those states that seek to perform any or all of these functions must notify the new NANP administrator within 120 days of the selection of the NANP administrator. Those states wishing to perform functions relating to initiation and development of area code relief prior to the transfer of such functions to the new NANP administrator must notify promptly the entity

---

[677] Indiana Commission Staff comments at 6-7; Florida Commission comments at 5.

[678] *See, e.g., Illinois Bell Telephone Company Petition for Approval of NPA Relief Plan for 708 Area Code by Establishing a 630 Area Code*, Order, No. 94-0315 (Ill. Comm. Comm'n March 20, 1995).

[679] The process of area code relief initiation and development varies by state. In most cases the incumbent LEC (as CO code administrator) declares that the supply of CO codes in a particular area code is about to exhaust, and invites all telecommunications entities with interests in the area code at issue to meet and attempt to reach consensus on a plan for area code relief. Issues before the industry include whether to propose an area code overlay or a geographic split. If the industry can agree on the proposal, it is submitted to the state commission for adoption. If the industry cannot agree, the incumbent LEC may submit a number of alternatives to the state commission from which to choose.

[680] State commissions have, however, recently begun to reject or significantly alter LEC proposals as area code relief has become more controversial. *See, e.g., Illinois Bell Telephone Company Petition for Approval of NPA Relief Plan for 708 Area Code by Establishing a 630 Area Code*, Order, No. 94-0315 (Ill. Comm. Comm'n March 20, 1995); *AirTouch V. Pacific Bell*, Case 94-09-058, *MCI V. Pacific Bell*, Case 95-01-001, Decision No. 95-08-052 (Cal. Pub. Util. Comm'n Aug. 11, 1995); *Petition of MCI Telecommunications Corp. for an Investigation of the Practices of Southwestern Bell Telephone Co. Regarding the Exhaustion of Telephone Numbers in the 214 Numbering Plan Area and Request for a Cease and Desist Order Against Southwestern Bell Telephone Co., Petition of the Office of the Public Utility Counsel for an Investigation of the Practices of Southwestern Bell Telephone Co. Regarding the Exhaustion of Telephone Numbers in the 713 Numbering Plan Area and Request for a Cease and Desist Order Against Southwestern Bell Telephone Co.*, Order on Rehearing, Docket No. 14447 (Tex. Pub. Util. Comm'n. Apr. 29, 1996).

currently performing CO code administration. States should inform the entities of the specific functions upon which the state wishes to take action. Area code relief initiation and development functions will be transferred to and performed by the new NANP administrator for those states that do not seek to perform such functions. We emphasize that, pursuant to our decision to authorize the states to address matters related to the implementation of area code relief, all state commissions will continue to be responsible for making the final decision on how new area codes will be implemented, subject to this Commission's guidelines.

320. While we authorize states to resolve specific matters related to initiation and development of area code relief plans, we do not delegate the task of overall number allocation, whether for NPA codes or CO codes. To do so would vest in fifty-one separate commissions oversight of functions that we have already decided to centralize in the new NANPA. A nationwide, uniform system of numbering, necessarily including allocation of NPA and CO code resources, is essential to efficient delivery of telecommunications services in the United States.[681]

321. With specific regard to CO code allocation, two BOCs and one state commission have asked us to delegate oversight of this function to the states on a permanent basis. We decline. In addition to the problems noted in the preceding paragraph, we are concerned that such an arrangement could complicate and increase the NANP administrator's workload, and could also lead to inconsistent application of CO code assignment guidelines. The oversight and dispute resolution process established in the *NANP Order*, whereby for the U.S. portions of NANP administration the NANC will have initial oversight and dispute resolution duties, with the Commission as the final arbiter, provides an adequate process for overseeing CO code administration.[682] This process also guarantees state participation in the oversight process through their representation on the NANC.

322. Finally, we decline to authorize states to perform CO code assignment functions as suggested by the Florida Commission for two reasons set forth in the *NANP Order*.[683] First, centralizing CO code assignment in one neutral entity will increase the efficiency of CO code assignment because it will preclude varying interpretations of CO code assignment guidelines. Consistent application of assignment guidelines will also diminish the administrative burden, which can be a potential barrier to entry, facing those carriers seeking codes in various states that would otherwise have to associate with a number of separate code assignment bodies rather than one. Second, a centralized CO code administration mechanism would allow the Commission and regulators from other NANP member countries to keep abreast of CO code assignments and predict potential problem areas, such as exhaust, sooner than is possible under the current system.

---

[681] *Ameritech Order*, 10 FCC Rcd at 4602.

[682] *See NANP Order*, 11 FCC Rcd at 2605-2610.

[683] *Id.* at 2620-2623.

5. Delegation of Existing Numbering Administration Functions Prior to Transfer

a. Background

323. Prior to the enactment of the 1996 Act, Bellcore, as the NANP Administrator, the incumbent LECs, as central office code administrators, and the states performed the majority of functions related to the administration of numbers.[684] In the *NPRM*, the Commission tentatively concluded that it should authorize Bellcore, the incumbent LECs and the states to continue performing each of their functions related to the administration of numbers as they existed prior to enactment of the 1996 Act until such functions are transferred to the new NANP administrator pursuant to the *NANP Order*.[685] We address this issue here.

b. Comments

324. Several commenters agree with our tentative conclusion to authorize Bellcore, the LECs, and states to continue performing the numbering administration functions they currently perform until such functions are transferred to the new NANP administrator.[686] Generally, these commenters contend that this is the most efficient and least disruptive solution, and that it should be implemented in the interest of numbering administration continuity. Using this approach, NYNEX says, the Commission can intervene and exercise its authority as specific future matters may warrant.[687] AT&T states that current functions should continue until transferred, provided that those functions are not expanded and that the Commission ensures prompt compliance with the *NANP Order*.[688] MFS supports interim delegation of current functions, but asserts that states should have the authority to implement

---

[684] For a discussion of NANP administration functions, *see NANP Order*, 11 FCC Rcd at 2595.

[685] *NPRM* at para. 258.

[686] *See, e.g.*, MFS comments at 9; ACSI comments at 13; Ameritech comments at 24; AT&T comments at 12; Bell Atlantic comments at 9; BellSouth comments at 20; District of Columbia Commission comments at 3; Florida Commission comments at 6; GTE comments at 30; NYNEX comments at 18-19; Pennsylvania Commission comments 6-7; PacTel comments at 25; Texas Commission comments at 6; SBC comments at 9.

[687] NYNEX comments at 18-19. NYNEX asserts that we should reject arguments in favor of implementation of an interim arrangement so that incumbent LECs no longer have responsibility for NXX code administration. Incumbent LECs currently assign the NXXs according to industry standards, and under Commission oversight, NYNEX notes. Therefore, there is no need for a short-lived transfer of the responsibilities to another party.

[688] AT&T comments at 12.

interim changes in number administration as long as their actions are consistent with our numbering policy objectives.[689]

325. The California Commission states that it is considering serving as CO code administrator until the NANC has developed its policy on numbering administration. It urges the Commission to allow states with unique number administration problems to resolve these issues in the interim.[690] PacTel states that it has proposed a partial transfer of CO code administration to the California Commission or a third party. In the alternative, it says, the California Commission could serve as an interim CO code administrator until the NANC completes its work, or until the California Commission selects a permanent administrator. In PacTel's view, these options are consistent with our proposal to permit the LECs, Bellcore, and the states to continue performing each of their respective functions related to number administration until those functions are transferred to the new entity.[691] PacTel asserts that California's plan to share code assignment functions between PacTel and the California Commission until the transfer to the new NANP administrator should be identified as a "safe harbor" under the Act.[692]

326. Other commenters oppose the Commission's proposal to authorize Bellcore, the incumbent LECs, and the states to continue performing those numbering administration functions they performed prior to enactment of Section 251(e)(1) on an interim basis until such functions are transferred to the new NANP administrator.[693] They express concern about the appearance of incumbent LEC dominance and discrimination in the assignment and administration of scarce numbering resources. The Indiana Commission Staff recommends that area code planning and implementation be removed from the responsibility of the LECs in favor of state commissions. In its view, delegating the planning and implementation process to state commissions will foster a "more competitive spirit" among the industry. The Indiana Commission Staff envisions that state commissions could obtain periodic reports from the present incumbent LEC administrator as well as Bellcore on projected exhaust dates for area codes.[694] Sprint states that, as long as Bellcore and the LECs serve as NANP and CO code administrators, they should be required to apply identical standards and procedures for

---

[689] By way of example, MFS notes that California is considering sharing CO code assignment with LECs until that function is transferred to the NANP administrator. MFS comments at 9.

[690] California Commission comments at 7-8.

[691] PacTel comments at 25.

[692] PacTel reply at 28.

[694] Indiana Commission Staff comments at 6.

processing all numbering requests, irrespective of the identity of the party submitting the request.[695]

327. Cox recommends that, in the event the Commission authorizes the state commissions to handle CO assignment, such assignment must be made on a nondiscriminatory basis, and states or the carriers currently administering the CO codes should not be permitted to deny codes to new entrants or to levy "code opening" charges. In Cox's view, the Commission should adopt specific CO code guidelines because: (a) there is evidence of continued discrimination in CO code assignment; and (b) without Commission guidance, states will develop inconsistent regimes. Cox notes that Commission action is especially important here because CO code assignments have not been transferred to a neutral party.[696] Similarly, several commenters argue in CC Docket No. 95-185 that many incumbent LECs are charging paging carriers and other CMRS providers discriminatory fees for activating CO codes, as well as unreasonable and discriminatory recurring monthly charges for blocks of numbers.[697]

c. Discussion

328. Until such functions are transferred to the new NANP administrator, we authorize Bellcore and the incumbent LECs to continue performing the number administration functions they performed prior to the enactment of the 1996 Act. Again, because of the need to avoid disruption in numbering administration, we find that there is good cause to make these authorizations effective immediately pursuant to 5 U.S.C. § 553(d)(3). We also conclude that any incumbent LEC charging competing carriers fees for assignment of CO codes may do so only if it charges the same fee to all carriers, including itself and its affiliates.

329. Numbering administration is a complex task that Bellcore, the incumbent LECs, and, to some extent, the states have been performing for over a decade. It is crucial that efficient and effective administration of numbers continues as the local market opens to competition. This delegation is the most practicable way that numbering administration can continue without disruption. During the transition period, those parties with experience should continue to perform the administrative functions that they have become uniquely equipped to handle. Thus, we authorize Bellcore to continue to perform its functions as the North American Numbering Plan Administrator in the same manner it did at the time of

---

[695] Sprint comments at 14.

[696] Cox comments at 7-9.

[697] With regard to the specific issue of paging carriers being charged recurring monthly fees for blocks of numbers, it is necessary to incorporate the record from CC Docket No. 95-185, *In the Matter of Interconnection Between Local Exchange Carriers and Commercial Mobile Radio Service Providers*. *See, e.g.*, AirTouch Communications comments, CC Docket No. 95-185, at 22 n.22; Arch Communications Group comments, CC Docket No. 95-185, at 7-8, 15, 23-24; PageNet comments, CC Docket No. 95-185, at 22 and App. C.

enactment of the 1996 Act. We also allow the incumbent LECs to continue to perform the CO code administration functions that they performed at the time of enactment of the 1996 Act. Finally, we allow the states, if they performed any number administration functions prior to enactment of the 1996 Act, to continue to do so until such functions are transferred to the new NANP administrator.

330. Some commenters argue that we should not authorize Bellcore and the incumbent LECs to perform numbering administration functions on a transitional basis because continued administration of numbers by these entities, which are not neutral administrators, will permit discriminatory treatment of the incumbents' competitors with respect to access to number resources. While we recognize these concerns, we see no alternative to the action we take here. Transfer of numbering administration functions will be a complex task, one that cannot be accomplished immediately even on transitional basis. The Commission, for example, does not have the resources to administer numbers on a day-to-day basis.

331. In this regard, we note that a proposal has been made to the California Commission to transfer CO code administration to the California Commission or a third party or, in the alternative, to have the California Commission serve as the interim CO code administrator until the NANC completes its work or until the California Commission selects a permanent administrator.[698] We conclude that the record does not support allowing states to change the way CO code administration is performed during the transition to the new NANP administrator. Uniform CO code administration is critical to efficient operation of the public switched network for proper delivery of telecommunications services. The transfer of CO code administration to the states pending the transition to the new NANP administrator would not foster that consistency because states wishing to assume such responsibilities would lack the necessary experience to perform them with speed and accuracy. The California Commission does not refute this persuasively. We therefore urge parties wishing to alter the administration of certain numbers or to change the assignment of responsibilities for administering numbers pending transfer of these functions to the new NANP administrator to raise these issues with the Commission on a case-by-case basis in separate proceedings. In their filings, these parties should state who would bear the cost of a temporary delegation and how such a delegation could be implemented without confusion to carriers and customers.

332. Some commenters have expressed concern that numbering administration will be performed in a discriminatory and anticompetitive manner as long as interested parties exercise these functions. For this reason, some commenters urge the Commission to adopt guidelines for CO code administration with which the incumbent LECs must comply prior to transfer of CO code administration to a new NANP administrator. Specifically, they ask the Commission to prohibit incumbent LECs from levying disparate "code opening" fees on different carriers. We conclude that charging different "code opening" fees for different providers or categories of providers of telephone exchange service constitutes discriminatory

---

[698] California Commission comments at 7-8.

access to telephone numbers and therefore violates section 251(b)(3)'s requirement of nondiscrimination. Charging different "code opening" fees for different providers or categories of providers of any telecommunications service (not just telephone exchange service) also violates section 202(a)'s prohibition of unreasonable discrimination and also constitutes an "unjust practice" and "unjust charge" under section 201(b).[699] Further. it is inconsistent with the principle stated in section 251(e)(1), which states that numbers are to be available on an equitable basis. Incumbent LECs have control over CO codes, a crucial resource for any competitor attempting to enter the telecommunications market; incumbent LECs must therefore treat other carriers as the incumbent LECs would treat themselves. To ensure that numbering administration does not become a barrier to competition in the telecommunications marketplace prior to the transfer of NANP administration functions to a neutral number administrator, we conclude that any incumbent LEC charging competing carriers fees for assignment of CO codes may only do so if the incumbent LEC charges one uniform fee for all carriers, including itself or its affiliates.

333. We are explicitly extending this protection, pursuant to section 202, from discriminatory "code opening" fees to telecommunications carriers, such as paging carriers, that are not providers of telephone exchange service or telephone toll service, and therefore are not covered by Section 251(b)(3).[700] Paging carriers are increasingly competing with other CMRS providers, and they would be at an unfair competitive disadvantage if they alone could be charged discriminatory code activation fees. For the reasons stated above, we explicitly forbid incumbent LECs from assessing unjust, discriminatory, or unreasonable charges for activating CO codes on any carrier or group of carriers. To the extent that recurring per-number charges represent charges for interconnection, they are governed by the principles set out in the *First Report and Order* in this proceeding. Moreover, the Commission has already stated that telephone companies may not impose recurring charges solely for the use of numbers.[701]

334. We emphasize that incumbent LEC attempts to delay or deny CO code assignments for competing providers of telephone exchange service would violate section 251(b)(3), where applicable, section 202(a), and the Commission's numbering administration guidelines found, *inter alia*, in the *Ameritech Order*, the *NANP Order*, and this *Order*. The Commission expects the incumbent LECs to comply strictly with those guidelines and act in an evenhanded manner as long as they retain their number administration functions. Specifically, incumbent LECs should apply identical standards and procedures for processing all numbering requests, regardless of the identity of the party making the request.

---

[699] 47 U.S.C. § 251(b)(3); 47 U.S.C. § 202(a).

[700] Paging is not "telephone exchange service" within the meaning of the Act because it is neither "intercommunicating service of the character ordinarily furnished by a single exchange" nor "comparable" to such service. See 47 U.S.C. § 153(47).

[701] *See The Need to Promote Competition and Efficient Use of Spectrum for Radio Common Carrier Services*, Memorandum Opinion and Order, 59 R.R.2d 1275, 1284 (1986).

335. Indeed, our delegation of matters related to numbering administration during the transition to a new NANP administrator is generally governed by the Commission's existing objectives and guidelines related to number administration as well as those enumerated in this proceeding. We will monitor closely the actions of Bellcore and the LECs with respect to numbering administration to ensure that they perform their tasks impartially and expeditiously until such tasks are transferred.

C. Cost Recovery for Numbering Administration

1. Background

336. In section 251(e)(2), Congress mandates that "[t]he cost of establishing telecommunications numbering administration arrangements and number portability shall be borne by all telecommunications carriers on a competitively neutral basis as determined by the Commission."[702] In the *NANP Order*, the Commission: (1) directed that the costs of the new impartial numbering administrator be recovered through contributions by all communications providers; (2) concluded that the gross revenues of each communications provider will be used to compute each provider's contribution to the new numbering administrator; and (3) concluded that the NANC will address the details concerning recovery of the NANP administration costs.[703] In the *NPRM*, we found that we did not need to take further action because the Commission had already determined that cost recovery for numbering administration arrangements must be borne by all telecommunications carriers on a competitively neutral basis.[704]

2. Comments

337. Several parties believe that the Commission should take further action with regard to cost recovery for numbering administration.[705] BellSouth states that, states should have the power to authorize cost recovery in conjunction with oversight of central office code implementation activities, until transfer of numbering administration to the NANP.[706]

338. Telecommunications Resellers Association urges us to reconsider the assessment that the costs associated with the administration of telecommunications numbering should be borne by telecommunications carriers on a competitively neutral basis. It asserts that reliance

---

[702] 47 U.S.C. § 251(e)(2).

[703] *NANP Order*, 11 FCC Rcd at 2627-2629.

[704] *NPRM* at para. 259.

[705] *See, e.g.*, BellSouth comments 20; Telecommunications Resellers Association comments at 10; NCTA comments at 11.

[706] BellSouth comments at 20.

upon gross revenues would result in a double or greater recovery from resale carriers and their customers.[707]

339. Similarly, NCTA urges us to require that companies providing telecommunications services in addition to other services fund NANP administration based on a percentage of their gross telecommunications revenues, and not their revenues from other services. Otherwise, NCTA argues, diversified companies that have relatively little need for NXXs but large gross revenues from other sources may have to fund a disproportionately large share of NANP administration expenses. Also, NCTA notes that the 1996 Act requires "telecommunications carriers" to contribute to cost recovery for number administration, but that the *NANP Order* requires recovery from all "communications providers." NCTA requests clarification that only "telecommunications carriers" as defined by the 1996 Act must contribute to cost recovery for number administration.[708]

340. Other commenters do not believe that it is necessary for the Commission to take additional action with regard to cost recovery for numbering administration.[709] These parties generally agree that the cost recovery approach taken in the *NANP Order* satisfies the 1996 Act's requirements with respect to ensuring nondiscriminatory access to telephone numbers. Several reiterate that the costs of number administration must be borne by all carriers on a competitively neutral basis. GTE states that the *NANP Order* conclusions satisfy the cost recovery requirement of the 1996 Act, if we ensure that those conclusions are implemented in a manner that does not unduly favor or disadvantage any particular industry segment or technology.[710]

341. In its reply comments, PacTel rejects MCI's suggestion that costs of implementing number portability should be reduced or eliminated. In PacTel's view, interim number portability is an essential element of achieving equitable number administration and all parties that benefit from this process should contribute to full cost recovery.[711]

3. Discussion

342. Because of ambiguity between the language of the 1996 Act and language in the *NANP Order*, we are persuaded that further action is necessary to meet the 1996 Act's

---

[709] *See, e.g.*, ACSI comments at 13; ALTS comments at 8; CTIA comments at 8; Frontier comments at 5 n.14; GCI comments at 6; GTE comments at 31; Ohio Consumers' Council comments at 5; PacTel comments at 26.

[710] GTE comments at 31. *See also* PacTel comments at 26.

[711] PacTel reply at 33.

requirement that cost recovery for number administration be borne by all telecommunications carriers on a competitively neutral basis, and to conform the cost recovery requirements specified in the *NANP Order* to the 1996 Act. First, we require that: (1) only "telecommunications carriers," as defined in Section 3(44), be ordered to contribute to the costs of establishing numbering administration; and (2) such contributions shall be based only on each contributor's gross revenues from its provision of telecommunications services.[712] We note that we have considered the economic impact of our rules in this section on small incumbent LECs and other small entities. We conclude that by basing contributions only on each contributor's gross revenues from its provision of telecommunications services (instead of, for example, imposing a flat fee contribution on all telecommunications carriers), we more equitably apportion the burden of cost recovery for numbering administration.

343. Section 251(e)(2) requires that the costs of telecommunications numbering administration be borne by all telecommunications carriers on a competitively neutral basis. Contributions based on gross revenues would not be competitively neutral for those carriers that purchase telecommunications facilities and services from other telecommunications carriers because the carriers from whom they purchase services or facilities will have included in their gross revenues, and thus in their contributions to number administration, those revenues earned from services and facilities sold to other carriers. Therefore, to avoid such an outcome, we require all telecommunications carriers to subtract from their gross telecommunications services revenues expenditures for all telecommunications services and facilities that have been paid to other telecommunications carriers.[713] It should be noted that this requirement is solely for the purpose of determining a carrier's contribution to numbering administration costs and not for any other purpose, interpretation, or meaning of any other Commission rule such as those contained in Parts 32, 36, 51, 64, 65, or 69 of the Commission's rules.

---

[712] 47 U.S.C. § 251(e)(2) also requires that the cost of establishing telecommunications number portability shall be borne by all telecommunications carriers on a competitively neutral basis. We note that cost recovery for number portability was addressed in the *Number Portability Order*.

[713] See *Assessment and Collection of Regulatory Fees for Fiscal Year 1995*, Report and Order, 10 FCC Rcd 13512, at 13558-59 (1995) (*Regulatory Fees Order*) In the *Regulatory Fees Order*, we stated that, in order to avoid imposing a double payment burden on resellers, we would permit interexchange carriers to subtract from their reported gross interstate revenues any payments made to underlying carriers for telecommunications facilities or services. *Id.* Our action here is consistent with that taken in the *Regulatory Fees Order*. We note that the gross telecommunications services revenues referenced in this discussion are not limited to gross interstate revenues.

D. Section 271 Competitive Checklist Requirement that the BOCs Provide Non-Discriminatory Access to Numbers for Entry into In-region InterLATA Services

1. Background and Comments

344. Section 271(c)(2)(B) contains a competitive checklist of requirements governing the access to functions, facilities and services or interconnection that BOCs must provide or generally offer to other competing telecommunications carriers if the BOC wants authority to provide in-region interLATA service. Pursuant to the competitive checklist, BOCs desiring to provide in-region interLATA telecommunications services must afford, "[u]ntil the date by which telecommunications numbering administration guidelines, plans or rules are established, non-discriminatory access to telephone numbers for assignment to the other carrier's telephone exchange service customers . . . [and] [a]fter that date, [must] compl[y] with such guidelines, plan or rules."[714] In the *NPRM*, we stated that these measures foster competition by ensuring telecommunications numbering resources are administered in a fair, efficient, and orderly manner.[715] Ameritech asks us to clarify that, by complying with the *NANP Order*, a BOC satisfies the competitive checklist requirement of nondiscriminatory access to numbers.[716] MCI argues that we must ensure that the BOCs comply with section 271(c)(2)(B) and assign NXX codes in a competitively neutral manner.[717]

2. Discussion

345. We decline to address section 271(c)(2)(B) issues in this *Order*. We will consider each BOC's application to enter in-region interLATA services pursuant to section 271(c)(2)(B) on a case by case basis, and will look specifically at the circumstances and business practices governing CO code administration in each applicant's state to determine whether the BOC has complied with section 271(c)(2)(B)(ix).

VI. FINAL REGULATORY FLEXIBILITY ANALYSIS

346. As required by Section 603 of the Regulatory Flexibility Act (RFA), 5 U.S.C. § 603, an Initial Regulatory Flexibility Analysis (IRFA) was incorporated in the Notice of Proposed Rulemaking (*NPRM*) in this proceeding. The Commission sought written public

---

[714] 47 U.S.C. § 271(c)(2)(B)(ix).

[715] *NPRM* at para. 251.

[716] Ameritech comments at 23. *See also* NYNEX comments at 18.

[717] MCI comments at 10. We also note that in its petition for declaratory ruling filed July 12, 1996, TCG has asked the Commission to require, as part of a BOC's application to provide in-region interLATA services pursuant to section 271, a demonstration that numbering resources are available to competing local carriers. *See supra* n.616.

comments on the proposals in the *NPRM*, including the IRFA. The Commission's Final Regulatory Flexibility Analysis (FRFA) in this *Order* conforms to the RFA, as amended by the Contract With America Advancement Act of 1996, (CWAAA), Pub. L. No. 104-121, 110 Stat. 847 (1996).[718]

A. Need for and Purpose of this Action

347. The Commission, in compliance with section 251(d)(1), promulgates the rules in this *Order* to ensure the prompt implementation of section 251, which is the local competition provision. Congress sought to establish through the 1996 Act "a pro-competitive, de-regulatory national policy framework" for the United States telecommunications industry.[719] Three principal goals of the telecommunications provisions of the 1996 Act are: (1) opening the local exchange and exchange access markets to competition; (2) promoting increased competition in telecommunications markets that already are open to competition, including, particularly, the long distance services market; and (3) reforming our system of universal service so that universal service is preserved and advanced as the local exchange and exchange access markets move from monopoly to competition.

348. The rules adopted in this *Order* implement the first of these goals -- opening the local exchange and exchange access markets to competition by eliminating certain operational barriers to competition. The objective of the rules adopted in this *Order* is to implement as quickly and effectively as possible the national telecommunications policies embodied in the 1996 Act and to promote the pro-competitive, deregulatory markets envisioned by Congress.[720] We are mindful of the balance that Congress struck between this goal and its concern for the impact of the 1996 Act on small local exchange carriers, particularly rural carriers. This balance is evidenced in section 251(f).

B. Summary of Issues Raised by Public Comments Made in Response to the IRFA

349. Summary of Initial Regulatory Flexibility Analysis (IRFA). In the *NPRM*, the Commission performed an IRFA.[721] In the IRFA, the Commission found that the rules it proposed to adopt in this proceeding may have a significant impact on a substantial number of small businesses as defined by section 601(3) of the RFA. The Commission stated that its regulatory flexibility analysis was inapplicable to incumbent LECs because such entities are

---

[718] Subtitle II of the CWAAA is "The Small Business Regulatory Enforcement Fairness Act of 1996" (SBREFA), codified at 5 U.S.C. § 601 *et. seq.*

[720] *Id.*

[721] *NPRM* at paras. 274-287.

dominant in their field of operation. The Commission noted, however, that it would take appropriate steps to ensure that special circumstances of smaller incumbent LECs are carefully considered in our rulemaking. Finally, the IRFA solicited comment on alternatives to our proposed rules that would minimize the impact on small entities consistent with the objectives of this proceeding.

1. Treatment of Small LECs

350. Comments. The Small Business Administration (SBA), Rural Tel. Coalition, and CompTel maintain that the Commission violated the RFA when it sought to exclude incumbent LECs from regulatory flexibility consideration without first consulting the SBA to establish a definition of "small business."[722] Rural Tel. Coalition and CompTel also argue that the Commission failed to explain its statement that "incumbent LECs are dominant in their field" or how that finding was reached.[723] Rural Tel. Coalition states that the lack of such analysis is inappropriate because incumbent LECs are now facing competition from a variety of sources, including wireline and wireless carriers. Rural Tel. Coalition recommends that the Commission abandon its determination that incumbent LECs are dominant, and perform the regulatory flexibility analysis for incumbent LECs having fewer than 1500 employees.[724]

351. Discussion. In essence, the SBA and the Rural Tel. Coalition argue that we exceeded our authority under the RFA by certifying all incumbent LECs as dominant in their field of operations, and therefore concluding on that basis that they are not small businesses under the RFA. They contend that the authority to make a size determination rests solely with the SBA, and that by excluding a group from the scope of regulatory flexibility analysis the Commission makes an unauthorized size determination.[725] Neither the SBA nor the Rural Tel. Coalition cite any specific authority for this latter proposition.

2. Other Issues

352. We have found incumbent LECs to be "dominant in their field of operations" since the early 1980's and consequently have consistently since that time certified under the RFA[726] that incumbent LECs are not subject to regulatory flexibility analyses because they are

[726] *See* 5 U.S.C. § 605(b).

not small businesses.[727] We have made similar determinations in other areas.[728] We recognize the SBA's special role and expertise with regard to the RFA, and intend to continue to consult with the SBA to ensure that the Commission is fully implementing the RFA. Although we are not fully persuaded on the basis of this record that our prior practice has been incorrect, in light of the special concerns raised by the SBA, the Rural Tel. Coalition, and CompTel in this proceeding, we will, nevertheless, include small incumbent LECs in this FRFA to remove any possible issue of RFA compliance. We, therefore, need not address directly the Rural Tel. Coalition's arguments that incumbent LECs are not dominant.[729]

353. Comments. Parties raised several other issues in response to the Commission's IRFA in the *NPRM*. The SBA and CompTel contend that commenters should not be required to separate their comments on the IRFA from their comments on the other issues raised in the *NPRM*.[730] SBA maintains that separating RFA comments and discussion from the rest of the comments "isolates" the regulatory flexibility analysis from the remainder of the discussion, thereby handicapping the Commission's analysis of the impact of the proposed rules on small businesses.[731] The SBA further suggests that our IRFA failed to: (1) give an adequate description of the projected reporting, recordkeeping, and other compliance requirements of the proposed rules, including an estimate of the classes of small entities which will be subject to the requirement and the professional skills necessary to prepare such reports or records;[732] and (2) describe significant alternatives that minimize the significant economic impact of the proposal on small entities, including exemption from coverage of the rule.[733] SBA also asserts that none of the alternatives in the *NPRM* are designed to minimize the impact of the proposed rules on small businesses.

354. The Idaho Public Utilities Commission argues that the Commission's rules will be devised for large carriers and therefore will be "*de facto*" burdensome to Idaho's incumbent LECs and probably to potential new entrants, which may be small companies.[734]

[733] SBA RFA comments at 7-8, *citing* 5 U.S.C. § 603(c).

[734] Idaho Commission comments at 15.

Therefore, Idaho requests that state commissions retain flexibility to address the impact of our rules on smaller incumbent LECs.

355. The Small Cable Business Association (SCBA) contends that the Commission's IRFA is inadequate because it does not state that small cable companies are among the small entities affected by the proposed rules.[735] In its comments on the IRFA, SCBA refers to its proposal that the Commission establish the following national standards for small cable companies: (1) the definition of "good faith" negotiation; (2) the development of less burdensome arbitration procedures for interconnection and resale; and (3) the designation of a small company contact person at incumbent LECs and state commissions. The SCBA also asserts that the Commission must adopt national standards to guide state commissions in their implementation of section 251(f),[736] the rural telephone company exemption. The *First Report and Order* and its FRFA discusses issues raised by the SCBA regarding its proposal that the Commission establish national standards for certain provisions of the rules that affect small cable companies. Accordingly, we do not repeat those analyses in this FRFA.

356. Discussion. We disagree with the SBA's assessment of our IRFA. Although the IRFA referred only generally to the reporting and recordkeeping requirements imposed on incumbent LECs, our *Federal Register* notice set forth in detail the general reporting and recordkeeping requirements as part of our Paperwork Reduction Act statement.[737] The IRFA also sought comments on the many alternatives discussed in the body of the *NPRM*, including the statutory exemption for certain rural telephone companies.[738] The numerous general public comments concerning the impact of our proposal on small entities in response to our notice, including comments filed directly in response to the IRFA,[739] have enabled us to prepare this FRFA. Thus, we conclude that the IRFA was sufficiently detailed to enable parties to comment meaningfully on the proposed rules and, thus, for us to prepare this FRFA. We have been working with, and will continue to work with the SBA, to ensure that both our IRFAs and FRFAs fully meet the requirements of the RFA.

357. The SBA also objects to the *NPRM's* requirement that responses to the IRFA be filed under a separate and distinct heading, and proposes that we integrate RFA comments into the body of general comments on a rule.[740] Almost since the adoption of the RFA, we

[737] *NPRM, summarized at* 61 Fed. Reg. 18311, 18312 (Apr. 25, 1996).

[738] 47 U.S.C. § 251(f).

[739] *See* SBA RFA comments; Rural Tel. Coalition reply at 38-41; Idaho Public Utilities Commission comments at 15; SCBA RFA comments; CompTel reply at 45-46.

[740] SBA RFA comments at 2.

have requested that IRFA comments be submitted under a separate and distinct heading.[741] Neither the RFA nor the SBA's rules prescribe the manner in which comments may be submitted in response to an IRFA[742] and, in such circumstances, it is well established that an administrative agency can structure its proceedings in any manner that it concludes will enable it to fulfill its statutory duties.[743] Based on our past practice, we find that separation of comments responsive to the IRFA facilitates our preparation of a compulsory summary of such comments and our responses to them, as required by the RFA. Comments on the impact of our proposed rules on small entities have been integrated into our analysis and consideration of the final rules. We therefore reject SBA's argument that we improperly required commenters to include their comments on the IRFA in a separate section.

358. We also reject SBA's assertion that none of the alternatives in the *NPRM* were designed to minimize the impact of the proposed rules on small businesses and the Idaho Public Utilities Commission's assertion that our rules will be burdensome on new entrants. For example, we proposed that incumbent LECs be required to disclose all information relating to network design and technical standards and information concerning changes to the network that affect interconnection facilities.[744] This proposal allows a potential competitor, that may be a small entity, to collect the information necessary to achieve and maintain efficient interconnection. Thus, the competitor can enter the market by relying, in part or entirely, on the incumbent LEC's facilities. Reduced operational entry barriers are designed to provide reasonable opportunities for new entrants, particularly small entities, to enter the market by minimizing the initial investment needed to begin providing service.

359. In addition, we disagree with the Idaho Public Utilities Commission's contention that the rules devised by the Commission will be burdensome to the majority of Idaho's incumbent LECs. We believe section 251(f) and the rules we have crafted provide states with significant flexibility to "deal with the needs of individual companies in light of public interest concerns," as requested by the Idaho Commission. We note that, pursuant to section 251(f), smaller LECs may petition their state commissioners for suspension or modification of the implementation schedule for toll dialing parity established under section 251(b)(3). Although we have required incumbent LECs to continue performing their current functions related to the administration of numbers, this requirement will expire when numbering administration is transferred to the new North American Number Plan (NANP) Administrator, pursuant to Section 251(e). As incumbent LECs are currently performing these functions and

---

[741] *See, e.g., Inquiry into the Development of Regulatory Policy in Regard to Direct Broadcast Satellites*, 86 F.C.C.2d 719, 755 (1981).

[742] *See* 5 U.S.C. § 603 (IRFA requirements).

[743] *See Vermont Yankee Nuclear Power Corp. v. Natural Resources Defense Council, Inc.*, 435 U.S. 519, 524-25 (1978) (*citing FCC v. Schreiber*, 381 U.S. 279, 290 (1965) and *FCC v. Pottsville Broadcasting Co.*, 309 U.S. 134, 138 (1940)).

[744] *NPRM* paras. 189-190.

we have received no comments from incumbent LECs objecting to this requirement, we do not consider it burdensome for them to continue to perform these tasks during the transition period.

360. In addition, we disagree with SCBA's assertion that the IRFA was deficient because it did not identify small cable operators as entities that would be affected by the proposed rules. The IRFA in the *NPRM* states: "Insofar as the proposals in this Notice apply to telecommunications carriers other than incumbent LECs (generally interexchange carriers and new LEC entrants), they may have a significant impact on a substantial number of small entities."[745] The phrase "new LEC entrants" clearly encompasses small cable operators that become providers of local exchange service. The *NPRM* even identifies cable operators as potential new entrants.[746] Thus, the record shows that we have identified small cable operators as entities that would be affected by the proposed rules.

C. Description and Estimate of the Small Entities Affected by the Rules

361. The RFA defines "small entity" to include the definition of "small business concern" under the Small Business Act, 15 U.S.C. § 632.[747] Under the Small Business Act, a "small business concern" is one that: (1) is independently owned and operated; (2) is not dominant in its field of operation; and (3) meets any additional criteria established by the Small Business Administration.[748] The SBA has defined companies listed under Standard Industrial Classification (SIC) categories 4812 (Radiotelephone Communications)[749] and 4813 (Telephone Communications, Except Radiotelephone) to be small entities when they have fewer than 1,500 employees.[750] The SBA has defined companies listed under the SIC category 7379 (Business Services, not otherwise classified) to be small entities when they have annual receipts of less than five million dollars.[751] These standards also apply in determining whether an entity is a small business for purposes of the RFA.

[746] *NPRM* para. 6.

[747] *See* 5 U.S.C. § 601(6) (incorporating by reference the definition of "small business concern" in 5 U.S.C. § 632).

[748] *See* 15 U.S.C. § 632(1)(a).

[749] 13 C.F.R. § 121.201, Standard Industrial Classification (SIC) Code 4812.

[750] 13 C.F.R. § 121.201, Standard Industrial Classification (SIC) Code 4813.

[751] 13 C.F.R. § 121.201, Standard Industrial Classification (SIC) Code 7379.

362. The rules we adopt today regarding dialing parity and nondiscriminatory access apply to all LECs. The rules regarding public disclosure of changes to local networks apply to all incumbent LECs. Finally, the rules regarding numbering administration impose financial obligations on all telecommunications carriers. These rules also affect IXCs, providers of cellular, broadband PCS, and geographic area 800 MHz and 900 MHz specialized mobile radio services, including licensees who have obtained extended implementation authorizations in the 800 MHz or 900 MHz SMR services, either by waiver or under section 90.629 of the Commission's rules,[752] which may be small business concerns. However, these rules will apply to SMR licensees only if they offer real-time, two-way voice service that is interconnected with the public switched network. Additional business entities affected by this rulemaking include providers of telephone toll service, providers of telephone exchange service, independent operator service providers, independent directory assistance providers, independent directory listing providers, independent directory database managers, and resellers of these services. These entities could be small business concerns.

363. Consistent with our prior practice, we shall continue to exclude small incumbent LECs from the definition of a small entity for the purpose of this FRFA. Nevertheless, as mentioned above, we include small incumbent LECs in our FRFA. Accordingly, our use of the terms "small entities" and "small businesses" does not encompass "small incumbent LECs." We use the term "small incumbent LECs" to refer to any incumbent LECs that arguably might be defined by SBA as "small business concerns."[753]

364. Local Exchange Carriers. Neither the Commission nor SBA has developed a definition of small providers of local exchange services. The closest applicable definition under SBA rules is for telephone communications companies other than radiotelephone (wireless) companies, SIC category 4813. For the purposes of revenue reporting, 1,347 companies reported doing business as LECs at the end of 1994.[754] Although it seems certain that some of these carriers are not independently owned and operated, or have more than 1,500 employees, we are unable at this time to estimate with any more particularity the number of LECs that would qualify as small business concerns. Consequently, we estimate that there are fewer than 1,347 small incumbent LECs that may be affected by the decisions and rules adopted in this *Order*.

365. Interexchange Carriers. Neither the Commission nor SBA has developed a definition of small entities that would apply specifically to providers of interexchange services (IXCs). The closest applicable definition under SBA rules is for telephone communications

---

[752] 47 C.F.R. § 90.629.

[753] *See* 13 C.F.R. § 121.210 (SIC 4813).

[754] Federal Communications Commission, CCB, Industry Analysis Division, *Telecommunications Industry Revenue: TRS Fund Worksheet Data*, Tbl. 21 (Average Total Telecommunications Revenue Reported by Class of Carrier) (Feb. 1996).

companies other than radiotelephone (wireless) companies, SIC category 4813. The most reliable source of information regarding the number of IXCs nationwide of which we are aware appears to be the data that we collect annually in connection with Telecommunications Relay Service (TRS). According to our most recent data, 97 companies reported that they were engaged in the provision of interexchange services.[755] Although it seems certain that some of these carriers are not independently owned and operated, or have more than 1,500 employees, we are unable at this time to estimate with greater precision the number of IXCs that would qualify as small business concerns under SBA's definition. Consequently, we estimate that there are fewer than 97 small entity IXCs that may be affected by the decisions and rules adopted in this *Order*.

366. Cellular Service Providers. Neither the Commission nor SBA has developed a definition of small entities specifically applicable to providers of cellular services. The closest applicable definition under SBA rules is for telephone communications companies other than radiotelephone (wireless) companies. The most reliable source of information regarding the number of cellular service carriers nationwide of which we are aware appears to be the data that we collect annually in connection with TRS. According to our most recent data 789 companies reported that they were engaged in the provision of cellular services.[756] Although it seems certain that some of these carriers are not independently owned and operated, or have more than 1,500 employees, we are unable at this time to estimate with greater precision the number of cellular service carriers that would qualify as small business concerns under SBA's definition. Consequently, we estimate that there are fewer than 789 small entity cellular service carriers that may be affected by the decision and rules adopted in this *Order*.

367. Broadband PCS Licensees. The broadband PCS spectrum is divided into six frequency blocks designated A through F. Pursuant to 47 C.F.R. § 24.720(b), the Commission has defined "small entity" in the auctions for Blocks C and F as a firm that had average gross revenues of less than $40 million in the three previous calendar years. This regulation defining "small entity" in the context of broadband PCS auctions has been approved by the SBA.[757] The Commission has auctioned broadband PCS licenses in Blocks A, B, and C. We do not have sufficient data to determine how many small businesses bid successfully for licenses in Blocks A and B. There were 90 winning bidders that qualified as small entities in the Block C auction. Based on this information, we conclude that the number of broadband PCS licensees affected by the decisions in this *Order* includes, at a minimum, the 90 winning bidders that qualified as small entities in the Block C broadband PCS auction.

---

[755] *Id.*

[756] 13 C.F.R. § 121.201, Standard Industrial Classification (SIC) Code 4812.

[757] *See Implementation of Section 309(j) of the Communications Act – Competitive Bidding*, PP Docket No. 93-253, Fifth Report and Order, 9 FCC Rcd 5532, 5581-84 (1994).

368. At present, no licenses have been awarded for Blocks D, E, and F of broadband PCS spectrum. Therefore, there are no small businesses currently providing these services. A total of 1,479 licenses will be awarded, however, in the D, E, and F Block broadband PCS auctions, which are scheduled to begin on August 26, 1996. Eligibility for the 493 F Block licenses is limited to entrepreneurs with average gross revenues of less than $125 million. We cannot estimate the number of these licenses that will be won by small entities, nor how many small entities will win D or E Block licenses. Given the facts that nearly all radiotelephone companies have fewer than 1,000 employees[758] and that no reliable estimate of the number of prospective D, E, and F Block licensees can be made, we assume, for purposes of our evaluations and conclusions in this FRFA, that all of the licenses will be awarded to small entities, as that term is defined by the SBA. Broadband PCS licensees are affected by the decisions and rules adopted in this *Order* to the extent that they provide telephone exchange service.

369. SMR Licensees. Pursuant to 47 C.F.R. § 90.814(b)(1), the Commission has defined "small entity" in auctions for geographic area 800 MHz and 900 MHz SMR licenses as a firm that had average gross revenues of less than $15 million in the three previous calendar years. This definition of a "small entity" in the context of 800 MHz and 900 MHz SMR has been approved by the SBA.[759]

370. The rule adopted in this *Order* applies to SMR providers in the 800 MHz and 900 MHz bands that either hold geographic area licenses or have obtained extended implementation authorizations. We do not know how many firms provide 800 MHz or 900 MHz geographic area SMR service pursuant to extended implementation authorizations, nor how many of these providers have annual revenues of less than $15 million. Since the RFA amendments were not in effect until the record in this proceeding was closed, the Commission was unable to request information regarding the number of small businesses in this category. We do know that one of these firms has over $15 million in revenues. We assume, for purposes of our evaluations and conclusions in this FRFA, that all of the remaining extended implementation authorizations may be held by small entities, which may be affected by the decisions and rules adopted in this *Order*.

371. The Commission recently held auctions for geographic area licenses in the 900 MHz SMR band. There were 60 winning bidders who qualified as small entities in the 900 MHz auction. Based on this information, we conclude that the number of geographic area

---

[758] *See* United States Department of Commerce, Bureau of the Census, *Standard Industrial Classification Manual* (1992) (*1992 Census*) SIC Code 4812.

[759] *See Amendment of Parts 2 and 90 of the Commission's Rules to Provide for the Use of 200 Channels Outside the Designated Filing Areas in the 896-901 MHz and the 935-940 MHz Bands Allotted to the Specialized Mobile Radio Pool*, PR Docket No. 89-583, Second Order on Reconsideration and Seventh Report and Order, 11 FCC Rcd 2639, 2693-702 (1995); *Amendment of Part 90 of the Commission's Rules to Facilitate Future Development of SMR Systems in the 800 MHz Frequency Band*, PR Docket No. 93-144, First Report and Order, Eighth Report and Order, and Second Further Notice of Proposed Rulemaking, 11 FCC Rcd 1463 (1995).

SMR licensees affected by the rule adopted in this *Order* includes these 60 small entities. No auctions have been held for 800 MHz geographic area SMR licenses. Therefore, no small entities currently hold these licenses. A total of 525 licenses will be awarded for the upper 200 channels in the 800 MHz geographic area SMR auction. The Commission, however, has not yet determined how many licenses will be awarded for the lower 230 channels in the 800 MHz geographic area SMR auction. There is no basis to estimate, moreover, how many small entities within the SBA definition will win these licenses. Because nearly all radiotelephone companies have fewer than 1,000 employees and no reliable estimate of the number of prospective 800 MHz licensees can be made, we assume, for purposes of our evaluations and conclusions in this FRFA, that all of the licenses will be awarded to small entities, as defined by the SBA. Those SMR licensees that provide telephone exchange service will be affected by the decisions in this *Order*.

372. Providers of Telephone Toll Service, Providers of Telephone Exchange Service. Neither the Commission nor the SBA has developed a definition of small entities applicable to providers of telephone toll service and telephone exchange service. According to the 1992 Census, there were approximately 3,497 firms engaged in providing telephone services, as defined therein, for at least a year.[760] This number contains a variety of different categories of carriers, including local exchange carriers, interexchange carriers, competitive access providers, cellular carriers, mobile service carriers, operator service providers, pay telephone operators, PCS providers, covered SMR providers, providers of telephone toll service, providers of telephone exchange service, and resellers. It seems certain that some of those 3,497 telephone service firms may not qualify as small businesses because they are not "independently owned and operated."[761] It seems reasonable to conclude, therefore, that fewer than 3,497 telephone service firms are providers of telephone toll service or providers of telephone exchange service and are small entities that may be affected by this *Order*.

373. Independent Operator Service Providers, Independent Directory Assistance Providers, Independent Directory Listing Providers, and Independent Directory Database Managers. We were unable to obtain reliable data regarding the number of entities that provide these telecommunications services or how many of these are small entities. The Commission has not developed a definition of small entities applicable to telecommunications service providers. Therefore, the closest applicable definition of a small entity providing telecommunications services is the definition under SBA rules applicable to business services companies, SIC 7389, which defines a small entity to be a business services company with annual receipts of less than five million dollars. U.S. Census data provides that 46,289 firms providing business services had annual receipts of 5 million dollars or less.[762] Because it

---

[760] *See* United States Department of Commerce, Bureau of the Census, *1992 Census of Transportation, Communications, and Utilities; Establishment and Firm Size*, at Firm Size 1-123 (1995) *(1992 Census)*.

[761] 15 U.S.C. § 632(a)(1).

[762] *1992 Census*, Table 2D, SIC Code 7389.

seems unlikely that all of the business services firms would meet the other criteria, it seems reasonable to conclude that fewer than 46,289 firms may be small entities that might be affected by our *Order*.

374. Resellers. Neither the Commission nor SBA has developed a definition of small entities specifically applicable to resellers. The closest applicable SBA definition for a reseller is a telephone communications company, SIC category 4813. However, the most reliable source of information regarding the number of resellers nationwide of which we are aware appears to be the data that the Commission collects annually in connection with TRS. For the purposes of revenue reporting, 206 companies reported doing business as resellers at the end of 1994.[763] Although it seems certain that some of these companies are not independently owned and operated, or have more than 1,500 employees, we are unable at this time to estimate with greater precision the number of resellers that would qualify as small entities or small incumbent LEC concerns under SBA's definition. Consequently, we estimate that there are fewer than 206 small entity resellers that may be affected by the decisions and rules adopted in this *Order*.

375. Telephone Companies. U.S. Census data provides that, at the end of 1992, there were 3,497 firms engaged in providing telephone services, as defined therein, for at least a year.[764] This number contains a variety of different categories of carriers, including local exchange carriers, interexchange carriers, competitive access providers, cellular carriers, mobile service, carriers, operator service providers, pay telephone operators, PCS providers, covered SMR providers, providers of telephone toll service, providers of telephone exchange service, and resellers. It seems certain that some of those 3,497 telephone service firms may not qualify as small businesses because they are not "independently owned and operated."[765] It seems reasonable to conclude, therefore, that fewer than 3,497 telephone service firms are telephone companies and small entities that may be affected by this *Order*.

376. Cable System Operators. SBA has developed a definition of small entities for cable and other pay television services, which includes all such companies generating less than $11 million in revenues annually. This definition includes cable systems operators, closed circuit television services, direct broadcast satellite services, multipoint distribution systems, satellite master antenna systems, and subscription television services. According to the Census Bureau, there were 1,323 such cable and other pay television services generating less

---

[763] Federal Communications Commission, CCB, Industry Analysis Division, *Telecommunications Industry Revenue: TRS Fund Worksheet Data*, Tbl. 21 (Average Total Telecommunications Revenue Reported by Class of Carrier) (Feb. 1996).

[764] *See* United States Department of Commerce, Bureau of the Census, *1992 Census of Transportation, Communications, and Utilities; Establishment and Firm Size*, at Firm Size 1-123 (1995) *(1992 Census)*.

[765] 15 U.S.C. § 632(a)(1).

than $11 million in revenue that were in operation for at least one year at the end of 1992.[766] The Commission has developed its own definition of a small cable system operator for the purposes of rate regulation, which has been approved by SBA.[767] Under the Commission's rules, a "small cable company is one serving fewer than 400,000 subscribers nationwide." Based on our most recent information, we estimate that there were 1,439 cable operators that qualified as small cable system operators at the end of 1995. Since then, some of those companies may have grown to serve over 400,000 subscribers, and others may have been involved in transactions that caused them to be combined with the other cable operators. Consequently, we estimate that there are fewer than 1,439 small entity cable companies that may be affected by the decisions and rules adopted in this *Order*.

377. The Communications Act of 1934 also contains a definition of a small cable system operator, which is "a cable operator that, directly or through an affiliate, serves in the aggregate fewer than 1 percent of all subscribers in the United States and is not affiliated with any entity or entities whose gross annual revenues in the aggregate exceed $250,000,000."[768] There were 63,196,310 basic cable subscribers at the end of 1995, and 1,450 cable system operators serving fewer than 1 percent (631,960) of subscribers.[769] Although it seems certain that some of these cable system operators are affiliated with entities whose gross annual revenues exceed $250,000,000, we are unable at this time to estimate with greater precision the number of cable systems operators that would qualify as small cable operators under the definition in the Communications Act of 1934.

D. Summary of Projected Reporting, Recordkeeping and Other Compliance Requirements and their Effect on Small Businesses And Steps Taken to Minimize the Significant Economic Impact on Small Entities and Alternatives Considered

378. Structure of the Analysis. In this section of the FRFA, we analyze the projected reporting, recordkeeping, and other compliance requirements that may apply to small entities as a result of this *Order*.[770] As a part of this discussion, we mention some of the types of skills that will be needed to meet the new requirements. We also describe the steps taken to minimize the economic impact of our decisions on small entities, including the significant

---

[766] *1992 Census, supra*, at Firm Size 1-123.

[767] Small Bus. Admin., *13 C.F.R. Part 121 - Small Business Size Regulations*, Proposed Rules, 60 Fed. Reg. 57982, 57988 (Nov. 24, 1995).

[768] 47 U.S.C. § 543(m)(2).

[769] Paul Kagan Associates, Inc., *Cable TV Investor*, Feb. 29, 1996 (based on figures for Dec. 30, 1995).

[770] *See* 5 U.S.C. § 604(a)(4).

alternatives considered and rejected.[771] Due to the size of this *Order*, we set forth our analysis separately for individual sections of the *Order*, using the same headings as were used above in the corresponding sections of the *Order*.

379. To the extent that any statement contained in this FRFA is perceived as creating ambiguity with respect to our rules or statements made in preceding sections of this *Order*, the rules and statements set forth in those preceding sections shall be controlling.

380. Dialing Parity Requirements. The dialing parity provisions of section 251(b)(3) entitle customers to choose different carriers for their local exchange, intraLATA toll, and interLATA toll services without the burden of dialing access codes. Each LEC is required to provide dialing parity to providers of telephone exchange and telephone toll service with respect to all telecommunications services that require dialing to route a call. This obligation encompasses international, interstate, intrastate, local and toll services.

381. Summary of Projected Reporting, Recordkeeping and Other Compliance Requirements. In order to comply with the guidelines and minimum federal standards established in this *Order*, each LEC must implement toll dialing parity utilizing the "full 2-PIC" presubscription method and following the mandated timetable for implementation of toll dialing parity. Although no timetable was adopted for implementing local dialing parity it is expected that it will be achieved through LECs' compliance with other section 251 requirements. LECs may recover the incremental costs of implementing local and toll dialing parity such as the costs of dialing parity-specific switch software, hardware, signalling system upgrades and necessary consumer education. These costs will be recovered from all providers of telephone exchange service and telephone toll service in the area served by the LEC, including the LEC, through the use of a competitively-neutral allocator established by each state. Compliance with these requirements may entail the use of engineering, technical, operational, and accounting skills.

382. Steps Taken to Minimize the Significant Economic Impact on Small Entities and Small Incumbent LECs, and Alternatives Considered. This *Order* adopts broad guidelines and minimum federal standards for toll dialing parity so that LECs and competing providers of telephone toll service, many of whom will be small business entities, will not be subject to an array of differing state standards and timetables requiring them to research and tailor their operations to the unique requirements of each state.

383. First, we required all LECs to implement toll dialing parity based on LATA boundaries.[772] Non-BOC LECs, including many smaller LECs, that implement intraLATA and interLATA toll dialing parity may choose whichever LATA within their state that they deem to be most appropriate to define the area within which they will offer intraLATA toll

---

[771] *See* 5 U.S.C. § 604(a)(5).

[772] *See supra* para. 37.

dialing parity. State commissions, in ruling upon such a choice of LATA association, shall determine whether the proposed LATA association is in the public interest. Because many smaller LECs have not been subject to LATA boundary distinctions, we also gave states the flexibility to take such factors into account and to require that toll dialing parity be based on state rather than LATA boundaries in their jurisdictions. Insofar as a state determines that presubscription should occur along state, rather than LATA, boundaries, we anticipate that such a determination will assist smaller LECs, in particular, by permitting those LECs to define their service markets based on a geographic distinction that is familiar to consumers.

384. In addition, we adopted the "full 2-PIC" nationwide presubscription method for implementing the toll dialing parity requirements.[773] In making this decision we considered a number of methodologies, including the "modified 2-PIC," "the multi-PIC" and the "smart-PIC" methods. We concluded that the "modified 2-PIC" would limit the number of competitive service providers that could participate in the market and that the "multi-PIC" method had not yet proven to be technically and economically feasible. As the "full 2-PIC" method is widely available and well defined, we noted that LECs, many of which are small entities, would not be forced to purchase and maintain an expensive, untested, and new technology. The *Order* provides that, until the Commission considers the use of the "multi-PIC" or "smart-PIC methods," states may impose such additional requirements only after evaluating the technical feasibility and economic impact of those requirements on smaller LECs in their jurisdictions.

385. We instituted a federal toll dialing parity implementation schedule rather than allowing states to implement their own schedules.[774] This federally-mandated plan will provide certainty for competitors, some of which may be small business entities, seeking to become telephone toll service providers. Both LECs and competing providers of telephone toll service will be able to develop business plans and advertising strategies based upon specific timelines. This ability to plan ahead is cost-efficient and levels the playing field for all seeking to participate in the marketplace.

386. We also concluded that a LEC may not accomplish toll dialing parity by automatically assigning toll customers to itself, to a customer's currently presubscribed interLATA or interstate toll carrier, or to any other carrier except when, in a state that already has implemented intrastate, intraLATA toll dialing parity, the subscriber has selected the same interLATA and intraLATA, or interstate and intrastate, presubscribed carrier.[775] This requirement prevents a carrier from automatically designating itself as a toll carrier without notifying the customer of the opportunity to choose an alternative carrier, one or more of which may be a small business.

---

[773] *See supra* paras. 49-50.

[774] *See supra* para. 62.

[775] *See supra* para. 81.

387. Lastly, we implemented national rules for the recovery of dialing parity costs.[776] Although it was suggested that these costs be borne only by new entrants, and not incumbent LECs, we determined that the network upgrades necessary to achieve dialing parity should be recovered on a competitively-neutral basis. A competitively neutral cost recovery mechanism prevents incumbent LECs from imposing excessive fees upon competing entrants, some of which may be small businesses. The imposition of excessive fees could constitute an impediment to entry into the intraLATA toll market by small entities that lack extensive financial resources and could reinforce the marketplace dominance of established LECs. A competitively-neutral cost recovery mechanism also benefits small LECs that might otherwise have been unduly burdened by a cost allocation plan requiring an equal payment from each entity.

388. Nondiscriminatory Access Provisions. Under section 251(b)(3), all LECs are required to allow competing providers of telephone exchange service and telephone toll service access to telephone numbers, operator services, directory assistance, and directory listings that is at least equal in quality to the access the LEC itself receives, without unreasonable dialing delays. LECs are required to make available to competing providers operator services and directory assistance and all adjunct features necessary for the use of these services.

389. Summary of Projected Reporting, Recordkeeping, and Other Compliance Requirements. In order to comply with the nondiscriminatory access provisions all LECs must share subscriber listing information with their competitors in "readily accessible" tape or electronic formats. This information must be provided upon request and in a timely manner.[777] In addition, each LEC must process all calls from competing providers, including calls to the LEC's operator services and directory assistance, on an equal basis as calls originating from the providing LEC.[778] LECs that refuse to comply with reasonable, technically feasible requests from competing providers for "rebranding" of resold operator services or directory assistance are presumed to be unlawfully restricting access to these services.[779] Compliance with these requests may require the use of engineering, computer, accounting, and legal skills.

390. Steps Taken to Minimize Significant Economic Impact on Small Entities and Small Incumbent LECs, and Alternatives Considered. The entitlement to access, on a nondiscriminatory basis, to telephone numbers, operator services, directory assistance and directory listings will benefit providers competing with incumbent LECs. Many of these

---

[776] *See supra* para. 92.

[777] *See supra* para. 141.

[778] *See supra* para. 159.

[779] *See supra* paras. 128, 148.

competitors will be small business entities. The requirement that LECs make their operator assistance and directory listing services available to competitors may allow those competitors to save the time and money it would take to build similar information resources. Additionally, these competing providers will benefit because they will be able to offer consumers at least the same quality of operator service and directory assistance that is provided by the established LEC. Small entities will be able to compete with established LECs more quickly and with less initial investment. Their services will have an opportunity to become equally valuable and equally marketable to consumers. We have declined to support alternatives that would have allowed LECs to degrade or limit access to these services, because such behavior would bar competitive entry into the telecommunications services market.

391. Network Disclosure. Pursuant to section 251(c)(5) incumbent LECs are required to provide "reasonable public notice" of changes in their network which would affect a competing service provider's performance or ability to provide service or otherwise affect carriers' interoperability. The types of changes that incumbent LECs must disclose include, but are not limited to, changes that affect transmission, signalling standards, call routing, network configuration, electronic interfaces or data elements.

392. Summary of Projected Reporting, Recordkeeping, and Other Compliance Requirements. To implement this disclosure requirement, this *Order* imposes a new filing requirement on incumbent LECs that plan to make changes to their networks. An incumbent LEC has a choice of filing certain information with the Commission or of filing a short certification with the Commission that the equivalent information has been disclosed elsewhere. In either case, the incumbent LEC is also responsible for maintaining the accuracy of the information. Compliance with this requirement may require the use of engineering, technical, computer, and legal skills.

393. Steps Taken to Minimize Significant Economic Impact on Small Entities and Small Incumbent LECs, and Alternatives Considered. This recordkeeping submission requirement should, in fact, ease the burden on smaller entities in their endeavor to remain abreast of changes to the incumbent LEC network with which they interconnect. In our *Order*, we authorize the use of industry forums, industry publications, and the Internet, to make public disclosure of network changes and required technical information by incumbent LECs. We believe that "this approach would build on a voluntary practice that now exists in the industry and would result in broad availability of the information."[780] By making information broadly available, we hope to facilitate the participation of entities, such as small businesses, that lack the resources to participate in industry forums. We originally postulated that public notice should be provided exclusively through industry fora or industry publications.[781] Upon further consideration, however, we broadened the means by which an

---

[780] *NPRM* at para. 191.

[781] *See supra* para. 192.

incumbent LEC could satisfy our public notice requirement to include two alternative low-cost mechanisms -- use of the Internet or filing with the Commission.[782] These additional options will be beneficial to small incumbent LECs because they will allow those small LECs to meet their network disclosure obligations without incurring the costs associated with attending industry conferences or publishing the information in an industry magazine or journal.

394. Numbering Administration. Section 251(e) confers upon the Commission exclusive authority over all matters relating to the administration of numbering resources that pertain to the United States. To implement section 251(e)(1) the Commission plans to designate a North American Numbering Plan (NANP) Administrator that will administer telecommunications numbering in the United States equitably and impartially. Pursuant to 251(e)(2) the cost of establishing and maintaining the NANP Administrator will be borne by all telecommunications carriers on a competitively neutral basis.

395. Summary of Projected Reporting, Recordkeeping, and Other Compliance Requirements. The Commission has authorized state public utility commissions to perform the task of implementing new area codes subject to Commission guidelines. If a state commission chooses to initiate and plan area code relief, it must inform the NANP Administrator of the functions the commission will perform. All telecommunications carriers will be required to contribute to the costs of establishing numbering administration. Compliance with this requirement will require engineering, technical, operational, and accounting skills.

396. Steps Taken to Minimize Significant Economic Impact on Small Entities and Small Incumbent LECs, and Alternatives Considered. Although the Commission has authorized states to implement new area codes, it has stipulated that states may not implement them in a manner that will unduly favor or disadvantage any particular industry segment or group of consumers.[783] Accordingly, the Commission has prohibited service-specific or technology specific area code overlays, because they would exclude certain services or carriers, that may be small business entities, from the existing area code and would segregate their operations in a new area code.[784] If states choose to implement all-service overlays, the Commission has required that there be 10-digit dialing for all local calls in areas served by such overlays to ensure that competition will not be deterred as a result of dialing disparity.[785] Without mandatory 10-digit dialing, customers might find it less attractive to switch carriers because competing LECs, many of which may be new entrants to the market and may include small businesses, would have to assign their customers numbers in the new overlay area code.

---

[782] *See supra* para. 198.

[783] *See supra* para. 281.

[784] *See supra* para. 285.

[785] *See supra* para. 286.

This would require those customers to dial 10 digits much more often than the incumbents' customers. Requiring 10-digit dialing for all local calls avoids the potentially anti-competitive effect of all-service area code overlays. In addition, to advance competition, the Commission has required that where an area code overlay is implemented, every entity authorized to provide local exchange service in the old area code, which may include small businesses, must be assigned at least one NXX in that area code.

397. Under the 1996 Act each telecommunications carrier must contribute to cover the cost of numbering administration. Many alternatives for allocating these costs were considered to ensure that each carrier would contribute to a fund to cover the cost of numbering administration on a competitively neutral basis. The contributions will be based on the carrier's gross revenues from its provision of telecommunications services reduced by all payments for telecommunications services or facilities that are paid to other telecommunications carriers. Such a competitively neutral cost allocation plan benefits small incumbent LECs that might have been unduly burdened by a cost apportionment plan requiring an equal payment from each entity.[786]

E. Report to Congress

398. The Commission shall send a copy of this Final Regulatory Flexibility Analysis, along with this *Order*, in a report to Congress pursuant to the Small Business Regulatory Enforcement Fairness Act of 1996, 5 U.S.C. § 801(a)(1)(A). A copy of this FRFA will also be published in the *Federal Register*.

VII. ORDERING CLAUSES

399. Accordingly, IT IS ORDERED that, pursuant to the authority contained in sections 1, 2, 4(i), 4(j), 201-209, 218, 251, and 332 of the Communications Act, as amended, 47 U.S.C. §§ 151, 152, 154(i), 154(j), 201-209, 218, 251 and 332, Parts 51 and 52 of the Commission's rules, 47 C.F.R. Parts 51, 52 are **AMENDED** as set forth in Appendix B hereto.

400. IT IS FURTHER ORDERED that the policies, rules, and requirements set forth herein ARE ADOPTED.

401. IT IS FURTHER ORDERED, pursuant to Sections 416(a) and 413 of the Communications Act of 1934, as amended, 47 U.S.C. §§ 416(a) and 413, that the Secretary shall serve this *Second Report and Order and Memorandum Opinion and Order* on all local exchange carriers, as defined in Section 3(26) of the Communications Act of 1934, as amended, 47 U.S.C. § 153(26), that have designated in writing an agent in the District of Columbia, upon whom service of all notices and process and all orders, decisions, and

---

[786] *See supra* para. 343.

requirements of the Commission may be made for and on behalf of the local exchange carrier, as required by Section 413 of the Communications Act of 1934, as amended, 47 U.S.C. § 413.

402. IT IS FURTHER ORDERED that, pursuant to the authority contained in section 408 of the Communications Act, as amended, 47 U.S.C. § 408, all authorizations for state commissions, Bellcore, and local administrators, including LECs, to perform certain numbering administration functions, consistent with the terms as defined in this *Order*, are effective immediately. Because of the need to avoid disruption in numbering administration, we find that there is good cause for this action pursuant to 5 U.S.C. § 553(d)(3). All other policies, rules, and requirements set forth herein are effective 30 days after publication of this order in the *Federal Register*, except for collections of information subject to approval by the Office of Management and Budget ("OMB"), which are effective 70 days following publication in the *Federal Register*.

403. IT IS FURTHER ORDERED that, pursuant to Sections 4, 5, and 405 of the Communications Act of 1934, as amended, 47 U.S.C. §§ 154, 155, and 405, *In the Matter of Proposed 708 Relief Plan and 630 Numbering Plan Area Code by Ameritech - Illinois*, IAD File no. 94-102, Declaratory Ruling and Order, 10 FCC Rcd. 4596 (1995) IS CLARIFIED to the extent indicated herein at paragraph numbers 281-293.

404. IT IS FURTHER ORDERED that, pursuant to the authority contained in Sections 4(i), 251(e)(1), and 405 of the Communications Act of 1934, as amended, 47 U.S.C. §§ 154(i), 251(e)(1) and 405, Comcast Corporation's Petition for Clarification or Reconsideration of *In the Matter of Proposed 708 Relief Plan and 630 Numbering Plan Area Code by Ameritech - Illinois*, IAD File no. 94-102, Declaratory Ruling and Order, 10 FCC Rcd. 4596 (1995), IS DISMISSED as moot.

405. IT IS FURTHER ORDERED that, pursuant to the authority contained in Sections 4(i), 251(e)(1), and 405 of the Communications Act, as amended, 47 U.S.C. §§154(i), 251(e)(1), and 405, the Petition for Limited Clarification and/or Reconsideration filed by the Pennsylvania Public Utilities Commission and the Request for Clarification filed by the National Association of Regulatory Utility Commissioners of *In the Matter of Administration of the North American Numbering Plan*, CC Docket No. 92-237, Report and Order, 11 FCC Rcd 2588 (1995) ARE hereby DISMISSED.

406. IT IS FURTHER ORDERED that the relief requested in the petition for declaratory ruling filed by the Texas Public Utilities Commission is DENIED.

407. IT IS FURTHER ORDERED that, pursuant to section 5(c)(1) of the Communications Act of 1934, as amended, 47 U.S.C. § 155(c)(1), authority is delegated to the Chief, Common Carrier Bureau, to act on petitions filed by parties wishing to dispute proposed area code plans, to act on toll dialing parity implementation plans filed by LECs seeking to implement toll dialing parity, and to issue orders fixing reasonable public notice

periods in the case of contested short term disclosure by incumbent local exchange carriers of network changes under 251(c)(5).

408. IT IS FURTHER ORDERED that, to the extent that issues from CC Docket No. 95-185, *In the Matter of Interconnection Between Local Exchange Carriers and Commercial Mobile Service Providers*, are resolved here, we incorporate the relevant portions of the record in that docket pertaining to paging carriers being charged fees for the opening of central office codes and for blocks of numbers.

APPENDIX B - FINAL RULES

Parts 51 and 52 of Title 47 of the Code of Federal Regulations are amended as follows:

PART 51 - INTERCONNECTION

1. The authority citation for Part 51 is:

AUTHORITY: Sections 1, 2, 4, 5, 48 Stat. 1066, as amended; 47 U.S.C. §§ 151, 152, 154, 155 unless otherwise noted. Interpret or apply secs. 3, 4, 201-05, 207-09, 218, 225-7, 251-2, 271 and 332, 48 Stat. 1070, as amended, 1077; 47 U.S.C. §§ 153, 154, 201-05, 207-09, 218, 225-7, 251-2, 271 and 332 unless otherwise noted.

2. Section 51.5 is amended by adding the following definitions in alphabetical order to read as follows:

§ 51.5 Terms and definitions.

• • • • •

Dialing Parity. The term "dialing parity" means that a person that is not an affiliate of a local exchange carrier is able to provide telecommunications services in such a manner that customers have the ability to route automatically, without the use of any access code, their telecommunications to the telecommunications service provider of the customer's designation from among 2 or more telecommunications service providers (including such local exchange carrier).

Information services. The term "information services" means the offering of a capability for generating, acquiring, storing, transforming, processing, retrieving, utilizing, or making available information via telecommunications, and includes electronic publishing, but does not include any use of any such capability for the management, control, or operation of a telecommunications system or the management of a telecommunications service.

Local Access and Transport Area (LATA). A "Local Access and Transport Area" is a contiguous geographic area -- (A) established before February 8, 1996 by a Bell operating company such that no exchange area includes points within more than 1 metropolitan statistical area, consolidated metropolitan statistical area, or State, except as expressly permitted under the AT&T Consent Decree; or (B) established or modified by a Bell operating company after February 8, 1996 and approved by the Commission.

Service provider. A "service provider" is a provider of telecommunications services or a provider of information services.

State. The term "state" includes the District of Columbia and the Territories and possessions.

Telecommunications service. The term "telecommunications service" refers to the offering of telecommunications for a fee directly to the public, or to such classes of users as to be effectively available directly to the public, regardless of the facilities used.

Telephone exchange service. A "telephone exchange service" is: (1) a service within a telephone exchange, or within a connected system of telephone exchanges within the same exchange area operated to furnish to subscribers intercommunicating service of the character ordinarily furnished by a single exchange, and which is covered by the exchange service charge, or (2) a comparable service provided through a system of switches, transmission equipment, or other facilities (or combination thereof) by which a subscriber can originate and terminate a telecommunications service.

Telephone toll service. The term "telephone toll service" refers to telephone service between stations in different exchange areas for which there is made a separate charge not included in contracts with subscribers for exchange service.

Unreasonable dialing delay. For the same type of calls, dialing delay is "unreasonable" when the dialing delay experienced by the customer of a competing provider is greater than that experienced by a customer of the LEC providing dialing parity, or nondiscriminatory access to operator services or directory assistance.

3. A new section 51.205 is added to read as follows:

§ 51.205 Dialing parity: general.

A local exchange carrier (LEC) shall provide local and toll dialing parity to competing providers of telephone exchange service or telephone toll service, with no unreasonable dialing delays. Dialing parity shall be provided for all originating telecommunications services that require dialing to route a call.

4. A new section 51.207 is added to read as follows:

§ 51.207 Local dialing parity.

A LEC shall permit telephone exchange service customers within a local calling area to dial the same number of digits to make a local telephone call notwithstanding the identity of the customer's or the called party's telecommunications service provider.

5. A new section 51.209 is added to read as follows:

§ 51.209 Toll dialing parity.

(a) A LEC shall implement throughout each state in which it offers telephone exchange service intraLATA and interLATA toll dialing parity based on LATA boundaries. When a single LATA covers more than one state, the LEC shall use the implementation procedures that each state has approved for the LEC within that state's borders.

(b) A LEC shall implement toll dialing parity through a presubscription process that permits a customer to select a carrier to which all designated calls on a customer's line will be routed automatically. LECs shall allow a customer to presubscribe, at a minimum, to one telecommunications carrier for all interLATA toll calls and to presubscribe to the same or to another telecommunications carrier for all intraLATA toll calls.

(c) A LEC may not assign automatically a customer's intraLATA toll traffic to itself, to its subsidiaries or affiliates, to the customer's presubscribed interLATA or interstate toll carrier, or to any other carrier, except when, in a state that already has implemented intrastate, intraLATA toll dialing parity, the subscriber has selected the same presubscribed carrier for both intraLATA and interLATA toll calls.

(d) Notwithstanding the requirements of subsections (a) and (b), states may require that toll dialing parity be based on state boundaries if it deems that the provision of intrastate and interstate toll dialing parity is procompetitive and otherwise in the public interest.

6. A new section 51.211 is added to read as follows:

§ 51.211 Toll dialing parity implementation schedule.

(a) A LEC that does not begin providing in-region, interLATA or in-region, interstate toll services in a state before February 8, 1999, must implement intraLATA and interLATA toll dialing parity throughout that state on February 8, 1999 or an earlier date as the state may determine, consistent with section 271(e)(2)(b) of the Communications Act of 1934, as amended, to be in the public interest.

(b) A Bell Operating Company (BOC) that provides in-region, interLATA toll services in a state before February 8, 1999 shall provide intraLATA toll dialing parity throughout that state coincident with its provision of in-region, interLATA toll services.

(c) A LEC that is not a BOC that begins providing in-region, interLATA or in-region, interstate toll services in a state before August 8, 1997, shall implement intraLATA and interLATA toll dialing parity throughout that state by August 8, 1997. If the LEC is unable to comply with the August 8, 1997 implementation deadline, the LEC must notify the

Commission's Common Carrier Bureau by May 8, 1997. In the notification, the LEC must state its justification for noncompliance and must set forth the date by which it proposes to implement intraLATA and interLATA toll dialing parity.

(d) A LEC that is not a BOC that begins providing in-region, interLATA or in-region, interstate toll services in a state on or after August 8, 1997, but before February 8, 1999 shall implement intraLATA and interLATA toll dialing parity throughout that state no later than the date on which it begins providing in-region, interLATA or in-region, interstate toll services.

(e) Notwithstanding the requirements of paragraphs (a) - (d) of this section, a LEC shall implement toll dialing parity under a state order as described below:

(i) If the state issued a dialing parity order by December 19, 1995 requiring a BOC to implement toll dialing parity in advance of the dates established by these rules, the BOC must implement toll dialing parity in accordance with the implementation dates established by the state order.

(ii) If the state issued a dialing parity order by August 8, 1996 requiring a LEC that is not a BOC to implement toll dialing parity in advance of the dates established by these rules, the LEC must implement toll dialing parity in accordance with the implementation dates established by the state order.

(f) For LECs that are not Bell Operating Companies, the term *in-region, interLATA toll service,* as used in this section and § 51.213, includes the provision of toll services outside of the LEC's study area.

7. A new section 51.213 is added to read as follows:

§ 51.213 Toll dialing parity implementation plans.

(a) A LEC must file a plan for providing intraLATA toll dialing parity throughout each state in which it offers telephone exchange service. A LEC cannot offer intraLATA toll dialing parity within a state until the implementation plan has been approved by the appropriate state commission or the Commission.

(b) A LEC's implementation plan must include:

(1) a proposal that explains how the LEC will offer intraLATA toll dialing parity for each exchange that the LEC operates in the state, in accordance with the provisions of this section, and a proposed time schedule for implementation; and

(2) a proposal for timely notification of its subscribers and the methods it proposes to use to enable subscribers to affirmatively select an intraLATA toll service provider.

A LEC that is not a BOC also shall identify the LATA with which it will associate for the purposes of providing intraLATA and interLATA toll dialing parity under this subpart.

(c) A LEC must file its implementation plan with the state commission for each state in which the LEC provides telephone exchange service, except that if a LEC determines that a state commission has elected not to review the plan or will not complete its review in sufficient time for the LEC to meet the toll dialing parity implementation deadlines in § 51.211, the LEC must file its plan with the Commission:

(1) no later than 180 days before the date on which the LEC will begin providing toll dialing parity in the state, or no later than 180 days before February 8, 1999, whichever occurs first; or

(2) for LECs that begin providing in-region, interLATA or in-region, interstate toll service (*see* § 51.211(f)) before August 8, 1997, no later than 90 days after these rules are published in the Federal Register.

(d) The Commission will release a public notice of any LEC implementation plan that is filed with the Commission under paragraph (c) of this section.

(1) The LEC's plan will be deemed approved on the fifteenth day following release of the Commission's public notice unless, no later than the fourteenth day following the release of the Commission's public notice, either

(i) the Common Carrier Bureau notifies the LEC that its plan will not be deemed approved on the fifteenth day; or

(ii) an opposition to the plan is filed with the Commission and served on the LEC that filed the plan. Such an opposition must state specific reasons why the LEC's plan does not serve the public interest.

(2) If one or more oppositions are filed, the LEC that filed the plan will have seven additional days (*i.e.*, until no later than the twenty-first day following the release of the Commission's public notice) within which to file a reply to the opposition(s) and serve it on all parties that filed an opposition. The response shall:

(i) include information responsive to the allegations and concerns identified by the opposing party; and

(ii) identify possible revisions to the plan that will address the opposing party's concerns.

(3) If a LEC's plan is opposed under paragraph (d)(1)(ii) of this section, the Common Carrier Bureau will act on the plan within ninety days of the date on which the Commission released its public notice. In the event the Bureau fails to act within ninety days, the plan will not go into effect pending Bureau action. If the plan is not opposed, but it did not go into effect on the fifteenth day following the release of the Commission's public notice (*see* paragraph (d)(1)(i) of this section), and the Common Carrier Bureau fails to act on the plan within ninety days of the date on which the Commission released its public notice, the plan will be deemed approved without further Commission action on the ninety-first day after the date on which the Commission released its public notice of the plan's filing.

8. A new section 51.215 is added to read as follows:

§ 51.215 Dialing parity: cost recovery.

(a) A LEC may recover the incremental costs necessary for the implementation of toll dialing parity. The LEC must recover such costs from all providers of telephone exchange service and telephone toll service in the area served by the LEC, including that LEC. The LEC shall use a cost recovery mechanism established by the state.

(b) Any cost recovery mechanism for the provision of toll dialing parity pursuant to this section that a state adopts must not:

(1) give one service provider an appreciable cost advantage over another service provider, when competing for a specific subscriber (*i.e.*, the recovery mechanism may not have a disparate effect on the incremental costs of competing service providers seeking to serve the same customer); or

(2) have a disparate effect on the ability of competing service providers to earn a normal return on their investment.

9. A new section 51.217 is added to read as follows:

§ 51.217 Nondiscriminatory access: telephone numbers, operator services, directory assistance services, and directory listings.

(a) Definitions. As used in this section, the following definitions apply:

(1) *Competing provider*. A "competing provider" is a provider of telephone exchange or telephone toll services that seeks nondiscriminatory access from a local exchange carrier (LEC) in that LEC's service area.

(2) *Nondiscriminatory access*. "Nondiscriminatory access" refers to access to telephone numbers, operator services, directory assistance and directory listings that is at least equal to the access that the providing local exchange carrier (LEC) itself receives. Nondiscriminatory access includes, but is not limited to: (i) nondiscrimination between and among carriers in the rates, terms, and conditions of the access provided; and (ii) the ability of the competing provider to obtain access that is at least equal in quality to that of the providing LEC.

(3) *Providing local exchange carrier* (LEC). A "providing local exchange carrier" is a local exchange carrier (LEC) that is required to permit nondiscriminatory access to a competing provider.

(b) *General rule*. A local exchange carrier (LEC) that provides operator services, directory assistance services or directory listings to its customers, or provides telephone numbers, shall permit competing providers of telephone exchange service or telephone toll service to have nondiscriminatory access to that service or feature, with no unreasonable dialing delays.

(c) *Specific requirements*. A LEC subject to paragraph (b) of this section must also comply with the following requirements:

(1) *Telephone numbers*. A LEC shall permit competing providers to have access to telephone numbers that is identical to the access that the LEC provides to itself.

(2) *Operator services*. A LEC must permit telephone service customers to connect to the operator services offered by that customer's chosen local service provider by dialing "0," or "0" plus the desired telephone number, regardless of the identity of the customer's local telephone service provider.

(3) *Directory assistance services and directory listings.*

(i) *Access to directory assistance*. A LEC shall permit competing providers to have access to its directory assistance services so that any customer of a competing provider can obtain directory listings, except as provided in paragraph (c)(3)(iii) of

this section, on a nondiscriminatory basis, notwithstanding the identity of the customer's local service provider, or the identity of the provider for the customer whose listing is requested.

(ii) *Access to directory listings.* A LEC shall provide directory listings to competing providers in readily accessible magnetic tape or electronic formats in a timely fashion upon request. A LEC also must permit competing providers to have access to and read the information in the LEC's directory assistance databases.

(iii) *Unlisted numbers.* A LEC shall not provide access to unlisted telephone numbers, or other information that its customer has asked the LEC not to make available. The LEC shall ensure that access is permitted only to the same directory information that is available to its own directory assistance customers.

(iv) *Adjuncts to services.* Operator services and directory assistance services must be made available to competing providers in their entirety, including access to any adjunct features (*e.g.*, rating tables or customer information databases) necessary to allow competing providers full use of these services.

(d) *Branding of operator services and directory assistance services.* The refusal of a providing local exchange carrier (LEC) to comply with the reasonable request of a competing provider that the providing LEC rebrand its operator services and directory assistance, or remove its brand from such services, creates a presumption that the providing LEC is unlawfully restricting access to its operator services and directory assistance. The providing LEC can rebut this presumption by demonstrating that it lacks the capability to comply with the competing provider's request.

(e) *Disputes.*

(1) *Disputes involving nondiscriminatory access.* In disputes involving nondiscriminatory access to operator services, directory assistance services, or directory listings, a providing LEC shall bear the burden of demonstrating with specificity: (i) that it is permitting nondiscriminatory access, and (ii) that any disparity in access is not caused by factors within its control. "Factors within its control" include, but are not limited to, physical facilities, staffing, the ordering of supplies or equipment, and maintenance.

(2) *Disputes involving unreasonable dialing delay.* In disputes between providing local exchange carriers (LECs) and competing providers involving unreasonable dialing delay in the provision of access to operator services and directory assistance, the burden of proof is on the providing LEC to demonstrate with specificity that it is processing the calls of the competing provider's customers on terms equal to that of similar calls from the providing LEC's own customers.

10. Section 51.305 is revised by adding a new subsection (f) as follows:

§ 51.305 Interconnection.

* * * * *

(f) An incumbent LEC shall provide to a requesting telecommunications carrier technical information about the incumbent LEC's network facilities sufficient to allow the requesting carrier to achieve interconnection consistent with the requirements of this section.

11. Section 51.307 is revised by adding a new subsection (e) as follows:

§ 51.307 Duty to provide access on an unbundled basis to network elements.

* * * * *

(e) An incumbent LEC shall provide to a requesting telecommunications carrier technical information about the incumbent LEC's network facilities sufficient to allow the requesting carrier to achieve access to unbundled network elements consistent with the requirements of this section.

12. A new section 51.325 is added to read as follows:

§ 51.325 Notice of network changes: public notice requirement.

(a) An incumbent local exchange carrier ("LEC") must provide public notice regarding any network change that:

(1) will affect a competing service provider's performance or ability to provide service; or

(2) will affect the incumbent LEC's interoperability with other service providers.

(b) For purposes of this section, *interoperability* means the ability of two or more facilities, or networks, to be connected, to exchange information, and to use the information that has been exchanged.

(c) Until public notice has been given in accordance with §§ 51.325 - 51.335, an incumbent LEC may not disclose to separate affiliates, separated affiliates, or unaffiliated entities (including actual or potential competing service providers or competitors), information about planned network changes that are subject to this section.

(d) For the purposes of §§ 51.325 - 51.335, the term *services* means telecommunications services or information services.

13. A new section 51.327 is added to read as follows:

§ 51.327 Notice of network changes: content of notice.

(a) Public notice of planned network changes must, at a minimum, include:

(1) the carrier's name and address;

(2) the name and telephone number of a contact person who can supply additional information regarding the planned changes;

(3) the implementation date of the planned changes;

(4) the location(s) at which the changes will occur;

(5) a description of the type of changes planned (Information provided to satisfy this requirement must include, as applicable, but is not limited to, references to technical specifications, protocols, and standards regarding transmission, signaling, routing, and facility assignment as well as references to technical standards that would be applicable to any new technologies or equipment, or that may otherwise affect interconnection); and

(6) a description of the reasonably foreseeable impact of the planned changes.

(b) The incumbent LEC also shall follow, as necessary, procedures relating to confidential or proprietary information contained in § 51.335.

14. A new section 51.329 is added to read as follows:

§ 51.329 Notice of network changes: methods for providing notice.

(a) In providing the required notice to the public of network changes, an incumbent LEC may use one of the following methods:

(1) filing a public notice with the Commission; or

(2) providing public notice through industry fora, industry publications, or the carrier's publicly accessible Internet site. If an incumbent LEC uses any of the methods specified in paragraph (a)(2) of this section, it also must file a certification with the Commission that includes:

(i) a statement that identifies the proposed changes;

(ii) a statement that public notice has been given in compliance with §§ 51.325 - 51.335; and

(iii) a statement identifying the location of the change information and describing how this information can be obtained.

(b) Until the planned change is implemented, an incumbent LEC must keep the notice available for public inspection, and amend the notice to keep the information complete, accurate and up-to-date.

(c) *Specific filing requirements.* Commission filings under this section must be made as follows:

(1) The public notice or certification must be labeled with one of the following titles, as appropriate: "Public Notice of Network Change Under Rule 51.329(a)," "Certification of Public Notice of Network Change Under Rule 51.329(a)," "Short Term Public Notice Under Rule 51.333(a)," or "Certification of Short Term Public Notice Under Rule 51.333(a)."

(2) Two paper copies of the incumbent LEC's public notice or certification, required under paragraph (a) of this section, must be sent to "Secretary, Federal Communications Commission, Washington, D.C. 20554." The date on which this filing is received by the Secretary is considered the official filing date.

(3) In addition, one paper copy and one diskette copy must be sent to the "Chief, Network Services Division, Common Carrier Bureau, Federal Communications Commission, Washington, D.C. 20554." The diskette copy must be on a standard 3½ inch diskette, formatted in IBM-compatible format to be readable by high-density floppy drives operating under MS DOS 5.X or later compatible versions, and shall be in a word-processing format designated, from time-to-time, in public notices released by the Network Services Division. The diskette must be submitted in "read only" mode, and must be clearly labeled with the carrier's name, the filing date, and an identification of the diskette's contents.

15. A new section 51.331 is added to read as follows:

§ 51.331 Notice of network changes: timing of notice.

(a) An incumbent LEC shall give public notice of planned changes at the make/buy point, as defined in paragraph (b) of this section, but at least 12 months before implementation, except as provided below.

(1) If the changes can be implemented within twelve months of the make/buy point, public notice must be given at the make/buy point, but at least six months before implementation.

(2) If the changes can be implemented within six months of the make/buy point, public notice may be given pursuant to the short term notice procedures provided in § 51.333.

(b) For purposes of this section, the *make/buy point* is the time at which an incumbent LEC decides to make for itself, or to procure from another entity, any product the design of which affects or relies on a new or changed network interface. If an incumbent LEC's planned changes do not require it to make or to procure a product, then the make/buy point is the point at which the incumbent LEC makes a definite decision to implement a network change.

(1) For purposes of this section, a *product* is any hardware or software for use in an incumbent LEC's network or in conjunction with its facilities that, when installed, could affect the compatibility of an interconnected service provider's network, facilities or services with an incumbent LEC's existing telephone network, facilities or services, or with any of an incumbent carrier's services or capabilities.

(2) For purposes of this section a *definite decision* is reached when an incumbent LEC determines that the change is warranted, establishes a timetable for anticipated implementation, and takes any action toward implementation of the change within its network.

16. A new section 51.333 is added to read as follows:

§ 51.333 Notice of network changes: short term notice.

(a) *Certificate of service.* If an incumbent LEC wishes to provide less than six months notice of planned network changes, the public notice or certification that it files with the Commission must include a certificate of service in addition to the information required by § 51.327(a) or § 51.329(a)(2), as applicable. The certificate of service shall include:

(1) a statement that, at least five business days in advance of its filing with the Commission, the incumbent LEC served a copy of its public notice upon each telephone exchange service provider that directly interconnects with the incumbent LEC's network; and

(2) the name and address of each such telephone exchange service provider upon which the notice was served.

(b) *Implementation date.* The Commission will release a public notice of such short term notice filings. Short term notices shall be deemed final on the tenth business day after

the release of the Commission's public notice, unless an objection is filed, pursuant to paragraph (c) of this section.

(c) *Objection procedures.* An objection to an incumbent LEC's short term notice may be filed by an information service provider or telecommunication service provider that directly interconnects with the incumbent LEC's network. Such objections must be filed with the Commission, and served on the incumbent LEC, no later than the ninth business day following the release of the Commission's public notice. All objections to an incumbent LEC's short term notice must:

(1) state specific reasons why the objector cannot accommodate the incumbent LEC's changes by the date stated in the incumbent LEC's public notice and must indicate any specific technical information or other assistance required that would enable the objector to accommodate those changes;

(2) list steps the objector is taking to accommodate the incumbent LEC's changes on an expedited basis;

(3) state the earliest possible date (not to exceed six months from the date the incumbent LEC gave its original public notice under this section) by which the objector anticipates that it can accommodate the incumbent LEC's changes, assuming it receives the technical information or other assistance requested under paragraph (c)(1) of this section;

(4) provide any other information relevant to the objection; and

(5) provide the following affidavit, executed by the objector's president, chief executive officer, or other corporate officer or official, who has appropriate authority to bind the corporation, and knowledge of the details of the objector's inability to adjust its network on a timely basis:

> "I, *(name and title)*, under oath and subject to penalty for perjury, certify that I have read this objection, that the statements contained in it are true, that there is good ground to support the objection, and that it is not interposed for purposes of delay. I have appropriate authority to make this certification on behalf of *(objector)* and I agree to provide any information the Commission may request to allow the Commission to evaluate the truthfulness and validity of the statements contained in this objection."

(d) *Response to objections.* If an objection is filed, an incumbent LEC shall have until no later than the fourteenth business day following the release of the Commission's public notice to file with the Commission a response to the objection and to serve the response on all parties that filed objections. An incumbent LEC's response must:

(1) provide information responsive to the allegations and concerns identified by the objectors;

(2) state whether the implementation date(s) proposed by the objector(s) are acceptable;

(3) indicate any specific technical assistance that the incumbent LEC is willing to give to the objectors; and

(4) provide any other relevant information.

(e) *Resolution.* If an objection is filed pursuant to paragraph (c) of this section, then the Chief, Network Services Division, Common Carrier Bureau, will issue an order determining a reasonable public notice period, *provided however*, that if an incumbent LEC does not file a response within the time period allotted, or if the incumbent LEC's response accepts the latest implementation date stated by an objector, then the incumbent LEC's public notice shall be deemed amended to specify the implementation date requested by the objector, without further Commission action. An incumbent LEC must amend its public notice to reflect any change in the applicable implementation date pursuant to § 51.329(b).

17. A new section 51.335 is added to read as follows:

§ 51.335 Notice of network changes: confidential or proprietary information.

(a) If an incumbent LEC claims that information otherwise required to be disclosed is confidential or proprietary, the incumbent LEC's public notice must include, in addition to the information identified in § 51.327(a), a statement that the incumbent LEC will make further information available to those signing a nondisclosure agreement.

(b) *Tolling the public notice period.* Upon receipt by an incumbent LEC of a competing service provider's request for disclosure of confidential or proprietary information, the applicable public notice period will be tolled until the parties agree on the terms of a nondisclosure agreement. An incumbent LEC receiving such a request must amend its public notice as follows:

(1) on the date it receives a request from a competing service provider for disclosure of confidential or proprietary information, to state that the notice period is tolled; and

(2) on the date the nondisclosure agreement is finalized, to specify a new implementation date.

PART 52 - NUMBERING

18. The authority citation for Part 52 is amended to read as follows:

AUTHORITY: Sections 1, 2, 4, 5, 48 Stat. 1066, as amended; 47 U.S.C. §§ 151, 152, 154, 155 unless otherwise noted. Interpret or apply secs. 3, 4, 201-05, 207-09, 218, 225-7, 251-2, 271 and 332, 48 Stat. 1070, as amended, 1077; 47 U.S.C. §§ 153, 154, 201-05, 207-09, 218, 225-7, 251-2, 271 and 332 unless otherwise noted.

19. The table of contents for Part 52 is amended to read as follows:

Subpart A - Scope and Authority

§ 52.1 Basis and purpose.
§ 52.3 General.
§ 52.5 Definitions.

Subpart B - Administration

§ 52.7 Definitions.
§ 52.9 General requirements.
§ 52.11 North American Numbering Council.
§ 52.13 North American Numbering Plan Administrator.
§ 52.15 Central office code administration.
§ 52.17 Costs of number administration.
§ 52.19 Area code relief.

Subpart C - Number Portability

§ 52.21 Definitions.
§ 52.23 Deployment of long-term database methods for number portability by LECs.
§ 52.25 Database architecture and administration.
§ 52.27 Deployment of transitional measures for number portability.
§ 52.29 Cost recovery for transitional measures for number portability.
§ 52.31 Deployment of long-term database methods for number portability by CMRS providers.
§§ 52.32 - 52.99 [Reserved]

20. Subpart A is added to Part 52 to read as follows:

Subpart A - Scope and Authority.

§ 52.1 Basis and purpose.

(a) *Basis.* These rules are issued pursuant to the Communications Act of 1934, as amended, 47 U.S.C. 151 *et. seq.*

(b) *Purpose.* The purpose of these rules is to establish, for the United States, requirements and conditions for the administration and use of telecommunications numbers for provision of telecommunications services.

§ 52.3 General.

The Commission shall have exclusive authority over those portions of the North American Numbering Plan (NANP) that pertain to the United States. The Commission may delegate to the States or other entities any portion of such jurisdiction.

§ 52.5 Definitions.

As used in this Part:

(a) *Incumbent local exchange carrier.* With respect to an area, an "incumbent local exchange carrier" is a local exchange carrier that -- (1) on February 8, 1996, provided telephone exchange service in such area; and (2) (i) on February 8, 1996, was deemed to be a member of the exchange carrier association pursuant to § 69.601(b) of this chapter (47 CFR 69.601(b)); or (ii) is a person or entity that, on or after February 8, 1996, became a successor or assign of a member described in clause (i).

(b) *North American Numbering Council* (NANC). The "North American Numbering Council" is an advisory committee created under the Federal Advisory Committee Act, 5 U.S.C., App (1988), to advise the Commission and to make recommendations, reached through consensus, that foster efficient and impartial number administration.

(c) *North American Numbering Plan* (NANP). The "North American Numbering Plan" is the basic numbering scheme for the telecommunications networks located in Anguilla, Antigua, Bahamas, Barbados, Bermuda, British Virgin Islands, Canada, Cayman Islands, Dominica, Dominican Republic, Grenada, Jamaica, Montserrat, St. Kitts & Nevis, St. Lucia, St. Vincent, Turks & Caicos Islands, Trinidad & Tobago, and the United States (including Puerto Rico, the U.S. Virgin Islands, Guam and the Commonwealth of the Northern Mariana Islands).

(d) *State.* The term "state" includes the District of Columbia and the Territories and possessions.

(e) *State commission*. The term "state commission" means the commission, board, or official (by whatever name designated) which under the laws of any state has regulatory jurisdiction with respect to intrastate operations of carriers.

(f) *Telecommunications*. "Telecommunications" means the transmission, between or among points specified by the user, of information of the user's choosing, without change in the form or content of the information as sent and received.

(g) *Telecommunications carrier*. A "telecommunications carrier" is any provider of telecommunications services, except that such term does not include aggregators of telecommunications services (as defined in 47 U.S.C. § 226(a)(2)).

(h) *Telecommunications service*. The term "telecommunications service" refers to the offering of telecommunications for a fee directly to the public, or to such classes of users as to be effectively available directly to the public, regardless of the facilities used.

21. In part 52, subpart B is redesignated as subpart C, and §§ 52.1 through 52.12 are redesignated as §§ 52.21 through 52.31; a new subpart B is added as follows:

Subpart B - Administration

§ 52.7 Definitions.

As used in this subpart:

(a) *Area code or numbering plan area* (NPA). The term "area code or numbering plan area" refers to the first three digits (NXX) of a ten-digit telephone number in the form NXX-NXX-XXXX, where N represents any one of the numbers 2 through 9 and X represents any one of the numbers 0 through 9.

(b) *Area code relief*. The term "area code relief" refers to the process by which central office codes are made available when there are few or no unassigned central office codes remaining in an existing area code and a new area code is introduced.

(c) *Central office (CO) code*. The term "central office code" refers to the second three digits (NXX) of a ten-digit telephone number in the form NXX-NXX-XXXX, where N represents any one of the numbers 2 through 9 and X represents any one of the numbers 0 through 9.

(d) *Central office (CO) code administrator*. The term "central office code administrator" refers to the entity or entities responsible for managing central office codes in each area code.

(e) *North American Numbering Plan Administrator* (NANPA). The term "North American Numbering Plan Administrator" refers to the entity or entities responsible for managing the NANP.

§ 52.9 General requirements.

(a) To ensure that telecommunications numbers are made available on an equitable basis, the administration of telecommunications numbers shall, in addition to the specific requirements set forth in this subpart:

(1) facilitate entry into the telecommunications marketplace by making telecommunications numbering resources available on an efficient, timely basis to telecommunications carriers;

(2) not unduly favor or disfavor any particular telecommunications industry segment or group of telecommunications consumers; and

(3) not unduly favor one telecommunications technology over another.

(b) If the Commission delegates any telecommunications numbering administration functions to any State or other entity pursuant to 47 U.S.C. § 251(e)(1), such State or entity shall perform these functions in a manner consistent with this part.

§ 52.11 North American Numbering Council.

The duties of the North American Numbering Council (NANC), may include, but are not limited to:

(a) advising the Commission on policy matters relating to the administration of the NANP in the United States;

(b) making recommendations, reached through consensus, that foster efficient and impartial number administration;

(c) initially resolving disputes, through consensus, pertaining to number administration in the United States;

(d) recommending to the Commission an appropriate entity to serve as the NANPA;

(e) recommending to the Commission an appropriate mechanism for recovering the costs of NANP administration in the United States, consistent with § 52.17;

(f) carrying out the duties described in § 52.25; and

(g) carrying out this part as directed by the Commission.

§ 52.13 North American Numbering Plan Administrator.

(a) The North American Numbering Plan Administrator (NANPA) shall be an independent and impartial non-government entity.

(b) The duties of the NANPA shall include, but are not limited to:

(1) ensuring that the interests of all NANP member countries are considered;

(2) processing number assignment applications associated with, but not limited to: area codes, N11 codes, carrier identification codes (CICs), "500" central office codes, "900"central office codes, "456" central office codes, Signalling System 7 network codes, and Automatic Number Identification Integration Integers (ANI II);

(3) assigning the numbers and codes described in paragraph (b)(2) of this section;

(4) maintaining and monitoring administrative number databases;

(5) assuming additional telecommunications number administration activities, as assigned; and

(6) ensuring that any action taken with respect to number administration is consistent with this Part.

§ 52.15 Central office code administration.

(a) Central Office Code Administration shall be performed by the NANPA, or another entity or entities, as designated by the Commission.

(b) Duties of the entity or entities performing central office code administration may include, but are not limited to:

(1) processing central office code assignment applications and assigning such codes in a manner that is consistent with this Part;

(2) accessing and maintaining central office code assignment databases;

(3) contributing to the CO Code Use Survey (COCUS), an annual survey that describes the present and projected use of CO codes for each NPA in the NANP;

(4) monitoring the use of central office codes within each area code and forecasting the date by which all central office codes within that area code will be assigned; and

(5) planning for and initiating area code relief, consistent with § 52.19.

(c) Any telecommunications carrier performing central office code administration:

(1) shall not charge fees for the assignment or use of central office codes to other telecommunications carriers, including paging and CMRS providers, unless the telecommunications carrier assigning the central office code charges one uniform fee for all carriers, including itself and its affiliates; and

(2) shall, consistent with this subpart, apply identical standards and procedures for processing all central office code assignment requests, and for assigning such codes, regardless of the identity of the telecommunications carrier making the request.

§ 52.17 Costs of number administration.

All telecommunications carriers in the United States shall contribute on a competitively neutral basis to meet the costs of establishing numbering administration.

(a) For each telecommunications carrier, such contributions shall be based on the gross revenues from the provision of its telecommunications services.

(b) The contributions in paragraph (a) of this section shall be based on each contributor's gross revenues from its provision of telecommunications services reduced by all payments for telecommunications services and facilities that have been paid to other telecommunications carriers.

§ 52.19 Area code relief.

(a) State commissions may resolve matters involving the introduction of new area codes within their states. Such matters may include, but are not limited to: directing whether area code relief will take the form of a geographic split, an overlay area code, or a boundary realignment; establishing new area code boundaries; establishing necessary dates for the implementation of area code relief plans; and directing public education and notification efforts regarding area code changes.

(b) State commissions may perform any or all functions related to initiation and development of area code relief plans, so long as they act consistently with the guidelines enumerated in this part, and subject to paragraph (b)(2) of this section. For the purposes of this paragraph, initiation and development of area code relief planning encompasses all functions related to the implementation of new area codes that were performed by central

office code administrators prior to February 8, 1996. Such functions may include: declaring that the area code relief planning process should begin; convening and conducting meetings to which the telecommunications industry and the public are invited on area code relief for a particular area code; and developing the details of a proposed area code relief plan or plans.

(1) The entity or entities designated by the Commission to serve as central office code administrator(s) shall initiate and develop area code relief plans for each area code in each state that has not notified such entity or entities, pursuant to paragraph (b)(2) of this section, that the state will handle such functions.

(2) Pursuant to paragraph (b)(1) of this section, a state commission must notify the entity or entities designated by the Commission to serve as central office code administrator(s) for its state that such state commission intends to perform matters related to initiation and development of area code relief planning efforts in its state. Notification shall be written and shall include a description of the specific functions the state commission intends to perform. Where the NANP Administrator serves as the central office code administrator, such notification must be made within 120 days of the selection of the NANP Administrator.

(c) New area codes may be introduced through the use of:

(1) a geographic area code split, which occurs when the geographic area served by an area code in which there are few or no central office codes left for assignment is split into two or more geographic parts;

(2) an area code boundary realignment, which occurs when the boundary lines between two adjacent area codes are shifted to allow the transfer of some central office codes from an area code for which central office codes remain unassigned to an area code for which few or no central office codes are left for assignment; or

(3) an area code overlay, which occurs when a new area code is introduced to serve the same geographic area as an existing area code, subject to the following conditions:

(i) No area code overlay may be implemented unless all central office codes in the new overlay area code are assigned to those entities requesting assignment on a first-come, first-serve basis, regardless of the identity of, technology used by, or type of service provided by that entity. No group of telecommunications carriers shall be excluded from assignment of central office codes in the existing area code, or be assigned such codes only from the overlay area code, based solely on that group's provision of a specific type of telecommunications service or use of a particular technology;

(ii) No area code overlay may be implemented unless there exists, at the time of implementation, mandatory ten-digit dialing for every telephone call within and between all area codes in the geographic area covered by the overlay area code; and

(iii) No area code overlay may be implemented unless every telecommunications carrier, including CMRS providers, authorized to provide telephone exchange service, exchange access, or paging service in that NPA 90 days before introduction of the new overlay area code, is assigned during that 90 day period at least one central office code in the existing area code.

22. Subpart C is added to read as follows:

Subpart C - Number Portability

• • • • •

§§ 52.1 through 52.12 [Redesignated]

23. Sections 52.1 through 52.12 are redesignated as follows:

Old section	New section
52.1	52.21
52.3	52.23
52.5	52.25
52.7	52.27
52.9	52.29
52.11	52.31
52.12 - 52.99 [Reserved]	52.32 - 52.99 [Reserved]

24. Paragraphs (f), (l), (s), (t) and (u) of section 52.21 are removed and redesignated respectively as paragraphs (a), (b), (f), (g) and (h) of section 52.5. The remaining paragraphs of section 52.21 are redesignated in alphabetical order to read (a) - (q).

V. ORDERING CLAUSES 75

I. INTRODUCTION

1. In this Order, we address two petitions for reconsideration or clarification of the *Local Competition and Order*[1] regarding the obligation of incumbent local exchange carriers (LECs) to provide unbundled access to interoffice transport facilities on a shared basis.[2] We intend to address petitions for reconsideration of other aspects of the *Local Competition Order* in the future.

2. In the *Local Competition Order*, which established rules to implement sections 251 and 252 of the Communications Act of 1934 (the Act),[3] as amended by the Telecommunications Act of 1996,[4] the Commission required incumbent LECs "to provide unbundled access to shared transmission facilities between end offices and the tandem switch."[5] In this reconsideration order, we first explain that the *Local Competition Order* required incumbent LECs to provide requesting carriers with access to the same transport facilities, between the end office switch and the tandem switch, that incumbent LECs use to carry their own traffic. We further explain that, when a requesting carrier takes unbundled local switching, it gains access to the incumbent LEC's routing table, resident in the switch. Second, we reconsider the requirement that incumbent LECs only provide "shared transport"[6]

Cir., Jul. 18, 1997) (*Iowa Utilities Bd.*).

[2] 47 C.F.R. § 51.319(d).

[3] 47 U.S.C. § 251.

[4] Telecommunications Act of 1996, Pub. L. No. 104-104, 110 Stat. 56 (1996 Act), *codified at* 47 U.S.C. §§ 151 *et seq.*

[5] *Local Competition Order*, 11 FCC Rcd at 15718, para. 440.

[6] Section 51.319(d) of the Commission's rules requires that incumbent LECs provide access on an unbundled basis to interoffice transmission facilities shared by more than one customer or carrier. 47 C.F.R. § 51.319(d). In this reconsideration order, we refer to such shared interoffice transmission facilities as "shared

between the end office and tandem. For the reasons discussed below, we conclude that incumbent LECs should be required to provide requesting carriers with access to shared transport for all transmission facilities connecting incumbent LECs' switches -- that is, between end office switches, between an end office switch and a tandem switch, and between tandem switches. Third, we conclude that incumbent LECs must permit requesting carriers that purchase unbundled shared transport and unbundled switching to use the same routing table and transport links that the incumbent LEC uses to route and carry its own traffic. By requiring incumbent LECs to provide requesting carriers with access to the incumbent LEC's rounting table and to all its interoffice transmission facilities on an unbundled basis, requesting carriers can route calls in the same manner that an incumbent routes its own calls and thus take advantage of the incumbent LEC's economies of scale, scope, and density. Finally, incumbent LECs must permit requesting carriers to use shared transport as an unbundled element to carry originating access traffic from, and terminating access traffic to, customers to whom the requesting carrier is also providing local exchange service.

3. We also issue a further notice of proposed rulemaking seeking comment on whether requesting carriers may use shared transport facilities in conjunction with unbundled switching, to originate or terminate interexchange traffic to customers to whom the requesting carrier does not provide local exchange service. Moreover, we seek comment on whether requesting carriers may use dedicated transport facilities to originate or terminate interexchange traffic to customers to whom the requesting carrier does not provide local exchange service.

II. BACKGROUND

A. Local Competition Order

4. Sections 251(c)(3) and 251(d)(2) of the Act set forth standards for identifying unbundled network elements that incumbent LECs must make available to requesting telecommunications carriers.[7] Section 251(c)(3) requires incumbent LECs to provide requesting carriers with "nondiscriminatory access to network elements on an unbundled basis at any technically feasible point."[8] Section 251(d)(2) provides that, in identifying unbundled elements, the "Commission shall consider, at a minimum, whether--

> (A) access to such network elements as are proprietary in nature is necessary; and

---

transport."

[7] 47 U.S.C. §§ 251(c)(3) and (d)(2).

[8] 47 U.S.C. § 251(c)(3).

> (B) the failure to provide access to such network elements would impair the ability of the telecommunications carrier seeking access to provide the services that it seeks to offer."[9]

5. In the *Local Competition Order*, the Commission, pursuant to sections 251(c)(3) and 251(d)(2), identified a minimum list of seven network elements to which incumbent LECs must provide access on an unbundled basis. These network elements included local switches, tandem switches, and interoffice transmission facilities. With respect to interoffice transmission facilities, the Commission required incumbent LECs to provide requesting telecommunications carriers access to both dedicated and "shared" interoffice transmission facilities.[10] The Commission defined "interoffice transmission facilities" as:

> incumbent LEC transmission facilities dedicated to a particular customer or carrier, or shared by more than one customer or carrier, that provide telecommunications between wire centers owned by incumbent LECs or requesting telecommunications carriers, or between switches owned by incumbent LECs or requesting telecommunications carriers.[11]

The Commission stated that "[f]or some elements, especially the loop, the requesting carrier will purchase exclusive access to the element for a specific period, [and for] other elements, especially shared facilities such as common transport, [carriers] are essentially purchasing access to a functionality of the incumbent's facilities on a minute-by-minute basis."[12] In

---

[9] 47 U.S.C. § 251(d)(2).

[10] *Local Competition Order*, 11 FCC Rcd at 15718, para. 440. 47 C.F.R. § 51.319(d)(2) states: The incumbent LEC shall:

> (i) provide a requesting telecommunications carrier exclusive use of interoffice transmission facilities dedicated to a particular customer or carrier, or use of the features, functions, and capabilities of interoffice transmission facilities shared by more than one customer or carrier;
>
> (ii) provide all technically feasible transmission facilities, features, functions, and capabilities that the requesting telecommunications carrier could use to provide telecommunications services;
>
> (iii) permit, to the extent technically feasible, a requesting telecommunications carrier to connect such interoffice facilities to equipment designated by the requesting telecommunications carrier, including, but not limited to, the requesting telecommunications carrier's collocated facilities . . . .

47 C.F.R. § 51.319(d)(2).

[11] 47 C.F.R. § 51.319(d)(1).

[12] *Local Competition Order*, 11 FCC Rcd at 15631, para. 258.

defining the network elements to which incumbent LECs must provide access on an unbundled basis, the Commission adopted the statutory definition of unbundled elements as physical facilities of the network, together with the features, functions, and capabilities associated with those facilities.[13] The Commission concluded that "the definition of the term network element includes physical facilities, such as a loop, switch, or other node, as well as logical features, functions, and capabilities that are provided by, for example, software located in a physical facility such as a switch."[14] The Commission found that:

> the embedded features and functions within a network element are part of the characteristics of that element and may not be removed from it. Accordingly, incumbent LECs must provide network elements along with all of their features and functions, so that new entrants may offer services that compete with those offered by incumbents as well as new services.[15]

The Commission also determined that "we should not identify elements in rigid terms, but rather by function."[16]

6. On July 18, 1997, the United States Court of Appeals for the Eighth Circuit issued a decision affirming certain of the Commission's rules adopted in the *Local Competition Order*, and vacating other rules.[17] With respect to issues relevant to this reconsideration decision, the court affirmed the Commission's authority to identify unbundled network elements pursuant to section 251(d)(2), and generally upheld the Commission's decision regarding incumbent LECs' obligations to provide access to network elements on an unbundled basis.[18] The order we issue today is consistent with the court's decision.

---

[13] The Act defines the term "network element" as:

> a facility or equipment used in the provision of a telecommunications service. Such term also includes features, functions, and capabilities that are provided by means of such facility or equipment, including subscriber numbers, databases, signaling systems, and information sufficient for billing and collection or used in the transmission, routing, or other provision of a telecommunications service.

B. Petitions

7. Parties contend that the *Local Competition Order* is not clear with respect to incumbent LECs' obligation to provide access to shared transport as a network element. Although only two petitions for reconsideration, filed by WorldCom, Inc. (WorldCom) and the Local Exchange Carriers Coalition (LECC), seek clarification or reconsideration of what incumbent LECs must provide pursuant to section 251(c)(3) with regard to "shared transport," several parties addressed that issue in oppositions to petitions for reconsideration and replies. Moreover, since the record closed in the reconsideration proceeding, some parties have made numerous *ex parte* presentations in this docket regarding their views on the proper definition of shared transport as a network element.

8. The record indicates that one basis for confusion is the discrepancy between our rule defining interoffice transmission facilities under section 251(c)(3), 47 C.F.R. § 51.319(d), and the rule that establishes the rate structure standard for shared transport, 47 C.F.R. § 51.509(d). The Eighth Circuit vacated the Commission's rule, 47 C.F.R. § 51.509(d), which established the rate structure standard for shared transport.[19] Although the discrepancy between our rule defining interoffice transmission facilities and the rate structure rule no longer exists, we nevertheless believe that it is useful to clarify the Commission's rules regarding shared transport. The definition of interoffice transmission facilities includes transmission facilities "dedicated to a particular customer or carrier, or shared by more than one customer or carrier, that provide telecommunications between wire centers[20] owned by incumbent LECs or requesting telecommunications carriers, or *between switches* owned by incumbent LECs or requesting telecommunications carriers."[21] The rule setting forth the rate structure for shared transport, which has been vacated by the Eighth Circuit, addressed only "[s]hared transmission facilities *between tandem switches and end offices*."[22] In the *Local*

---

[19] *Iowa Utilities Bd.* at *9, n.20.

[20] A wire center, or serving wire center, is defined as a telephone company central office designated by the telephone company to serve the geographic area in which the interexchange carrier or other person's point of demarcation is located. 47 C.F.R. § 69.2(rr).

[21] *See* 47 C.F.R. §51.319(d) (emphasis added). Switches include both end office and tandem switches.

[22] 47 C.F.R. § 51.509(d) (emphasis added). That rule (now vacated) stated:

> (d) Shared transmission facilities between tandem switches and end offices. The costs of shared transmission facilities between tandem switches and end offices may be recovered through usage-sensitive charges, or in another manner consistent with the manner that the incumbent LEC incurs those costs.

47 C.F.R. § 51.509(d).

Competition Order, we promulgated no rules mandating the rate structure for shared transport *between end offices*. WorldCom requests that the Commission clarify that incumbent LECs must offer a usage option for shared transport regardless of whether the traffic is routed through the tandem.[23] LECC requests that the Commission clarify that shared transmission facilities must be provided to a requesting carrier only "in conjunction with" both a local switching and tandem switching capability.[24]

9. More fundamentally, parties ask the Commission to clarify, or reconsider, the definition of shared transport. WorldCom asks the Commission to clarify that section 251(c)(3) requires incumbent LECs to provide shared transport as a network element pursuant to a usage option whereby the requesting carrier pays a single, usage based rate for the routing functionality between the end office and the serving wire center (SWC).[25] LECC, on the other hand, asserts that "transmission facilities are 'shared' only if they are associated with switching capability. If they are not so associated, such facilities presumably must be considered dedicated facilities."[26]

10. In support of WorldCom's petition, various competitive carriers argue that the Commission was clear in the *Local Competition Order* that "shared transport," as defined by the Commission, requires incumbent LECs to make available to requesting carriers access to all transport links between any two incumbent LEC switches (*i.e.*, between two end office switches, between an end office switch and a tandem switch, or between two tandem switches) on a per minute of use basis.[27] AT&T notes that, in defining unbundled network elements, the Commission stated that the definition includes "all the features, functions, and capabilities that are provided by means of such facility or equipment" and that "carriers seeking . . . shared facilities, such as common transport, are essentially purchasing access to a

Caton, Acting Secretary, FCC, Jan. 28, 1997 (AT&T Jan. 28 *Ex Parte*), *citing Local Competition Order*, 11 FCC Rcd at 15633, 15631, paras. 262, 258; Letter from Leonard S. Sawicki, Director FCC Affairs, MCI, to William F. Caton, Acting Secretary, FCC, June 17, 1997 (MCI June 17 *Ex Parte*).

functionality of the incumbent's facilities on a minute-by-minute basis."[28] WorldCom claims that the 1996 Act and the Commission's rules make clear that carriers taking unbundled local switching have the right to use the incumbent LEC's entire interoffice network on a cost based, nondiscriminatory basis to complete local calls. WorldCom asserts that several incumbent LECs, such as NYNEX and Bell Atlantic, have made this form of transport available.[29]

11. Ameritech argues that the network element "interoffice transport" must be unbundled from switching and must be a discrete facility or piece of equipment used in the provision of telecommunications services.[30] Ameritech contends that the Commission's requirement to provide unbundled shared interoffice facilities means that requesting carriers have the option of sharing dedicated interoffice facilities by subdividing those facilities among themselves, but that requesting carriers do not have the right to share the links used to transport Ameritech's own traffic.[31] Ameritech claims that unbundled transport can be provided in two ways: (1) dedicated transport, which is a discrete network element used exclusively by a single carrier and billed to that carrier; and (2) shared transport, which is a discrete network element jointly used by two or more requesting carriers, with the bill being pro-rated as directed by sharers.[32] Ameritech contends that, although requesting carriers may have the option of combining unbundled network elements, the definition of the term "network element" requires that the element must be able to be used separate from the rest of the incumbent LEC's network or facilities.[33]

12. Several incumbent LECs argue that the competitive carriers' definition of shared transport is inconsistent with the definition of an unbundled network element. Ameritech and BellSouth argue that shared transport, as proposed by competitive carriers, constitutes a

[33] Ameritech Opposition at 7-8.

service rather than an unbundled element.[34] According to Ameritech, such a definition bundles two elements -- transport and switching.[35] Ameritech also argues that the competitive carriers' position is contrary to the basic concept of unbundled network elements because unbundled elements are billed on a per facility/per month basis, which is consistent with the purchase of facilities as opposed to services.[36] Ameritech contends that competitive LECs are requesting "common transport" service rather than the network element "shared transport." Ameritech claims that the term "common transport" is used to describe basic network connectivity, where incumbent LECs are responsible for transporting the call to the destination. Ameritech contends that it is currently offering "common transport" service as switched access service and wholesale usage service. Ameritech argues that these services are not network elements; rather, the switched access and wholesale usage services use many separate components of the existing public switched network in combination. Ameritech claims that "common transport" is thus inextricably intertwined with switching, and is not "transport unbundled from switching."[37] Ameritech also argues that the Commission's rules applicable to the provision of unbundled switching only require that incumbent LECs offer the features "the switch is capable of providing."[38] Ameritech claims that the switch does not include the routing instructions, which are a proprietary product of Ameritech, and are not a feature of the switch.[39]

13. Ameritech contends that competitive LECs are trying to "game" the statutory pricing scheme by attempting to purchase minutes of use of Ameritech's entire network, as opposed to a specific transport facility within the network. According to Ameritech, competitive carriers would thus be able to purchase unbundled elements while avoiding the concomitant risk that the leased facility will be underutilized. This, according to Ameritech,

[39] Gebhardt Supplemental Rebuttal Testimony at 6.

is contrary to the FCC's intent.[40] Bell Atlantic contends that WorldCom is requesting a single usage-sensitive rate for both dedicated and tandem switched transport. Bell Atlantic opposes this request on the ground that it seeks reinstatement of the "equal charge per unit of traffic" rule[41] that the Commission abandoned years ago.[42] BellSouth claims that per minute-of-use pricing for shared transport would be inconsistent with the 1996 Act because, pursuant to Section 252(d)(1), pricing for an unbundled element shall be "based on the cost . . . of providing" the element.[43] BellSouth contends that the "common" transport option that WorldCom requests would consist of "common" transport between an incumbent LEC's local end office and tandem plus dedicated transport between the incumbent LEC's tandems and the serving wire center. BellSouth argues that the costs of the dedicated transport are not usage-sensitive.[44] In addition, several incumbent LECs object to WorldCom's petition on the ground that it would enable requesting carriers, in effect, to obtain access service without having to pay access charges.[45]

14. AT&T contends that Ameritech's proposal for "shared transport" is merely dedicated transport with a billing option that would enable carriers to resell portions of the

---

[40] Ameritech Feb. 3 *Ex Parte*, *citing Local Competition Order*, FCC Rcd at 15668-69, para. 334. *See also* Ameritech Opposition at 7-8 (citing the Commission's statement that carriers purchasing network elements by definition face a greater risk than a reseller but under WorldCom's proposal, requesting carriers assume no additional risk).

[41] The "equal charge per unit of traffic rule" was established in the Modification of Final Judgment (MFJ) in *United States v. AT&T*, 552 F. Supp. 131 (D.D.C. 1982), *affirmed sub. nom., Maryland v. United States*, 103 S. Ct. 1240 (1983). The rule required that until Sept. 1, 1991:

> Charges for delivery or receipt of traffic of the same type between end offices and facilities of interexchange carriers within an exchange area, shall be equal, per unit of traffic delivered or received, for all interexchange carriers.

MFJ, Appendix B, Section B.

[42] Bell Atlantic Opposition at 20; Bell Atlantic Reply at 10. Bell Atlantic claims, however, that, if WorldCom seeks merely to route *local calls* made by customers of competitive carriers that purchase unbundled switching over the incumbent's network in common with local calls made by customers of the incumbent, then Bell Atlantic is willing to provide such transport and will route competitive carrier's local calls between offices exactly the way Bell Atlantic routes its own local calls. dedicated transport and have Ameritech act as the billing agent.[46] AT&T argues that shared transport, as defined by Ameritech, would not provide a viable transport option for competitive carriers. AT&T claims that competitive carriers cannot properly engineer a transport network because they do not have access to data about existing traffic patterns and levels. Consequently, AT&T alleges that, under Ameritech's shared transport proposal, competitive carriers will be forced to route their traffic to tandems even when it would be more efficient to route such traffic directly to end offices. AT&T claims that this will lead to poor utilization of incumbent LEC interoffice transport facilities and will require the inefficient deployment of additional transport facilities between incumbent LEC end offices and the tandems.[47] AT&T also argues that usage sensitive pricing for shared use of interoffice transport facilities is consistent with other network elements such as unbundled switching, tandem switching, signalling, and call related databases, which are either partly or entirely priced on a per minute-of-use or per query basis.[48] In contrast to Ameritech's position regarding the routing table, NYNEX claims that the shared transport unbundled element being offered by NYNEX allows competing carriers to use the same end office routing tables and functions that are used by NYNEX to route its own traffic.[49] Also, WorldCom claims that, when a carrier purchases unbundled local switching, it purchases all "features and functions, including functions integral to call routing" including the routing table.[50]

15. MCI and AT&T assert that the per minute-of-use option for shared transport is critical when providing local exchange service via unbundled local switching.[51] AT&T states that the Commission, in the *Local Competition Order*, recognized that the unbundling requirements of the 1996 Act provided competitive carriers with the opportunity to share the economies of scale and scope of the incumbent LEC. AT&T contends that access to shared

[51] MCI June 17 *Ex Parte*; AT&T Jan. 25 *Ex Parte*.

transport on a cost-based, per minute-of-use basis is critical to preserving such scale and scope economies for competitive carriers.[52] MCI claims that competing carriers will need access to unbundled local switching and shared transport in less densely populated areas, because they are likely to build their own facilities early on only in urban centers. MCI contends that transport thus needs to be priced on a per minute-of-use basis because, in less densely populated areas, new entrants may have insufficient customer volume to justify flat-rated, dedicated transport.[53] MCI notes that other incumbent LECs, including NYNEX and BellSouth, are offering shared transport on a per minute-of-use basis.[54] MCI further notes that Ameritech's proposed non-recurring charges associated with Ameritech's shared and dedicated transport make the use of flat-rated shared and dedicated facilities even more uneconomic.[55] MCI contends that in Illinois Ameritech, in connection with its unbundled local switching proposal, is attempting to impose monthly trunk port charges of $147.56 for each digital trunk port and a nonrecurring charge of $729.39 for each trunk port. MCI claims that, if Ameritech is successful in forcing new entrants to use dedicated trunking in connection with unbundled local switching at these rates, there is little likelihood that use of unbundled local switching will be a viable entry strategy where traffic volumes do not justify flat-rated transport.[56]

16. AT&T and WorldCom also argue that, contrary to Ameritech's contention, defining shared transport consistent with the competitive carriers' interpretation would not eliminate the difference between resale and unbundled elements.[57] AT&T claims that the

[55] MCI June 17 *Ex Parte*.

[56] MCI June 17 *Ex Parte*.

[57] Letter from Bruce K. Cox, Government Affairs Director, AT&T, to William F. Caton, Acting Secretary, FCC, May 14, 1996 (AT&T May 14 *Ex Parte*); Letter from Linda L. Oliver, Counsel for WorldCom, Inc., to William F. Caton, Acting Secretary, FCC, May 23, 1997 (WorldCom May 23 *Ex parte*).

Commission. in the *Local Competition Order*, identified three differences between the purchase of unbundled elements and resale, and all three differences continue to be valid.[58]

17. WorldCom contends that the Act and the Commission's rules make clear that the requesting carrier, purchasing unbundled local switching, is the sole provider of the local switching portion of interexchange access, regardless of the method of transport chosen by the interexchange carrier (IXC) to reach the unbundled local switch.[59] WorldCom suggests that NYNEX and Bell Atlantic do not contest this.[60] AT&T contends that, when a requesting carrier purchases the unbundled local switch and the unbundled loop, that requesting carrier is entitled to bill an IXC for the access services associated with those unbundled network elements when the competitive carrier's local customer initiates or receives an interexchange call carried by that IXC. AT&T also claims that the requesting carrier has the right to offer transport services to the IXC; it is, however, the IXC's decision as to which carrier it uses to provide access transport services.[61]

18. Responding to LECC's petition, WorldCom argues that, by tying the provision of shared transmission facilities to both local switching and tandem capabilities, the clarification sought by LECC is overbroad and would unnecessarily constrain the ability of requesting carriers to purchase access to shared transmission facilities between two end offices as a

[58] AT&T May 14 *Ex Parte*. First, according to AT&T, network element purchasers bear the risk if elements, such as the loop and the switch, are not profitably utilized by customers. Carriers purchasing end-to-end rebundled unbundled elements face the risk that their users will generate substantial switch usage costs on local calls (free usage), without generating significant interLATA traffic and associated revenue. Second, competitive carriers buying the end-to-end unbundled elements can use their elements to create services the incumbent does not offer, and thus increase competitive options to consumers. Finally, use of rebundled unbundled network elements fosters the growth of facilities-based competition because competitors can gradually introduce their own facilities in place of elements purchased from incumbents. AT&T contends that most large competitive carriers would prefer to own their own networks because it reduces their vulnerability to discrimination by the incumbent, and gives them greater control over their costs, network quality, and ability to provide new services in response to consumer demand. *Id. See also* WorldCom May 23 *Ex Parte* (combinations of network elements provide new entrants an entirely different competitive entry strategy than resale. Such combinations of network elements permit new entrants the opportunity to provide new service and price pressures on incumbent LECs).

[61] Letter from Bruce K. Cox, Government Affairs Director, AT&T, to William F. Caton, Acting Secretary, FCC, filed July 11, 1997.

network element.[62] WorldCom further contends that such a transport regime would require that each requesting carrier that purchases dedicated trunks between end offices establish customized routing using new line class codes. According to WorldCom, this would lead to rapid line class code exhaustion.[63]

III. DISCUSSION

19. On July 18, 1997, the United States Court of Appeals for the Eighth Circuit affirmed in part and vacated in part the Commission's *Local Competition Order*. We note, as a predicate to our discussion below, that the court affirmed the Commission's rulemaking authority to identify unbundled network elements. The court held that section 251(d)(2) of the Act expressly gave the Commission jurisdiction in this area.[64] We thus conclude that the Commission has authority to address, in this reconsideration order, the issues raised by petitioners concerning the extent to which "shared transport" should be provided as an unbundled element.

20. WorldCom filed a petition for clarification, and LECC filed a petition for reconsideration of the *Local Competition Order*; both petitions concerned the definition of shared transport as an unbundled network element. WorldCom filed a petition for clarification pursuant to 47 U.S.C. § 405 and 47 C.F.R. § 1.429, which set forth rules regarding petitions for reconsideration. In its petition WorldCom also stated that, "[s]hould the Commission not regard this petition as a request for clarification of the *Local Competition Order*, WorldCom requests that it be regarded as a petition for reconsideration."[65] We believe WorldCom's filing is more properly addressed as a petition for reconsideration, and treat it as such in this decision.

21. Parties disagree about what we required in the *Local Competition Order* with respect to shared transport. In addition, parties ask us to clarify or reconsider our decision regarding the provision of shared transport under section 251(c)(3). We first restate what we required in the *Local Competition Order*, and then reconsider certain aspects that may have been unclear or that were not addressed in the *Local Competition Order*. We then respond to

---

[62] WorldCom Opposition at 3-5 (network cost and efficiency of both the incumbent and the requesting carrier would suffer because additional and unnecessary dedicated trunk groups would have to be created, raising the costs for competitors, and the incumbent's own trunk groups would operate less efficiently as new entrant's traffic is removed from trunk groups already sized to handle this traffic load).

[63] WorldCom Opposition at 5.

[64] *Iowa Utilities Bd.* at *32, n.10.

[65] WorldCom Petition at 1, fn 1.

arguments raised by parties that advocate a different approach to the provision of shared transport than our rules require.

22. We believe that the petitions for reconsideration have raised reasonable questions about the scope and nature of an incumbent LEC's obligation to offer shared transport as an unbundled network element, pursuant to section 251(c)(3) and our implementing regulations. We address these issues below. We also believe, however, some parties have argued that certain aspects of the rules adopted last August were ambiguous which, in our view, were clear. Specifically, in the *Local Competition Order*, we expressly required incumbent LECs to provide access to transport facilities "shared by more than one customer or carrier."[66] The term "carrier" includes both an incumbent LEC as well as a requesting telecommunications carrier. We, therefore, conclude that "shared transport," as required by the *Local Competition Order* encompasses a facility that is shared by multiple carriers, including the incumbent LEC. We recognize that the *Local Competition Order* did not explicitly state that an incumbent LEC must provide shared transport in a way that enables the traffic of requesting carriers to be carried on the same facilities that an incumbent LEC uses for its traffic. We find, however, that a fair reading of our order and rules does not support the claim advanced by Ameritech that a shared network element necessarily is shared only among competitive carriers and is separate from the facility used by the incumbent LEC for its own traffic. Indeed, only Ameritech and US West suggest that the *Local Competition Order* could be interpreted to require sharing only between multiple competitive carriers.[67] Moreover, the fact that we required incumbent LECs to provide access to other network elements, such as signalling, databases, and the local switch, which are shared among requesting carriers and incumbent LECs is consistent with our view that transport facilities "shared by more than one customer or carrier" must be shared between the incumbent LECs and requesting carriers. Furthermore, with respect to local switching, we expressly rejected, in the *Local Competition Order*, a proposal that incumbent LECs could, or were required to, partition local switches before providing requesting carriers access to incumbent LEC switches under section 251(c)(3). We stated that "[t]he requirements we establish for local switch unbundling do not entail physical division of the switch, and consequently do not impose the inefficiency or technical difficulties identified by some commentators."[68] We thus required that shared portions of incumbent LEC switches would be shared by all carriers, including the incumbent LEC. Although we do not believe that the *Local Competition Order* was unclear as to this aspect of an incumbent LEC's obligation to provide shared transport, we take this opportunity to state explicitly that the *Local Competition Order* requires incumbent LECs to offer

[66] 47 C.F.R. § 51.319(d)(2)(i).

[67] *See* Ameritech Jan. 28. *Ex Parte*; US West Feb. 27 *Ex Parte*.

[68] *Local Competition Order*, 11 FCC Rcd at 15708, para. 416.

requesting carriers access, on a shared basis, to the same interoffice transport facilities that the incumbent uses for its own traffic.

23. We also conclude that the *Local Competition Order* was not ambiguous as to an incumbent LEC's obligation to offer access to the routing table resident in the local switch to requesting carriers that purchase access to the unbundled local switch.[69] The *Local Competition Order* made clear that requesting carriers that purchase access to the unbundled local switch may obtain customized routing, unless it is not technically feasible to provide customized routing from that switch. In those instances, a requesting carrier is limited to using the routing instructions in the incumbent LEC's routing table.[70] In so holding, we necessarily accepted the view that requesting carriers that take unbundled local switching have access to the incumbent LEC's routing table, resident in the switch. We find nothing in the *Local Competition Order* that supports the contention that requesting carriers that obtain access to unbundled local switching, pursuant to section 251(c)(3), do not obtain access to the routing table in the unbundled local switch.

24. The *Local Competition Order* did not clearly define certain aspects of incumbent LECs' obligation to provide access to shared transport under section 251(c)(3). In particular, we did not clearly and unambiguously (1) identify all portions of the network to which incumbent LEC must provide interoffice transport facilities on a shared basis; and (2) address whether requesting carriers may use shared transport facilities to provide exchange access service to IXCs for access to customers to whom they also provide local exchange service. We do so here on reconsideration.

A. Incumbent LECs' obligation regarding shared transport

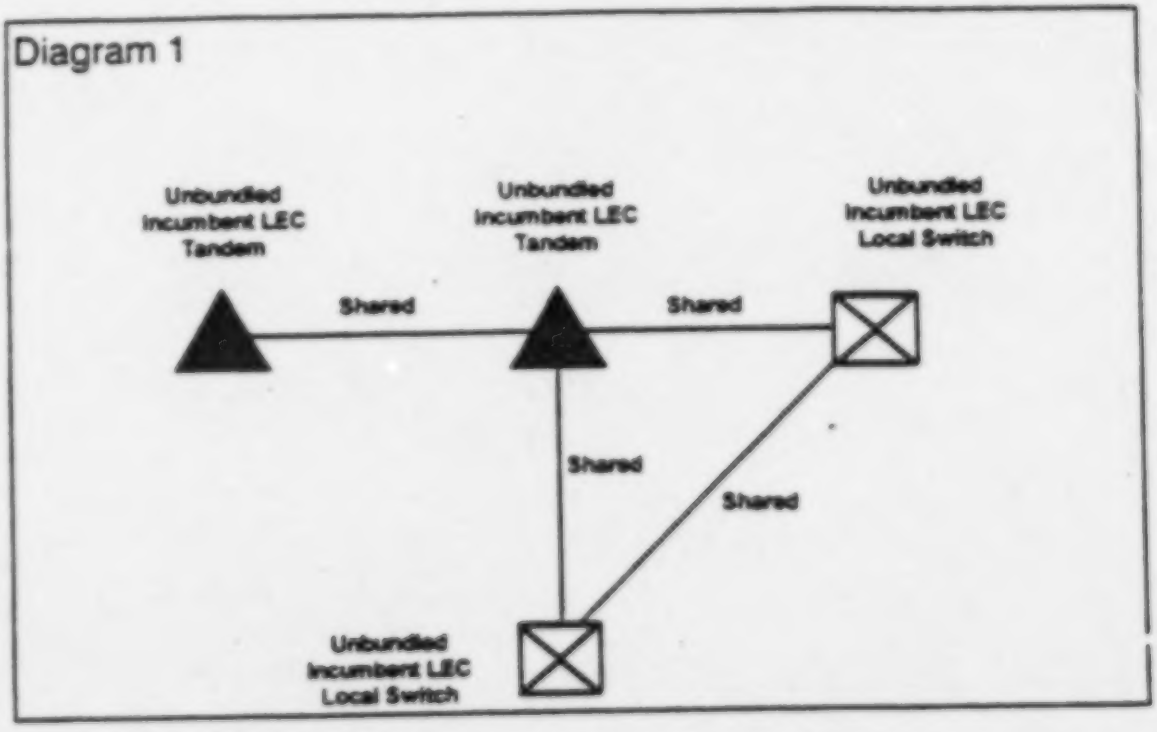
25. We conclude that the obligation of incumbent LECs to provide requesting carriers with access to shared transport extends to all incumbent LEC interoffice transport facilities, and not just to interoffice facilities between an end office and tandem. Thus, incumbent LECs are required to provide shared transport between end offices, between tandems, and between tandems and end offices).[71]

---

[69] Both end office and tandem switches contain routing tables, which provide information about how to route each call. The routing instructions notify the switch as to which trunks are to be used in transporting a call. Depending upon the availability of circuits, a call may be routed directly from the end office of the calling party to the called party's end office, or routed through a tandem switch.

[70] *Local Competition Order*, 11 FCC Rcd at 15706, para. 412.

[71] *See* Diagram 1.



26. The *Local Competition Order* expressly required "incumbent LECs to provide unbundled access to shared transmission facilities between end offices and the tandem switch."[72] Parties disagree, however, about whether incumbent LECs are required to provide shared transport between end offices. As noted above,[73] there is a discrepancy between the rule that establishes the general obligation to provide shared transport as a network element, and the rule vacated by the court that purports to establish the pricing standard for shared transport.[74] To the extent that incumbent LECs already have transport facilities between end offices, and between tandems, the routing table contained in the switch most likely would

[72] *Local Competition Order*, 11 FCC Rcd at 15718, para. 440. The Commission also stated in its rules that shared transmission facilities must be made available between "tandem switches and end offices." 47 C.F.R. § 51.509(d).

[73] *See supra* para. 9.

[74] 47 C.F.R. §§ 51.319(d) and 51.509(d). We note that the Eighth Circuit has held that the Commission lacked jurisdiction to adopt the pricing standard set forth in section 51.509(d), and accordingly vacated that section of the Commission's rules.

route calls between such switches.[75] We therefore conclude that there is no basis for limiting the use of shared transport facilities to links between end office switches and tandem switches. Limiting the definition of shared transport in this manner would not permit requesting carriers to utilize the routing tables in the incumbent LECs' switches. To the contrary, such a limitation effectively would require a requesting carrier to design its own customized routing table, in order to avoid having its traffic transported over the same interoffice facilities, connecting end offices, that the incumbent LEC use to transport its own interoffice traffic. Moreover, in the *Local Competition Order*, we held that it is technically feasible to provide access to interoffice transport facilities between end offices and between end offices and tandem switches.[76] No new evidence has been presented in this proceeding to convince us that our earlier conclusion regarding technical feasibility was incorrect.[77]

27. We further clarify in this order that incumbent LECs are only required to offer *dedicated* transport between their switches, or serving wire centers, and requesting carriers' switches. Our *Local Competition Order* was not absolutely clear as to whether incumbent LECs must provide dedicated or shared interoffice transport between incumbent LEC switches, or serving wire centers, and switches owned by requesting carriers. In the *Local Competition Order*, we required incumbent LECs to "provide access to *dedicated transmission*

---

[75] In fact, incumbent LECs would have to *modify* their routing tables in order to prevent calls from being routed between end offices or between tandems.

[76] *Local Competition Order*, 11 FCC Rcd at 15719, paras. 442 and 443.

[77] Among incumbent LECs, only Ameritech, in various *ex parte* submissions, asserts that its switches are unable to "provide precise usage data or originating carrier identity for terminating local usage, or to identify terminating access usage with the called number." In essence, Ameritech contends that it is unable to accurately bill for the use of shared transport, including exchange access. Letter from James K. Smith, Director Federal Relations, Ameritech, to William F. Caton, Acting Secretary, FCC, July 15, 1997 (Ameritech July 15 *Ex Parte*) attaching Reply Brief in Support of Application by Ameritech Michigan for Provision of In-Region, InterLATA Services in Michigan at 22-23 (Ameritech 271 Michigan Application Reply). As we held in our *Local Competition Order*, however, a determination of technical feasibility does not include consideration of billing concerns. 47 C.F.R. §51.5. *Accord Iowa Utilities Bd.* at *21. Moreover, as noted above, Ameritech is the only party to contend that it is not currently able to measure and bill for shared transport. In contrast, Bell Atlantic, NYNEX, and PacTel have stated that they offer shared transport in conjunction with unbundled local switching. Letter from Patricia E. Koch, Assistent Vice President - Government Relations - FCC, Bell Atlantic, to William F. Caton, Acting Secretary, FCC, August 4, 1997. Letter from G.R. Evans, Vice President Federal Regulatory Affairs, NYNEX, to William F. Caton, Acting Secretary, FCC, July 18, 1997; Letter from M.E. Garber, Senior Counsel, Pacific Telesis, to William F. Caton, Acting Secretary, FCC, Mar. 3, 1997. In any event, we note that Ameritech has stated in another proceeding that it has proposed a settlement mechanism as an interim solution until it develops a long-term solution. Ameritech 271 Michigan Application Reply, CC Docket No. 97-137, at 22. Ameritech has also stated that it "is operationally capable of furnishing the 'platform' (unbundled local switching and shared transport) upon request." Ameritech 271 Michigan Application Reply, CC Docket No. 97-137, at 23. We thus find no evidence that it is not technically feasible to provide shared transport.

facilities between LEC central offices or between end offices and those of competing carriers."[78] This could be read to suggest that incumbent LECs are only required to provide dedicated (but not shared) interoffice transport facilities between their end offices, or serving wire centers, and points in the requesting carrier's network. The rule that defines interoffice transmission facilities, however, is less clear, and could be read to require incumbent LECs to provide shared transport between incumbent LECs' switches, or serving wire centers, and requesting carriers' switches.[79]

28. We therefore clarify here that incumbent LECs must offer only *dedicated transport*, and not shared transport, between their switches, or serving wire centers, and requesting carriers' switches, as set forth in the *Local Competition Order*. We also note that the *Local Competition Order* expressly limited the requirement to provide unbundled interoffice transport facilities to *existing* incumbent LEC facilities.[80]

29. On reconsideration, we further clarify that incumbent LECs are not required to provide shared transport between incumbent LEC switches and serving wire centers.[81] We stated above that shared transport must be provided between incumbent LEC switches. Serving wire centers are merely points of demarcation in the incumbent LEC's network, and are not points at which traffic is switched. Traffic routed to a serving wire center is traffic dedicated to a particular carrier. We thus conclude that unbundled access to the transport links between incumbent LEC switches and serving wire centers must only be provided by incumbent LECs on a *dedicated* basis.[82]

---

[78] *Local Competition Order*, 11 FCC Rcd at 15718, para. 440 (emphasis added).

[79] 47 C.F.R. 51.319(d)(1) states:

> Interoffice transmission facilities are defined as incumbent LEC transmission facilities dedicated to a particular customer or carrier, or shared by more than one customer or carrier, that provide telecommunications between wire centers owned by incumbent LECs or requesting telecommunications carriers, or between switches owned by incumbent LECs or requesting telecommunications carriers.

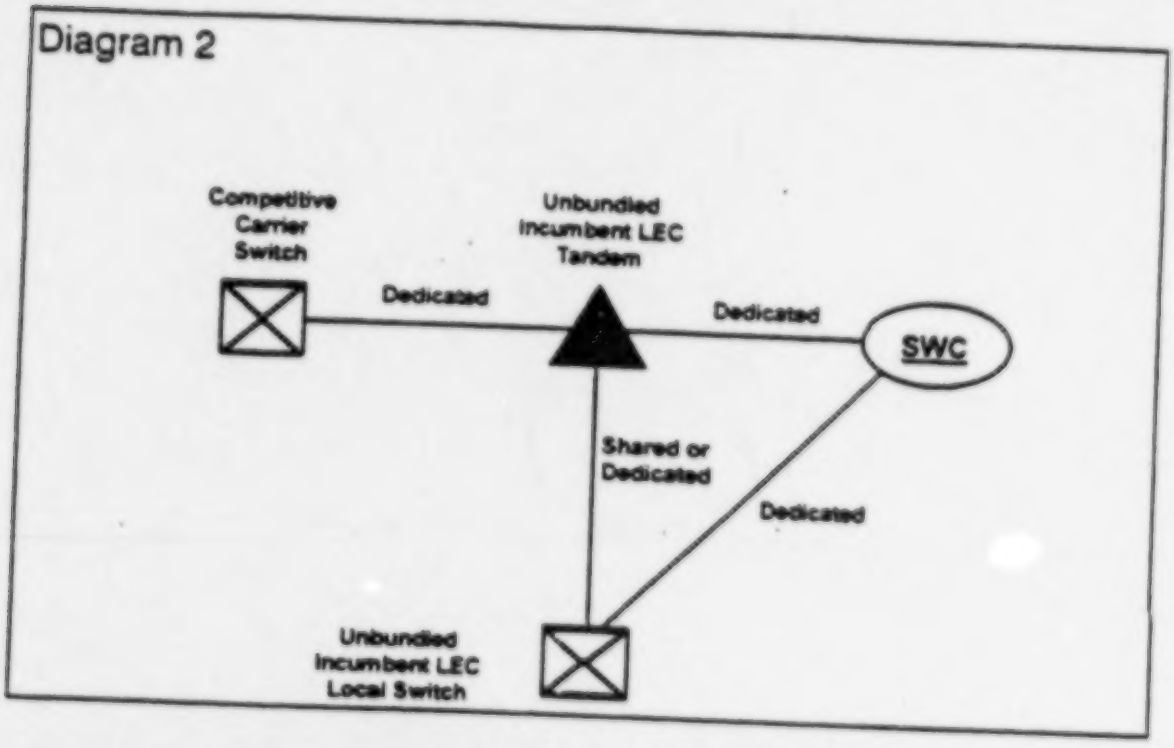
47 C.F.R. 51.319(d)(1).

[80] *Local Competition Order*, 11 FCC Rcd at 15722, para. 451.

[81] We note that this clarification finds some support in the *Local Competition Order*, where we concluded that: "[t]his requirement [that incumbent LECs provide access to dedicated transmission facilities] includes, at a minimum, interoffice facilities between end offices and serving wire centers . . ." *Local Competition Order* at 15718, para 440.

[82] *See* Diagram 2.

Diagram 2



30. Finally, we note that, traditionally, shared facilities are priced on a usage-sensitive basis, and dedicated facilities are priced on a flat-rated basis. We believe that this usage-sensitive pricing mechanism provides a reasonable and fair allocation of cost between the users of shared transport facilities. For example, in the *Access Charge Reform Order*, specifically the sections dealing with rate structure issues for interstate access charges, we required that the cost of switching, a shared facility, be recovered on a per minute of use basis, while the cost of entrance facilities, which are dedicated to a single interexchange carrier, be recovered on a flat-rated basis.[83] We note that several state commissions, in proceedings conducted pursuant to section 252 of the Act, have required incumbent LECs to offer shared transport priced on a usage-sensitive basis.[84] We acknowledge that, under the Eighth Circuit's decision, we may not establish pricing rules for shared transport. However, in situations where the Commission is required to arbitrate interconnection agreements

[83] Access Charge Reform, First Report and Order, CC Docket 96-262, FCC 97-158 (rel. May, 16, 1997) (*Access Charge Reform Order*) at paras. 135, 153.

[84] *See, e.g.*, Michigan Public Service Commission, Case No. U-11280, July 14, 1997, Order at 26; Public Service Commission of Wisconsin, Case No. 6720-TI-120, Findings of Fact, Conclusions of Law, and Second Order, May 30, 1997.

pursuant to subsection 252(e)(5), we intend to establish usage-sensitive rates for recovery of shared transport costs unless parties demonstrate otherwise.[85]

B. Application of the requirements of section 251(d)(2) to shared transport

31. Shared transport, as defined in this order, satisfies the two-prong test set forth in section 251(d)(2) of the Act. Section 251(d)(2) requires the Commission, in determining what network elements should be made available under section 251(c)(3), to consider "at a minimum, whether (A) access to such network elements as are proprietary in nature is necessary; and (B) the failure to provide access to such network elements would impair the ability of the telecommunications carrier seeking access to provide the services that it seeks to offer."[86] In the *Local Competition Order*, we held that an incumbent could refuse to provide access to a network element pursuant to section 251(d)(2) only if the incumbent LEC demonstrated that "the element is proprietary and that gaining access to that element is not necessary because the competing provider can use other, nonproprietary elements in the incumbent LEC's network to provide service."[87] We further held that, under section 251(d)(2)(B), we must consider "whether the failure of an incumbent to provide access to a network element would decrease the quality, or increase the financial or administrative cost of the service a requesting carrier seeks to offer, compared with providing that service over other unbundled elements in the incumbent LEC's network."[88] The Eighth Circuit affirmed the Commission's interpretation of section 251(d)(2).[89]

32. In the *Local Competition Order*, we concluded that, with respect to transport facilities, "the record provides no basis for withholding these facilities from competitors based on proprietary considerations."[90] We also concluded that section 251(d)(2)(B) requires incumbent LECs to provide access to shared interoffice facilities and dedicated interoffice facilities.[91] With respect to the unbundled local switch, we held that, even assuming that

[85] *See* 47 U.S.C. § 252(e)(5). *See also Local Competition Order*, 11 FCC Rcd at 16127-32, paras. 1283-95 (giving notice of certain minimum procedural rules and substantive standards that the Commission will use if it assumes jurisdiction pursuant to section 252(e)(5)).

[86] 47 U.S.C. § 251(d)(2).

[87] *Local Competition Order*, 11 FCC Rcd at 15710, para. 419. *See also id.* at 15642, para. 283.

[88] *Local Competition Order*, 11 FCC Rcd at 15643, para. 285.

[89] *Iowa Utilities Bd. v. FCC*, at *22-24.

[90] *Local Competition Order*, 11 FCC Rcd at 15720, para. 446.

[91] *Local Competition Order*, 11 FCC Rcd at 15720-21, para. 447.

switching may be proprietary, at least in some respects, "access to unbundled local switching is clearly 'necessary' under our interpretation of section 251(d)(2)(A)."[92] We also concluded that a requesting carrier's ability to offer local exchange service would be "impaired, if not thwarted," without access to the unbundled local switch, and therefore, that section 251(d)(2)(B) requires incumbent LECs to provide access to the unbundled local switch.[93]

33. Upon reconsideration, we herein affirm that incumbent LECs are obligated under section 251(d)(2) to provide access to shared transport, as we here define it, as an unbundled network element. Parties in the record have not contended that interoffice transport facilities are proprietary, and we have no basis for modifying our prior conclusion that interoffice transport facilities are not proprietary. Thus, there is no basis under section 251(d)(2)(A) for incumbent LECs to refuse to provide interoffice transport facilities on a shared as well as a dedicated basis.

34. We also note that the failure of an incumbent LEC to provide access to all of its interoffice transport facilities on a shared basis would significantly increase the requesting carriers' costs of providing local exchange service and thus reduce competitive entry into the local exchange market. In the *Local Competition Order*, we observed that:

> By unbundling various dedicated and shared interoffice facilities, a new entrant can purchase *all* interoffice facilities on an unbundled basis as part of a competing local network, or it can combine its own interoffice facilities with those of the incumbent LEC. The opportunity to purchase unbundled interoffice facilities will decrease the cost of entry compared to the much higher cost that would be incurred by an entrant that had to construct all of its own facilities. An efficient new entrant might not be able to compete if it were required to build interoffice facilities where it would be more efficient to use the incumbent LEC's facilities.[94]

We continue to find the foregoing statements to be true with respect to shared as well as dedicated transport facilities. Requesting carriers should have the opportunity to use *all* of the incumbent LEC's interoffice transport facilities. Moreover, the opportunity to purchase transport facilities on a shared basis, rather than exclusively on a dedicated basis, will decrease the costs of entry.

---

[92] *Local Competition Order*, 11 FCC Rcd at 15710, para. 419. In the *Local Competition Order*, we defined "necessary" in this specific context as meaning "that an element is a prerequisite for competition." *Id.* at para. 282. We also note that the Eighth Circuit affirmed this definition. *Iowa Utilities Bd.* at *22-23.

[93] *Local Competition Order*, 11 FCC Rcd at 15710-11, para. 420.

[94] *Local Competition Order*, 11 FCC Rcd at 15718-19, para. 441 (emphasis added).

35. We believe that access to transport facilities on a shared basis is particularly important for stimulating initial competitive entry into the local exchange market, because new entrants have not yet had an opportunity to determine traffic volumes and routing patterns. Moreover, requiring competitive carriers to use dedicated transport facilities during the initial stages of competition would create a significant barrier to entry because dedicated transport is not economically feasible at low penetration rates. In addition, new entrants would be hindered by significant transaction costs if they were required to continually reconfigure the unbundled transport elements as they acquired customers. We note that incumbent LECs have significant economies of scope, scale, and density in providing transport facilities. Requiring transport facilities to be made available on a shared basis will assure that such economies are passed on to competitive carriers. Further, if new entrants were forced to rely on dedicated transport facilities, even at the earliest stages of competitive entry, they would almost inevitably miscalculate the capacity or routing patterns. We recognize, however, that the need for access to all of the incumbent LEC's interoffice facilities on a shared basis may decrease as competitive carriers expand their customer base and have an opportunity to identify traffic volumes and call routing patterns. We therefore may revisit at a later date whether incumbent LECs continue to have an obligation, under section 251(d)(2), to provide access to all of their interoffice transmission facilities on a shared, usage sensitive basis.[95]

36. As noted above, although interoffice transport, as we define the element pursuant to section 251(c)(3), refers to the transport links in the incumbent LEC's network, access to those links on a shared basis effectively requires a requesting carrier to utilize the routing table contained in the incumbent LEC's switch. Ameritech contends that the routing table contained in the switch, which is used in conjunction with shared transport, is proprietary. Ameritech and other incumbent LECs further allege that requesting carriers may obtain the functional equivalent of shared transport either by purchasing transport as an access service, or by purchasing dedicated transport facilities. These parties thus contend that, under section 251(d)(2)(A), incumbent LECs are not required to provide shared transport (including use of the routing table contained in the switch) as a network element.

37. Issues regarding intellectual property rights associated with network elements are before us in a separate proceeding.[96] For purposes of this Order only, we therefore assume without deciding that the routing table is proprietary. We nevertheless conclude that section

[95] We note that, if, in the future, competitive carriers gain sufficient market penetration to justify obtaining dedicated transport facilities, either through the use of unbundled elements or through building their facilities, shared transport may no longer meet the section 251(d)(2) requirements. In that event, the Commission can evaluate at that time whether incumbent LECs must continue to provide access to shared transport as a network element.

[96] *See* MCI Petition for Declaratory Ruling, CC Docket No. 96-98, CCB Pol. 97-4 (Mar. 11, 1997).

251(d)(2) requires an incumbent LEC to provide access to both its interoffice transmission facilities and to the routing tables contained in the incumbent LEC's switches.[97] We affirm our finding in the *Local Competition Order* that transport provided as part of access service, or as a wholesale usage service, is not a viable substitute for shared transport as a network element.[98] All incumbent LECs are not required to offer transport as an access service on a stand alone basis. Only Class A carriers are required, under our *Expanded Interconnection* rules, to unbundle interstate transport service.[99] Moreover, transport service that incumbents offer under the *Expanded Interconnection* tariffs may include only interstate transport facilities (transport provided either via a tandem switch or direct trunked between a local switch and the serving wire center), not interoffice transport facilities directly connecting two local switches. In the *Local Competition Order*, moreover, we expressly rejected the suggestion that requesting carriers "are not impaired in their ability to provide a service . . . if they can provide the proposed service by purchasing the service at wholesale rates from a LEC."[100]

C. Use of shared transport facilities to provide exchange access service

38. In this order on reconsideration, we clarify that requesting carriers that take shared or dedicated transport as an unbundled network element may use such transport to provide interstate exchange access services to customers to whom it provides local exchange service. We further clarify that, where a requesting carrier provides interstate exchange access services to customers, to whom it also provides local exchange service, the requesting carrier is entitled to assess originating and terminating access charges to interexchange carriers, and it is not obligated to pay access charges to the incumbent LEC.

39. In the *Local Competition Order*, we held that, if a requesting carrier purchases access to a network element in order to provide local exchange service, the carrier may also use that element to provide exchange access and interexchange services.[101] We did not impose any restrictions on the types of telecommunications services that could be provided over network elements. We did not specifically consider in the *Local Competition Order*,

---

[97] The Eighth Circuit recognized that "the Act itself expressly contemplates that requesting carriers will have access to network elements that are proprietary in nature." *Iowa Utilities Bd.* at *32, n.37.

[98] *See Local Competition Order*, 11 FCC Rcd at 15721, para. 448.

[99] Class A carriers are those exchange carriers that have more than $100 million in total company regulated revenues. 47 C.F.R. §§ 32.11(a)(1), 32.9000.

[100] *Local Competition Order*, 11 FCC Rcd at 15643-44, para. 286. *See also id.* at 15644, para. 287. *See also Iowa Utilities Bd.* at *21 (stating that the fact that a capability may be available as a service does not necessarily preclude that capability from being available as a network element).

[101] *Local Competition Order*, 11 FCC Rcd at 15679, para. 356.

however, whether a requesting carrier may use interoffice transport to provide exchange access service. We conclude here that a requesting carrier may use the shared transport unbundled element to provide exchange access service to customers for whom the carrier provides local exchange service.[102] We find that this is consistent with our initial decision.[103]

D. Response to Specific Arguments Raised by Parties

40. As discussed above, we define the unbundled network element of shared transport under section 251(c)(3) as interoffice transmission facilities, shared between the incumbent LEC and one or more requesting carriers or customers, that connect end office switches, end office switches and tandem switches, or tandem switches, in the incumbent LEC's network. We exclude from this definition interoffice transmission facilities that connect an incumbent LEC's switch and a requesting carrier's switch, and those connecting an incumbent LEC's end office switch, or tandem switch, and a serving wire center. This definition of shared transport assumes the interconnection point between the two carriers' networks, pursuant to section 251(c)(2), is at the incumbent LEC's switch. This definition is consistent with the statutory definition of network elements, which defines a network element as a facility or equipment used in the provision of a telecommunications service, including the features, functions, and capabilities provided by means of such facility or equipment.[104]

41. As an initial matter, we reject Ameritech's contention that, by definition, network elements must be partly or wholly dedicated to a customer.[105] To the contrary, we held in the *Local Competition Order* that some network elements, such as loops, are provided exclusively to one requesting carrier, and some network elements, such as interoffice transport provided on a shared basis, are provided on a minute-of-use basis and are shared with other carriers.[106] In the *Local Competition Order*, we also identified signalling, call-related databases, and the

---

[102] We issue a further notice of proposed rulemaking below seeking comment on whether carriers may use dedicated and shared unbundled transport facilities to carry originating to, and terminating access traffic from, customer to whom the requesting carrier does not also provide local exchange service. *See infra* paras. 51-52.

[103] *See, e.g., Local Competition Order*, 11 FCC Rcd at 15679, para. 356 (section 251(c)(3) permints interexchange carriers and all other requesting telecommunications carriers, to purchase unbundled elements for the purpose of offering exchange access services). *See also* NYNEX July 18 *Ex Parte* (recognizing that, when a requesting carrier "wins a local service customer," and uses an unbundled network element such as shared transport to serve that customer, that the carrier "is entitled to use that same element to provide other telecommunications services, such as exchange access, to IXCs.")

[104] 47 U.S.C. § 153(29).

[105] *See* Ameritech Reply at 19.

[106] *Local Competition Order*, 11 FCC Rcd at 15631, para. 258.

switch, as network elements that necessarily must be shared among the incumbent and multiple competing carriers.[107]

42. We also reject Ameritech's and BellSouth's contention that, because WorldCom and other requesting carriers seek access to an element -- shared transport -- that cannot be effectively disassociated from another element -- local switching, the requesting carriers are in fact seeking access to a bundled service rather than to transport as a network element unbundled from switching.[108] As previously discussed, several of the network elements we identified in the *Local Competition Order* depend, at least in part, on other network elements. In particular, although we identified the signalling network as a network element, the information necessary to utilize signalling networks resides in the switch, which we identified as a separate network element. In addition, we required incumbent LECs, upon request, to provide access to unbundled loops conditioned to provide, among other things, digital services such as ISDN, even though the equipment used to provide ISDN service typically resides in the local switch, rather than in the loop.[109] We thus find no basis for concluding that each network element must be functionally independent of other network elements.

43. We reject as well Ameritech's contention that a network element must be identifiable as a limited or pre-identified portion of the network. We find nothing in the statutory definition of network elements that prohibits requesting telecommunications carriers from seeking access to every transport facility within the incumbent's network. Our definition of signalling as a network element does not require requesting carriers to identify in advance a particular portion of the incumbent LEC's signalling facilities, but instead permits requesting carriers to obtain access to multiple signalling links and signalling transfer points in the incumbent LEC's network on an as-needed basis.[110] We also reject Ameritech's assertion that shared transport cannot be physically separated from switching.[111] Both dedicated and shared transport facilities are transport links between switches. These links are physically distinct from the end office and tandem switches themselves.

---

[107] *See* 47 C.F.R. § 51.319(e). *See also Iowa Utilities Bd.* at *18 (affirming determination that signalling and databases are network elements).

[108] *See* Ameritech Opposition at 7 and Bell South Reply at 6. Ameritech also contends that incumbent LECs are not required to provide bundled services at cost-based rates under section 251(c)(3) and section 252(d)(1). *See* Ameritech Opposition at 7.

[109] *Local Competition Order*, 11 FCC Rcd at 15691, para. 380.

[110] *See generally Local Competition Order*, 11 FCC Rcd at 15738-41, paras. 479-483.

[111] *See* May 9, 1997 *ex parte* from Jim Smith, Director, Federal Relations, Ameritech, to William Caton, Acting Secretary, FCC, attaching Supplemental Rebuttal Testimony of David H. Gebhardt at 2 (Gebhardt Supplemental Rebuttal Testimony).

44. Although we conclude that shared transport is physically severable from switching, incumbent LECs may not unbundle switching and transport facilities that are already combined, except upon request by a requesting carrier. Although, the Eighth Circuit struck down the Commission's rule that required incumbent LECs to rebundle separate network elements,[112] the court nevertheless stated that it: "upheld the remaining unbundling rules as reasonable constructions of the Act, because, as we have shown, the Act itself calls for the rapid introduction of competition into the local phone markets by requiring incumbent LECs to make their networks available to . . . competing carriers."[113] Among other things, the court left in effect section 51.315(b) of the Commission's rules, which provides that, "[e]xcept upon request, an incumbent LEC shall not separate requested network elements that the incumbent LEC currently combines."[114] Therefore, although incumbent LECs are not required to combine transport and switching facilities to the extent that those elements are not already combined, incumbent LECs may not separate such facilities that are currently combined, absent an affirmative request. In addition to violating section 51.315(b) of our rules, such dismantling of network elements, absent an affirmative request, would increase the costs of requesting carriers and delay their entry into the local exchange market, without serving any apparent public benefit. We believe that such actions by an incumbent LEC would impose costs on competitive carriers that incumbent LECs would not incur, and thus would violate the requirement under section 251(c)(3) that incumbent LECs provide nondiscriminatory access to unbundled elements. Moreover, an incumbent LEC that separates shared transport facilities that are already connected to a switch would likely disrupt service to its own customers served by the switch because, by definition, the shared transport links are also used by the incumbent LEC to serve its customers. Thus, incumbent LECs would seem to have no network-related reason to separate network elements that it already combines absent a request.

45. We likewise reject Ameritech's contention that purchasing access to the switch as a network element does not entitle a carrier to use the routing table located in that switch.[115] According to Ameritech, vendors provide switches that are capable of acting on routing instructions, but the switch itself does not include routing instructions; those instructions are added by the carrier after it purchases the switch from the vendor and are contained in a routing table resident in the switch. Ameritech asserts that its routing tables are proprietary products, and "are not a feature of the switch."[116] In the *Local Competition Order*, we

---

[112] *Iowa Utilities Bd.* at *25. *See also* 47 C.F.R. § 51.315(c)-(f) (vacated rules).

[113] *Iowa Utilities Bd.* at *28.

[114] 47 C.F.R. § 51.315(b).

[115] Gebhardt Supplemental Rebuttal Testimony at 6-7.

[116] Gebhardt Supplemental Rebuttal Testimony at 6-7.

determined that "we should not identify elements in rigid terms, but rather by function."[117] Routing is a critical and inseverable function of the local switch. One of the most essential features a switch performs is to provide routing information that sends a call to the appropriate destination. We find no support in the statute, the *Local Competition Order*, or our rules for Ameritech's assertion that the switch, as a network element, does not include access to the functionality provided by an incumbent LEC's routing table. In fact, the only question addressed in the *Local Competition Order* was whether requesting carriers could obtain *customized* routing, that is, routing different from the incumbent LEC's existing routing arrangements.[118]

46. We further find that access to unbundled switching is not necessarily limited to the product the incumbent LEC originally purchased from a vendor. As we noted in the *Local Competition Order*, incumbent LECs may in some instances be required to modify or condition a network element to accommodate a request under section 251(c)(3).[119] Moreover, we held that unbundled local switching includes access to the vertical features of the switch, regardless of whether the vertical features were included in the switch when it was purchased, or whether the vertical features were purchased separately from the vendor or developed by the incumbent.[120] We held that network elements include physical facilities "as well as logical features, functions, and capabilities that are provided by, *for example, software located in a physical facility such as a switch*."[121] We also note that the Eighth Circuit affirmed the Commission's interpretation of the Act's definition of "network elements." The court stated that "the Act's definition of network elements is not limited to only the physical components of a network that are directly used to transmit a phone call from point A to point B" and that the Act's definition explicitly made reference to "databases, signaling systems, and information sufficient for billing and collection."[122] Thus, just as databases and signaling systems may include software created by the incumbent LEC, which must be made available to competitive carriers purchasing those elements on an unbundled basis, we believe that the

---

[117] *Local Competition Order*, 11 FCC Rcd at 15631-32, para. 259.

[118] *Local Competition Order*, 11 FCC Rcd at 15709, para. 418. We concluded that incumbent LECs must offer customized routing unless they prove to the state commission that doing so would not be technically feasible in a particular switch.

[119] *See, e.g., Local Competition Order*, 11 FCC Rcd at 15692, para. 382. This determination was specifically "endorsed" by the Eighth Circuit. *Iowa Utilities Bd.* at *32, n.33. *See also* 47 C.F.R. § 51.307.

[120] *See generally Local Competition Order*, 11 FCC Rcd at 15706, para. 412. *See also* 47 C.F.R. § 51.319(c)(1)(i)(C).

[121] *Local Competition Order*, 11 FCC Rcd at 15632, para. 260 (emphasis added).

[122] *Iowa Utilities Bd.* at *20.

routing table created by the incumbent LEC that is resident in the switch must be made available to requesting carriers purchasing unbundled switching. Finally, we note that Ameritech is the only incumbent LEC that has argued in this record that the routing table is not included in the unbundled local switching element. Other incumbent LECs have stated that they offer shared transport in conjunction with unbundled local switching.[123] This suggests that other incumbent LECs recognize that the routing table is a feature, function, or capability of the switch.

47. We also disagree with Ameritech's and BellSouth's argument that defining the unbundled network element shared transport as all transport links between any two incumbent LEC switches would be inconsistent with Congress's intention to distinguish between resale services and unbundled network elements. Section 251(c)(3) requires incumbent LECs to make available unbundled network elements at cost-based rates; sections 251(c)(4) and 252(d)(3) require incumbent LECs to make available for resale, at retail price less avoided costs, services the incumbent LEC offers to retail users. In the *Local Competition Order*, we held that a key distinction between section 251(c)(3) and section 251(c)(4) is that a requesting carrier that obtains access to unbundled network elements faces greater risk than a requesting carrier that only offers services for resale.[124] A requesting carrier that takes a network element dedicated to that carrier, and recovered on a flat-rated basis, must pay for the cost of the entire element, regardless of whether the carrier has sufficient demand for the services that the element is able to provide. The carrier thus is not guaranteed that it will recoup the costs of the element. By contrast, a carrier that uses the resale provision will not bear the risk of paying for services for which it does not have customers.[125] In particular, a requesting carrier that takes an unbundled local switch must pay for all of the vertical features included in the switch, even if it is unable to sell those vertical features to end user customers.[126] Requesting carriers that purchase shared transport as a network element to provide local exchange service must also take local switching, for the practical reasons set forth herein, and consequently will be forced to assume the risk associated with switching.[127]

---

[123] *See* n.77 *supra*.

[124] *Local Competition Order*, 11 FCC Rcd at 15668-69, para. 334.

[125] *Iowa Utilities Bd.* at *26-27.

[126] *Local Competition Order*, 11 FCC Rcd at 15707-08, para. 414.

[127] A requesting carrier that uses its own self-provisioned local switches, rather than unbundled local switches obtained from an incumbent LEC, to provide local exchange and exchange access service would use dedicated transport facilities to carry traffic between its network and the incumbent LEC's network. Thus, the only carrier that would need shared transport facilities would one that was using an unbundled local switch.

48. BellSouth's arguement. that assessing a usage-sensitive rate for shared transport would be inconsistent with the 1996 Act because it would not reflect the manner in which costs are incurred. is similarly unpersuasive. BellSouth's argument is premised on the assumption that incumbent LECs would be required to provide shared transport over facilities between the tandem switch and the serving wire center. In this order, however, we make clear that incumbent LECs are required to provide transport on a dedicated, but not on a shared basis, over transport facilities between the incumbent LEC's tandem and the serving wire center. Thus, BellSouth's concern is misplaced.

49. We also find that there is no element in the incumbent LEC's network that is an equivalent substitute for the routing table. We agree with Ameritech that requesting carriers could duplicate the shared transport network by purchasing dedicated facilities. But in that instance, requesting carriers would be forced to develop their own routing instructions, and would not be utilizing a portion of the incumbent LEC's network to substitute for the routing table. In the *Local Competition Order*, we specifically rejected the suggestion that an incumbent LEC is not required to provide a network element if a requesting carrier could obtain the element from a source other than the incumbent LEC.[128] The Eighth Circuit affirmed the Commission's conclusion.[129]

50. Furthermore, we find that, at this stage of competitive entry, limiting shared transport to dedicated transport facilities, as Ameritech suggests, would impose unnecessary costs on new entrants without any corresponding, direct benefits. AT&T and Ameritech have both presented evidence regarding the costs of dedicated transport facilities linking every end office and tandem in a incumbent LEC's network as significant relative to the cost of "shared transport.". For example, AT&T contends that the cost is $.041767 per minute for dedicated transport plus associated non-recurring charges (NRCs).[130] AT&T claims that Ameritech would charge a total of $5008.58 per DS1 (including administrative charges and connection charges) and $58,552.87 per switch (including customized routing and billing development).[131] AT&T argues that this compares with $.000776 per minute for unbundled shared transport.[132]

---

[128] *Local Competition Order*, 11 FCC Rcd at 15643-44, paras. 286-87. We found that requiring incumbent LECs to provide an element only where it is unavailable from any other source would nullify section 251(c)(3) because any new entrant, theoretically, could duplicate the incumbent LEC's entire network. Congress recognized that such duplication could delay entry and might be inefficient.

[129] *Iowa Utilities Bd.* at *22.

[130] Letter from Bruce Cox, Government Affairs Director, AT&T, to William F. Caton, Acting Secretary, FCC, March 20, 1997 (AT&T Mar. 20 *Ex Parte*).

[131] AT&T Mar. 20 *Ex Parte*.

[132] AT&T Mar. 20 *Ex Parte*.

Ameritech, on the other hand, contends the use of tandem routed dedicated facilities cost is $.0031148 per minute plus associated NRCs.[133] Ameritech claims that the nonrecurring charges per DS1 are $2769.27 (including administrative charges per order). Ameritech states that other NRCs include two trunk port connection charges ($770.29 initial, $29.16 subsequent), service ordering charge per occasion ($398.72 initial, $17.37 subsequent), billing development charge per switch ($35,328.87), custom routing charge, per line class code per switch ($232.24), and a service order charge ($398.73).[134] Nevertheless, under either AT&T's or Ameritech's cost calculations for dedicated transport, we conclude that the relative costs of dedicated transport, including the associated NRCs, is an unnecessary barrier to entry for competing carriers.

51. We also find that limiting shared transport to dedicated facilities, as defined by Ameritech, would be unduly burdensome for new entrants. First, we agree with MCI, AT&T, et al., that a new entrant may not have sufficient traffic volumes to justify the cost of dedicated transport facilities.[135] Second, a new entrant entering the local market with smaller traffic volumes would have to maintain greater excess capacity relative to the incumbent LEC in order to provide the same level of service quality (i.e., same level of successful call attempts) as the incumbent LEC.[136] As a new entrant gains market share and increased traffic volumes for local service, however, the relative amount of excess capacity necessary to prevent blocking should decrease. We do not rule out the possibility, therefore, that, once new entrants have had a fair opportunity to enter the market and compete, we might reconsider incumbent LECs' obligations to provide access to the routing table.[137]

52. As discussed above, requesting carriers may use shared transport to provide exchange access service to customers for whom they also provide local exchange service.

---

[133] Letter from James K. Smith, Director Federal Relations, Ameritech, to William F. Caton, Acting Secretary, FCC, Mar. 28, 1997 (Ameritech Mar. 28 *Ex Parte*).

[134] Ameritech Mar. 28 *Ex Parte*.

[135] *See* n. 53 *supra*.

[136] *See* William W. Sharkey, *The Theory of Natural Monopoly* 184-85, (1982) ("that for a given number of circuits the economies [of scale] are more pronounced at higher grades of service (lower blocking probability). The economics of scale, however, decline substantially as the number of circuits increases. *Therefore for small demands a fragmentation of the network could result in a significant cost penalty, because more circuits would be required to maintain the same grade of service. At larger demands the costs of fragmentation are less pronounced.*") (emphasis added).

[137] As we held in the *Local Competition Order*, "the plain language of section 251(d)(2), and the standards articulated there, give us the discretion to limit the general obligation imposed by section 251(c)(3), but they do not require us to do so." *Local Competition Order*, 11 FCC Rcd at 15643-44, para. 286.

Several competing carriers contend that an interexchange carrier (IXC) has the right to select a requesting carrier that has purchased unbundled shared transport to provide exchange access service.[138] The carriers further contend that, if the IXC selects a requesting carrier, rather than the incumbent LEC, as the exchange access provider, the competing carrier is entitled to bill the IXC for the access services associated with shared transport. We find that a requesting carrier may use shared transport facilities to provide exchange access service to originate or terminate traffic to its local exchange customers, regardless of whether the requesting carrier or another carrier is the IXC for that traffic. We further conclude that a requesting carrier that provides exchange access service to another carrier is entitled to assess access charges associated with the shared transport facilities used to transport the traffic. We believe that this necessarily follows from our decision in the *Local Competition Order*[139] where we stated that:

> [W]here new entrants purchase access to unbundled network elements to provide exchange access services, whether or not they are also offering toll services through such elements, the new entrants may assess exchange access charges to IXCs originating or terminating toll calls on those elements. In these circumstances, incumbent LECs may not assess exchange access charges to IXCs because the new entrants, rather than the incumbents, will be providing exchange access services . . . .[140]

We therefore find that requesting carriers that provide exchange access using shared transport facilities to originate and terminate local exchange calls may also use those same facilities to provide exchange access service to the same customers to whom the requesting carrier is providing local exchange service. Requesting carriers are then entitled to assess access charges to interexchange carriers that use the shared transport facilities to originate and terminate traffic to the requesting carrier's customers.

---

[138] Letter from Bruce D. Cox, Government Affairs Vice President for AT&T, to William F. Caton, Acting Secretary, FCC, July 11, 1997; WorldCom June 27 *Ex Parte*.

[139] In the *Local Competition Order*, we adopted a limited, transitional plan to address public policy concerns raised by the potential for requesting carriers to bypass access charges through the use of unbundled network elements. *See Local Competition Order* at 15862-69, paras. 716-32. Our authority to adopt that interim plan generally was upheld in *Competitive Telecommunications Association v. FCC*, although the court noted that the Commission lacks authority to decide whether carriers are obligated to continue to pay intrastate access charges. *Competitive Telecommunications Association v. FCC*, 1997 WL 352284 (8th Cir. June 27, 1997) at *6, n.5. Outside the scope of that transitional plan, however, we held that parties that use network elements to provide interexchange or exchange access services are not required to pay access charges. *Local Competition Order*, 11 FCC Rcd at 15682, para. 363; *Access Charge Reform Order* at paras. 339-340.

[140] *Local Competition Order*, 11 FCC Rcd at 15682, para. 363 n.772.

E. Final Regulatory Flexibility Analysis

53. As required by the Regulatory Flexibility Act (RFA),[141] the Commission issued a Final Regulatory Flexibility Analysis (FRFA) in its *Local Competition Order* in this proceeding.[142] None of the petitions for reconsideration filed in Docket No. 96-98 specifically address, or seek reconsideration of, that FRFA. This present Supplemental Final Regulatory Flexibility Analysis addresses the potential effect on small entities of the rules adopted pursuant to the *Third Order on Reconsideration* in this proceeding, *supra*. This Supplemental FRFA incorporates and adds to our FRFA.

54. *Need for and Objectives of this Third Order on Reconsideration and the Rules Adopted Herein.* The need for and objectives of the rules adopted in this *Third Order on Reconsideration* are the same as those discussed in the *Local Competition Order*'s FRFA "Summary Analysis of Section V Access to Unbundled Network Elements."[143] In general, our rules adopted in Section V were intended to facilitate the statutory requirement that incumbent local exchange carriers (LECs) are required to provide nondiscriminatory access to unbundled network elements.[144] In this *Third Order on Reconsideration*, we grant in part and deny in part the petitions filed for reconsideration and/or clarification of the *Local Competition Order*, in order to further the same needs and objectives. We conclude that the duty of incumbent LECs to provide access to unbundled network elements also includes the provision of "shared transport" as an unbundled network element between end offices, even if tandem switching is not used to route the traffic. We also hold that the term "shared transport" refers to all transmission facilities connecting an incumbent LEC's switches -- that is, between end office switches, between an end office switch and a tandem switch, and between tandem switches. We conclude that incumbent LECs are obligated under Section 251(d)(2) of the Communications Act of 1934, as amended, 47 U.S.C. § 251(d)(2), to provide access to both their interoffice transmission facilities and their routing tables contained in the incumbent LEC's switches. Finally, we conclude that a requesting carrier may use the shared transport unbundled element to provide exchange access service to customers for whom the carrier provides local exchange service.

---

[141] *See* 5 U.S.C. § 604. The RFA, *see* 5 U.S.C. § 601 et seq., has been amended by the Contract With America Advancement Act of 1996, Pub. L. No. 104-121, 110 Stat. 847 (1996) (CWAAA). Title II of the CWAAA is the Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA).

[142] *Local Competition Order*, 11 FCC Rcd at 16143-80, paras. 1324-441.

[143] *Local Competition Order* at 16161, paras. 1374-1383.

[144] *Local Competition Order* at 16161, para. 1374.

55. *Description and Estimate of the Number of Small Entities To Which the Rules Will Apply.* In determining the small entities affected by our *Third Order on Reconsideration* for purposes of this Supplemental FRFA, we adopt the analysis and definitions set forth in the FRFA in our *Local Competition Order*.[145] The RFA directs the Commission to provide a description of and, where feasible, an estimate of the number of small entities that might be affected by the rules we have adopted. The RFA defines the term "small entity" as having the same meaning as the terms "small business," "small organization," and "small business concern" under Section 3 of the Small Business Act.[146] A small business concern is one which: (1) is independently owned and operated; (2) is not dominant in its field of operation; and (3) satisfies any additional criteria established by the Small Business Administration (SBA).[147] The SBA has defined a small business for Standard Industrial Classification (SIC) categories 4812 (Radiotelephone Communications) and 4813 (Telephone Communications, Except Radiotelephone) to be an entity with no more than 1,500 employees.[148] Consistent with our FRFA and prior practice, we here exclude small incumbent local exchange carriers (LECs) from the definition of "small entity" and "small business concern."[149] While such a company may have 1500 or fewer employees and thus fall within the SBA's definition of a small telecommunications entity, such companies are either dominant in their field of operations or are not independently owned and operated. Out of an abundance of caution, however, for regulatory flexibility analysis purposes, we will consider small incumbent LECs within this present analysis and use the term "small incumbent LECs" to refer to any incumbent LEC that arguably might be defined by SBA as a small business concern.

56. In addition, for purposes of this Supplemental FRFA, we adopt the FRFA estimates of the numbers of telephone companies, incumbent LECs, and competitive access providers (CAPs) that might be affected by the *Local Competition Order*. In the FRFA, we determined that it was reasonable to conclude that fewer than 3,497 telephone service firms are small entity telephone service firms or small incumbent LECs that might be affected.[150] We further estimated that there are fewer than 1,347 small incumbent LECs that might be

---

[145] *See Local Competition Order* at 16149-57, paras. 1341-60.

[146] *See* 5 U.S.C. § 601(3) (incorporating by reference the definition of "small business concern" in 5 U.S.C. § 632). The Commission may also develop additional definitions that are appropriate to its activities.

[147] 15 U.S.C. § 632.

[148] *Id.* (*citing* 13 C.F.R. § 121.201).

[149] *See Local Competition Order*, 11 FCC Rcd at 16150, para. 1342.

[150] *Local Competition Order* at 16150, para. 1343.

affected.[151] Finally, we estimated that there were fewer than 30 small entity CAPs that would qualify as small business concerns.[152]

57. *Summary of Projected Reporting, Recordkeeping and Other Compliance Requirements.* As a result of the rules adopted in the *Third Order on Reconsideration*, we require incumbent LECs to provide requesting carriers with access to the same shared transport for all transmission facilities connecting incumbent LECs' switches. No party to this proceeding has suggested that changes in the rules relating to access to unbundled network elements would affect small entities or small incumbent LECs. We determine that complying with this rule may require use of engineering, technical, operational, accounting, billing, and legal skills. For example, a new entrant may be required to combine its own interoffice facilities with those of the incumbent LEC, or be required to combine purchased unbundled network elements into a package unique to its own needs.

58. *Steps Taken to Minimize Significant Economic Impact on Small Entities, and Alternatives Considered.* As stated in our FRFA, we determined that our decision to establish minimum national requirements for unbundled elements should facilitate negotiations and reduce regulatory burdens and uncertainty for all parties, including small entities and small incumbent LECs.[153] National requirements for unbundling may allow new entrants, including small entities, to take advantage of economies of scale in network design, which may minimize the economic impact of our decision in the *Local Competition Order*. As stated above, no petitioner has challenged this finding. We further find that our new rules, which clarify the definition of "shared transport," will likely ensure that small entities obtain the unbundled elements that they request.

59. **Report to Congress**: The Commission will send a copy of the *Third Order on Reconsideration*, including this Supplemental FRFA, in a report to be sent to Congress pursuant to the Small Business Regulatory Enforcement Fairness Act of 1996, *see* 5 U.S.C. § 801(a)(1)(A). A copy of the *Third Order on Reconsideration* and this supplemental FRFA (or summary thereof) will also be published in the Federal Register, *see* 5 U.S.C. § 604(b), and will be sent to the Chief Counsel for Advocacy of the Small Business Administration.

IV. FURTHER NOTICE OF PROPOSED RULEMAKING

A. Discussion

[151] *Local Competition Order* at 16151, para. 1345.

[152] *Local Competition Order* at 16151, para. 1347.

[153] *Local Competition Order* at 16162, para 1376.

60. In the *Local Competition Order*, we did not condition use of network elements on the requesting carrier's provision of local exchange service to the end-user customer. We recognized, however, that, as a practical matter, a requesting carrier using certain network elements would be unlikely to obtain customers unless it offered local exchange service as well as exchange access service over those network elements. In particular, we found that local loops are dedicated to the premises of a particular customer.[154] Therefore, we stated that a requesting carrier would need to provide all services requested by the customer to whom the local loops are dedicated, and that, as a practical matter, requesting carriers usually would need to provide local exchange service over any unbundled local loops that it purchases under section 251(c)(3).[155] We similarly held in our *Order on Reconsideration* that the unbundled switch, as defined in the *Local Competition Order*, includes the line card, which is typically dedicated to a particular customer. We concluded that:

> Thus, a carrier that purchases the unbundled switching element to serve an end user effectively obtains the exclusive right to provide all features, functions, and capabilities of the switch, including switching for exchange access and local exchange service, for that end user. A practical consequence of this determination is that the carrier that purchases the local switching element is likely to provide all available services requested by the customer served by that switching element, including switching for local exchange and exchange access.[156]

61. Neither of the petitions for reconsideration expressly asked the Commission to determine whether requesting carriers may purchase shared transport facilities under section 251(c)(3) of the Act to originate or terminate interexchange traffic to customers to whom the requesting carrier does not provide local exchange service.[157] Moreover, the oppositions and replies to the two petitions for reconsideration, as well as the *ex partes*, focused on the issue of whether requesting carriers may use unbundled shared transport facilities, in conjunction

---

[154] *Local Competition Order*, 11 FCC Rcd at 15679, para. 357.

[155] *Local Competition Order*, 11 FCC Rcd at 15679, para. 357.

[156] *Order on Reconsideration*, 11 FCC Rcd at 13048, para. 11.

[157] *See, e.g.*, WorldCom Petition at 6 (new local entrants may need to use shared transport facilities between end offices as well as between an end office and a tandem); WorldCom Opposition at 4 (contending that requesting carriers that purchase unbundled local switching should be able to route calls over the same facilities the incumbent LEC uses to transport its traffic); LECC Petition at 33 ("the Order requires incumbent LECs to provide unbundled access to shared transmission facilities between end offices and tandem switches . . . [t]he Commission, however, should clarify that such shared transmission facilities may be provided to a requesting carrier only in conjunction with local switching and tandem capability).

with unbundled switching, to compete in the local exchange market.[158] In fact, the issue of whether requesting carriers may purchase unbundled shared transport facilities to originate or terminate interexchange traffic to customers to whom the requesting carrier does not provide local exchange service was specifically addressed only in two recent *ex parte* submissions.[159] In order to develop a complete record on this issue, we issue this further notice of proposed rulemaking specifically asking whether requesting carriers may use unbundled dedicated or shared transport facilities in conjunction with unbundled switching, to originate or terminate interstate toll traffic to customers to whom the requesting carrier does not provide local exchange service. Absent restrictions requiring carriers to provide local exchange service in order to purchase unbundled shared or dedicated transport facilities, an IXC, for example, could request shared or dedicated transport under section 251(c)(3) for purposes of carrying originating interstate toll traffic between an incumbent LEC's end office and the IXC's point of presence (POP). Likewise, an IXC could request such transport network elements for purposes of terminating interstate toll traffic from its POP to an incumbent LEC's end office. Parties that advocate the use of transport network elements for the transmission of such access traffic should address whether that approach is consistent with our *Order on Reconsideration* regarding the use of the unbundled local switching element to provide interstate access service[160] as well as recent appellate court decisions interpreting section 251(c)(2) and (3).[161] Parties that advocate restricting the use of transport network elements should address whether such restrictions are consistent with section 251(c)(3) of the Act, which requires an incumbent LEC to provide access to unbundled network elements "for the provision of a telecommunications service." Moreover, those parties should also address the technical feasibility of requiring an IXC to identify terminating toll traffic that is destined for customers that are not local exchange customers of the incumbent LEC.

B. Procedural Matters

1. Ex Parte Presentations

[158] WorldCom April 16 *Ex Parte* (asserting that carriers that purchase unbundled local switching have the right to use incumbent LECs' interoffice transport facilities to complete local calls); AT&T Jan. 28 *Ex Parte* (noting that the Commission had held that carriers that seek to enter the local exchange market should be able to take advantage of the incumbent LEC's economies of scale); Bell Atlantic Reply at 10 (requesting carriers are entitled to purchase shared transport in conjunction with local switching to route local calls).

[159] WorldCom June 27 *Ex Parte*; NYNEX July 18 *Ex Parte*.

[160] *Order on Reconsideration*, 11 FCC Rcd at 13048-49, para. 12-13.

[161] *CompTel*, 11 F.3d at 1073-75; *Iowa Utilities Bd.* at n. 20.

62. This *Further Notice* is a permit-but-disclose notice-and-comment rulemaking proceeding. *Ex parte* presentations are permitted, in accordance with the Commission's rules, provided that they are disclosed as required.[162]

2. Initial Regulatory Flexibility Analysis

63. As required by the Regulatory Flexibility Act (RFA),[163] the Commission has prepared this present Initial Regulatory Flexibility Analysis (IRFA) of the expected significant economic impact on small entities by the policies and rules proposed in the *Further Notice of Proposed Rulemaking* (*Further Notice*). Written public comments are requested on the IRFA. These comments must be filed by the deadlines for comment on the remainder of the Further Notice, and should have a separate and distinct heading designating them as responses to the IRFA. The Commission will send a copy of the *Further Notice*, including the IRFA, to the Chief Counsel for Advocacy of the Small Business Administration (SBA) in accordance with the RFA, 5 U.S.C. § 603(a).

64. *Need for and Objectives of the Proposed Rules.* We seek comment on whether requesting carriers may use unbundled shared transport facilities in conjunction with unbundled switching, to originate or terminate interexchange traffic to customers to whom the requesting carrier does not provide local exchange service. We also seek comment on whether similar use restrictions may apply to the use of unbundled dedicated transport facilities. We propose no new rules at this time. In light of comments received in response to the *Further Notice*, we might issue new rules.

65. *Legal Basis.* The legal basis for any action that may be taken pursuant to the Further Notice is contained in Sections 1, 2, 4, 201, 202, 274, and 303(r) of the Communications Act of 1934, as amended, 47 U.S.C. §§ 151, 152, 154, 201, 202, 274, and 303(r).

66. *Description and Estimate of the Number of Small Entities That May Be Affected by the Further Notice of Proposed Rulemaking.* In determining the small entities affected by our *Further Notice* for purposes of this Supplemental FRFA, we adopt the analysis and definitions set forth in the FRFA in our *First Report and Order*.[164] The RFA directs the Commission to provide a description of and, where feasible, an estimate of the number of

---

[162] *See generally* 47 C.F.R. §§ 1.1200, 1.1202, 1.1204, 1.1206.

[163] *See* 5 U.S.C. § 603. The RFA, *see* 5 U.S.C. § 601 et seq., has been amended by the Contract With America Advancement Act of 1996, Pub. L. No. 104-121, 110 Stat. 847 (1996) (CWAAA). Title II of the CWAAA is the Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA).

[164] *Local Competition Order*, 11 FCC Rcd at 16149-57, paras. 1341-60.

small entities that might be affected by proposed rules. The RFA defines the term "small entity" as having the same meaning as the terms "small business," "small organization," and "small business concern" under Section 3 of the Small Business Act.[165] A small business concern is one which: (1) is independently owned and operated; (2) is not dominant in its field of operation; and (3) satisfies any additional criteria established by SBA.[166] The SBA has defined a small business for Standard Industrial Classification (SIC) categories 4812 (Radiotelephone Communications) and 4813 (Telephone Communications, Except Radiotelephone) to be an entity with no more than 1,500 employees.[167] Consistent with our FRFA and prior practice, we here exclude small incumbent local exchange carriers (LECs) from the definition of "small entity" and "small business concern."[168] While such a company may have 1500 or fewer employees and thus fall within the SBA's definition of a small telecommunications entity, such companies are either dominant in their field of operations or are not independently owned and operated. Out of an abundance of caution, however, for regulatory flexibility analysis purposes, we will consider small incumbent LECs within this present analysis and use the term "small incumbent LECs" to refer to any incumbent LEC that arguably might be defined by SBA as a small business concern.

67. In addition, for purposes of this IRFA, we adopt the FRFA estimates of the numbers of telephone companies, incumbent LECs, and competitive access providers (CAPs) that might be affected by the *First Report and Order*. In the FRFA, we determined that it was reasonable to conclude that fewer than 3,497 telephone service firms are small entity telephone service firms or small incumbent LECs that might be affected.[169] We further estimated that there are fewer than 1,347 small incumbent LECs that might be affected.[170] Finally, we estimated that there are fewer than 30 small entity CAPs that might qualify as small business concerns.[171]

68. *Description of Projected Reporting, Recordkeeping and Other Compliance Requirements.* It is probable that any rules issued pursuant to the *Further Notice* would not

---

[165] *See* 5 U.S.C. § 601(3) (incorporating by reference the definition of "small business concern" in 5 U.S.C. § 632). The Commission may also develop additional definitions that are appropriate to its activities.

[166] 15 U.S.C. § 632.

[167] *Id.* (*citing* 13 C.F.R. § 121.201).

[168] *See Local Competition Order*, 11 FCC Rcd at 16150, para. 1342.

[169] *Local Competition Order* at 16150, para. 1343.

[170] *Local Competition Order* at 16151, para. 1345.

[171] *Local Competition Order* at 16151-52, para. 1347.

change the projected reporting, recordkeeping, or other compliance requirements already adopted in this proceeding.[172]

69. *Steps Taken to Minimize Significant Economic Impact on Small Entities, and Alternatives Considered.* As stated in our FRFA, we determined that our decision to establish minimum national requirements for unbundled elements would likely facilitate negotiations and reduce regulatory burdens and uncertainty for all parties, including small entities and small incumbent LECs.[173] National requirements for unbundling may allow new entrants, including small entities, to take advantage of economies of scale in network design, which may minimize the economic impact of our decision in the *First Report and Order*. This finding has not been challenged. We do not believe that any rules that may be issued pursuant to the *Further Notice* will change this finding. We seek comment on this tentative conclusion.

70. *Federal Rules that May Duplicate, Overlap, or Conflict with the Proposed Rules.* None.

3. Comment Filing Procedures

71. Pursuant to applicable procedures set forth in Sections 1.415 and 1.419 of the Commission's rules, 47 C.F.R. §§ 1.415, 1.419, interested parties may file comments on or before October 2, 1997, and reply comments on or before October 17, 1997. To file formally in this proceeding, you must file an original and six copies of all comments, reply comments, and supporting comments. If you want each Commissioner to receive a personal copy of your comments, you must file an original and eleven copies. Comments and reply comments should be sent to the Office of the Secretary, Federal Communications Commission, 1919 M Street, N.W., Room 222, Washington, D.C., 20554, with a copy to Janice Myles of the Common Carrier Bureau, 1919 M Street, N.W., Room 544, Washington, D.C., 20554. Parties should also file one copy of any documents filed in this docket with the Commission's copy contractor, International Transcription Services, Inc., 1231 20th Street, N.W., Washington, D.C., 20036. Comments and reply comments will be available for public inspection during regular business hours in the FCC Reference Center, 1919 M Street, N.W., Room 239, Washington, D.C., 20554.

72. Comments and reply comments must include a short and concise summary of the substantive arguments raised in the pleading. Comments and reply comments must also

---

[172] *See, e.g., Local Competition Order* at 16161-62, paras. 1374-1375.

[173] *Local Competition Order*, 11 FCC Rcd at 16162, para 1376.

comply with Section 1.49 and all other applicable sections of the Commission's Rules.[174] We also direct all interested parties to include the name of the filing party and the date of the filing on each page of their comments and reply comments. All parties are encouraged to utilize a table of contents, regardless of the length of their submission.

73. Parties are also asked to submit comments and reply comments on diskette. Such diskette submissions would be in addition to, and not a substitute for, the formal filing requirements addressed above. Parties submitting diskettes should submit them to Janice Myles of the Common Carrier Bureau, 1919 M Street, N.W., Room 544, Washington, D.C., 20554. Such a submission should be on a 3.5 inch diskette formatted in an IBM compatible form using MS DOS 5.0 and WordPerfect 5.1 software. The diskette should be submitted in "read only" mode. The diskette should be clearly labelled with the party's name, proceeding, type of pleading (comment or reply comments) and date of submission. The diskette should be accompanied by a cover letter.

74. In addition to filing comments with the Secretary, a copy of any comments on the information collections contained herein should be submitted to Judy Boley, Federal Communications Commission, Room 234, 1919 M Street, N.W., Washington, D.C., 20554, or via the Internet to jboley@fcc.gov, and to Timothy Fain, OMB Desk Officer, 10236 NEOB, 725 - 17th Street, N.W., Washington, D.C., 20503 or via the Internet to fain_t@al.eop.gov.

V. ORDERING CLAUSES

75. Accordingly, IT IS ORDERED that, pursuant to sections 1-4, 201-205, 214, 251, 252, and 303(r) of the Communications Act of 1934, as amended, 47 U.S.C. §§ 151-154, 201-205, 214, 251, 252, and 303(r), the Third Order on Reconsideration is ADOPTED.

76. IT IS FURTHER ORDERED that changes adopted on reconsideration in section III.B. and the rule appendix will be effective 30 days after publication in the Federal Register.

77. IT IS FURTHER ORDERED, pursuant to section 405 of the Communications Act of 1934, as amended, 47 U.S.C. § 405, and section 1.106 of the Commission's rules, 47 C.F.R. § 1.106 (1995), that the petitions for reconsideration filed by WorldCom, Inc. and the Local Exchange Carriers Coalition are DENIED IN PART and GRANTED IN PART to the extent indicated above.

---

[174] *See* 47 C.F.R. § 1.49. However, we require here that a summary be included with all comments and reply comments, regardless of length. This summary may be paginated separately from the rest of the pleading (*e.g.*, as "i, ii").

78. IT IS FURTHER ORDERED, that the Commission SHALL SEND a copy of this Third Order on Reconsideration and Further Notice of Proposed Rulemaking, including the associated Supplemental Final Regulatory Flexibility Analysis and Initial Regulatory Flexibility Analysis, to the Chief Counsel for Advocacy of the Small Business Administration.

79. IT IS FURTHER ORDERED that pursuant to sections 1, 2, 4, 201, 202, 274 and 303(r) of the Communications Act of 1934, as amended, 47 U.S.C. §§ 151, 152, 154, 201, 202, 274, and 303(r), the FURTHER NOTICE OF PROPOSED RULEMAKING IS ADOPTED.

FEDERAL COMMUNICATIONS COMMISSION

William F. Caton
Acting Secretary

Appendix A

Final Rules

Part 51--INTERCONNECTION

1. The authority citation for part 51 continues to read as follows:

Authority: Sections 1-5, 7, 201-05, 218,l 225-27, 251-54, 271, 48 Stat. 1070, as amended, 1077; 47 U.S.C. 151-55, 157, 201-05, 218, 225-27, 251-54, 271, unless otherwise noted.

2. Paragraph (d)(1) of Section 51.319 is revised to read as follows:

§ 51.319 Specific unbundling requirements.

•••••

(d) *Interoffice Transmission Facilities*.

(1) Interoffice transmission facilities include:

(i) Dedicated transport, defined as incumbent LEC transmission facilities dedicated to a particular customer or carrier that provide telecommunications between wire centers owned by incumbent LECs or requesting telecommunications carriers, or between switches owned by incumbent LECs or requesting telecommunications carriers;

(ii) Shared transport, defined as transmission facilities shared by more than one carrier, including the incumbent LEC, between end office switches, between end office switches and tandem switches, and between tandem switches, in the incumbent LEC's network;

3. Section 51.515 is revised to read as follows:

§ 51.515 Application of access charges.

(d) Interstate access charges described in part 69 shall not be assessed by incumbent LECs on each element purchased by requesting carriers providing both telephone exchange and exchange access services to such requesting carriers' end users.

SEPARATE STATEMENT OF CHAIRMAN REED HUNDT

RE: Implementation of the Local Competition Provisions of the Telecommunications Act of 1996; Third Order on Reconsideration and Further Notice of Proposed Rulemaking

The Commission today reaffirms and clarifies a very important aspect of our Local Competition Order: the ability of a competitive local exchange carrier to obtain transport on a shared basis from the incumbent local exchange carrier. More fundamentally, this decision highlights the importance we place on incumbents making available to new entrants their network elements on a combined basis -- a combination sometimes referred to as the UNE platform.

In the Telecommunications Act of 1996, Congress mandated that new entrants into the formerly monopolized local exchange market have the ability to choose any or all of three entry strategies: interconnection, resale and unbundled network elements. Congress correctly foresaw that new entrants would need these flexible strategies if they are to compete successfully with the incumbents and their extraordinary economies of scale and scope.

In its decision last month, the Eighth Circuit explicitly affirmed our authority under the Act to define unbundled network elements. This is a very important aspect of our local competition policies. Where the purpose or effect of moves by an incumbent LEC to break apart currently combined elements is to create a barrier to competition, we will take action to tear down or prevent the erection of such barriers.

SUPREME COURT, U.S.

On Petitions for Writ of Certiorari
to the United States Court of Appeals
for the Eighth Circuit

OPPOSITION OF THE REGIONAL BELL COMPANIES AND GTE TO MOTIONS TO EXPEDITE CONSIDERATION OF PETITIONS FOR CERTIORARI

Respondents Ameritech Corporation, Bell Atlantic Corporation, BellSouth Corporation, SBC Communications Inc., U S WEST, Inc., and GTE Entities ("respondents") respectfully oppose the motions of the FCC and AT&T et al. ("AT&T") to expedite consideration of the petitions for certiorari.

Respondents address this opposition primarily to the request that the Court depart from its normal procedures in order to act on a group of related petitions at the Court's conference on January 23, 1998. AT&T's alternative request for accelerated merits briefing is obviously premature. If the Court were to deny certiorari, the issue would be moot. And if the Court were

15pp

to grant certiorari on one or more questions, only then would it be in a position effectively to judge whether the question or questions to be reviewed could be manageably briefed, argued, and decided this Term.

The pending petitions and conditional cross-petitions, and any additional timely petitions and cross-petitions that may be filed in the coming days, should be decided after full briefing by all parties. Indeed, for the reasons set forth below, it is difficult to imagine a case less well suited to rushed decision.

1. The time for filing petitions or cross-petitions for certiorari from the Eighth Circuit's decision in Iowa Utilities Board v. FCC does not expire until 90 days from the court of appeals' order on rehearing entered October 14, 1997: that is, on January 12, 1998. 28 U.S.C. § 2101(c); Sup. Ct. R. 13. The six petitions and conditional cross-petitions filed to date have already generated hundreds of pages of briefs addressing complicated -- and, in some cases, highly technical -- questions arising from a 700-page administrative order.

AT&T and the FCC nevertheless propose expedited consideration of all petitions and cross-petitions before they can even know what that would entail. Well over 100 entities, including a score of state regulatory commissions as well as interest groups and telecommunications industry participants of all description, were parties to the proceedings below. As

matters now stand, no one can say how many petitions there ultimately will be, what issues the petitions and cross-petitions will present, or how many responses and replies will be filed.

What is certain is that AT&T and the FCC would deny numerous parties important rights afforded under this Court's Rules. For example, the time for parties to respond to the Regional Bell Companies' conditional cross-petition will not expire until January 23, 1998. The time for parties to respond to the conditional cross-petition of GTE Midwest Incorporated will not expire until January 28, 1998. The cross-petitioners would then have a right to file timely replies under the Court's usual procedures. Sup. Ct. R. 15.5, 15.6.

Under AT&T's and the FCC's proposal, however, parties who wish to respond to these cross-petitions would be denied their full opportunity to do so. (In fact, counsel for respondents understand from discussions with counsel for certain state commissions that the States will soon consult among themselves to determine whether and how to respond to the cross-petitions.) If these parties did accelerate preparation of their responses to file just before the January 23 conference, the cross-petitioners would then be denied an opportunity to reply. In their haste for a hearing on their own petitions, AT&T and the FCC would have the Court disregard the legitimate interests of dozens of other parties to the case below, on all sides of the issues.

2. AT&T and the FCC suggest that compromising numerous other parties' rights is appropriate because respondents supposedly "withheld" or "postponed" filing their cross-petitions. AT&T Motion at 3, 8; FCC Motion at 6. The assertion is baseless. We will let the facts speak for themselves.

On December 18, 1997 -- within 30 days of being bombarded with four separate petitions -- all five Regional Bell Companies filed a single opposition to all four petitions. On the same day, GTE likewise filed its opposition to all four petitions. Although a request for additional time might well have been justified under the circumstances, respondents did not seek an extension.

Respondents then filed their cross-petitions weeks before they were due. On December 24, 1997 -- nearly three weeks before the deadline and just six days after filing their opposition -- the Regional Bell Companies filed a conditional cross-petition (No. 97-1075). On December 30, 1997 -- nearly two weeks before the deadline -- GTE Midwest filed its conditional cross-petition (No. 97-1087).[1] Each cross-petition was filed as soon as it was ready.

---

[1] Respondent U S WEST, Inc. will file today a conditional cross-petition. U S WEST has moved with dispatch to prepare this cross-petition and accordingly will file a week before the deadline. To avoid any needless delay, moreover, it will make clear in its transmittal letter to the Clerk that it will not object if other parties wish to treat their responses to other cross-petitions as responses to U S WEST's cross-petition.

AT&T and the FCC fault respondents for violating a rule of their own imagining, which would require filing cross-petitions on the same day as briefs in opposition. AT&T Motion at 3, 8; FCC Motion at 6. There is no such rule. See Sup. Ct. R. 13.4 (time for filing cross-petitions). Nor could anyone suggest that these cross-petitions were unwarranted: In their responses to the cross-petitions, AT&T and the FCC have both agreed that, if their own petitions are granted, the conditional cross-petitions should be granted in large part as well.

3. Efforts to fault respondents' timely -- indeed, early -- filings are especially inappropriate given that neither AT&T nor the FCC did what they could have done to ensure expedited consideration of their petitions. The Eighth Circuit issued its decision in this case on July 18, 1997. Among other things, that decision resolved the jurisdictional issue on which AT&T and the FCC principally focus in their petitions for certiorari. Because no party sought rehearing with respect to the court's jurisdictional ruling, AT&T and the FCC had ample time to prepare their petitions for certiorari on that issue well before the Eighth Circuit issued its order on rehearing in October.

The other issues raised by AT&T and the FCC do not explain their delay in filing petitions for certiorari. The Eighth Circuit's order on rehearing did not amend that court's prior ruling with respect to the FCC's "pick and choose" rule. See

Regional Bell Company Conditional Cross-Pet. 9-12 (discussing rehearing decision). Although the court of appeals did address FCC Rule 51.315(b) on rehearing, AT&T and the FCC simply repeat in their petitions for certiorari the same arguments they presented to the Eighth Circuit in their responses to the rehearing petitions.

All but a paragraph of the Eighth Circuit's final decision was available to AT&T and the FCC on July 18. If they had been truly intent on doing "everything within their power" (AT&T Motion at 7) to secure this Court's consideration of their petitions in January, AT&T and the FCC would have filed their petitions within days after the court of appeals' October 14 order on rehearing. Likewise, they would have made their request for expedited scheduling at the time they filed their petitions. Instead, AT&T and the FCC waited nearly five weeks after the rehearing decision before filing their petitions for certiorari. See AT&T Motion at 8 n.4. And even then, they did not submit their motions to expedite until six weeks after that. Having chosen to proceed at that pace, neither AT&T nor the FCC can fairly expect this Court to compensate for their delay by short-circuiting its own procedures to the detriment of other parties.

4. Movants' new-found interest in hurrying the Court's deliberations is particularly curious in light of the Eighth Circuit's recent order scheduling oral argument on January 15,

1998, to consider petitions filed by some 33 state commissions, the Regional Bell Companies, GTE, and others to enforce the court's mandate. These petitions argue that the FCC has continued improperly to assert jurisdiction over local pricing matters in violation of the court of appeals' ruling. When it addresses these petitions, the Eighth Circuit may well elaborate on the limits of federal jurisdiction in the pricing area.

Any such elaboration would assist the Court's consideration of the certiorari petitions, particularly because interpretation of the court of appeals' ruling is a matter of dispute between the parties. Compare, e.g., AT&T Pet. 13-16 (claiming that jurisdictional ruling turned on section 2(b) of the Communications Act of 1934), with GTE Opp. 15-21 (explaining that ruling rested on plain language of 1996 Act). Rushing to act on the petitions and cross-petitions shortly before such assistance would be offered would not serve the interests of sound decisionmaking.

5. In attempting to manufacture a reason for granting certiorari, AT&T has alleged that the decision below "squarely conflicts" with a recent D.C. Circuit decision interpreting different provisions of the Telecommunications Act of 1996. See AT&T Pet. 20. There is no conflict between these appellate decisions. See Regional Bell Company Opp. 17 n.8. As it happens, however, the supposedly conflicting decision is itself

the subject of a recent certiorari petition filed by two state agencies. Virginia State Corp. Comm'n, et al. v. FCC, No. 97-1072 (filed Dec. 29, 1997). That petition will be on essentially the same timetable as this case if the Court holds to its customary procedures. This Court's consideration of the statutory provisions at issue in that case -- particularly when contrasted with those on which petitioners rely in this case -- will demonstrate vividly that Congress, in crafting the 1996 Act, knew precisely how to give the FCC intrastate jurisdiction when it wanted to do so. There is thus good reason not to disrupt a schedule that would allow the Court to consider these two cases concurrently.

6. AT&T and the FCC argue that the issues they present are of such pressing national importance that the petitions should be moved to the front of the Court's queue. These claims ring hollow. The same parties presented nearly identical arguments more than 14 months ago in three separate applications to vacate the Eighth Circuit's interim stay of the FCC's pricing rules. They there trumpeted the same dire warnings that they echo here. All three applications to vacate the stay were denied (initially by Justice Thomas, and subsequently by the full Court after referral by Justices Stevens and Ginsburg). See 117 S. Ct. 378 (1996); 117 S. Ct. 379 (1996); 117 S. Ct. 429 (1996). This Court

rightly rejected these inflated claims of extraordinary urgency in 1996, and it should do so again in 1998.

As demonstrated in respondents' briefs in opposition, the AT&T and FCC petitions are not even worthy of review, much less extraordinary expedition. See Regional Bell Company Opp. 10-29; GTE Opp. 12-30. In particular, the assertion that the Eighth Circuit is "largely responsible for the virtual absence of competition in local telephone markets" is preposterous. FCC Motion at 5.

As Congress contemplated, the States have moved ahead with implementation of local competition since enactment of the Telecommunications Act in February 1996. Nationwide, state commissions have reviewed some 1700 negotiated agreements between local carriers and have completed numerous arbitration proceedings to resolve disputed issues under 47 U.S.C. § 252. On the strength of these negotiated and arbitrated agreements, dozens of national and regional companies that are genuinely interested in entering the local telephone business are doing so.

This activity confirms that legal disputes over a few portions of the FCC's Local Interconnection Order have not stalled the development of local competition. The Eighth Circuit upheld, or was not even asked to consider, the vast majority of the rules established by the FCC's 700-page decision. Although the Eighth Circuit did invalidate the FCC's pricing rules, that

action, by the FCC's own account, had little impact because "virtually every state in the union has adopted [the FCC's] policies."[2] It is bizarre for the FCC to argue that state jurisdiction over local pricing prevents competition, when nearly every State has adopted the FCC's own pricing approach. Nor are AT&T's claims of crippling uncertainty defensible where state commissions and the FCC are in accord. See AT&T Motion at 3-6.

The Eighth Circuit's decision to strike down 47 C.F.R. § 51.315(b) also has not slowed local competition. See FCC Motion at 5; AT&T Motion at 7. Rule 51.315(b) was in force from August 1996 to October 1997, yet AT&T and its co-movants -- who now say the rule allowed "the immediate introduction of . . . broad-based local exchange competition" -- by their own admission did not take advantage of it. AT&T Motion at 7.

The Eighth Circuit's decision to vacate Rule 51.315(b) will in fact foster, rather than hinder, the construction of competitive local telephone networks that Congress wished to promote.[3] The issue is whether new local telephone companies will have any incentive to build networks of their own (as

---

[2] Reed Hundt, Chairman, Federal Communications Commission, remarks to the Chamber of Commerce, Washington, D.C. (May 29, 1997) (as prepared for delivery).

[3] See, e.g., S. Conf. Rep. No. 104-230, at 1 (1996) (Telecommunications Act "designed to accelerate rapidly private sector deployment of advanced telecommunications and information technologies").

Congress intended) or whether they will use existing networks at subsidized prices (as AT&T would like). See Regional Bell Company Conditional Cross-Pet. 14-22; GTE Midwest Conditional Cross-Pet. 18-21. Companies that do seek to build new local networks in competition with incumbent carriers have strongly endorsed the Eighth Circuit's decision. One such new entrant recently said that it "owe[s] a debt of gratitude to the Eighth Circuit" for denying AT&T and others a "free ride."[4] Another explained that the Eighth Circuit's approach restored "the careful balance crafted by Congress," whereas the policies urged by AT&T and the FCC would "frustrate" the congressional goal of opening local markets to full competition.[5]

Whatever the long-term importance of the issues raised, the fate of local telephone competition will not remotely turn on whether the petitions and conditional cross-petitions are considered at the Court's January 23 conference, before the close of the pleading cycle, or in due course under the Court's normal procedures.

IN THE SUPREME COURT OF THE UNITED STATES

OCTOBER TERM, 1997

FEDERAL COMMUNICATIONS COMMISSION AND
THE UNITED STATES OF AMERICA, PETITIONERS

v.

IOWA UTILITIES BOARD, et al.

REPLY BRIEF IN SUPPORT OF THE MOTION OF THE UNITED STATES AND THE FEDERAL COMMUNICATIONS COMMISSION TO EXPEDITE CONSIDERATION OF THE PETITION FOR CERTIORARI

---

1. In their opposition to our motion to expedite consideration of the petition in this case, the nation's largest local carriers make one thing clear: they do not want the Court to hear this case this Term. There is a reason for that. At present, 98% of local telephone revenues still belong to the local monopolists. The longer that respondents succeed in keeping competition out of local markets, the longer they will sustain their monopoly market shares. But immediate competition is what Congress intended, and respondents well know that they would have much to gain from a year's delay in this Court's review. That gain, however, would be the public's loss.

Review this Term is needed to prevent the confusion that would result from an additional year's worth of private agreements negotiated under an erroneous and exceptionally destabilizing legal regime. Unless and until this Court corrects that decision, which invalidates the core of the FCC's national regulatory framework for implementing the 1996 Act, the basic

5 pp

controversies under the Act will be litigated and relitigated in various federal district courts and courts of appeals rather than resolved in a single administrative proceeding. See Fed. Pet. 22-24. For example, respondents themselves have already challenged state commission pricing determinations in dozens of separate district court proceedings. See Reply Br. in Support of Fed. Pet. 5-6. Each change in the law under that regime -- and there would be many -- would subject numerous private interconnection agreements to a potential need for renegotiation. Delaying consideration of this case until next Term would create another year's worth of agreements negotiated in that climate of uncertainty. Because uncertainty discourages the investment necessary for competition, the only beneficiaries of postponing legal clarity for another year are the incumbent local carriers -- which, in their opposition to our motion, essentially ignore this concern.

2. We have asked this Court to schedule consideration of our petition for the January 23 Conference because, in our view, that course would be the best means of hearing this case during this judicial Term. Respondents, however, contend that it would be unfair -- not to themselves, but to unnamed other parties -- to decide on that date whether this case should be briefed and argued. We disagree. We filed our petition nearly two months ahead of schedule, on November 19, 1997, and responses to it, as well as our reply brief, have now been filed. By January 12 -- 90 days from the final judgment -- the procession of staggered

cross-petitions must run its course, and this Court will know exactly what issues it has been asked to review. We have now filed responses to each of the three separate cross-petitions filed by respondents, and we will respond to any additional cross-petitions with similar expedition. Given the unusual stature and public importance of this case, we do not believe that it would be at all unfair to ask other interested parties to disclose their own views before January 23, more than two months after the filing of our petition.[1]

3. Finally, respondents encourage this Court to postpone review of the petitions until after the Eighth Circuit has ruled on several mandamus petitions "to enforce the court's mandate." See Opp. 6-7. We addressed those mandamus petitions in our petition for certiorari and explained why they should not "delay this Court's disposition of the pressing issues presented in this petition." See Fed. Pet. 11 n.4 (citing Pet. App. 68a). In the various briefs in opposition to certiorari, no party disagreed with that position, and nothing has changed since then other than the scheduling of oral argument in the Eighth Circuit.

The mandamus petitions in the court of appeals involve

---

[1] Respondents argue that this Court should delay consideration of this case, not on their own behalf, but because they "understand" that "the States will soon consult among themselves to determine whether and how to respond to the cross-petitions." Opp. 3. We note, moreover, that those cross-petitions are all explicitly conditioned upon a grant of certiorari on the second question presented in our petition, and that, except for California, "the States" have not even opposed certiorari on that question. See Joint Brief for State Commission Respondents and the National Association of Regulatory Utility Commissioners in Opposition, in No. 97-826 et al.

issues arising under 47 U.S.C. 271, which governs the terms under which the Bell Operating Companies may apply to the Federal Communications Commission to enter the interstate long-distance market.[2] Our petition for certiorari addresses separate provisions of the Telecommunications Act of 1996 governing competition in local telephone markets. See 47 U.S.C. 251 et seq. We have challenged, among other things, the Eighth Circuit's ruling that the FCC lacks statutory jurisdiction to implement many of those local competition provisions. The mandamus petitions argue that that aspect of the Eighth Circuit's decision has binding effect on the FCC's dispositions of the Bell Companies' applications to enter the long-distance market under Section 271 -- and that the Eighth Circuit is the appropriate forum to determine what that effect is, even though the District of Columbia Circuit has exclusive jurisdiction to adjudicate denials of all such applications. See 47 U.S.C. 402(b)(9).

The pendency of those mandamus petitions provides no plausible basis for delaying this Court's review of the underlying final judgment, which, if left uncorrected, would have

---

[2] In a separate proceeding, a federal district court in Wichita Falls, Texas, recently held that Section 271 is an unconstitutional "bill of attainder" on the theory that it improperly "punishes" the Bell Companies by subjecting them to more regulation than other local telephone companies. See SBC Communications, Inc. v. FCC, Civ. No. 7-97-CV-163-X (N.D. Tex. Dec. 31, 1997). That decision is subject to review in the court of appeals, and, on January 6, 1998, the Solicitor General authorized an appeal. That district court ruling has no bearing on the need for this Court to grant expeditious review of the local competition issues presented in this case, and respondents do not suggest otherwise.

irreversibly binding effects on judicial interpretation of the Act. In particular, the Eighth Circuit's disposition of the mandamus petitions, whenever it may come, could not change the legal basis for the holdings as to which we seek review. Those holdings require prompt correction whether or not the Eighth Circuit seeks to extend their practical effect beyond local telephone markets to proceedings concerning the long-distance market under Section 271.[3]

CONCLUSION

The motion to expedite consideration of the petition should be granted, and the petition should be scheduled for Conference on January 23, 1998.

Respectfully submitted.

SETH P. WAXMAN
Solicitor General
Department of Justice
Washington, D.C. 20530-0001

JANUARY 1998

---

[3] Respondents also ask this Court to hold our petition pending disposition of the recently filed petition in Virginia State Corp. Comm'n v. FCC, No. 97-1072 (filed Dec. 29, 1997). The ordinary procedure, however, is to hold later-filed petitions (if at all) pending disposition of earlier-filed petitions, and respondents present no plausible reason for doing the opposite here.

v.

IOWA UTILITIES BOARD, ET AL., RESPONDENTS

ON WRITS OF CERTIORARI TO THE UNITED STATES COURT OF APPEALS FOR THE EIGHTH CIRCUIT

AND RELATED CASES

RECEIVED
MAR 23 1998
OFFICE OF THE CLERK
SUPREME COURT, U.S.

COMMENTS OF THE ASSOCIATION FOR LOCAL TELECOMMUNICATIONS SERVICES ON MOTION OF THE LOCAL EXCHANGE CARRIERS REGARDING ORAL ARGUMENT

Pursuant to Rules 21 and 28 of the Rules of this Court, the Association for Local Telecommunications Services (ALTS) hereby submits its comments on the motion of the local exchange carriers ("LEC Movants") regarding oral argument and states as follows:

ALTS is the petitioner in Case No.97-830. ALTS concurs with the LEC Movants that the number of issues, the complexity of the FCC regulations before the Court in these cases, and the range of interests of the parties warrants an additional one hour of oral argument time beyond the hour already allotted. Accordingly, ALTS supports that portion of the LEC Movants' motion requesting an additional hour or oral argument time.

ALTS does not support the other aspects of the LEC Movants' motion and it respectfully urges the Court not to act on those aspects of the motion at this time. Specifically, ALTS requests that the Court defer consideration of LEC Movants' proposals to restructure the oral argument and to permit the LEC Movants and the State petitioners both to argue the jurisdictional issues.

Those aspects of the motion are premature for several reasons. First, on March 13, 1998, two additional petitions for certiorari were filed with the Court asking the Court to review a related order issued by the U.S. Court of Appeals for the Eighth Circuit. One petition was filed by the FCC and the United States of America (Federal Communications Commission and the United States of America v. Iowa Utilities Board, *et al* Case No. 97-1519); the other petition was filed by a group of private petitioners (AT&T Corp. *et al* v. Iowa Utilities Board, Case No. 97-1520). At this time, it is not known whether the Court will grant either or both of those petitions for certiorari, nor is it known whether those cases will be consolidated with this case. Until those decisions are made, it cannot be determined whether additional issues will be before the Court, nor can it be determined whether such consolidation would necessitate increasing oral argument time.

Second, not all parties to the pending case have formulated their positions on each issue before the Court. ALTS, for example, does not expect to finalize its position on certain issues until it has reviewed the initial briefs of petitioners.

Under the current briefing schedule established by the Court, there will be ample opportunity for LEC Movants and other parties to bring their concerns to the Court regarding the structure for oral argument well in advance of oral argument.

For the foregoing reasons, ALTS supports the LEC Movants' request that the Court order one additional hour for oral argument, but asks that the Court defer decision on the other aspects of the motion until completion of the briefing in this case.

QUESTIONS PRESENTED

Respondent/Cross-Petitioner Ameritech Corporation will address the following questions:

1. Whether FCC Rule 315(b), which requires incumbent local exchange carriers to provide their competitors with preassembled combinations of network elements, (i) violates the plain language of 47 U.S.C. § 251(c)(3), which imposes an obligation on incumbent carriers to provide "access" to "network elements on an unbundled basis at a technically feasible point" "in a manner that allows requesting carriers to combine such elements," and (ii) destroys the statutory distinction between the unbundled network element and resale provisions of the Telecommunications Act of 1996.

2. Whether the FCC's "all elements" rule violates the statutory distinction between resale of finished telecommunications services and unbundled network elements by allowing new entrants to provide telecommunications services *entirely* through the incumbent's network elements, not at the statutory wholesale rates for resale, but at the cost-based rates reserved by Congress for competitors with some of their own facilities who purchase access to individual network elements.

PARTIES TO THE PROCEEDING AND RULE 29.6 STATEMENT

The parties to the underlying proceedings are listed in the appendix to the petition for a writ of certiorari in *AT&T Corp., et al.* v. *Iowa Utilities Board, et al.*, No. 97-826, at 1a-4a, 73a-78a, 92a.

Respondent/Cross-Petitioner Ameritech Corporation has no parent corporation and no non-wholly owned subsidiaries.

SUMMARY OF ARGUMENT 22

ARGUMENT 24

I. The UNE Platform Undermines The Structure Of Section 251(c) By Subverting The Statutory Distinction Between Access To Unbundled Network Elements And Resale 24

II. The UNE Platform Does Not Provide A New Entrant With "Access To Network Elements On An Unbundled Basis At Any Technically Feasible Point." 32

A. The UNE Platform Does Not Give A New Entrant "Access" At A "Technically Feasible Point" To Network Elements 32

B. The Components Of The UNE Platform Are Not "Unbundled" Network Elements, Even Under The Unduly Restrictive Definition Of "Unbundled" Advocated By Petitioners 34

III. The Policy Justifications Advanced By Petitioners In Favor Of The UNE Platform Are Both Irrelevant And Invalid 37

CONCLUSION 41

Transcript, Remarks at the National Press Club (Jan. 22, 1998) 29

BRIEF FOR RESPONDENT/CROSS-PETITIONER AMERITECH CORPORATION

For the reasons set forth in the briefs submitted by other respondents/cross-petitioners,[1] the Eighth Circuit correctly held that FCC Rule 315(b) is inconsistent with the plain text of section 251(c)(3) of the Telecommunications Act of 1996 ("1996 Act"), Pub. L. No. 104-104, 110 Stat. 56, and the structure of section 251(c) as a whole. Those briefs also demonstrate that the Eighth Circuit's decision to uphold the FCC's "all elements" rule must be reversed.

Ameritech submits this separate brief to address the central issue underlying the controversy over Rule 315(b) and the "all elements" rule. That issue is whether incumbent local exchange carriers may be required to provide new entrants with "assembled platform(s) of combined network elements" (Pet. App. 71a) — which are commonly known as "unbundled network element platforms" or "UNE platforms." The battles fought in the court of appeals and this Court over Rule 315(b) and the "all elements" rule are, in large measure, skirmishes in the larger battle over the UNE platform.

As defined by the FCC and new entrants such as AT&T and MCI, the UNE platform is a purported combination of unbundled network elements that consists of *precisely* the same facilities, in *exactly* the same configuration, as the network designed by the incumbent carrier to provide its own retail telecommunications services to customers and resale services to new entrants. Contrary to the network element entry option established by Congress in section 251(c)(3),

---

[1] Ameritech Corporation endorses the arguments set forth in the Brief for Respondents/Cross-Petitioners Bell Atlantic, *et al.* ("Bell Atlantic Brief"); the Brief for Respondent/Cross-Petitioner U S WEST, Inc. ("U S WEST Brief"); and the Brief for Respondents/Cross-Petitioners the GTE Entities ("GTE Brief").

however, entrants acquiring the UNE platform would not design and establish an alternative network, would not determine the amount of network elements necessary to carry their customers' traffic, and would not make any effort even to identify the particular network elements they need. Rather, the platform would allow new entrants to use the incumbent's entire preassembled network — identical to what an entrant acquires when purchasing resale services under section 251(c)(4). Yet the platform would give new entrants such access *not* at the statutory wholesale discount mandated by Congress for the resale of retail services, but rather at the lower cost-based rates reserved for unbundled network elements. Requiring incumbent carriers to provide the UNE platform therefore would create arbitrage opportunities that undermine Congress' distinction between unbundled network elements and resale services. For these reasons and others, the UNE platform is flatly inconsistent with the 1996 Act.

Before the Eighth Circuit vacated Rule 315(b), petitioners consistently maintained that the Rule, together with the "all elements" rule, required incumbent carriers to provide the UNE platform at rates below those charged for resale services. When apprised of this gambit, the court of appeals invalidated Rule 315(b). The court explained that section 251(c)(3) "does not permit a new entrant to purchase the incumbent [carrier's] assembled platform(s) of combined network elements" to serve local customers. Pet. App. 71a. The court added that "[t]o permit the acquisition" of the platform "at cost based rates for unbundled access would obliterate the careful distinctions Congress has drawn in subsections 251(c)(3) and (4) between access to unbundled network elements * * * and * * * resale." *Id.*

As we explain below, the court of appeals correctly concluded that the UNE platform is incompatible with the 1996 Act. Accordingly, this Court should affirm the Eighth Circuit's invalidation of Rule 315(b) and strike down the "all elements" rule. And even if this Court were to find that Rule

315(b) and the "all elements" rule are valid on their face, the Court should hold that the rules are invalid insofar as they require incumbent carriers to provide the UNE platform at the cost-based rates reserved by Congress for unbundled network elements.

STATEMENT

The network element issues presented here require some understanding of the basic architecture of the local telephone network. Understanding this architecture will allow the Court to appreciate the distinction between unbundled network elements available under section 251(c)(3) and resale services available under section 251(c)(4), and therefore to comprehend why the UNE platform is flatly inconsistent with the 1996 Act. The following describes the statutory distinction between unbundled network elements and resale, and traces the history of the FCC's campaign to subvert that distinction by requiring incumbent carriers to provide the UNE platform.

1. The Local Telephone Network. The local telephone network consists of several types of facilities constructed, installed, and combined by the incumbent local exchange carrier ("incumbent carrier" or "incumbent LEC"). Each customer's telephone is connected to the network by wires called "local loops." The loops connect the customer's premises to an "end office," which consists largely of a "local switch." The principal function of the local switch is to read the telephone number dialed by the calling party and, based on routing instructions programmed into the switch by the incumbent carrier to reflect its network configuration, connect the call to a transmission path so that the call reaches the called party.

If the party being called is connected to the same end office as the calling party, the local switch connects the call directly. Thus, in Figure 1, when Customer A calls Customer B, the call originates at Customer A's premises and

travels over the local loop to the end office. At the end office, the local switch routes and then connects the call to the local loop connecting the end office to Customer B's premises:

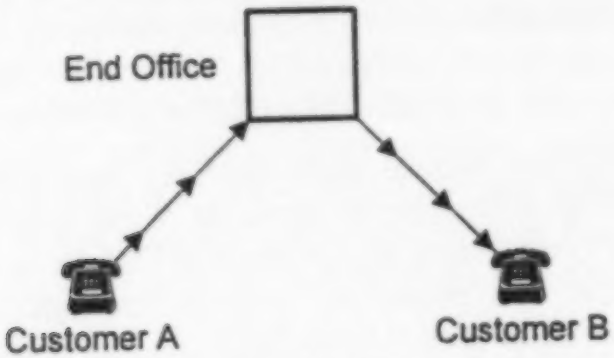

Figure 1

Most cities are served by numerous end offices. The end offices are connected to one another by "interoffice transmission facilities," which generally are fiber-optic cables that can be divided electronically into hundreds of circuits for voice and data transmission. These interoffice transmission facilities also connect end offices to one or more "tandem switches" in a hub-and-spoke-arrangement. A tandem switch directs calls from one end office to another. Tandem switches connect end offices that are not directly connected and provide an alternative means of connecting calls between customers served by different end offices that are directly connected.

The local network in a city with four end offices could look like this:

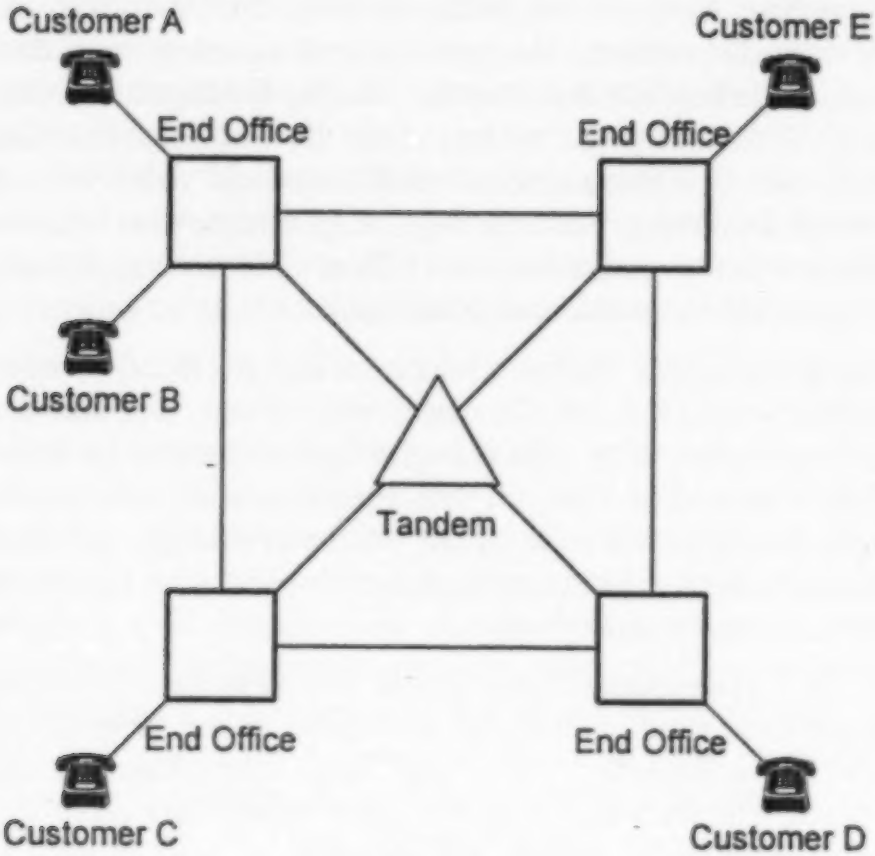

Figure 2

If the calling party and the called party are served by different end offices, the call must be "transported" from the calling party's end office to the called party's end office. The local switch uses a "routing table" — a list of steps the incumbent carrier has programmed into the switch to define how incoming calls should be handled — to select the particular physical "interoffice" pathways that will carry the call to its destination.

For example, in Figure 2, the first option for routing a call from Customer C to Customer D would be over interoffice transmission facilities directly linking their respective end offices. If that direct link is being used to capacity at the time the call is placed, the call would be routed over the

interoffice transmission facility linking Customer C's end office to the tandem, through the tandem switch, and then over the interoffice transmission facility linking the tandem to Customer D's end office. And, if Customer C called Customer E, Customer C's end office would route the call through the tandem because there is no direct route between the customers' respective end offices. More complex networks include tandem-to-tandem cables.

Accordingly, whether a telephone call is placed between customers served by the same end office, or between customers served by distant end offices connected by interoffice transmission facilities and a tandem switch, use of the local telephone network entails access to multiple facilities that have been constructed and combined into an integrated network by the incumbent.

2. **Competitive Entry Under The 1996 Act.** Congress enacted the local competition provisions of the 1996 Act to promote competitive entry into local telecommunications markets. In section 251(c), Congress established three distinct methods by which new entrants — also known as competitive local exchange carriers ("CLECs") or requesting carriers — may compete in local service markets. These three options require different levels of investment, impose different risks, and promise different rewards.

a. *Physically Constructing a New Network.* The most investment- and labor-intensive entry option is for a CLEC to build each component of its own local telephone network. This entry option requires the greatest investment in network facilities, and therefore entails the greatest risk, while promising the greatest opportunity for reward. The risk lies in the fact that a new entrant that designs and physically constructs an entire local network will not know whether it will be able to attract the customers (and, therefore, the revenue) necessary to recoup its investment.

Section 251(c)(2) of the 1996 Act facilitates entry for these new entrants by requiring an incumbent carrier to provide "interconnection" for the "facilities and equipment of" another carrier with the incumbent's network. 47 U.S.C. § 251(c)(2). Through this "interconnection," the new entrant's network is physically connected to the incumbent's network, so that the entrant's local customers can place calls to persons using the incumbent's network, and vice versa.

b. *Network Elements*. Congress "recognize[d] that it is unlikely that competitors will have a fully redundant network in place when they initially offer local service, because the investment necessary is so significant." H.R. Rep. No. 104-458, at 148 (1996) ("Conf. Rep."). Section 251(c)(3) establishes an alternate method of entry under which a new entrant may design and establish its own network without having to construct anew all of the facilities and equipment in that network. Specifically, section 251(c)(3) permits a new carrier to lease particular "network elements" from the incumbent on an "unbundled basis at any technically feasible point," and "to combine such elements in order to provide * * * telecommunications service." 47 U.S.C. § 251(c)(3). The 1996 Act defines "network element" as "*a* facility or equipment used in the provision of a telecommunications service," including "features, functions, and capabilities that are provided by means of *such* facility or equipment." *Id.* § 153(45) (emphasis added). That is, a "network element" is a particular building block ("facility or equipment") that the incumbent makes available separately to a new entrant, so that the new entrant can put together its own network to provide its own retail service to customers.

A CLEC that leases one or more unbundled network elements from an incumbent designs and establishes its own alternative, competing network without having to construct each facility from scratch. The new entrant simply combines unbundled network elements leased from the incumbent with other facilities (whether constructed by the entrant or

acquired from elsewhere) in order to provide local telephone service over its alternative network. See S. Rep. No. 104-23, at 19-20 (1995) ("unbundled access to the local exchange carrier's telecommunications facilities" is necessary to ensure "the interoperability of *both carriers' networks*") (emphasis added); *First Report and Order*, ¶ 441 ("[b]y unbundling various [network elements], a new entrant can purchase [network elements] on an unbundled basis as part of a *competing local network*") (emphasis added) (J.A. 97).[2] Under section 251(c)(2), such an entrant then would "interconnect" its own alternative network with the incumbent's existing network.

For example, consider a small telecommunications carrier with an advanced local switch but no local loops. To establish its own alternative network, that firm could lease local loops and then interconnect its local switch to the incumbent's tandem switch. Or consider a cable television provider that already has laid wires (loops) to its customers' homes and built a fiber-optic transport network covering a certain geographic region. That provider could establish its own alternative network by leasing local switches and a tandem switch from the incumbent.[3] The cable provider then could interconnect the leased local and tandem switches with the facilities it previously constructed to provide local service over its own network.

Although these two new entrants would lease different unbundled network elements, they would share certain characteristics common to all carriers that enter local service

---

[2] *In re Implementation of the Local Competition Provisions in the Telecommunications Act of 1996*, CC Docket No. 96-98, FCC 96-325, First Report and Order (rel. Aug. 8, 1996) ("*First Report and Order*").

[3] See Conf. Rep. at 148 ("Some facilities and capabilities (*e.g.*, central office switching) will likely need to be obtained from the incumbent local exchange carrier as network elements pursuant to new section 251.").

markets through unbundled network elements. In particular, both entrants would design and establish an alternative, competing local network by leasing network elements from the incumbent to fill the gaps between facilities they already have constructed or acquired from elsewhere. The FCC and commentators alike have recognized this distinguishing attribute of the network element entry option. See *First Report and Order*, ¶ 14 ("many new entrants will not have fully constructed their local networks when they begin to offer service. Although they may provide some of their own facilities, these new entrants will be unable to reach all of their customers without depending on the incumbent's facilities") (J.A. 414); Sidak & Spulber, *The Tragedy of the Telecommons: Government Pricing of Unbundled Network Elements Under the Telecommunications Act of 1996*, 97 Colum. L. Rev. 1081, 1082 (1997) (new entrant using unbundled network elements "can build its own network on an à la carte basis, leasing some inputs from the incumbent LEC and procuring other inputs from rivals already in the market * * * or directly from equipment vendors").

Congress specified a rate structure for leasing unbundled network elements that reflects the network-building nature of the network element entry option. The rates for access to a network element are to be "based on the cost" to the incumbent of providing that element. 47 U.S.C. § 252(d)(1).

Properly implemented, the "network element" mode of entry carries *some* risks and requires *some* investment, but not to the extent faced by new entrants that physically construct each facility in their own networks. For example, a new entrant may decide to serve a customer with an unbundled local switch leased from the incumbent carrier. If the customer then "migrates" to a different carrier, the entrant may terminate the lease and thereby limit its financial exposure (and hence its financial risk). By contrast, if the new entrant had acquired its own new local switch, it would have incurred sunk costs that could be neither recouped nor

limited if the customer subsequently migrated to a different carrier.

c. *Resale*. "Resale" entry is the least risk- and labor-intensive of the three options established by Congress. Section 251(c)(4) allows a new entrant to buy, at a wholesale discount, complete telecommunications services from the incumbent carrier — using precisely the same configuration of facilities and equipment that the incumbent carrier uses to provide local retail services — and then resell those services in competition with the incumbent.

In contrast to the first two methods of entry, CLECs that engage in "resale" do not design an alternative network or make *any* up-front investment in leased or constructed facilities. See H.R. Rep. No. 104-204, at 77 (1995) (unlike resellers, CLECs using network elements "offer[] * * * [a] competitive alternative" to the incumbent's network). When a new entrant buys an incumbent's finished service for resale, it uses the same local network already constructed and combined by the incumbent. Accordingly, a "reseller" relies upon the incumbent to design the entire local telephone network used by the entrant's customers and to determine how calls are switched or transported throughout the network.

The 1996 Act establishes a rate structure for the incumbent's "resale" services that differs markedly from the cost-based rate structure for network elements. Section 252(d)(3) provides that a new entrant may buy the incumbent's retail services at "wholesale" prices, a term defined by Congress as the incumbent's "retail rates" less the "marketing, billing, collection, and other costs that will be avoided" by the incumbent carrier in selling its services at wholesale rather than retail. 47 U.S.C. § 252(d)(3). The Eighth Circuit correctly recognized that the cost-based rates for unbundled network elements are lower than the wholesale rates for resale services. Pet. App. 54a-57a. As the Bell Atlantic, U S WEST and GTE Briefs explain in detail, the wholesale rates

for resale services are higher because they are calculated by taking a discount from the incumbent's *retail* rates (which reflect universal service cross-subsidies), while the rates for network elements are based on the *cost* to the incumbent of providing each individual element.

Nonetheless, by mandating a wholesale discount for the incumbent's retail services, Congress guaranteed a margin for new carriers entering through the "resale" route that makes "resale" an extremely low-risk entry option. Not only is the CLEC relieved of any need to invest in network facilities, but it can acquire customers first, and then purchase from the incumbent only the amount of retail services necessary to serve those customers.

3. The FCC's Network Element Regulations. The FCC implemented section 251(c) of the Act in its *First Report and Order*. That Order generally defined network elements to "correspond to distinct network facilities." *First Report and Order*, ¶ 678 (J.A. 137). Thus, the FCC defined the "local loop," "switching," and "interoffice transmission facilities" to be separate unbundled network elements. 47 C.F.R. § 51.319(a), (c), (d). In so doing, the FCC noted that Congress required Bell operating companies to provide these elements separately as a precondition for providing long distance services. *First Report and Order*, ¶¶ 377, 410, 439 (J.A. 71-72, 84-85, 96-97), citing 47 U.S.C. §§ 271(c)(2)(B)(iv) ("[l]ocal loop transmission from the central office to the customer's premises, *unbundled* from local switching"), 271(c)(2)(B)(vi) ("[l]ocal switching *unbundled* from transport [and] local loop transmission"), 271(c)(2)(B)(v) ("[l]ocal transport from the trunk side of a wireline local exchange carrier switch *unbundled* from switching") (emphasis added). The FCC's regulations permit new entrants to lease these and other network elements from the incumbent. See 47 C.F.R. § 51.319.

a. *Combinations*. In addition to defining which types of network elements an incumbent LEC must lease to

new entrants, the FCC also addressed how leased elements may be combined with other network elements or with facilities built by the new carrier. One such regulation permits new entrants to combine unbundled network elements with facilities constructed or otherwise acquired by the new entrant, or with other leased elements, and thereby to design an alternative network for providing local service to its customers. 47 C.F.R. § 51.315(a) ("Rule 315(a)"). Rule 315(a) states that an incumbent carrier "shall provide unbundled network elements in a manner that allows requesting carriers to combine such elements in order to provide a telecommunications service." Therefore, if the cable television operator described above seeks to combine the local loops it has installed with an unbundled local switch leased from the incumbent, the incumbent would have to provide the switch "in a manner that allows" the *cable operator* to combine its loops with the unbundled switch.

Rule 315(a) plainly complies with — and in fact tracks the second sentence of — section 251(c)(3). However, despite its claims to the contrary, the FCC went far afield from the statute in promulgating two other requirements related to combining network elements. *First*, the FCC required incumbents to combine, at the new entrant's request, network elements that are *not* currently combined in the incumbent's network. 47 C.F.R. § 51.315(c)-(f) ("Rules 315(c)-(f)"). That is, if a new entrant ordered two or more network elements that were not physically connected, Rules 315(c)-(f) obligated the incumbent to combine those elements on behalf of the new entrant.

Second, the FCC required incumbent carriers to provide new entrants with preassembled, or existing, combinations of network elements. 47 C.F.R. § 51.315(b) ("Rule 315(b)"). Rule 315(b) reads: "Except upon request, an incumbent LEC shall not separate requested network elements that the incumbent LEC currently combines." That is, Rule 315(b) gave new entrants the right to order, on a preassembled basis, two

or more network elements that were currently combined in the incumbent's network. Like Rules 315(c)-(f), Rule 315(b) relieves "requesting carriers" of their statutory obligation "to combine [network] elements" themselves. 47 U.S.C. § 251(c)(3).

b. *The "All Elements" Rule.* As described previously (pp. 7-9, *supra*), the network element entry option permits new entrants to fill the gaps in their own previously acquired facilities by leasing selected network elements from the incumbent on an unbundled basis. However, the FCC read section 251(c)(3) to permit a new entrant to acquire from an incumbent, at cost-based rates, *all* of the network elements necessary to provide a local telecommunications service. *First Report and Order*, ¶¶ 328-41 (J.A. 57-65). Put another way, the "all elements" rule allows a new carrier to provide local service entirely through a combination of unbundled network elements. Under the "all elements" rule, then, a new entrant may use the network element entry option even if it has constructed no network facilities of its own.

4. The Eighth Circuit's Initial Ruling. Incumbent carriers brought petitions for review to challenge, *inter alia*, Rules 315(c)-(f) (which required incumbents to combine network elements on behalf of new entrants) and Rule 315(b) (which required incumbents to provide preassembled combinations of network elements). The incumbent LECs argued that these rules violated the plain language of section 251(c)(3), which grants access to network elements only "on an unbundled basis" at "any technically feasible point" and specifies that *new entrants* have the obligation to combine network elements. The incumbent LECs also maintained that requiring incumbents to provide certain network elements combinations — in particular, a preexisting combination consisting of all of the elements required to provide a retail service — would destroy the distinction between the network element and resale entry options under sections 251(c)(3) and (c)(4).

a. *Combinations.* In a ruling that petitioners did not challenge in their petitions for certiorari, the Eighth Circuit invalidated Rules 315(c)-(f). The court of appeals explained that these Rules were contrary to the plain text of Section 251(c)(3), which requires incumbent carriers to provide "'unbundled network elements in a manner that allows *requesting carriers to combine* such elements.'" Pet. App. 70a (quoting 47 U.S.C. § 251(c)(3)) (emphasis added by Eighth Circuit). The statutory text "unambiguously indicates that requesting carriers will combine the unbundled elements themselves" and therefore "cannot be read to levy a duty on the incumbents to do the actual combining of elements" on behalf of new entrants. *Id.* The court's initial opinion left Rule 315(b) in place, without comment.

b. *The "All Elements" Rule.* At the same time, and based upon its vacatur of Rules 315(c)-(f), the Eighth Circuit upheld the "all elements" rule, which permits new entrants to provide local service entirely through unbundled network elements leased from the incumbent carrier. The incumbent carriers had maintained that new entrants would use the "all elements" rule to evade the distinctions between access to network elements under section 251(c)(3) and resale services under section 251(c)(4). Addressing those concerns, the Eighth Circuit held that the network element mode of entry differs from resale entry in critical respects, with "unbundled access ha[ving] several disadvantages that preserve resale as a meaningful alternative." Pet. App. 56a.

First, the court of appeals observed that, unlike pure resellers, new entrants providing local service entirely through network elements must "expend[] valuable time and resources recombining unbundled network elements." Pet. App. 57a. This distinction followed from the court's vacatur of Rules 315(c)-(f). As the court explained, "requiring the requesting carriers to combine the elements themselves increases the costs and risks associated with unbundled access as a method of entering the local telecommunications indus-

try and simultaneously makes resale a distinct and attractive option." *Id.* at 56a-57a. In other words, a new entrant providing local service entirely through network elements still must design and establish its own alternative network, while a reseller simply relies on the same preexisting local telephone network used by the incumbent to provide service to its own customers.

Second, the Eighth Circuit noted that a new carrier "entering the local telecommunications markets by purchasing unbundled network elements faces greater risks than those carriers that resell an incumbent [carrier's] services." Pet. App. 56a. Carriers leasing unbundled network elements "must make an up-front investment that is large enough to pay for the cost of acquiring access to all of the unbundled elements of the incumbent LEC's network * * * without knowing whether consumer demand will be sufficient to cover such expenditures." *Id.* By contrast, a reseller can "more easily match its supply with its demand because it can purchase telephone services from incumbent LECs on a unit-by-unit basis," and thus "is able to purchase only as many services (or as much thereof) as it needs to satisfy customer demand." *Id.* That is, an entrant leasing network elements as a means of providing service over its own competing network faces demand-contingent risks — risks that are not faced by carriers that simply resell the retail service provided by the incumbent over the incumbent's network.

Thus, although it upheld the "all elements" rule, the court of appeals recognized Congress's intent that to qualify for the lower cost-based prices applicable to unbundled network elements, a new entrant must be more than a passive reseller of the incumbent's retail services.

5. The Controversy Over The "UNE Platform." As noted above, the Eighth Circuit's initial ruling did not address Rule 315(b), which provided that "an incumbent LEC shall not separate requested network elements that the incumbent LEC currently combines." 47 C.F.R. § 51.315(b). In

the weeks that followed the court of appeals' ruling, the FCC and new entrants such as AT&T and MCI seized upon the survival of Rule 315(b) to advance an agenda that — in defiance of the Eighth Circuit's initial ruling — would have obliterated the statutory distinction between the unbundled network element and resale entry options.

In proceedings before State public utility commissions, AT&T maintained that Rule 315(b), together with the "all elements" rule, permitted new entrants to obtain the so-called "UNE platform" as a purported combination of network elements under section 251(c)(3). As defined by petitioners, the UNE platform is not an alternative, competing network that a new entrant establishes by combining unbundled network elements with facilities already owned by the new entrant. Rather, the platform consists of *precisely* the same facilities, configured in *exactly* the same manner, as the integrated local telephone network that the incumbent designed and constructed to provide its own retail services — the same retail services available to new entrants for resale under section 251(c)(4). In fact, the platform *is* the incumbent's integrated local telephone network.

As AT&T acknowledged, the UNE platform is particularly attractive because it can be acquired on an "as is" basis. That is, if AT&T served a customer with a resale service purchased under section 251(c)(4), AT&T would have the right instantaneously to "convert" that customer to the UNE platform under section 251(c)(3). Likewise, if AT&T won over one of the incumbent carrier's current retail customers, it could instantaneously "migrate" that customer to the UNE platform.[4] As AT&T put it, migration to the UNE

---

[4] See Comments of AT&T Communications of Ohio Regarding the Effect of the Eighth Circuit Order, Case No. 96-922-TP-UNC (Pub. Util. Comm'n of Ohio), at 6-9 (filed Aug. 19, 1997) (arguing that Rule 315(b) requires "as is" migration to the UNE platform) ("AT&T Ohio Comments on Eighth Circuit Initial Order"). Accord, Comments of MCI Telecommunications on

platform is appropriate "for Ameritech retail customers who want to keep *the same type of service* * * * but simply want to switch local service providers from Ameritech to AT&T." In those circumstances, AT&T added, "no physical changes are necessary and no interconnection charge will be assessed."[5]

To accomplish these "as is" conversions and migrations to the UNE platform, a CLEC would not have to design an alternative network, combine unbundled network elements, make up-front investments in network elements, or even identify the particular network facilities (apart from the customer's local loop) used to carry the customer's telecommunications traffic. All the CLEC would have to do is utter the words "UNE platform" rather than "resale." As AT&T conceded, however, the actual product delivered would be the same: *undifferentiated use of the entire preexisting and integrated network designed by the incumbent carrier to provide retail services to its local customers.*

AT&T has been remarkably candid — at least to investment analysts — as to why it seeks to affix the "UNE platform" label, rather than the "resale" label, to its use of the incumbent's preexisting and preconfigured network. As John Zeglis, AT&T's current president, proclaimed, the UNE platform gives AT&T "another way to resell" the incumbent's retail services, but at a discount greater than that applicable to resale services under the 1996 Act.[6] Mr. Zeglis

---

the Impact of the Decision of the Eighth Circuit, Case No. 96-922-TP-UNC (Pub. Util. Comm'n of Ohio), at 6-9 (filed Aug. 19, 1997) (relying upon both Rule 315(b) and the "all elements" rule).

[5] AT&T's Memorandum Contra to Ameritech Ohio's Application for Rehearing and Request for Stay, Case No. 96-922-TP-UNC (Pub. Util. Comm'n of Ohio), at 25-26 (filed May 4, 1998) (emphasis added).

[6] Transcript, AT&T Investment Community Meeting (Mar. 3, 1997) (comments of John Zeglis) (J.A. 255).

observed that while the wholesale discount for resold services in one State is only 25.9%, the UNE platform may be acquired at "a discount of 52 percent" or higher, depending upon a customer's particular calling patterns. The difference in price has absolutely nothing to do with the actual product sold by the incumbent LEC to the new entrant, since the UNE platform and the preassembled network used by the incumbent to provide resale services are one and the same.

Despite the Eighth Circuit's initial ruling, which held that the CLECs themselves must combine the unbundled network elements they lease from incumbent LECs, AT&T cobbled together a strained legal rationale to support the platform. Specifically, AT&T argued to State commissions that Rule 315(b), in tandem with the "all elements" rule, allowed new entrants to acquire all of the network elements necessary to provide retail service, and further prohibited the incumbent LECs from separating facilities that are already combined in their networks. AT&T claimed that because an incumbent carrier "currently combined" all of the facilities necessary to serve its own retail customers, Rule 315(b) required the incumbent to provide those facilities to CLECs as an "existing combination[]" of purported unbundled network elements at no extra charge.[7] Therefore, AT&T contended, new entrants could obtain the incumbent's retail services, not as a resale service under section 251(c)(4), but at lower rates as a preassembled UNE platform under section 251(c)(3).

While AT&T was pressing State commissions to use Rule 315(b) and the "all elements" rule as a means of approving the UNE platform, the FCC issued orders expressly

[7] AT&T Ohio Comments on Eighth Circuit Initial Order, at 8. See also *Eighth Circuit's Order May Imperil FCC Enforcement, Triggers Call to Revive Rules*, Telco Competition Report (July 31, 1997) (despite Eighth Circuit's initial order, "the UNE platform is [not] dead") (statement of Mark Rosenblum, AT&T Vice President-law and public policy).

intended to advance that agenda. In the *Third Reconsideration Order*,[8] promulgated in the same docket as the regulations at issue here, the FCC required incumbent carriers to provide new entrants with a purported network element dubbed "shared transport." Although petitions for review challenging the *Third Reconsideration Order* remain pending before the Eighth Circuit, that order illustrates the extent to which the FCC abused the (temporary) survival of Rule 315(b) in an effort to require incumbent carriers to provide the UNE platform.

The *Third Reconsideration Order* (¶ 34 (J.A. 244-245)) defines shared transport as a purported network element consisting of *every* interoffice transmission facility in the incumbent's network — each of which had previously been defined in the *First Report and Order* as a network element in its own right.[9] The regulation relieved new entrants of any obligation to design their own alternative networks, or even to identify or designate which *particular* individual interoffice facilities would carry their customer's traffic. *Id.* ¶ 43 ("shared transport" need not be "identified as a limited or pre-identified portion of the network") (J.A. 246-247). The FCC acknowledged that shared transport could function only in combination with switching network elements also ac-

---

[8] *In re Implementation of the Local Competition Provisions in the Telecommunications Act of 1996* (CC Docket No. 96-98), Third Order on Reconsideration and Further Notice of Proposed Rulemaking, FCC 97-295 (rel. Aug. 18, 1997) ("*Third Reconsideration Order*") (J.A. 1359-1402), petitions for review pending, *Southwestern Bell Tel. Co.* v. *FCC*, Nos. 97-3389 *et al.* (8th Cir.).

[9] See *First Report and Order*, ¶ 442 ("it is technically feasible for incumbent LECs to unbundle * * * interoffice facilities as individual network elements") (J.A. 97); *id.* ¶ 441 ("by unbundling various dedicated and shared interoffice facilities, a new entrant can purchase all interoffice facilities on an unbundled basis *as part of a competing network*, or it can combine its own interoffice facilities with those of the incumbent") (emphasis added) (J.A. 97).

quired from the incumbent, but, expressly relying upon Rule 315(b), required incumbents to provide shared transport as part of a preassembled combination with switching. *Id.* ¶¶ 44, 47 (J.A. 247-249). Accord, *In the Matter of Application of Ameritech Michigan Pursuant to Section 271 of the Communications Act of 1934, as amended, To Provide In-Region, InterLATA Services In Michigan*, CC Docket No. 97-137, FCC 97-298, ¶¶ 327-28, 336 (rel. Aug. 19, 1997). Thus, according to the FCC, shared transport gives new entrants undifferentiated use of the entire preassembled and integrated combination of each and every interoffice transport facility, tandem switch, and local switch in the incumbent's network. Or, as AT&T recently conceded, shared transport is "the use of [the incumbent carrier's] public switched network to carry traffic from point to point."[10]

There can be no question that the FCC promulgated the *Third Reconsideration Order* to give CLECs the right to acquire the UNE platform at the cost-based rates reserved for unbundled network elements. As then-FCC Chairman Reed Hundt made clear, the shared transport requirement "highlights the importance [the FCC] place[s] on incumbents making available to new entrants their network elements on a combined basis — a combination sometimes referred to as the UNE platform." *Third Reconsideration Order*, Separate Statement of Chairman Reed Hundt (J.A. 250).[11]

6. The Eighth Circuit's Order On Rehearing. Several incumbent LECs filed petitions for rehearing with the Eighth Circuit. The petitions informed the court of appeals

---

[10] AT&T Communication of Michigan's Brief in Support of its Motion to Dismiss Under Rule 12(b)(6) or, in the Alternative, for Summary Judgment at 1 n.1, *Michigan Bell Tel. Co.* v. *Strand*, Case No. 5:98-CV-20 (W.D. Mich.) (filed April 20, 1998).

[11] Accord, Evaluation of the United States Department of Justice, CC Docket No. 97-137 (FCC), at 34 (filed June 25, 1997) ("shared transport * * * [is] needed to support entry through the 'network platform'").

of the events described above, in particular that the FCC, together with CLECs such as AT&T, had relied on the survival of Rule 315(b), together with the "all elements" rule, to require incumbent LECs to provide the UNE platform at the cost-based rates reserved by Congress for unbundled network elements. This regulatory action, the incumbent LECs charged, nullified key provisions of the 1996 Act and was at odds with the court's initial opinion.

The rehearing petitions asked the court of appeals to invalidate Rule 315(b). Alternatively, the petitions urged the Eighth Circuit to reconsider its earlier affirmance of the "all elements" rule. If Rule 315(b) stood, the petitions maintained, the premises underlying the court's prior affirmance of the "all elements" rule (see pp. 14-15, *supra*) would disappear. And if the FCC and AT&T were correct in asserting that Rule 315(b) authorized CLECs to acquire the UNE platform, CLECs would simply use the incumbent's entire preexisting network, rather than design and combine alternative, competing networks of their own. This, in turn, would destroy the distinction between the unbundled network element and resale entry options fashioned by Congress.

The Eighth Circuit granted the petitions for rehearing. Amending its initial opinion, the court of appeals vacated Rule 315(b) as "contrary to § 251(c)(3)," given that "the rule would permit the new entrant access to the incumbent['s] network elements on a bundled rather than an unbundled basis." Pet. App. 71a. The court reaffirmed its prior ruling that the plain language of Section 251(c)(3) "requires an incumbent LEC to provide access to the elements of its network only on an unbundled (as opposed to a combined) basis." *Id.* In so doing, the court directly considered and invalidated the UNE platform, holding that section 251(c) "does not permit a new entrant to purchase the incumbent LEC's assembled platform(s) of combined network elements (or any lesser existing combination of two or more elements)." *Id.* The court explained that "[t]o permit such an

acquisition of already combined elements at cost based rates for unbundled access would obliterate the careful distinction Congress has drawn in subsections 251(c)(3) and (4)" between access to unbundled network elements and the purchase of an incumbent's retail services for resale. *Id.*

SUMMARY OF ARGUMENT

In striking down Rule 315(b), the court of appeals held that section 251(c)(3) of the 1996 Act "does not permit a new entrant to purchase the incumbent LEC's assembled platform(s) of combined network elements * * *." Pet. App. 71a. Yet petitioners' defense of Rule 315(b) barely mentions the UNE platform, let alone their persistent campaign to require incumbent LECs to provide the platform at the cost-based rates reserved by Congress for unbundled network elements.

Although petitioners understandably are reluctant to address the point, the battle over Rule 315(b) and the "all elements" rule was and remains, in principal part, a battle over the UNE platform. Petitioners want this Court to reverse the Eighth Circuit's vacatur of Rule 315(b), and affirm the Eighth Circuit's approval of the "all elements" rule, because they believe that those rulings would allow CLECs to acquire the UNE platform. Indeed, the Eighth Circuit invalidated Rule 315(b) only upon learning that petitioners — most notably, the FCC, AT&T and MCI — had employed Rule 315(b), together with the "all elements" rule, in an effort to require incumbent carriers to provide the UNE platform under the guise of a combination of unbundled network elements. The Court could not render an informed and complete judgment without appreciating these crucial and undeniable facts.

The UNE platform would be a dead letter if this Court affirmed the Eighth Circuit's invalidation of Rule 315(b), or if it reversed the Eighth Circuit's decision to uphold the "all elements" rule. However, even if the Court were to conclude

that Rule 315(b) and the "all elements" rule were valid in some instances, it should hold that the rules would violate the 1996 Act insofar as they required incumbent LECs to provide the UNE platform at the cost-based rates reserved for unbundled network elements. This is so for two principal reasons.

First, the UNE platform obliterates the distinction between the unbundled network element and resale entry options established by Congress in sections 251(c)(3) and (c)(4), and thus undermines the structure of section 251(c). The UNE platform is identical to resale in several critical respects. Both allow new entrants to compete without designing and establishing an alternative network; both give new entrants identical access to the same configuration of network facilities used by the incumbent to provide retail service to its customers; and both relieve new entrants of the need even to identify which particular facilities will carry their customers' traffic. The only difference is price: by affixing the "UNE platform" label, as opposed to the "resale" label, to the undifferentiated use of the incumbent's preassembled network, the new entrant receives the benefit of the lower cost-based rates reserved by Congress for unbundled network elements. The effect of the UNE platform, then, is to nullify the resale provisions of the Act.

Second, the UNE platform is inconsistent with the plain language of section 251(c)(3). If a CLEC were to acquire the UNE platform, it would not obtain "access" to "network elements" "on an unbundled basis at any technically feasible point." 47 U.S.C. § 251(c)(3). Obtaining "access" to network elements "at a technically feasible point" unquestionably requires a new entrant to obtain some sort of *physical* access to the incumbent's network facilities. Moreover, the UNE platform is not a combination of *unbundled* network elements, even under petitioners' unduly restrictive definition of "unbundled," because a CLEC does not have the option

of acquiring one essential component of the UNE platform without taking another essential component.

ARGUMENT

I. The UNE Platform Undermines The Structure Of Section 251(c) By Subverting The Statutory Distinction Between Access To Unbundled Network Elements And Resale.

As described above (see pp. 6-11, *supra*), the 1996 Act establishes three distinct methods by which carriers may enter the local telecommunications market. *First*, new entrants may build an alternative local network from scratch, and interconnect that network with the incumbent's network. 47 U.S.C. § 251(c)(2). *Second*, an entrant may design and establish an alternative network with unbundled network elements acquired from the incumbent carrier. *Id.* § 251(c)(3). Consistent with the network-building nature of this entry option, Congress provided that the rate for network elements must be "based on the cost" to the incumbent "of providing the * * * network element." *Id.* § 252(d)(1). *Third*, a new entrant may use the incumbent carrier's entire preassembled network by acquiring the incumbent's actual retail services at a wholesale discount and reselling those services to customers. *Id.* § 251(c)(4). Because these entrants simply resell the incumbent's services, they need not design an alternative network to serve their customers. In light of the distinction between the resale and network element entry options, Congress based the wholesale discount for resale services not on cost to the incumbent of providing the service, but on the incumbent's retail rates, minus certain avoided costs. *Id.* § 252(d)(3). As the court of appeals recognized, the cost-based rates for network elements are lower than the wholesale rates for resale services. Pet. App. 54a-57a.

The UNE platform would make nonsense out of this statutory scheme. The UNE platform is the undifferentiated

use of the *same* entire preassembled network used by the incumbent carrier to provide retail services — the *same* retail services available for resale under section 251(c)(4). See pp. 16-20, *supra*. A CLEC acquiring the UNE platform does not have to engage in the tasks that distinguish the network element entry option from the resale entry option: designing and establishing an alternative network; calculating the volume of unbundled interoffice transmission facilities necessary to handle its anticipated traffic volume; identifying which particular network elements would carry its customers' traffic; assuming the risk that it will miscalculate traffic volumes and not recoup its investment in network elements; or combining the elements into an alternative network. The only difference between the UNE platform and resale is price: by substituting the phrase "UNE platform" for "resale," CLECs such as AT&T and MCI hope to obtain the same retail services at the lower cost-based rates reserved for network elements, rather than at the wholesale discount mandated by Congress for resale services.

At the time it enacted the 1996 Act, Congress plainly understood that each incumbent carrier already had designed and constructed a fully functioning, preassembled, integrated network to provide service to its local customers. See 47 U.S.C. §§ 251(c)(4), 271(c)(2)(B)(xiv). Congress required incumbents to make available *those* finished retail services to new entrants for resale under section 251(c)(4), and mandated a wholesale discount for that product under section 252(d)(3). If new entrants could acquire that very same product under the guise of a preassembled combination of purportedly unbundled network elements under section 251(c)(3), at the lower cost-based rates established by section 252(d)(1), Congress's inclusion of the resale provision in the 1996 Act would be meaningless. Reading the 1996 Act in that manner would run contrary to "the cardinal principle of statutory construction" that courts must "give effect, if possible, to every clause and word of a statute * * * rather

than to emasculate an entire section." *Bennett* v. *Spear*, 117 S. Ct. 1154, 1166 (1997) (internal quotation marks omitted); see also *Bailey* v. *United States*, 516 U.S. 137, 145-46 (1995); *Smith* v. *Robinson*, 468 U.S. 992, 1011 (1984).

The UNE platform undermines the structure of section 251(c), and nullifies the 1996 Act's resale provisions, in at least three respects.

1. The first conflict between the UNE platform and the terms of the 1996 Act concerns the nature of the platform as a telecommunications product. That product is the incumbent carrier's preexisting, bundled network used to provide retail service to the incumbent's customers — *the identical product available for resale under section 251(c)(4)*. At the same time, the UNE platform is absolutely inconsistent with the network element entry vehicle established in section 251(c)(3). New entrants providing service with unbundled network elements do not simply re-use the incumbent's preassembled network; rather, Congress expected them to establish their own alternative networks to serve their customers. See 47 U.S.C. § 251(c)(3) (incumbent carrier "shall provide such unbundled network elements in a manner that allows *requesting carriers* to combine such elements in order to provide [a] telecommunications service") (emphasis added); S. Rep. No. 104-23, at 19-20 (1995) ("unbundled access to the [incumbent] local exchange carrier's telecommunications facilities" necessary to ensure "the interoperability of *both carriers' networks*") (emphasis added). As Congress recognized, CLECs using network elements "offer[] * * * a competitive alternative" to the incumbent's network in a manner that resellers do not. H.R. Rep. No. 104-204, at 77 (1995).

Establishing an alternative network requires, at a minimum, that the new entrant identify and designate the particular network facilities — *i.e.*, unbundled network elements, facilities constructed anew or acquired from elsewhere by the entrant — that will carry its customers' traffic. Yet the

essential nature of, and principal justification for, the UNE platform is that it *relieves* entrants of these very obligations — obligations that serve to distinguish network element entry under section 251(c)(3) from resale entry under section 251(c)(4). To make the UNE platform available under section 251(c)(3) would eviscerate this congressionally mandated distinction. See *Colautti* v. *Franklin*, 439 U.S. 379, 392 (1979) (adhering to the "elementary canon of construction that a statute should be interpreted so as not to render one part inoperative").

MCI maintains that the UNE platform is distinct from resale because a new entrant acquiring the UNE platform, unlike a reseller, must "create" and "bill for" "the network it builds out of the leased elements." MCI Br. 23. That argument is frivolous. The UNE platform does not require the new entrant to "create" or "build[]" anything, because it gives entrants access to the incumbent carrier's entire preassembled, bundled network. See pp. 16-20, *supra*. Indeed, MCI elsewhere has acknowledged that the UNE platform consists of "facilities [that] are all interconnected components of the existing Ameritech network and are used to provide exchange access service to end-user customers."[12] With respect to the need to "bill for" services, a new entrant must bill its customers regardless of whether it provides service through the network element entry option or the resale entry option. Contrary to MCI's contention, then, the network configuration used when a new entrant requests the "UNE platform" is indistinguishable from the network configuration used when the entrant requests a "resale service."

2. The UNE platform also undermines the 1996 Act's provisions governing price. By requiring incumbent carriers

---

[12] Memorandum of MCI Telecommunications Corporation and MCI Access Transmission Services, Inc. Contra Ameritech's Third Application for Rehearing, Case No. 96-922-TP-UNC (Pub. Util. Comm'n of Ohio), at 6 (filed May 4, 1998).

to sell their entire preassembled, integrated network under the guise of the UNE platform, the FCC fostered arbitrage strategies that eliminate the statutory distinction between unbundled network elements and resale. With the UNE platform, a new entrant acquires use of the incumbent's preassembled network at the lower cost-based prices reserved by section 252(d)(1) for unbundled network elements, rather than at the statutory wholesale discount established in section 252(d)(3) for resale services. Moreover, as envisioned by petitioners, CLECs may pay for the UNE platform primarily on an after-the-fact usage-sensitive basis, just as a reseller pays for resale services.[13] Thus, the court of appeals was entirely correct in concluding that the UNE platform would "obliterate" the distinction between the network element and resale entry options prescribed by Congress. Pet. App. 71a.

The CLECs themselves have touted the UNE platform's pricing anomalies as its principal virtue. As noted above, AT&T President Zeglis noted that, in one State, the section 252(d)(3) wholesale discount applicable to section 251(c)(4) resale services is 25.9%. By contrast, the UNE platform version of the same services — which Mr. Zeglis assumed would be available under section 251(c)(3) at the cost-based rates established by section 252(d)(1) — could be acquired at an effective discount of 52%. Thus, according to AT&T, an incumbent carrier must make available the preassembled, integrated network through which it provides retail services *either* (a) under the label "resale," at a 26% discount, *or* (b) under the label "UNE platform," at an effective 52% discount. See pp. 17-18, *supra*.

---

[13] See AT&T/MCI Joint Application for Rehearing and/or Clarification, Case No. 96-922-TP-UNE (Pub. Util. Comm'n of Ohio), at 8-9 (filed July 21, 1997) (urging PUCO to "order Ameritech to provide interoffice transport * * * on a usage sensitive basis"). The FCC announced that it will "establish usage-sensitive rates for recovery of shared transport costs" in any interconnection arbitrations it conducts under section 252(e)(5) of the 1996 Act. *Third Reconsideration Order*, ¶ 30 (J.A. 243-244).

Neither AT&T nor its allies have ventured to explain why Congress would have enacted an elaborate statutory scheme governing distinct network element and resale entry options, only to give new entrants the "choice" between a 26% discount and a 52% discount for the very same product. Petitioners show no respect for Congress's judgment in advocating such a construction of the 1996 Act. And this Court should "not be disposed to give the statute a meaning that produces such strange consequences." *Deal* v. *United States*, 508 U.S. 129, 134 (1993).

MCI's solution to this dilemma is simply to deny that the UNE platform enjoys an inherent "economic advantage" over resale. MCI Br. 23-24. MCI's point appears to be that a new entrant would *not* receive a lower price for the incumbent's retail service when it utters "UNE platform" rather than "resale service." But this argument flatly contradicts what the CLECs have acknowledged in other forums. As noted previously, AT&T has made no bones about the fact that the UNE platform gives new entrants a far deeper discount for the incumbent's retail services than the wholesale discount mandated by Congress in section 252(d)(3). Indeed, MCI and AT&T have attempted to justify their withdrawal from the local residential market on the theory that the statutory discount for resale services is somehow insufficient, and that it is feasible to compete only if the incumbent's resold services are available under the label of the "UNE platform" at the lower cost-based rates reserved for network elements under section 252(d)(1).[14]

---

[14] AT&T Communications of Illinois, Inc.'s Response to Motion for Stay of Illinois Bell Telephone Company, Docket No. 96-0486/0569 (Ill. Comm. Comm'n), at 10 (filed March 18, 1998) ("Experience has shown that CLECs cannot enter the market via resale of [the incumbent LEC's] local service on a financially viable basis."); Transcript, Remarks at the National Press Club (Jan. 22, 1998) (claiming that "[c]urrent resale discounts make it impossible for any competitor to ever make money selling local in any state in America") (statement of Timothy F. Price, MCI President).

Despite MCI's claims to the contrary, then, the "economic advantage" that the UNE platform affords over resale is the only reason why CLECs such as AT&T and MCI want the UNE platform so badly. The bottom line is that these carriers are dissatisfied with the wholesale discount established in section 252(d)(3) for new entrants that simply wish to resell the incumbent's retail services. Of course, if AT&T and MCI believe that the wholesale discount established by Congress for resold services is too meager, they should seek redress from Congress.[15] See *MCI* v. *AT&T*, 512 U.S. 218, 234 (1994). Instead, these carriers petition the Court to allow them to have their cake and eat it too: they want to obtain the incumbent's resold services under the guise of the UNE platform, thereby obviating the need to establish their own alternative networks, at the lower cost-based rates applicable to unbundled network elements. This the 1996 Act does not allow.

3. Finally, the UNE platform would allow the large long distance carriers to evade the 1996 Act's joint marketing restrictions. Section 271(e)(1) provides that large long distance carriers such as AT&T and MCI may not "jointly

---

[15] MCI's and AT&T's unjustified complaints about the 1996 Act's wholesale discount for resale services have been rejected by the current Chairman of the FCC. See *Kennard Says Competition in Residential Telephony is Top Priority on 1998 Agenda*, TeleCompetition Report (Feb. 12, 1998) ("When asked about the recent claims by AT&T Corp. and MCI * * * that reselling residential local service is not viable, [FCC Chairman] Kennard said he didn't 'fully understand why not. * * * USN [Communications, Inc.] is providing local competition exclusively through resale. There are companies out there doing it.'"); Krause, *Computers & Technology Kennard's Call Is Implementing Telecom Reform*, Investor's Business Daily (Feb. 18, 1998) ("'Yes, I'm aware that the large (long-distance carriers) have backed away from a resale strategy. But some smaller [new entrants] haven't backed away from resale, and it seems to be viable for some new entrants.'") (statement of Chairman Kennard). In fact, Ameritech has provided new entrants with over 500,000 resold lines, approximately 55% of which are residential.

market" their long distance services with local services acquired from Bell operating companies under the 1996 Act's resale provisions. 47 U.S.C. § 271(e)(1) (prohibition expires three years after enactment of 1996 Act or in States where Bell company is authorized to provide long distance services). Congress enacted this provision "to provide parity between the Bell operating companies and other telecommunications carriers in their ability to offer 'one stop shopping' for telecommunications services." S. Rep. 104-23, at 43 (1995). This joint marketing restriction applies *only* to carriers that resell the incumbent's local services; large long distance companies that offer local service via the network element entry option are *not* covered. *First Report and Order*, ¶ 335 (J.A. 61-62).

The UNE platform would permit the large long distance carriers to nullify section 271(e)(1). The platform allows CLECs to resell the incumbent carrier's retail services under the guise of a purported combination of unbundled network elements. Thus, if AT&T were to affix the "resale" label to its resale of a Bell company's retail services, the joint marketing restriction would apply. However, according to petitioners, AT&T could evade that restriction simply by affixing the "UNE platform" label to the identical resale of a Bell company's retail services. The UNE platform, then, would nullify not only section 251(c)(4), but also section 271(e)(1), and is inconsistent with the 1996 Act for that reason as well. See *Rake* v. *Wade*, 508 U.S. 464, 471 (1993) ("We generally avoid construing one provision in a statute so as to suspend or supersede another provision.").

In sum, petitioners' campaign to require incumbent carriers to provide the UNE platform — a drive dependent upon Rule 315(b) and the "all elements" rule — is a blatant attempt to subvert the 1996 Act's clear distinction between unbundled network elements and resale.

II. The UNE Platform Does Not Provide A New Entrant With "Access To Network Elements On An Unbundled Basis At Any Technically Feasible Point."

Section 251(c)(3) requires incumbent carriers to "provide * * * nondiscriminatory access to network elements on an unbundled basis at any technically feasible point." 47 U.S.C. § 251(c)(3). While the UNE platform may be a preassembled combination of the incumbent carrier's *facilities*, it plainly is *not* a combination of *unbundled network elements* within the meaning of section 251(c)(3). *First*, because new entrants acquire the UNE platform on an "as is" basis, they do not obtain "access" to network elements at a "technically feasible point." *Second*, because a new entrant *must* take essential components of the UNE platform together as an integrated whole, and does not have the option of taking those components separately, the platform is not a combination of *unbundled* network elements *even* under petitioners' unduly restrictive definition of "unbundled."

A. The UNE Platform Does Not Give A New Entrant "Access" At A "Technically Feasible Point" To Network Elements.

Section 251(c)(3) requires incumbent carriers to provide "nondiscriminatory access to network elements on an unbundled basis *at any technically feasible point*." 47 U.S.C. § 251(c)(3) (emphasis added). The term "at any technically feasible point" — which MCI (MCI Br. 14) and the FCC (FCC Br. 43) omit from their respective recitations of section 251(c)(3) — undeniably has a physical dimension. The noun "point" refers to a physical place in the physical world. The adjective phrase "technically feasible" makes sense only in the context of obtaining actual *physical* access to a network element.[16]

---

[16] The FCC's *First Report and Order* adopted this understanding of the statutory text: "We conclude that the term 'technically feasible' refers solely

The UNE platform does not give a new entrant physical access to network facilities at *any* point, let alone at a "technically feasible point." As described previously (see pp. 16-20 & 25-28, *supra*), the UNE platform allows CLECs to use the precise preassembled combination of network facilities that comprises the incumbent's entire local network. Thus, in acquiring the UNE platform, a new entrant obtains use of the incumbent's network as a bundled, amalgamated whole. There is no need for the entrant to design an alternative network, designate or request any particular facilities to carry its customers' telecommunications traffic, or combine leased network facilities with one another. Indeed, to CLECs like AT&T, the principal benefit of acquiring the UNE platform on an "as is" basis (see pp. 16-18, *supra*) lies in the fact that the UNE platform does not require a new entrant to obtain physical access to *any* specific facilities in the incumbent's network.

That feature of the UNE platform, however, is precisely what renders it invalid under section 251(c)(3). Because the UNE platform does not give a new entrant "access * * * at any technically feasible point" to network elements, the platform is "flatly inconsistent" with the terms of the 1996 Act. *Maislin Indus.* v. *Primary Steel, Inc.*, 497 U.S. 116, 131 (1990).

---

to technical or operational concerns, rather than economic, space, or site considerations. We further conclude that the obligations imposed by section[] * * * 251(c)(3) include modifications to incumbent [carrier] facilities to the extent necessary to accommodate * * * access to network elements." *First Report and Order*, ¶ 198 (J.A. 34). This passage plainly demonstrates the FCC's understanding that new entrants will obtain physical access to unbundled network elements. That is the only context in which it would make sense to speak of the "technical and operational concerns," or of the "modifications to incumbent [carrier] facilities," involved in granting access to network elements. See also *id.* ¶¶ 202-204 (J.A. 34-37).

B. The Components Of The UNE Platform Are Not "Unbundled" Network Elements, Even Under The Unduly Restrictive Definition Of "Unbundled" Advocated By Petitioners.

There is an independent reason why the UNE platform is not a combination of unbundled network elements within the meaning of section 251(c)(3). The statute requires incumbent carriers to provide "access" to network elements "on an unbundled basis." 47 U.S.C. § 251(c)(3). The UNE platform, however, is not a combination of "unbundled" network elements under *any* definition of "unbundled." If, as the court of appeals correctly held, the term "unbundled" in section 251(c)(3) means physically separated, the UNE platform obviously could not be a combination of "unbundled" facilities. And even if, as petitioners incorrectly maintain, two physically connected network elements may be "unbundled" when a new entrant has the ability to acquire one of the elements but not the other, the UNE platform — which allows a new entrant to share the incumbent's network facilities in their current configuration — *still* is not a combination of "unbundled" network elements. For example, as the FCC has acknowledged, a new entrant does not have the option of taking the shared interoffice transmission component of the UNE platform without *also* taking the local switching component of the platform.

1. The Bell Atlantic, U S WEST and GTE Briefs cogently explain why the Eighth Circuit correctly concluded that incumbent carriers cannot be required to provide assembled network element combinations. Section 251(c)(3) requires that the new entrant itself physically combine network elements leased from the incumbent. Thus, as the court of appeals ruled, the term "unbundled," understood in the context of section 251(c)(3) as a whole, means physically separated as well as separately priced. The FCC, at least originally, shared this understanding: "the terms 'access' to network elements 'on an unbundled basis' mean that incum-

bent [carriers] must provide the facility or functionality of a particular element to requesting carriers, separate from the facility or functionality of other elements, for a separate fee." *First Report and Order*, ¶ 268 (J.A. 43). It necessarily follows that the FCC and CLECs such as AT&T and MCI are wrong to characterize the UNE platform — *i.e.*, the incumbent's preassembled, integrated network — as a combination of "unbundled" network elements under section 251(c)(3). See *Public Employees Retirement System of Ohio* v. *Betts*, 492 U.S. 158, 171 (1989) ("no deference is due to agency interpretations at odds with the plain language of the statute itself").

2. Petitioners argue vigorously that to be "unbundled," a network element need not be physically separated from adjacent network elements. As AT&T puts it, "[t]o provide something on an unbundled basis is * * * simply to state a different price for it and *to give users the option of declining to purchase it as part of a package.*" AT&T Br. 38-39 (emphasis added). See also MCI Br. 19 (the "normal meaning" of "unbundled" is "'*separately available* at a separate price'") (emphasis added); FCC Br. 44 ("the term 'unbundle' * * * denote[s] giving someone a *choice* of elements at separate prices") (emphasis added). That is, petitioners contend that two physically connected network elements may be "unbundled" within the meaning of section 251(c)(3) if a new entrant has the ability, if it so desires, to acquire one of the elements but not the other. See AT&T Br. 39 (to provide network components on an "unbundled" basis, incumbent carrier must "give customers the option of declining to obtain the unbundled component in combination with the [incumbent's] other * * * facilities").

Petitioners' strained interpretation of the statutory term "unbundled" is incorrect for the reasons set forth in the Bell Atlantic, U S WEST and GTE Briefs. However, even assuming *arguendo* that petitioners were correct, the UNE platform *still* could not be characterized as a combination of "unbun-

dled" network elements under section 251(c)(3). The reason is plain.

The UNE platform is the existing preassembled combination of equipment and facilities that the incumbent LEC uses to provide retail telecommunications service to its customers. As petitioners have acknowledged (see p. 20 & n.11, *supra*), a CLEC cannot acquire the UNE platform without leasing the incumbent carrier's entire interoffice transmission network. And whether the incumbent's entire interoffice transport network is viewed as a single network element or an integrated combination of separate network elements, the FCC has correctly recognized that a CLEC sharing use of that transport network "must also take local switching" from the incumbent. *Third Reconsideration Order*, ¶ 47 (J.A. 249). Moreover, it is undisputed that interoffice transmission and local switching are separate network elements. See 47 U.S.C. §§ 271(c)(2)(B)(v) ("[l]ocal transport" is transport "from the trunk side of a * * * switch unbundled from switching"), 271(c)(2)(B)(vi) ("[l]ocal switching" is switching "unbundled from transport").

The bottom line is that CLECs acquiring the UNE platform do not have the option of obtaining the interoffice transmission component of the platform without also taking the local switching component of the platform. Thus, even accepting petitioners' erroneous contention that the term "unbundled" in section 251(c)(3) means only that a new entrant has the *option* of obtaining a network element without also taking adjacent network elements, the UNE platform still cannot be considered a combination of *unbundled* network elements. It necessarily follows that incumbent LECs may not be compelled to provide the UNE platform under section 251(c)(3) at the cost-based rates reserved by Congress for unbundled network elements. See *Brown* v. *Gardner*, 513 U.S. 115, 122 (1994) (Court will not defer to agency interpretation of statute that "flies against the plain language of the statutory text").

There is an additional reason why the UNE platform is not a combination of *unbundled* network elements within the plain meaning of section 251(c)(3). That provision obligates incumbent carriers to provide unbundled network elements only if it is "technically feasible" to do so. 47 U.S.C. § 251(c)(3). But the FCC has conceded that an incumbent carrier providing shared local transport facilities separately from local switching would court disaster: "an incumbent LEC that separates shared transport facilities that are already connected to a switch would likely disrupt service to its own customers served by the switch." *Third Reconsideration Order*, ¶ 44 (J.A. 248). Ameritech agrees: if a CLEC purchasing the UNE platform exercised its "option" to receive separately the switching and transport facilities that the incumbent carrier currently combines and uses, the local telephone network would crash. It therefore is technically infeasible to give CLECs the option to acquire the components of the UNE platform separately from one another. See *First Report and Order*, ¶ 203 ("[n]egative network reliability effects are necessarily contrary to a finding of technical feasibility") (J.A. 36). Thus, the text of section 251(c)(3) squarely precludes imposing upon incumbent LECs an obligation to provide the UNE platform.

III. The Policy Justifications Advanced By Petitioners In Favor Of The UNE Platform Are Both Irrelevant And Invalid.

In defending Rule 315(b) before this Court, petitioners barely address the UNE platform. This is no surprise. Although Rule 315(b) is central to petitioners' efforts to obtain the UNE platform, actually addressing the platform would have compelled petitioners to explain how it could possibly be consistent with the distinction drawn by Congress between the unbundled network element and resale entry options.

MCI makes a feeble effort to justify the UNE platform. It does so by attacking what it calls the Eighth Circuit's

"policy rationale" for holding that new entrants may not obtain the UNE platform under section 251(c)(3). MCI Br. 22-26. MCI's characterization of the court of appeals' decision is incorrect. As demonstrated in the Bell Atlantic, U S WEST and GTE Briefs, the Eighth Circuit rested its decision entirely upon the text of section 251(c)(3) and the structure of section 251(c) as a whole, not on its view of what constitutes sound public policy. See Pet. App. 71a. There can be no question that the court of appeals fully appreciated its responsibilities under *Chevron*. *Id.* at 8a ("We must defer to administrative agency interpretations only if they are consistent with the plain meaning of a statute or are reasonable constructions of ambiguous statutes * * * [O]ur review does not encompass any determination regarding the wisdom or prudence of the policies Congress set forth in the Act * * *") (citing *Chevron U.S.A. Inc.* v. *NRDC*, 467 U.S. 837, 842-45 (1984)). Accord, *MCI* v. *AT&T*, *supra*, 512 U.S. at 229.

Rather, it is MCI that seeks refuge in policy arguments to validate the UNE platform. Those arguments, of course, are irrelevant, given that the UNE platform is prohibited by the statutory text and structure of section 251(c). See *Central Bank* v. *First Interstate Bank*, 511 U.S. 164, 188 (1994) ("[p]olicy considerations cannot override * * * the text and structure of the Act"); *LeFlore* v. *Marvel Entertainment Group*, 493 U.S. 120, 126 (1989) ("[o]ur task is to apply the text, not to improve upon it").

Even if they were somehow relevant, MCI's policy arguments are meritless. In essence, MCI maintains that the Eighth Circuit's invalidation of the UNE platform "handicap[s]" the network element entry strategy and "compel[s] market participants to compete through inefficient means." MCI Br. 26. The only strategy hindered by the court of appeals, however, is that of the largest long distance carriers to acquire the incumbent carriers' resale services on the cheap. This is a view shared not only by incumbent

carriers like Ameritech, but also by new entrants that have actually invested in new network facilities and combined those facilities with unbundled network elements. Those new entrants, in fact, have praised the Eighth Circuit's decision as a boon for carriers seeking to compete for customers via the unbundled network element entry option.

For example, the CEO of Brooks Fiber, a facilities-based entrant operating in Ameritech's region, declared that new local entrants "'owe[] a debt of gratitude to the Eighth Circuit. * * * The fact that there will be no free ride' for interexchange [*i.e.*, long distance] carriers seeking a cheap method of local market entry is a 'plus for our industry.'"[17] Time Warner, another facilities-based entrant, warned that making the UNE platform available to CLECs would "discourag[e] investment in alternative networks which, over the long-term, will be the most significant competition to [incumbent carriers]."[18] In sum, the UNE platform is not essential to, but in fact is destructive of, facilities-based competition through the network element entry option. The

[17] *ALTS Members Tout 'Year of the CLEC'*, Telco Competition Rep. (Nov. 20, 1997) (quoting James Allen).

[18] Comments of the Ohio Cable Telecommunications Ass'n and Time Warner Communications of Ohio, L.P., Case No. 96-922-TP-UNC (Pub. Util. Comm'n of Ohio), at 4, 6 (filed Aug. 25, 1997). Accord, *RHCs as wholesalers: As competitors become customers, RHCs are staffing up to serve them*, Telephony (Jan. 5, 1998) ("'Facilities-based [new entrants] have put a lot of money into the ground,' says Cindy Schonhaut, ICG's senior vice president for government and external affairs. 'If someone can buy [the incumbent's] network at substantially lower rates, that's not going to * * * help us recoup our investment.'"); Time Warner Communications Mem. In Support of Petitions for Rehearing at 8 (8th Cir. filed Oct. 1, 1997) ("If the advocates of [the UNE platform] prevail, then only the illusion of local competition will have been created * * * resulting in a reallocation of revenues and earnings between and among the incumbent [carriers] and the major interexchange carriers who have chosen to enter the local market by reselling * * * platforms of network elements which have been combined into complete services by the [incumbent carriers].").

platform would give AT&T and MCI a grossly unfair competitive advantage not only over incumbent carriers, but also over smaller new entrants that have chosen to invest in new network facilities and design alternative networks with the help of unbundled network elements.

In the end, there is no need for the Court to choose sides in the policy debate over the UNE platform. Congress has resolved that dispute through the text and structure of the 1996 Act, which preclude a CLEC from acquiring an incumbent's entire preassembled network configuration while avoiding the statutory provisions applicable to resale. It follows that the Eighth Circuit correctly held that section 251(c)(3) "does not permit a new entrant to purchase the incumbent LEC's assembled platform(s) of combined network elements" as a cut-rate substitute for resale. Pet. App. 71a. This Court should confirm that section 251(c)(3) does not permit CLECs to acquire the UNE platform at the cost-based rates reserved for unbundled network elements.

CONCLUSION

The judgment of the court of appeals should be affirmed insofar as it vacates Rule 315(b), and reversed insofar as it upholds the "all elements" rule. If this Court determines that Rule 315(b) and the "all elements" rule are valid on their face, the Court should hold that the rules are invalid to the extent they require incumbent LECs to provide the UNE platform at the cost-based rates reserved for unbundled network elements.

Respectfully submitted.

Contel of Minnesota, Inc.
Contel of the South, Inc.

QUESTIONS PRESENTED

1. Did the Court of Appeals correctly decide (i) that the plain terms of the Telecommunications Act of 1996 leave pricing determinations under the local competition provisions of the Act to state public utility commissions, rather than to the FCC; and (ii) that as to both pricing and other intrastate matters addressed by the Act, Section 2(b) of the Communications Act of 1934, 47 U.S.C. § 152(b), limits the FCC's authority to areas where the agency was assigned a role in straightforward and unambiguous terms by Congress?

2. Did the Court of Appeals err in affirming the FCC's determination that the term "network elements" is not limited to equipment in an incumbent's call routing network (and features of such equipment), but rather includes virtually all important aspects of the incumbent telephone company's business, including separate software systems used for business functions (such as billing) and distinct services that are separately available for purchase at wholesale rates?

3. Did the Court of Appeals err in accepting the FCC's determination that in evaluating whether access to a particular network element was "necessary" or whether a failure to provide access to such an element would "impair" an entrant's ability to provide service, *see* 47 U.S.C. § 251(d)(2), the ready availability of alternative facilities outside the incumbent's network should be deemed irrelevant?

4. Did the Court of Appeals err in affirming the FCC's determination that entrants may purchase from an incumbent telephone company *all* of the network elements

QUESTIONS PRESENTED
(continued)

needed to provide service without using any facilities of their own?

5. Did the Court of Appeals correctly interpret 47 U.S.C. § 251(c)(3), which requires incumbent telephone companies to provide network elements to requesting carriers "in a manner that allows requesting carriers to combine such elements," as requiring requesting carriers, rather than incumbents, to undertake the burden of combining elements in order to provide telephone service?

6. Was the Court of Appeals correct in vacating the FCC's rule implementing 47 U.S.C. § 252(I), which provides that an incumbent telephone company must "make available any interconnection, service, or network element provided under an agreement . . . to which it is a party to any other requesting telecommunications carrier upon the same terms and conditions as those provided in the agreement," where the FCC's rule would have allowed requesting carriers to pick and choose individual terms from other agreements without accepting all of the trade-offs that had produced those terms?

RULE 29.6 STATEMENT

Pursuant to Supreme Court Rule 29.6, the GTE Entities advise the Court that each of the GTE Entities listed inside the front cover of this brief is a subsidiary of GTE Corporation. In addition, GTE Corporation has the following subsidiaries or affiliates that have outstanding securities in the hands of the public:

Acentech
AG Communication Systems Corporation
Alabama 1-Franklin RSA Partnership

I. CONGRESS RESERVED AUTHORITY OVER THE ACT'S PRICING AND OTHER INTRASTATE MATTERS TO THE STATES . . 27

A. Congress Expressly Reserved Authority Over the Act's Pricing Provisions to the States 28

1. The Plain Terms of the Act Assign Pricing Authority to the States 28
2. The FCC Cannot Point to Any Terms in the 1996 Act Assigning It Authority Over Pricing 31
3. The FCC's Second-Line Statutory Arguments Provide No Better Support for Its Claim to Pricing Authority 33
4. The FCC's Policy Arguments Ignore Congress's Plan for Implementing the Act and Cannot Override the Text of the Statute 38

B. Section 2(b) Independently Confirms That the FCC Has No Jurisdiction Over Pricing, and Also Restricts the FCC's Authority Over Other Intrastate Matters Addressed by the 1996 Act 41

1. Section 2(b) Is a Statute-Specific Counter-*Chevron* Rule of Construction 42

TABLE OF CONTENTS
(continued)

Page

2. The Court of Appeals Correctly Held That Section 2(b) Would Resolve Any Ambiguity in the Act Against the FCC's Assertion of Jurisdiction Over Pricing Matters 43
3. The Court of Appeals Was Also Correct That Section 2(b) Restricts the FCC's Jurisdiction Over Other, Non-Pricing Matters Involving Intrastate Telecommunications 48

II. THE EIGHTH CIRCUIT PROPERLY VACATED ONE OF THE FCC'S FOUR RULES RADICALLY EXPANDING THE UNBUNDLING DUTY, BUT FAILED TO ENFORCE THE REMAINING RESTRICTIONS IMPOSED BY CONGRESS .. 49

A. The Combined Effect of the FCC's Four Unlawful Decisions on Unbundling Highlights the Conflict Between the FCC's Rules and the Act 50

B. The Court of Appeals Erred in Upholding Three of the FCC's Improper Expansions of the Duty To Provide Unbundled Network Elements 54

1. The FCC Improperly Expanded the Definition of Network Elements 54

TABLE OF CONTENTS
(continued)

INTRODUCTION

In the Telecommunications Act of 1996 ("Act" or "1996 Act"), Congress established federal standards governing the introduction of competition into markets for local telephone service. The 104th Congress fashioned a specialized mechanism for implementing these standards: private negotiations backed up by arbitrations conducted by state public utility commissions. The Act thus leaves control over implementing the new era of competition in *intra*state markets precisely where control over these markets has always been — in the hands of the States.

The Act also strikes a careful balance. On the one hand, Congress wanted to promote rapid entry by competitors even before they could build ubiquitous local telephone facilities of their own. The Act thus requires an incumbent local telephone company to provide interconnection, wholesale services, and elements of its network to competing entrants. On the other hand, Congress placed equal importance on establishing rules that would (i) encourage new entrants to build facilities; (ii) preserve the traditional goal of ensuring that basic service is universally available at low, affordable rates ("universal service"); and (iii) compensate incumbents fully for the forced use of their networks and services by competitors.

The Federal Communications Commission (FCC), however, attempted to undo Congress's most important decisions. *First*, the FCC sought to usurp authority to set the critical *prices* for wholesale services, interconnection, and network elements, which the Act expressly assigns to the States. *Second*, the FCC radically expanded an incumbent's duty to provide its competitors with access to its network elements in order to promote the FCC's view that it needed to "jump start" entry by new firms. The FCC's rules would have destroyed the Act's careful balance between promoting rapid entry and preserving universal service, compensating incumbents, and fostering true facilities-based competition.

The Eighth Circuit struck down the FCC's most blatant attempts to rewrite the Act and substitute its policy choices for those made by Congress. As we demonstrate below, the Court of Appeals was correct to invalidate the worst of the FCC's usurpations — including its attempt to grab jurisdiction away from the States — but in fact it should have invalidated significantly more of the FCC's Order.

STATEMENT OF THE CASE

A. The Regulatory Background Before 1996.

Regulation of telecommunications has long been divided into separate spheres of responsibility for the States and the federal government. Section 2(b) of the Communications Act of 1934 provides the central command limiting federal authority over intrastate communications. Except for certain enumerated sections of the Act, "nothing in this Act shall be construed to apply or to give the [Federal Communications] Commission jurisdiction with respect to . . . charges, classifications, practices, services, facilities, or regulations for or in connection with intrastate communication service." 47 U.S.C. § 152(b). Regulating intrastate service — including local service — has thus been the exclusive province of state public utility commissions for decades.

Regulators long operated under the assumption that local telephone service is a natural monopoly. State laws thus granted an exclusive franchise in each local service area and provided for regulating the incumbent local exchange carrier (or incumbent "LEC") as a public utility.

The system of exclusive franchises was critical for ensuring that telephone service was universally available at affordable rates to all residents, including those in remote and other expensive-to-serve areas. To promote this objective of "universal service," States set low (often below-cost) rates for basic residential service (particularly in more rural areas) and subsidized those rates with higher, above-cost charges for

business service and for services such as special calling features.[1] It was only by restricting entry into the local market that States could ensure that above-cost rates in some segments of the market would not encourage competitors to enter and strip away the high-margin customers that were funding low residential rates. The exclusive franchise system thus allowed the States to operate a subsidy system by requiring the incumbent carrier to serve as the conduit, or the tax collector, for the subsidy flows, collecting high rates for some services in order to subsidize lower rates for others.

B. The Telecommunications Act of 1996.

In more recent years, advances in technology began to erode the assumption that local service could be provided most efficiently by a single carrier. In the mid-1990s, therefore, many States began efforts to introduce competition into local markets and undertook the difficult task of allowing competitive entry while still preserving the traditional regulatory goal of universal, affordable service.[2]

In the Telecommunications Act of 1996, Congress determined to follow the lead of these States, and concluded that all telecommunications markets should be opened to competition. With respect to markets for local service, Congress rejected the idea that it was efficient for only one

---

[1] The FCC has outlined the typical system of implicit cross-subsidies. *See, e.g.*, In the Matter of Federal-State Joint Board on Universal Service, CC Docket No. 96-45, ¶ 11 (May 8, 1997) (hereinafter "Universal Service Order") ("Most states have established local rate levels such that businesses pay more on a per-line basis for basic local service than do residential customers, although the costs of providing business and residential lines are generally the same. In addition, rates charged for vertical services such as touch tone, conference calling and speed dialing, subsidize basic local service rates.").

[2] *See, e.g.*, Cal. Pub. Util. Code § 709 (1994); *see also Iowa Utils. Bd. v. FCC*, 109 F.3d 418, 427 n.7 (8th Cir. 1996).

firm to operate a local network and instead outlined a "pro-competitive, de-regulatory" framework for introducing full, facilities-based competition into all segments of the telecommunications industry. H.R. Conf. Rep. No. 104-458 at 113 (1996) (hereinafter "Conf. Rep."). Congress proceeded explicitly on the assumption that "meaningful facilities-based competition is possible," *id.* at 148, and thus set out to craft a statutory plan that would "accelerate rapidly private sector deployment of advanced telecommunications and information technologies and services . . . by opening all telecommunications markets to competition," *id.* at 113.

To foster the ultimate goal of facilities-based competition, Congress had to strike a careful balance between a series of competing considerations. Congress recognized, for example, "that it is unlikely that competitors will have a fully redundant network in place when they initially offer local service." Conf. Rep. at 148. To spur rapid entry, therefore, Congress allowed competitors to make some use of the existing network facilities of incumbent LECs. But granting access to incumbents' facilities raised countervailing concerns.

First, Congress had to ensure that access to existing equipment was not granted *so* expansively and made *so* attractive that it would stifle incentives for entrants to deploy their own rival facilities. That would sacrifice the long-term objective of the Act (facilities-based competition) in favor of the superficial, short-term achievement of merely multiplying the number of firms in the market using the same network.

Second, Congress had to ensure that incumbents would be fully compensated for the forced use of their property. The bedrock constitutional command embodied in the Takings Clause, U.S. Const. Amend. V, requires that incumbents who are forced to turn over their property to competitors be compensated fully for *all* of their costs and be afforded an opportunity to earn a fair rate of return.

Third, Congress recognized that there was an inherent conflict between competition and the current system of implicit subsidies used to maintain low residential rates. Once markets were opened, cross-subsidies in incumbents' rates would give new entrants an artificial ability to undercut incumbents and to strip away high-value customers. Indeed, by cherry-picking such customers, entrants would divert the very revenue streams that had subsidized below-cost service and would put pressure on the subsidy system to collapse. In confronting this problem, Congress had to protect two goals. First, Congress wanted to preserve universal service. Abandoning universal service altogether and letting the market set rates, after all, would mean *increases* in rates for most Americans. Congress therefore mandated the creation of explicit subsidy funds that would be sustainable in a competitive market. Second, Congress also had to ensure that during the interim period before such new funds were established, States would have sufficient flexibility to ensure that entrants could not cherry-pick the highest-value consumers in the market without making a fair contribution to universal service.

As outlined below, the Act reconciles these competing considerations through a series of restrictions ensuring that each facet of the plan for competition fulfills a limited role and does not upset the structure of the whole.

1. Opening the Local Exchange.

To promote the basic objective of spurring competition, Congress explicitly preempted all state barriers to entry in local service. *See* § 253(a). Congress also recognized that spurring rapid entry would require aiding competitors who would not be able instantly to deploy ubiquitous local networks of their own. Congress therefore imposed a series of duties on incumbents requiring them to allow entrants to use their existing networks.

First, Congress required each incumbent to allow entrants to "interconnect" with its network. *See* § 251(c)(2). This duty

made it possible for an entrant to compete by deploying only a limited network of its own since it eliminated the need to create a free-standing, ubiquitous network that connected all consumers in an area. Interconnection allows an entrant, in effect, to buy ubiquitous access to all consumers on the incumbent's network. Through interconnection, an entrant with only a small network of its own can ensure that customers on its network can speak to everyone else.

Second, Congress acted on its recognition that entrants may need to obtain "*[s]ome* facilities and capabilities (*e.g.*, central office switching)" from incumbents, Conf. Rep. at 148 (emphasis added), by requiring incumbents to make pieces or "elements" of their networks available on an "unbundled basis" in "a manner that allows requesting carriers to combine such elements in order to provide . . . telecommunications service." § 251(c)(3). This provided a method for entrants with *some* facilities of their own to purchase selected pieces of equipment from an incumbent (for example, the "loop" or wire connecting the customer to the switch) so that the entrants could begin competing without having to build out the full facilities needed to serve even a small number of customers.

Third, Congress directed incumbents to make finished telecommunications services available to entrants at wholesale rates. *See* § 251(c)(4). That allowed entrants to provide a limited form of competition by acting as middlemen reselling an incumbent's own service, and more importantly would allow entrants to build up a customer base of significant scale that would then enable them to invest in facilities of their own.[3]

---

[3] *Cf.* Remarks of FCC Chairman Reed Hundt, "Antitrust and Interconnection: Old Wine in New Bottles (Telecommunications Act of 1996)," 1996 WL 646783 (November 8, 1996) (explaining that resale played exactly this role as a "competitive stepping stone to facilities-based competition" in long distance markets).

While it granted entrants forced access to incumbents' property, Congress also carefully *limited* these obligations to protect competing objectives served by the Act. In particular, to ensure that access to the existing network would not erode entrants' incentives to deploy competing facilities, Congress carefully circumscribed the duty to provide network elements.

First, Congress defined "network element" as "a facility or equipment used in the provision of a telecommunications service," including the "features, functions, and capabilities that are provided by means of such facility or equipment." 47 U.S.C. § 153(29). Network elements are thus definitionally limited to *physical* parts of the call-routing network — and features provided by those parts.

Second, Congress made it clear that even if a facility qualified as a "network element," a new entrant could not obtain that facility absent some demonstration of need. Congress thus required an evaluation of whether access to a proprietary element was "necessary" for a competitor, and for non-proprietary elements required an evaluation of whether a failure to provide access "would impair the ability of the telecommunications carrier seeking access to provide the services that it seeks to offer." § 251(d)(2).

Through these first two restrictions, Congress limited access to elements to what — as AT&T rightly recognizes — would conventionally be termed "essential facilities" of the local exchange — the facilities that had long been thought to be so difficult to duplicate that they justified treating incumbent LECs as natural monopolies. *See* AT&T Br. 2. These restrictions played a critical role in ensuring that allowing access to existing networks would not undermine the primary goal of "meaningful facilities-based competition,"

Conf. Rep. at 148, by eliminating incentives for entrants to build facilities of their own.[4]

Third, the Act restricted network elements to provide a limited entry path between simple "interconnection," which would be useful only for those who had end-to-end local exchange facilities of their own, and "resale," which would be used by those who had no facilities and who wanted to be middlemen reselling an incumbent's service. By mandating "access" to discrete pieces of the network "at any technically feasible point," § 251(c)(3), Congress provided entrants who had some facilities a method for entering immediately by filling out their networks with leased equipment — but it did not eliminate the need to have *any* facilities whatsoever.

Fourth, Congress directed that incumbents were required to provide these parts of their networks only as separate, discrete pieces — that is, "on an unbundled basis" and "in a manner that allows *requesting carriers* to combine such elements" to provide service. § 251(c)(3) (emphasis added). The statutory rubric of providing "access" to "elements" did *not* require them to turn over their *entire networks* ready for an entrant to use to resell fully preassembled telephone service.

In addition to those limitations on access to network elements, Congress also designed the pricing standards for both network elements and wholesale services to serve the concurrent objectives of retaining incentives for entrants to deploy their own facilities, allowing immediate entry by those who lacked complete networks of their own, compensating incumbents, and preserving universal service.

---

[4] *Cf., e.g.*, W. Blumenthal, *Three Vexing Issues Under the Essential Facilities Doctrine: ATM Networks as Illustration*, 58 Antitrust L.J. 855, 860 (1989) ("In light of the potentially perverse competitive incentives created by the opportunity for compulsory access, a plaintiff should not be granted access in an essential facilities case unless the alternatives to the facility are extraordinarily difficult for anyone to put in place.").

Congress required wholesale prices for finished service made available for resale to be based on retail rates reduced only by the "costs that will be avoided by the local exchange carrier" through offering the service at wholesale rather than at retail. § 252(d)(3). That standard ensures that incumbents will be compensated for all their costs (which are necessarily reflected in retail rates set by state regulators) and that entrants who can provide service more cheaply than the incumbent will have an incentive to do so. It also ensures that wholesale rates will incorporate whatever cross-subsidy structure regulators have embedded in retail rates. *Cf.* H.R. Rep. No. 104-204, pt. 1, at 72 (1995) ("The [resale] rate should reflect whether, and to what extent, the local dialtone service is subsidized by other services . . . ."). It thus prevents entrants from purchasing wholesale services without contributing to universal service and ensures that entrants will not be given prices that allow them automatically to undercut the incumbent's rates (which include contributions to universal service).

For interconnection and unbundled network elements, Congress specified that rates must be "based on the cost . . . of providing the interconnection or network element" and "may include a reasonable profit." § 252(d)(1). Properly construed,[5] that standard ensures that incumbents will receive full compensation based on all the actual costs of providing their existing facilities. At the same time, it preserves incentives for entrants to construct their own facilities if they would be more efficient (*i.e.*, lower-cost) than the incumbent's.

---

[5] As outlined below, the FCC misinterpreted the standard in § 252(d)(1) to preclude the States from considering either the costs of universal service subsidies or the actual costs of past investments in the network ("historical costs"). *See infra* pp. 15-16. Although the Eighth Circuit vacated that rule on jurisdictional grounds, state commissions have applied a similar interpretation.

2. Reform of Universal Service Subsidies.

Congress also recognized that competition required a comprehensive reform of universal service subsidies. Implicit subsidies embedded in retail rates are not sustainable in a competitive environment. Indeed, if left in place, they would unfairly hobble incumbents in the competitive race. Entrants unfettered by a state-imposed rate structure would have a guaranteed opportunity to offer lower rates than an incumbent. Thus, they could target and strip away precisely the high-margin customers who currently support low residential rates, diverting to themselves the revenues that now fund universal service. That result could not be permitted, since requiring incumbents to continue providing below-cost rates to residential subscribers in that scenario would impermissibly convert the incumbent from a conduit for subsidies to a deep pocket funding the subsidy itself.[6]

Wary of these dangers, Congress demanded reforms in universal service to ensure both that universal service was not sacrificed and that entrants would not be given an unfair advantage by being exempted from universal service burdens. Congress thus commanded in § 254 that the current system of implicit subsidies embedded in rates should be replaced by "explicit" subsidies sustainable in a competitive market. § 254(e).

---

[6] The FCC itself has explained that the "system [of implicit subsidies] is not sustainable in its current form in a competitive environment. Implicit subsidies were sustainable in the monopoly environment because some consumers (such as urban business customers) could be charged rates for local exchange and exchange access service that significantly exceeded the cost of providing service, and the rates paid by those customers would implicitly subsidize service provided by the same carrier to others. . . . In a competitive market, a carrier that attempts to charge rates significantly above cost to a class of customers will lose many of those customers to a competitor." Universal Service Order ¶ 17.

Section 254 also makes clear that the States play a critical role in coordinating the transition to a new subsidy structure with the advent of competition. In particular, Congress wanted to ensure that in the interim period before new explicit subsidy systems were fully ready, entrants would not simply be given a free ride by being exempted from any universal service burden whatsoever. Thus, Congress obligated the States in unequivocal terms to ensure that "*[e]very* telecommunications carrier that provides intrastate telecommunications services *shall contribute, on an equitable and nondiscriminatory basis*, in a manner determined by the State to the preservation and advancement of universal service." § 254(f) (emphasis added). No entrant, in other words, could be absolved of a fair share of the burden of universal service. By giving them the flexibility to incorporate universal service costs into the prices for wholesale services and network elements, the Act's pricing standards provided the States a critical ability to coordinate their progress in universal service reform with advancing competition.

3. Decentralized Implementation of the Act.

In opening local markets to competition, Congress was extensively applying federal law to purely *intra*state communications — and particularly to matters of competition in intrastate communications — for the first time. Congress thus faced a significant choice. It could follow the extension of substantive federal law with a corresponding extension in the power of the FCC, or it could rely on a more localized mechanism to implement the Act.

In this deregulatory legislation, the 104th Congress was hardly enamored with the prospect of granting more power to federal bureaucracies, especially in an area traditionally subject to state control. Thus, it should come as no surprise that to implement the Act — part of the stated goal of which was to "reduce regulation," Pub. L. No. 104-104 (preamble) — Congress did not simply turn over the reins to regulators at the

FCC. Instead, Congress pursued a decentralized plan for establishing the Act's "de-regulatory" framework.

First and foremost, Congress did not turn to any government agency at all to administer the Act, but rather relied on *private negotiations* to establish agreements implementing the duties imposed on incumbents. Congress thus imposed a duty on both incumbents and new entrants to negotiate in good faith. *See* § 251(c)(1). Moreover, to provide an incentive for negotiations, the Act freed negotiated agreements from many of the substantive standards of § 251. *See* § 252(a).

Next, Congress provided that if private negotiations proved unfruitful, either party could petition a *state public utility commission* to conduct a binding arbitration on open issues. § 252(b)(1). States thus could use the expertise they had developed through decades as the sole regulators of local service to apply the Act, through individualized arbitration proceedings, to the specific circumstances of particular carriers in different parts of the country while protecting universal service.

In particular, Congress made clear in § 252(d) that *States* would determine the *prices* that would apply to interconnection, unbundled elements, and resold service. That section provides that "a State commission" will make the "[d]etermination" of the rates for interconnection and network elements and spells out the specific standard state commissions are to apply. § 252(d)(1). Similarly, it commands that a "State commission shall determine wholesale rates." § 252(d)(3).

Congress also assigned the FCC a number of significant tasks in implementing the local competition provisions of the Act. If a State decides not to undertake its role under § 252, the statute provides that the FCC "shall assume the responsibility of the State commission . . . with respect to the proceeding or matter." § 252(e)(5). In addition, Congress

assigned the FCC several specific responsibilities, including "exclusive jurisdiction" over "telecommunications numbering." § 251(e)(1). Similarly, Congress envisioned the FCC's having some role in determining which network elements should be made available, *see* § 251(d)(2), and in defining requirements for "number portability," § 251(b)(2).

Significantly, Congress declined to amend § 2(b) of the Communications Act to exempt the new provisions of the 1996 Act from § 2(b)'s strict limitation on the FCC's power over intrastate matters. Indeed, while such an amendment had been part of both the House and Senate bills, *see* S. 652, 104th Cong., 1st Sess. § 101(c)(2) (1995); H.R. 1555, 104th Cong., 1st Sess. § 101(e)(1) (1995), the Conference Committee removed such a provision from the final legislation.

To speed competition, Congress set deadlines for both the States and the FCC. Congress directed the FCC to "establish regulations" for implementing the tasks assigned to it in § 251 "[w]ithin 6 months after the date of enactment," § 251(d)(1), and directed the States to conclude arbitrations "not later than 9 months after the date on which the local exchange carrier received the request [for negotiations]." § 252(b)(4).

Lastly, consistent with its decentralized approach to administering the Act, Congress provided for exclusive review of state commission arbitration decisions in the various federal district courts. *See* § 252(e)(4), (e)(6). Congress gave the FCC no authority to review the States' determinations.

C. The FCC's First Report and Order.

After passage of the Act in February 1996, private negotiations started promptly and, under timetables set in the Act, state commissions soon began arbitrating agreements. As the Court of Appeals later explained in entering a stay of the FCC's pricing rules, "[t]he Act's system of private negotiation backed by state-run arbitration was operating without the input from the FCC" to speed the transition to competition and had

"initially proved to be successful." *Iowa Utilities Board v. FCC*, 109 F.3d 418, 427-28 (8th Cir. 1996).

On August 8, 1996, however, the FCC issued its 700-page First Report and Order,[7] which threatened to derail that process entirely. While the 1996 Act had set out a self-described "de-regulatory" framework for introducing competition and had carefully limited the expansion of federal regulatory power by assigning a vital role to the States, the FCC's ponderous Order attempted to regulate every facet of the transition to competition and dramatically extended the FCC's authority.

To start, the FCC attempted to countermand Congress's view that private negotiations were a reliable first-line mechanism for implementing the Act. Indeed, the FCC continues to insist that given "disparit[ies] in bargaining power," negotiations could not work unless the FCC declared a "national regulatory baseline" of outcomes to "reduce transaction costs," FCC Br. 10, — *i.e.*, unless the FCC dictated outcomes in advance.

1. The FCC's Proxy Prices and Pricing Rules.

In its First Report and Order, the FCC ignored Congress's fundamental choice to assign the states the authority to implement the Act's pricing standards under §252. The FCC thus declared that *it* had authority to adopt "national pricing rules" and proceeded to relegate the States to the role of mechanically applying detailed methods dictated by the FCC. J.A. 17-18 (¶¶ 104-05). Indeed, while the FCC now portrays its pricing rules as a project in cooperation with the States in which the FCC defined a general "methodology" and the States retained authority to implement that method by setting specific rates, *see* FCC Br. 10, 26-27, the Order went far beyond mere

---

[7] In the Matter of Implementation of the Local Competition Provisions in the Telecommunications Act of 1996, CC Docket No. 96-98, 11 F.C.C.R. 15499 (Aug. 8, 1996).

methodologies. The FCC set specific prices — so-called "proxy prices" — that States were *required* to apply unless they justified any departure with a detailed cost study prepared to the FCC's specifications. J.A. 132 (¶ 619).

Not surprisingly, the FCC does not even *mention* its indefensible proxy prices in this Court. In 1996, however, they were a grave threat to the negotiation and arbitration process set out in the Act. By guaranteeing entrants a known price if they held out for arbitrations, the proxies threatened to pull the plug on meaningful negotiations and arbitrations altogether. As the Eighth Circuit explained in entering its stay, "the negotiations preferred by the Congress [were] already breaking down due to the competitors' desire to hold out for the FCC's proxy rates." 109 F.3d at 425.

In addition to setting specific proxy prices, the FCC also spelled out extensive rules that it required the States to follow in implementing the Act's pricing standards. For example, the FCC determined that the cost-based pricing standard for network elements required the States to adhere to the FCC's own newly minted "Total Element Long Run Incremental Cost" or "TELRIC" pricing method. Under that method, network element prices were to be set based only on the forward-looking cost of operating a hypothetical network constructed solely with the most efficient technology available. J.A. 140, 141-42 (¶¶ 685, 690).

The FCC's TELRIC pricing rule would have exposed the States to potentially enormous liabilities, would have undermined universal service, and would have thwarted the goal of facilities-based competition. First, by requiring States to ignore an incumbent LEC's actual investment in its network, the FCC's TELRIC rule would open the States up to potentially massive liability for the taking of LEC property, since the States could not ensure that a LEC would have the opportunity to earn a fair rate of return on state-approved and state-required investments.

Second, the FCC's TELRIC rule would prohibit States from including in the price of network elements the substantial costs of subsidizing universal service. By forcing the States to exclude these subsidy costs from element prices (even before completing universal service reform), the TELRIC rule exacerbated the potential for cherry-picking: new entrants using an incumbent's network elements (with no obligation to serve high-cost residential customers) could selectively capture the high-revenue customers who subsidize universal service and pocket for themselves the revenues that currently fund universal service.

Third, the FCC's TELRIC rule would doom any hope of promoting true facilities-based competition. By making the incumbent's network available at the cost of a hypothetical, least-cost, ideally efficient network, the FCC ensured that no entrant could ever hope to construct cheaper, more efficient facilities of its own, and thus that it would have no incentive even to attempt to do so. The FCC's TELRIC rule aptly reflects the Commission's barely disguised belief that facilities-based competition is not a realistic objective — a guiding assumption to which the FCC clings in its brief in this Court. *See* FCC Br. 5 ("[N]o prospective entrant could hope to compete with the incumbent LECs . . . by replicating the existing local network infrastructure").

The First Report and Order, indeed, was tacitly based on the assumptions that Congress was wrong about the prospect for facilities-based competition in the local exchange, that local service remained a natural monopoly, and that the only way to spur a form of "competition" in local service was effectively to nationalize existing local networks and to sell them off piecemeal so that various competitors could use the same facilities simultaneously to offer the same service under different brand names. Rather than fostering real facilities-based competition, therefore, the FCC set about to generate a form of pseudo-competition by hypothesizing the prices that the process of

competition *might* achieve and declaring by fiat that the existing network should be sold at those prices. In that way, the FCC abandoned the objective of allowing competition to develop so that *competition* itself could gradually drive prices down and sought instead to impose the *end results* of competition through an edict of central planning that would merely promote the proliferation of resellers using the same network — and regulators parceling out rights to use that network.[8]

Finally, the FCC's exhaustively detailed pricing rules eliminated any role for the States other than crunching numbers to implement the FCC's formula. Reducing the States to the function of implementing the FCC's *diktat* was entirely in keeping with the FCC's view of the division of responsibilities in the Act. As the then-Chairman of the FCC put it, in the FCC's view, the 1996 Act threw the State's ability "to make their own decisions on things like local loop unbundling, pricing — that kind of thing" into "the trash can of history."[9] Indeed, to extend its control even further, despite the explicit terms of the Act granting federal district courts exclusive jurisdiction to review state arbitration decisions, the FCC purported to claim that *it* would have authority to review arbitrations under the complaint procedure provided in § 208 of the Communications Act. J.A. 465-69 (¶¶ 121-28).

[8] *Cf.* Hon. Stephen G. Breyer, *Antitrust, Deregulation, and the Newly Liberated Marketplace*, 75 Calif. L. Rev. 1005, 1018 (1987) (explaining the "special policy risk of deregulation" that regulators may attempt to protect "competitors instead of protecting competition").

[9] Interview with Reed Hundt, *in* Telecommunications Report, Supplement at 10 (July 9, 1996).

2. The FCC's Radical Expansion of the Duty To Provide Unbundled Network Elements.

In addition to seizing control for itself over the Act's pricing terms, the FCC also swung a wrecking ball through each of four critical limitations Congress incorporated into incumbents' duty to provide access to network elements.

First, while Congress had carefully limited the definition of a "network element" to a "facility or equipment used in the provision of a telecommunications service" (or the "features, functions, and capabilities" provided by a facility), § 153(29), the FCC radically expanded the term to include virtually every aspect of an incumbent's business. For example, the FCC concluded that an incumbent must make available to its competitors (i) its operators, (ii) its directory assistance personnel, and (iii) its internal operations support software systems. J.A. 116-17, 129-30 (¶¶ 516, 554). By doing so, the FCC obliterated Congress's effort to restrict elements to what could be considered the "essential facilities" of the incumbent's network.

Second, Congress restricted access even to items that met the definition of "network element" by directing the FCC to consider whether access to proprietary elements was "necessary" and whether failure to provide non-proprietary elements would "impair" an entrant's ability to provide service. § 251(d)(2). The FCC's Order followed a two-step approach to eliminate these limitations. The agency first reinterpreted § 251(c)(3)'s direction concerning *where* incumbents should provide "access" to elements ("at any technically feasible point") into a broad presumption governing *what* parts of the network should be unbundled. It ruled that every element that could technically be unbundled *must* be unbundled. J.A. 49

(¶ 278).[10] Next, when it turned to the restrictions of § 251(d)(2), the FCC sought to protect its erroneous presumption requiring blanket unbundling by reading § 251(d)(2) in a way that would not "significantly diminish the obligation imposed by section 251(c)(3)." *Id.* at 53-54 (¶ 286).

To serve that end, the FCC effectively read the limitations imposed by § 251(d)(2) out of the Act by determining that it would conduct an evaluation of whether access to an element was "necessary," or whether failure to provide the element would "impair" an entrant's ability to provide service, by looking solely to the availability of alternative facilities *within the incumbent LEC's own network*. J.A. 51-52, 54-55 (¶¶ 283, 287). The availability of comparable facilities from other sources (for example, a tandem switch or trunking facilities from a long distance carrier) was irrelevant in the FCC's view. As a result, under the FCC's standard, access to a network element is virtually always required — an incumbent's network rarely contains needlessly duplicative facilities. And since no element would ever be available elsewhere at the price of a hypothetical, most-efficient network (the price mandated by the FCC), buying an element from another source would always "impair" a carrier's ability to provide service.

Third, having expanded the duty to provide "elements" to every conceivable aspect of an incumbent's business, the FCC took the further step of allowing a new entrant to purchase *all* of the network elements needed to provide completed service without providing *any* facilities or personnel of its own. Instead, the new entrant could simply order from the incumbent (at hypothetically most-efficient, cost-based prices) the *entire network* needed to provide completed telephone service, *plus* all of the incumbent's ancillary business functions (such as

---

[10] The Court of Appeals struck down this presumption as contrary to the terms of the Act, *see* Pet. App. 46a-47a, and the FCC has not even attempted to seek review of that decision.

operator and directory services) and use all of these so-called "unbundled" elements to provide telephone service. J.A. 59, 63-65 (¶¶ 331, 338-41).

Fourth, the FCC ruled that even though the Act required incumbents only to provide elements in "a manner that allows requesting carriers to combine" them, § 251(c)(3), incumbents would instead be required to provide elements preassembled as they already existed in the network, *see* 47 C.F.R. § 51.315(a), and would even be required to combine them in any new fashion requested by an entrant. *Id.* §§ 51.315(c)-(f).[11]

This quadruple-whammy expansion of the unbundling duty destroyed the careful balance struck by Congress in the Act. By broadening "elements" to include every aspect of an incumbent's business, removing any limit on when they must be provided, and ruling that all elements must be provided already assembled into a functioning platform, the FCC turned network elements into another route for effectively obtaining finished service ready for resale. As a result, an entrant could ignore the statutory terms governing resale and instead could declare that it wanted to use the fiction of ordering *all* of the elements necessary to provide service *preassembled* — and supported by operators, directory assistance services, and operational support systems, to boot. Moreover, an entrant could use this fiction of sham unbundling to evade the wholesale rate under the Act and receive instead a rate that is the sum of the hypothetical, cost-based prices set by the FCC.

---

[11] The agency actually attempted an even more extravagant extension of the unbundling duty by declaring that entrants would be able to demand that an incumbent upgrade its facilities to provide them with elements that are "superior in quality to that which the incumbent LEC provides to itself." 47 C.F.R. § 51.311. The FCC thus sought to give entrants the right to control for their own benefit the incumbent's network planning and the deployment of new technology in the network. The Eighth Circuit vacated this rule, *see* Pet. App. 50a-52a, and the FCC has not even attempted to seek review of that decision.

The FCC describes its expansions of unbundling as giving entrants a "choice" about entering the market. On the one hand, the entrant can purchase local service at the Act's wholesale prices — *in which case the entrant would contribute fairly to universal service and compensate the incumbent for the actual costs of its network.* Alternatively, under the fiction of buying "unbundled" elements that are preassembled, the entrant can declare that it wants *all* of the elements needed to provide completed service already combined together into a finished platform — *in which case the entrant would contribute nothing to universal service and compensate the incumbent only for the costs of a hypothetical, ideally-efficient network.*

Far from creating a meaningful "choice" of alternative entry strategies, this end-run around the wholesale rate opened an irresistible avenue for arbitrage that would have upset the careful balances Congress imposed in the statutory pricing standard. It would allow entrants — while merely reselling service provided entirely over an incumbent's network — not only to avoid contributing to universal service, but also to pocket for themselves the revenues from business and urban customers that currently maintain low residential rates. The FCC's rules, in short, would have sacrificed the critical goals of preserving universal service, fully compensating an incumbent for the use of its property, and promoting facilities-based competition, all for the short-term goal of promoting immediate entry by a number of firms and stripping away market share from incumbents.

Not surprisingly, when the Order was released, new entrants could not conceal their glee at this guaranteed opportunity for windfall profits. AT&T's president touted to investment analysts that the network element platform provided new entrants with "another way to resell" incumbent services, but at what he calculated to be a "52 percent" discount from retail rates — more than *two to three times* the discounts set according to the statutory standards for wholesale services.

See Transcript, "AT&T Investment Community Meeting" (March 3, 1997), J.A. 255, 258.

3. The FCC's Pick-and-Choose Rule.

Finally, the FCC distorted the obligation Congress imposed in § 252(i) of the Act. That section requires an incumbent to "make available any interconnection, service, or network element" that it provides under an agreement with one party "to any other requesting telecommunications carrier upon the same terms and conditions as those provided in the agreement." The FCC expanded that unremarkable requirement into an extraordinary option for entrants to pick and choose any individual term from earlier agreements *without* having to accept all the trade-offs and conditions built into the agreement that made those terms possible. J.A. 1044-45, 1048 (¶¶ 1310, 1321).

D. Review in the Eighth Circuit.

Several States, joined by GTE and other incumbent LECs, sought a stay of the FCC's pricing rules and the pick-and-choose rule — the elements of the Order that most immediately threatened to derail the process of negotiations and arbitrations envisioned by Congress. After briefing and oral argument, the Eighth Circuit stayed these provisions.[12]

On the merits, the Eighth Circuit determined that the FCC lacked jurisdiction to issue rules implementing the pricing terms of the local competition provisions of the Act. Centering its analysis on the text of the Act, the court explained that § 252(c)(2) plainly commands state commissions, not the FCC, to establish rates in arbitrations and that § 252(d) again directs

---

[12] The FCC, AT&T, and MCI unsuccessfully asked Circuit Justice Thomas to vacate the stay. 117 S. Ct. 378; 117 S. Ct. 379 (1996). The FCC then reapplied to Justice Ginsburg, and AT&T and MCI reapplied to Justice Stevens. After being referred to the Court, these applications were also denied. 117 S. Ct. 429 (1996).

the States to set rates and defines the specific standards they are to apply. Given the absence of any reference to the FCC in the sections of the Act that explicitly addressed pricing, the court concluded that "the Act plainly grants the state commissions, not the FCC, the authority to determine the rates involved in the implementation of the local competition provisions of the Act." Pet. App. 14a.

Alternatively, the court explained that *even if* the text of § 252 were not clear, any ambiguity was resolved by the plain command of § 2(b) of the Communications Act. Under settled law, the restriction of § 2(b) barring the FCC from authority over intrastate matters can be overcome only by a straightforward and unambiguous command from Congress. *See* Pet. App. 15a-19a (citing *Louisiana Pub. Serv. Comm'n v. FCC*, 476 U.S. 355 (1986)). But far from providing any unambiguous grant of authority to the FCC, the 1996 Act unequivocally assigned pricing authority to the States.[13]

Given the command of § 2(b), the court also ruled that the FCC could claim authority to implement other intrastate matters addressed in the Act only where Congress had explicitly given the FCC a role. *See* Pet. App. 12a n.10, 37a.

As to the unbundling rules, the court upheld some of the FCC's decisions and struck down others. The court deferred both to the FCC's view of what constitutes a "network element," Pet. App. 41a-45a, and to the agency's view as to when access to a network element is "necessary" or would "impair" an entrant's ability to provide service, *id.* 47a-48a. The court also agreed with the FCC that the Act did not preclude an entrant from relying *solely* on network elements obtained from an incumbent to provide service. *Id.* 53a-58a.

---

[13] Because it struck down the pricing rules on jurisdictional grounds, the court did not address the substantive challenges that GTE and others had brought against the FCC's pricing rules. *See* Pet. App. 23a-24a.

At the same time, however, the court made plain that the Act did not convert network elements into a second avenue for providing the same thing as finished service ready for resale. *Id.* 54a-55a. The court struck down the FCC's rules requiring incumbents to combine elements for new entrants. *See* 47 C.F.R. § 51.315 (c)-(f). In addressing those rules, the court explained that § 251(c)(3) of the Act "unambiguously indicates that requesting carriers will combine the unbundled elements themselves" and "does not require the incumbent LECs to do *all* of the work." *Id.* 53a (emphasis in original). The court further made clear that its "decision requiring the requesting carriers to combine the elements themselves" was critical for preserving the distinction between network elements and wholesale service. *Id.* 56a-57a.

In its initial opinion, however, the court without comment left in place one rule, 47 C.F.R. § 51.315(b), that required incumbent LECs to provide entrants with elements already pre-assembled into a functioning package if the elements were connected in the LEC's own network. In a petition for rehearing, GTE and other parties pointed out that the failure to vacate this rule would undermine the distinction between network elements and wholesale service that the court had recognized as fundamental to the structure of the Act. If an entrant could purchase the network already pre-assembled, it would simply be obtaining finished service for resale, but at a lower price that undermined the system of universal service. The Eighth Circuit agreed and, vacating § 51.315(b), explained that "[t]o permit such an acquisition of already combined elements at cost based rates for unbundled access would obliterate the careful distinctions Congress has drawn in subsections 251(c)(3) and (4) between access to unbundled network elements on the one hand and the purchase at wholesale rates of an incumbent's telecommunications retail services for resale on the other." Pet. App. 71a.

Lastly, the Eighth Circuit struck down the FCC's pick-and-choose rule. Concluding that the terms of § 252(i) in isolation did not flatly foreclose the FCC's interpretation, Pet. App. 25a & n.22, the court proceeded to "'look to the structure and language of the statute as a whole' to determine if the FCC's interpretation of this ambiguous provision is a reasonable one." Pet. App. 25a (quoting *National R.R. Passenger Corp. v. Boston & Maine Corp.*, 503 U.S. 407, 417 (1992)). Under this second prong of *Chevron* analysis, the court held that the pick-and-choose rule would undermine the negotiation process Congress had established, and thus that the FCC's expansive gloss was not a reasonable construction of the Act. *Id.* 25a-27a.

E. The Dialing Parity Decision.

In a decision consolidated for review, the Eighth Circuit applied the same analysis under § 2(b) outlined in its main decision to hold that the FCC's dialing parity rules for *intrastate* calls were beyond the FCC's jurisdiction. *See* Pet. App. 79a-89a.

SUMMARY OF ARGUMENT

1. Congress expressly assigned authority over the pricing terms of the Act's local competition provisions to state public utility commissions. Section 252(c)(2) commands that "State commission[s] shall . . . establish any rates," and § 252(d) provides the standards that States must apply. Neither the FCC's efforts to construct an expansive rulemaking role for itself under the non-pricing terms of § 251, nor its efforts to dragoon into service general grants of rulemaking authority plucked from the 1934 Act can alter the explicit terms of the 1996 Act specifically addressing pricing — all of which direct the States, and only the States, to apply the Act's pricing standards.

Even if § 252 of the Act were not so clear, the Eighth Circuit correctly held that § 2(b) of the Communications Act

confirms the FCC's lack of authority over pricing. Section 2(b) unequivocally commands that ambiguity in the Act cannot be construed to give the FCC jurisdiction with respect to intrastate matters. That directive not only provides a statute-specific rule of construction that defeats any claim for *Chevron* deference to the FCC's grasp for authority over pricing; it also imposes a substantive limit on the FCC's power that can be overcome only by a "straightforward" grant of authority in the Act. No such grant of authority exists here.

2. The FCC's four major expansions of the unbundling duty violate the Act both in their individual terms and in their cumulative effect. First, the FCC stretched the term "network element" to encompass every aspect of a LEC's business, whether or not it formed a part of the call-routing "network." Second, while Congress sought to encourage deployment of competing facilities by requiring an evaluation of need before network elements would be made available, *see* § 251(d)(2), the FCC read this limitation out of the Act. Third, the FCC converted the duty to provide individual pieces of the network into a duty to provide *every* piece, so that an entrant would need no facilities of its own. Finally, the FCC completed its transformation of unbundling by turning an obligation to provide discrete, separate pieces of the network into a duty to turn over the entire network, preassembled into a functioning platform ready to provide service.

This quadruple expansion not only obliterated important distinctions in the Act by making network elements what AT&T has termed "another way to resell," but even worse, it made this second route to resell available at a different price. The FCC provided entrants the irresistible option of relying entirely on the incumbent's network to resell the incumbent's own service, but at a price vastly lower than the wholesale rate set by Congress — a price, indeed, that freed entrants of any of the burdens of universal service. The FCC thus opened an avenue for rampant arbitrage that provided an end-run around

the wholesale rate set by Congress and Congress's repeated commands designed to ensure that competition would not undermine universal service.

The Eighth Circuit rightly recognized that the FCC's approach would "obliterate the careful distinctions Congress has drawn" between network elements and wholesale service, Pet. App. 71a, and properly vacated the FCC's rule requiring incumbents to provide preassembled combinations of elements. But the court also should have struck down the FCC's further three expansions of the unbundling duty.

3. The Eighth Circuit rightly recognized that the FCC's pick-and-choose rule was fundamentally incompatible with Congress's plan for relying on binding negotiations to implement the terms governing local competition. The pick-and-choose rule would have scuttled that plan and made effective negotiations and the creation of binding agreements impossible.

ARGUMENT

I. CONGRESS RESERVED AUTHORITY OVER THE ACT'S PRICING AND OTHER INTRASTATE MATTERS TO THE STATES.

Despite the bold proclamation of the FCC's then-chairman that state control over local competition had been consigned to "the trash can of history," the terms of the 1996 Act reveal an entirely different plan. As the Court of Appeals made clear, proper analysis of the role Congress assigned the FCC in the local competition provisions requires addressing the statute in two steps.

First, even without regard to § 2(b), the Act by its terms unequivocally assigns authority over the pricing provisions of the Act to the States — *not* to the FCC.

Second, reading the Act under § 2(b)'s rule of construction not only confirms that the FCC has no authority over the

pricing terms in the local competition provisions; it also shows that the lower court was correct in limiting the FCC's role in other intrastate matters to subjects where Congress explicitly gave the FCC a role.[14]

A. Congress Expressly Reserved Authority Over the Act's Pricing Provisions to the States.

1. The Plain Terms of the Act Assign Pricing Authority to the States.

Section 252(c)(2) unequivocally provides that in arbitrations "State commission[s] shall . . . establish any rates for interconnection, services, or network elements." Similarly, section 252(d) — the section expressly entitled "Pricing Standards" — makes it clear that "[d]eterminations . . . of the just and reasonable rate[s]" for arbitrated agreements must be made by a "State commission." Section 252(d), moreover, goes on to provide the specific standards that *state commissions* are to apply in determining rates. These provisions make it abundantly clear that the States, not the FCC, are to implement the pricing terms of the Act.

A clear dichotomy in § 252(c) confirms the States' exclusive role in pricing. Section 252(c)(1) generally directs the state commissions in concluding "open issues" in arbitrations to ensure that terms they impose meet *both* "the requirements of section 251" *and* "regulations prescribed by the [FCC] pursuant to section 251." In contrast, the next paragraph specifically addresses *pricing* as a separate matter

---

[14] AT&T attempts to slip through the back door some new challenges to the Eighth Circuit's rulings, arguing that the rulings were based on the court's jurisdictional holdings. AT&T Br. 32-34. The Court should not consider these issues, as they were not properly raised in the petitions for *certiorari*. On those issues, the Eighth Circuit did not rule, as AT&T suggests, based on the scope of the FCC's interpretive authority. Instead, the court held that the FCC's actions violated the substantive provisions of the Act. *See* Pet. App. 47a, 52a-53a.

and — omitting any reference to FCC rules — commands solely that States shall "establish rates . . . according to subsection (d)" — *i.e.*, according to § 252(d). As the Court of Appeals explained in staying the FCC's pricing rules, the contrast between subsections (c)(1) and (c)(2) demonstrates that "where Congress intended for the state commissions to follow FCC rules in arbitrations, it expressly said so." 109 F.3d at 424. As to pricing, Congress decidedly did not say so.

The FCC's contrary claim that § 252(c) somehow *supports* its authority over pricing is nonsensical. *See* FCC Br. 27. Under the FCC's tortured reading, § 252(c)(1) covers *all* issues, including rates, and requires States to follow the FCC's rules. Subsection (c)(2) then addresses pricing distinctly, but because pricing was already included in (c)(1), it *adds* a requirement that States also apply the standards of § 252(d). The FCC's interpretation gives no effect to Congress's decision to separate its directions concerning "establish[ing] rates" into a separate subsection. There would have been no need for such a division if Congress had intended all the same directions from § 251(c)(1) to apply to rates. The FCC's reading thus contravenes the settled principle that "[w]here Congress includes particular language in one section of a statute but omits it in another section of the same Act, it is generally presumed that Congress acts intentionally and purposely in the disparate inclusion or exclusion." *Russello v. United States*, 464 U.S. 16, 23 (1983) (citations omitted).

The plain division drawn in § 252(c), moreover, is echoed more broadly in the structure of the Act. Section 252(d) breaks out "Pricing Standards" into a separate, self-contained section that explicitly describes the standards that "State commission[s]" must apply in determining rates and conspicuously omits any role for the FCC.

This special treatment for pricing was no accident. Neither the House nor the Senate bill contained an analog to section 252, but rather in a single section defined the duties imposed

on incumbent LECs and the role that States were to fulfill in arbitrations. In the Senate bill, that section included a broad command for States to ensure that terms imposed in arbitrations "are consistent with the [FCC's] rules." S. 652, 104th Cong., 1st Sess. § 101(a) (creating § 251(d)(5)(D)) (1995). Concerned that such language might be construed to require States to conform to the FCC's commands on all matters, including pricing, States objected to the draft legislation.[15] In response, that language was deleted, a new § 252 outlining the States' role in arbitrations was created, and, in particular, a new § 252(c) established a bifurcated command concerning the standards States were to apply. On matters of pricing, the States were directed to apply solely the standards of § 252(d). The new § 252(d), in turn, outlined the principles for States to use in setting rates.[16] The legislative history thus

---

[15] *See, e.g.*, Initial Comments of National Association of Regulatory Utility Commissioners, Implementation of the Local Competition Provisions of the Telecommunications Act of 1996, CC Docket No. 96-88, at 10 (May 16, 1996) (describing States' efforts to influence the Act before the Conference Committee); Comments of the Florida Public Service Commission at 8.

[16] The FCC's supporters would like to dismiss this dramatic restructuring as a non-substantive change. *See, e.g.*, MCI Br. 32-33 & n.23. Indeed, MCI claims that the FCC must retain any role in pricing arguably implied in the House and Senate bills simply because no change was discussed in the Conference Report. *Id.* That approach to the legislative history is insupportable. The plain implications of the reworking of the text cannot be overridden by reference to drafts of the statute. Moreover, MCI's claim that the lack of discussion in the Conference Report can deprive the changed text of any meaning is doubly flawed. It amounts to the view, firmly rejected by this Court, "not only that plain statutory language cannot be credited unless specifically explained in legislative history, but also that the apparent import of legislative history [*i.e.*, the change in text] cannot be credited unless specifically explained in legislative history." *Morales v. Trans World Airlines, Inc.*, 504 U.S. 374, 386 n.2 (1992). In any event, MCI's claim that any substantive change *must* be discussed in the report is flatly undermined

(continued...)

plainly confirms what the text of the Act makes clear: Congress expressly singled out pricing and reserved it to state control.

2. The FCC Cannot Point to Any Terms in the 1996 Act Assigning It Authority Over Pricing.

In the face of § 252's express assignment of pricing authority to the States, the FCC cannot point to any language that plausibly supports its claim to a role in pricing. Indeed, the FCC meticulously avoids § 252 — the section that explicitly addresses pricing — and diverts attention instead to § 251.

Specifically, the FCC claims that § 251(d)(1) gives it plenary rulemaking authority to implement "this section" and that this power extends to pricing. *See* FCC Br. 18. *See also* MCI Br. 27. That argument is flawed in several respects. In the first place, as the Eighth Circuit recognized, § 251(d)(1) is not a grant of rulemaking authority. Rather, it places a limitation on the FCC by directing the agency to complete "[w]ithin 6 months after the date of enactment" any rulemaking in areas where it has power under § 251.

Second, even if § 251(d)(1) could imply authority for the FCC to implement the terms of *that section*, as the court pointed out, "[n]owhere in section 251 is the FCC authorized specifically to issue rules governing the rates" for local competition. Pet. App. 12a. The pricing standards of the Act appear in § 252, not § 251.

To fill that hole, the FCC seizes upon the fact that in defining the duties imposed on incumbents, § 251(c) mentions

---

[16] (...continued)
by the preamble to the report itself, which makes clear that in addition to omitting discussion of "clerical corrections" and "minor drafting" changes, the report also does not discuss "conforming changes *made necessary by agreements reached by the conferees*." Conf. Rep. at 113 (emphasis added).

"just" and "reasonable" "rates, terms, and conditions" for interconnection and network elements and "wholesale rates" for services. *See* § 251(c)(2)(D), (c)(3), (c)(4)(A). According to the FCC, § 251(d)(1) gives it authority to "implement" § 251(c)'s references to rates. FCC Br. 18. The FCC thus proceeds with its eyes shut tightly to the plain terms of the statute, pretending that § 251(c) sets out the "substantive rate provisions" of the Act. *Id.* at 28. That is fanciful. Section 252 expressly defines the "Pricing Standards" of the Act, and the plain terms of both § 251 and § 252 make clear that Congress directed the States to implement those standards.

Indeed, even § 251(c)'s passing reference to "just" and "reasonable" rates itself directs that this duty should be implemented "*in accordance with*" the "requirements" of "*section 252*." § 251(c)(3) (emphasis added). Section 252(c)(2) in turn directs the States to set rates following only the standards of § 252(d). Section 252(d), in fact, is the *only* section in the Act in which Congress defined the standards of "just and reasonable" rates and "wholesale" rates mentioned in § 251(c). Moreover, if there were any doubt that § 252(d) is the controlling provision on authority over pricing, § 252(d) states plainly that the States have the role of defining "just and reasonable rates" "*for purposes of*" the duty imposed in § 251(c). § 252(d)(1) (emphasis added). *See also* § 252(d)(3) ("*For the purposes of section 251(c)(4)*, a State commission shall determine wholesale rates . . . .") (emphasis added).

The FCC's claim that the relationship runs the other way, *see* FCC Br. 28 n.10, and that § 251(c)'s reference to § 252 somehow gives the FCC plenary authority to promulgate rules implementing § 252 — a section that conspicuously makes no mention of the FCC — ignores the terms of the Act. Congress directed that "*for purposes of*" any reference to rates in § 251, *state commissions* would determine rates under the standards defined in § 252. *See* § 252(d)(1), (3) (emphasis added). Congress could hardly have used any clearer language to

establish that to the extent rates were mentioned in § 251, the task of implementing the Act's *rate* requirements was to be carved out and implemented solely through the explicit commands given to the States in § 252.[17]

3. The FCC's Second-Line Statutory Arguments Provide No Better Support for Its Claim to Pricing Authority.

Unable to construct a coherent argument for its claimed pricing authority based on the express commands of the 1996 Act, the FCC and its supporters comb through both the Communications Act of 1934 and additional provisions of the 1996 Act hoping to find snippets to bolster the FCC's claims. To start, the FCC seizes upon a grab-bag of general provisions from the 1934 Act that grant the agency rulemaking power and tries to press them into service for its pricing authority under the 1996 Act. Specifically, the FCC calls upon §§ 201(b), 303(r) and 154(i), but none is up to the task.

Despite the FCC's protests, the Eighth Circuit rightly held that § 201(b) is limited to *interstate* communication. *See* Pet. App. 12a. Section 201(a) addresses solely "interstate or foreign communication by wire or radio," and the first sentence of § 201(b) limits that section to "*such* communication service." (emphasis added). AT&T's assertion that the subsequent "sentences" of the section are somehow not limited to interstate communication is preposterous. *See* AT&T Br. 23-24. The next clauses (they are not separate sentences at all) are merely provisos limiting the duty applied to "such

---

[17] The FCC's tortured construction, moreover, does not even apply to pricing for wholesale service. The FCC's textual link — the reference in § 251(c) to rates "in accordance with . . . section 252" — does not exist in § 251(c)(4). Rather, the only cross-reference is § 252(d)(3)'s command that "[f]or the purposes of section 251(c)(4), a State commission shall determine wholesale rates." This hole in the FCC's theory confirms that the FCC has the relationship between the sections backwards.

communication service" in the first sentence. They imply no departure from the basic subject matter of interstate communication. In any event, even if the last sentence of the section were somehow wholly unconstrained by the context preceding it, the FCC cannot pluck such a generalized term out of the 1934 Act and purport to trump the 1996 Act's express grant of exclusive authority over pricing to the States. As this Court has repeatedly affirmed, "it is a commonplace of statutory construction that the specific governs the general." *Morales v. Trans World Airlines, Inc.*, 504 U.S. 374, 384-85 (1992) (citation omitted).

For the same reason, the general rulemaking provisions of § 303(r) (which appears only in a list of FCC responsibilities relating to *radio* communications) and § 154(i) (which is simply the general grant of power to the FCC to execute "its functions" assigned elsewhere under the Act) cannot support the FCC's claims. Indeed, these provisions are particularly poor candidates for trumping § 252's explicit directions assigning pricing to the States since each is expressly limited to grant power only to the extent consistent with other provisions of the chapter.[18]

The FCC next runs through a list of provisions in the 1996 Act that it claims can bolster its assertion of pricing authority. In each case, the argument is the same. According to the FCC, these sections obliquely acknowledge a role for the FCC in implementing intrastate matters but do not *expressly* grant the FCC rulemaking power. In the FCC's view, therefore, one or another of the provisions in its grab-bag should be stretched to

---

[18] *See* 47 U.S.C. § 303(r) ("*Except as otherwise provided in this chapter*, the [FCC] . . . shall . . . make such rules and regulations . . . not inconsistent with law, as may be necessary to carry out the provisions of this chapter . . . .") (emphasis added); *id.* § 154(i) ("The [FCC] may perform any and all acts, make such rules and regulations, and issue such orders, *not inconsistent with this chapter*, as may be necessary in the execution of its functions.") (emphasis added).

supply it with a broad authority to implement *all* local competition provisions of the Act, including the pricing terms, in order to avoid the "interpretive anomalies" that might result if some sections *acknowledged* a rulemaking role for the FCC without some other section *expressly granting* that role. FCC Br. 21. But an oblique reference to a role for the FCC on one topic cannot justify expanding general or ambiguous phrasing in *another section* so as to trump the explicit assignment of pricing authority to the States in § 252. Moreover, as outlined below, none of the provisions the FCC cites even implies the broad-ranging role the FCC would like.

The FCC first relies on § 251(d)(2), which outlines the standards that the FCC must apply in determining what network elements should be unbundled. While the section does expressly indicate a role for the FCC in implementing the unbundling obligation under the Act, that hardly indicates any broader role for the agency, particularly any role in pricing. To the contrary, the section strikingly demonstrates that where Congress intended the FCC to play a rulemaking role, Congress recognized that role explicitly in the text and prescribed standards for the FCC to apply.

Next, the FCC would rely on § 251(d)(3). *See* FCC Br. 22-23. That section, however, in no way assumes a broad rulemaking role for the FCC. To the contrary, as its title — "Preservation of State Access Regulations" — suggests, it assumes power in the *States* to define access requirements and explicitly *limits* the FCC, directing that the FCC "shall not" preclude the enforcement of any state access rules that are "consistent with the requirements of this section" and that do not "substantially prevent" implementation of the "requirements of this section" and "purposes of this part." § 251(d)(3). The FCC's attempt to suggest that the reference to "purposes of this part" implies a broad-ranging role for it in defining extra-textual "purposes" of the Act simply distorts the text. The clear import of the section is to require the FCC to

hew closely to the terms of the statute in order to prevent the agency from intruding on States' rules more than required to implement Congress's commands. Moreover, once again, it is particularly fanciful for the FCC to argue that a limitation on its power over one subject — access rules — can be transformed through negative implication into a sweeping grant of authority over a different subject — pricing.

Reaching to increasingly remote sections of the Act, the FCC next points to § 253(d), which gives the FCC a circumscribed authority "after notice and an opportunity for public comment" to preempt state laws that are the most egregious obstacle to the Act, namely those that flatly "*prohibit* or have the effect of *prohibiting*" any entity from providing a telecommunications service. § 253(d) (emphasis added). Contrary to the FCC's implausible assertions, that limited ability is not a blank check for the FCC to promulgate rules promoting its self-aggrandizing regulatory agenda. Rather, the section expressly allows the FCC to act only retrospectively after a "State or local government has permitted or imposed" a legal requirement prohibiting entry.

The FCC's appeal to § 160, which the Eighth Circuit ruled was not even properly raised below, *see* Pet. App. 13a n.11, is equally unavailing. That section was part of a separate title addressing "Regulatory Reform." It allows the FCC to forbear from enforcing any provision of the entire Communications Act and requires the agency before doing so to consider whether "charges, practices, classifications, or regulations" will be "just and reasonable," § 160(a)(1). It also restricts the FCC's ability to "forbear from applying the requirements of section 251(c)." § 160(d). From this, the FCC again jumps to the conclusion that any time it is mentioned in the same sentence as the word "rates" or "charges," Congress must have given it plenary authority specifically to implement § 252(d), and that it must have authority over § 251(c) as well.

Such inferences are wholly unwarranted. Since § 160 applies to the entire Communications Act, it had to refer to "charges" to ensure that the new regulatory forbearance measure would apply to all the charges for interstate service that the FCC has long controlled. Moreover, even in the 1996 Act, the FCC has an *express* role in implementing *some* unbundling provisions of § 251(c), *see* § 251(d)(2), and an explicit role in applying both the Act's pricing terms and § 251(c) when a State refuses to conduct arbitrations. *See* § 252(e)(5). The terms of § 160 thus mesh comfortably with the terms of both the 1996 Act and the 1934 Act without any need to invent an *über*-rulemaking authority for the FCC.

Lastly, the FCC strains to pluck pricing authority out of its entirely unrelated role in certifying Bell Operating Company (BOC) compliance with the competitive checklist that regulates BOCs' admission into the long distance market. *See* FCC Br. 29-31. The checklist requires a BOC to offer interconnection and network elements in accordance with the requirements of § 251(c) and § 252(d)(1), *see* § 271(c)(2)(B), and directs the FCC to approve an application only if "it finds that . . . [the BOC] has fully implemented the competitive checklist." § 271(d)(3)(A)(i). The FCC's theory that it cannot possibly determine compliance with § 252(d) unless it has independent authority to define the standards of that section is fanciful. Section 271 does not give the FCC any independent role in pricing; it does nothing more than require the FCC to ensure that a BOC has complied with what § 252(d)(1) calls for — namely, the "[d]eterminations *by a State commission* of the just and reasonable rate" for interconnection and elements. § 252(d)(1) (emphasis added). The FCC's effort to turn the statute around ignores once again the maxim that the specific governs the general. A mere cross-reference to § 252(d)(1) cannot *negate* the explicit command in § 252(d) for the States to establish rates and *reassign* authority to the FCC.

The FCC's effort to twist § 271 into authority over pricing is particularly audacious, moreover, since Congress recognized that control over the BOCs' gateway into the long distance market would give the FCC a potential choke-hold on the companies and explicitly directed the FCC not to stray from the text of the Act. Congress thus commanded that the FCC "may not, by rule or otherwise, limit or extend the terms used in the competitive checklist." § 271(d)(4). The FCC's attempt to parlay the mere cross-reference to § 252(d)(1) into complete rulemaking authority over pricing would accomplish precisely the sort of expansion of power that Congress forbade.

4. The FCC's Policy Arguments Ignore Congress's Plan for Implementing the Act and Cannot Override the Text of the Statute.

Having failed to provide any textual basis for its authority over pricing, the FCC and its supporters predictably resort to a host of policy arguments. The FCC tries to reconcile its assertion of power with the terms of the Act by arguing that it has not usurped the States' pricing role *entirely*. Rather, the FCC claims, it has devised a system of "concurrent and complementary pricing roles" under which the FCC prescribes pricing methodologies and the States set actual rates. FCC Br. 26; *see also* MCI Br. 30-31. This effort to justify the FCC's approach is also fatally flawed.

In the first place, the First Report and Order did not limit the FCC to this newly-packaged cooperative role at all. Rather, it set specific proxy prices that States were required to apply. J.A. 132 (¶ 619). Not surprisingly, even the FCC does not defend its improper attempt to set specific rates in this Court.

Moreover, the FCC's current embrace of a "cooperative" role is nothing more than patronizing rhetoric. The FCC pays lip-service to the idea of reserving to the States the "important task of tailoring [the Act's] standards to accommodate region- or carrier-specific variables," FCC Br. 39, and allowing States

to "exercise their considerable discretion," *id.* at 26, because the text and structure of the statute amply reveal Congress's intent to enlist the expertise of States in administering the Act and in particular to rely on their judgment in making "[d]eterminations . . . of the just and reasonable rate." § 252(d)(1). But after the FCC has exhaustively defined and artificially restricted the costs state commissions are allowed to consider, it leaves the States no role other than plugging numbers into a uniform FCC formula.

Finally, the dual control over pricing that the FCC espouses has no basis in the text of the Act. As outlined above, the Act's pricing terms are directed to the States and only to the States — they suggest *no* role for the FCC at any level of generality. Indeed, § 252(d) explicitly defines the "Pricing Standards" that are to be used to set rates and directs the *state commissions* to implement them. Seeking a textual hook for its argument, MCI suggests that the command to the States to "establish" rates somehow limits the States' role and distinguishes their function from the broader one of "prescribing pricing methodology." MCI Br. 30. But that purported distinction is baseless. Far from suggesting a narrow role for the States, Congress made it perfectly clear that it expected them to exercise considerable discretion by directing them to make "*[d]eterminations*" of "just and reasonable rate[s]." § 252(d)(1) (emphasis added).

The FCC's strained attempt to support its theory of dual pricing roles is particularly unconvincing since the terms of the 1996 Act bear no resemblance to other statutes clearly granting the FCC the role it longs for here. For example, in the Cable Act of 1992 — which the FCC itself showcased below as an example of the sort of role it has in mind — Congress explicitly directed that "[t]he Commission shall, by regulation, ensure that [cable] rates . . . are reasonable," 47 U.S.C. § 543(b)(1), and enumerated specific "factors" the FCC was to consider, § 543(b)(2). Congress also left no uncertainty about

the States' subsidiary role in applying the FCC's determinations as it directed that "the rates for the provision of basic cable service shall be subject to regulation by a franchising authority . . . in accordance with the regulations prescribed by the Commission." § 543(a)(2)(A). Even a cursory comparison to the Cable Act amply demonstrates that Congress knew how to create a system of dual authority over pricing and that it simply did not take that approach in the 1996 Act.[19]

Next, the FCC and its supporters fall back on a parade of horribles they claim will result from the decision below. Their dire warnings boil down to the repeated assertion that the Eighth Circuit has supposedly created an "incoherent jurisdictional scheme," MCI Br. 35, in which States will be applying "radically disparate methodologies" to pricing, FCC Br. 30, and in which there will be endless rounds of litigation before the courts ever arrive at what the FCC's rules already provide: a single, uniform, nationwide interpretation of the finest details of the pricing methods to be used under the Act.

What the FCC and its supporters attempt to caricature as a descent into chaos, however, is nothing more than a system that allows the States much-needed localized discretion in applying the federal standards supplied by the Act — an outcome the 104th Congress saw as one of the *advantages* of federalism. The FCC's strident claims that States will be wildly varying on basic methodological issues is belied by the

---

[19] AT&T's claim that this Court found such a plan for dual control over rates under the Medicaid Act despite supposedly clearer language assigning responsibility to the States is simply false. *See* AT&T Br. 26 (citing *Wilder v. Virginia Hospital Ass'n*, 496 U.S. 498 (1990)). *Wilder* involved no question of the agency's authority, but addressed only the availability of a § 1983 action. The statute, moreover, made the agency's oversight authority clear as it required States to "mak[e] assurances *satisfactory to the Secretary [of HHS]*" that the rates they used were "reasonable and adequate." *Id.* at 503 (quoting statute) (emphasis added).

terms of the Act itself. Section 252(d) provides sufficient guidance to ensure that States will operate under the same fundamental principles. And while it is true that application of the Act's standards may vary in the details from State to State, it is entirely appropriate for different States to take into account their particular regulatory histories and current circumstances by considering different categories of costs in setting rates.

Two obvious circumstances that would vary from State to State and that States would have to accommodate in setting rates involve the ever-important issues of protecting universal service and compensating incumbents for their historical investments. By assigning the States control over pricing, Congress ensured that the same entity that controlled both the level of intrastate universal service subsidy costs and the mandated investments incumbents must make in their networks would also have authority to set prices for use of the incumbent's property that would fairly distribute those costs.

B. Section 2(b) Independently Confirms That the FCC Has No Jurisdiction Over Pricing, and Also Restricts the FCC's Authority Over Other Intrastate Matters Addressed by the 1996 Act.

As outlined above, the Court of Appeals squarely held that "the Act plainly grants the state commissions, not the FCC, the authority to determine the rates involved in the implementation of the local competition provisions of the Act." Pet. App. 14a. It went on, moreover, to buttress that holding by ruling that even if the Act were ambiguous in assigning pricing to the States, "[a]ny ambiguity regarding the FCC's vacuum of authority over local telecommunications pricing under the Act is resolved by operation of section 2(b)" *against* the FCC. *Id.* at 15a.

Because the Court of Appeals was correct that the Act explicitly assigns pricing authority to the States, whether or not § 2(b) applies does not matter for the question of authority over

pricing. Nevertheless, the court's § 2(b) analysis is correct, and provides an *independent* ground for invalidating the FCC's assertion of jurisdiction over pricing. Section 2(b), moreover, provides the critical command limiting the FCC's authority over other, non-price intrastate matters addressed in the Act.

1. Section 2(b) Is a Statute-Specific Counter-*Chevron* Rule of Construction.

Section 2(b) of the Communications Act of 1934 unambiguously commands that "nothing in this Chapter shall be construed to apply *or to give the Commission jurisdiction with respect to* . . . charges, classifications, practices, services, facilities, or regulations for or in connection with intrastate communication service." 47 U.S.C. § 152(b) (emphasis added). As this Court has explained, the section constitutes a "congressional denial of power to the FCC." *Louisiana Public Serv. Comm'n v. FCC*, 476 U.S. 355, 374 (1986). Indeed, the court has emphasized that the "sweeping" wording of the section "[b]y its terms" "fences off from FCC reach or regulation intrastate matters — indeed, including matters 'in connection with' intrastate service." *Id.* at 370.

In addition, § 2(b) "provides its own rule of statutory construction," *id.* at 377 n.5, under which any ambiguity concerning the application of the statute or the extension of FCC jurisdiction over intrastate matters must be resolved *against* extension of federal authority. Section 2(b) thus provides a statute-specific, counter-*Chevron* rule that precludes the FCC from claiming deference for attempts to extend its rules to intrastate matters. *Cf. Chevron U.S.A., Inc. v. Natural Resources Defense Council, Inc.*, 467 U.S. 837, 842-43 (1984).

This rule of construction, moreover, plainly applies to the local competition provisions of the 1996 Act. Indeed, Congress pointedly *declined* to amend § 2(b) to exempt the local competition provisions from its reach. While both the House and Senate bills included such an amendment,

see S. 652, 104th Cong., 1st Sess. § 101(c)(2) (1995); H.R. 1555, 104th Cong., 1st Sess. § 101(e)(1) (1995), Congress *removed* such a provision from the final legislation.[20]

2. The Court of Appeals Correctly Held That Section 2(b) Would Resolve Any Ambiguity in the Act Against the FCC's Assertion of Jurisdiction Over Pricing Matters.

As the Court of Appeals correctly concluded, even if the Act were ambiguous in assigning pricing jurisdiction to the States — which it is not — § 2(b) would resolve that ambiguity against the FCC's assertion of jurisdiction.

As the Court of Appeals found, "the prices that incumbent local exchange carriers may charge their new competitors for interconnection, unbundled access, and resale ... as well as the rates for the transport and termination of telecommunication traffic qualify as 'charges . . . for or in connection with intrastate communications service.'" Pet. App. 15a. Accordingly, the rule of construction embodied in § 2(b) applies, which means that the FCC has no jurisdiction over prices unless the Act "unambiguous[ly]" and "straightforward[ly]" gives it such jurisdiction. *Louisiana*, 476 U.S. at 377. Even if one were to disagree with the Court of Appeals' primary holding that the Act "plainly" assigns pricing jurisdiction to the States, Pet. App. at 14a, the Act cannot be fairly characterized as doing the opposite — namely, "unambiguous[ly]" and "straightforward[ly]" assigning pricing jurisdiction to the FCC. Accordingly, under the rule of

---

[20] The FCC attempts to bury this damning fact in a footnote and to dismiss the elimination of the amendment as a "non-substantive" change because it was not expressly discussed in the Conference Report. But that tactic ignores the express statement in the Report that it does not discuss "conforming changes made necessary by agreements reached by the conferees." Conf. Rep. at 113. *See also supra* n. 16.

construction in § 2(b), any ambiguity is resolved *against* the FCC's assertion of jurisdiction.

The FCC and its supporters offer four insubstantial arguments to avoid this straightforward application of § 2(b).

First, the FCC dredges up the same list of supposed "interpretive anomalies" addressed above, *see supra* pp. 34-35, to argue that the Act must be read to grant it broad powers over *intra*state matters relating to both pricing and nonpricing issues. As explained earlier, none of the provisions to which the FCC points implies any broad rulemaking power for the FCC whatsoever. But more importantly, the FCC's entire approach to establishing its supposedly "straightforward" grant of jurisdiction is precisely what § 2(b) *prohibits*. The FCC's entire argument is an effort to pick out sections of the Act that the FCC thinks *obliquely* suggest some rulemaking role for it and to leverage these sections into a basis for "construe[ing]" *other* ambiguous or general provisions of the Act into a sweeping grant of rulemaking authority over *all* intrastate matters. That roundabout approach to the text is exactly what does *not* provide a "straightforward" and "unambiguous" command sufficient to "override" § 2(b). *Louisiana*, 476 U.S. at 377.

Indeed, where Congress has intended to supersede § 2(b) by expressly assigning the FCC intrastate authority, it has generally done so in exceedingly clear terms. In the 1996 Act itself, for example, Congress directed that the FCC should "take all actions necessary" to "prescribe regulations that establish a per call compensation plan . . . for each and every completed *intrastate and interstate call using [a] payphone*." § 276(b)(1)(A) (emphasis added). Similarly, in § 225, Congress directed the FCC to "ensure that *interstate and intrastate* telecommunications relay services are available . . . to hearing-impaired and speech-impaired individuals." § 225(b)(1) (emphasis added). Congress thus demonstrated repeatedly that it could provide exactly the sort of

unambiguous command that would override § 2(b); yet the FCC can nowhere point to remotely comparable language giving it any role in pricing for the local competition provisions.

Second, the FCC and other petitioners attempt to circumvent § 2(b) by arguing that the 1996 Act straightforwardly *applies* to intrastate matters, and that this alone should suffice to give the FCC rulemaking power. That approach runs afoul of the plain terms of the section, which expressly imposes a *dual* limitation — phrased in the disjunctive — commanding that "nothing in this Chapter shall be construed *to apply or to give the [FCC] jurisdiction with respect to*" intrastate matters. 47 U.S.C. § 152(b) (emphasis added). According to the FCC, however, the disjunctive phrasing should simply be ignored.

On this score, the FCC's primary argument amounts to the assertion that federal telecommunications law cannot conceivably apply to any matter outside the FCC's rulemaking authority. The FCC argues this proposition: as long as the Communications Act applied only to interstate matters, the FCC's jurisdiction was coextensive with the Act; therefore, now that the Act also applies to intrastate matters, the FCC's authority should automatically be extended to the full scope of the statute, because to do otherwise would be to give effect to the disjunctive phrasing of § 2(b) for the first time. *See* FCC Br. 34; *id.* at 21. Merely to state that position is to refute it.

Third, replaying an argument already rejected by this Court in *Louisiana*, the FCC appeals to a form of pseudo-legislative history to narrow § 2(b). The FCC claims that § 2(b) was passed in response to the intrastate authority that the Interstate Commerce Commission had been permitted to exercise in the *Shreveport Rate Case, Houston, E. & W.T.R. Co. v. United States*, 234 U.S. 342 (1914). That case involved ICC regulation of intrastate matters to which federal law did not directly apply — what the FCC now calls "ancillary"

jurisdiction. As a result, the FCC claims, whatever the terms of § 2(b), the provision should be limited to overruling *Shreveport* on its facts and to prohibiting similar exercises of "ancillary" jurisdiction. *See, e.g.*, FCC Br. 34-35; MCI Br. 45-47.

Even apart from the flaws this approach has as an attempt to elevate ambiguous legislative history over the terms of the statute, the FCC's maneuver is hobbled by a more fundamental error: this Court has already rejected this same argument. In *Louisiana*, the FCC claimed that because *Shreveport* had involved power to set intrastate rates, § 2(b) should only limit the FCC's power over that precise subject. The Court emphatically rejected this "narrow reading." *Louisiana*, 476 U.S. at 371. The Court explained that the provision was not limited to responding to the facts of the *Shreveport* case, but rather dealt more broadly with "[t]he question of an appropriate division between federal and state regulatory power." *Id.* at 372. The Court thus concluded that the "breadth of the language" in the section should be given full effect. *Id.* at 373. The FCC's effort to use *Shreveport* to cabin the terms of § 2(b) is thus a tactic that has already been soundly rejected.

The FCC's *final* attempt to slip out from under § 2(b) is a belated assertion of the so-called "impossibility" exception. FCC Br. 36. As described by the Court of Appeals, "this quite narrow exception," recognized in some court of appeals decisions, "provides that the FCC may preempt state regulation of intrastate telecommunications matters only when (1) it is impossible to separate the interstate and intrastate components of the FCC regulation and (2) the state regulation would negate the FCC's lawful authority over interstate communications." Pet. App. 16a. The FCC claims that this exception grants it pricing authority because local telephone facilities carry *both* intrastate and interstate calls.

The agency's belated resort to this theory is fruitless for a number of reasons.

First, the FCC never relied on this basis for jurisdiction in the First Report and Order. J.A. 448-56, 461-65 (¶¶ 83-103, 111-20). (outlining the FCC's grounds for authority). It is a bedrock principle of administrative law that a reviewing court "must judge the propriety of [administrative] action solely by the grounds invoked by the agency," *SEC v. Chenery Corp.*, 332 U.S. 194, 196 (1947), including the agency's articulated rationale for bringing its action within its statutory authority, *see American Textile Mfrs. Inst., Inc. v. Donovan*, 452 U.S. 490, 539-540 (1981). The *post hoc* impossibility claims of the FCC's appellate counsel thus cannot be substituted for the agency's own basis for acting.

Indeed, the policies behind *Chenery* apply with particular force here. Had the agency ever attempted to spell out its impossibility analysis, it would have been patently obvious that the theory could not remotely apply to a large portion of the FCC's claims for power. For example, setting wholesale prices for local service by definition involves matters that are solely *intrastate* in nature. Indeed, before the Eighth Circuit the FCC conceded that this service was "solely intrastate." Brief for the FCC and the United States at 30. The impossibility exception thus cannot remotely justify the wholesale pricing authority the FCC claimed. The FCC, moreover, has never claimed that jurisdiction to set wholesale prices under § 252(d)(3) should rest with a different entity from authority to set prices for interconnection and network elements under § 252(d)(1). As a result, the incontestable failure of the FCC's "impossibility" theory as to wholesale pricing necessarily undermines the FCC's claims over the remaining pricing authority as well.

But even if the FCC could get beyond both *Chenery* and the patent inapplicability of the impossibility exception to much of the authority the FCC wants to claim, that exception would still not justify FCC power over *any* pricing matter. Impossibility analysis protects the efficacy of the FCC's rulemaking authority only where the FCC has clear authority

over some interstate matter to start with. But the FCC itself acknowledges that the Act assigns authority over pricing as one indivisible unit (covering, for example, element pricing whether the elements are used for *inter*state or *intra*state calls), *see* FCC Br. 36-37, and the best the FCC can plausibly argue to get its foot in the door is that the Act has not been entirely clear in *foreclosing* any FCC role. From that starting point the FCC cannot call on "impossibility" to bootstrap a purported *ambiguity* about pricing into *complete control* for itself over the very same subject — unless the exception is an entirely circular device for expanding FCC power. To the contrary, impossibility analysis requires a clear FCC role in some *inter*state matter as an essential predicate for extending the FCC's reach into *intra*state matters. It cannot convert a purported lack of clarity into an absolute assignment of all pricing authority to the FCC.

3. The Court of Appeals Was Also Correct That Section 2(b) Restricts the FCC's Jurisdiction Over Other, Non-Pricing Matters Involving Intrastate Telecommunications.

Having relied on § 2(b) to provide "belt-and-suspenders" support for its ruling on jurisdiction over pricing, the Eighth Circuit was entirely correct to apply the plain terms of § 2(b) to restrict the FCC's authority over other, non-pricing intrastate matters addressed by the 1996 Act as well. As the court explained, Congress used express and unambiguous terms to assign the FCC a role in several intrastate matters under the Act. Absent such an express grant of authority, the FCC could point to no basis for ignoring the command of § 2(b). As a result, the court correctly held that the FCC's intrastate authority under § 251 was "confined to the six areas where

Congress expressly called for the FCC's participation." Pet. App. 37a.[21]

II. THE EIGHTH CIRCUIT PROPERLY VACATED ONE OF THE FCC'S FOUR RULES RADICALLY EXPANDING THE UNBUNDLING DUTY, BUT FAILED TO ENFORCE THE REMAINING RESTRICTIONS IMPOSED BY CONGRESS.

As explained above, Congress balanced a series of competing concerns as it opened local markets to competition. While seeking to encourage immediate entry by granting access to incumbents' facilities, at the same time Congress sought to protect incentives for facilities-based competition, ensure that incumbents would be fully compensated for the use of their property, and preserve support for universal service. The FCC wholly upset the balance reconciling these objectives by driving a freight train through each of four critical limitations Congress placed on incumbents' duty to provide access to elements of the network.

First, it redefined "network element[s]" to include *all* significant aspects of an incumbent's business, not just pieces of its call delivery system (and the features thereof). *Second*, it effectively read out of the Act the standards requiring the agency to evaluate whether access to network elements was "necessary" or whether denial of access would "impair" the ability of competitors to provide service. *Third*, it transformed the Act's requirement that an incumbent sell its competitor individual *pieces* of its network into an obligation to sell the entire network. *Finally*, the FCC attempted to force incumbents to provide a package of "unbundled" network

---

[21] By identifying these areas of FCC power under § 251, the court did not purport to catalogue *all* grants of intrastate authority to the FCC in the Act. The question whether the FCC could identify sufficiently explicit language elsewhere in the Act to grant intrastate authority is not presented here.

elements already combined together into completed telephone service with all advanced features and functions.

The Eighth Circuit rightly vacated the last of these four extra-statutory efforts to redefine the unbundling duty. Each of the first three expansions of the duty is also flatly contrary to the Act. In upholding those FCC rules on unbundling, the Eighth Circuit erred.

A. The Combined Effect of the FCC's Four Unlawful Decisions on Unbundling Highlights the Conflict Between the FCC's Rules and the Act.

As outlined in detail below, the FCC violated the plain terms of the Act with each of its four expansions of the unbundling duty. But the stark disparities that exist between the FCC's individual rules and the terms of the Act do not tell the whole story here. It is the cumulative effect of the FCC's decisions that graphically shows how the FCC has expanded access to unbundled elements beyond all confines and turned it into an irresistible opportunity for entrants to engage in arbitrage at the expense of universal service.

The Eighth Circuit properly recognized the need to evaluate the FCC's rules against the plan of the Act as a whole. Thus, in vacating the FCC's attempt to require incumbents to provide network elements already combined together, the court explained that, viewed in the context provided by the broader structure of the Act, the FCC's rule would improperly "obliterate the careful distinctions Congress has drawn" between network elements and resale. Pet. App. 71a.

Indeed, the court's ruling prevented the FCC's multiple expansions of the unbundling duty from completely undoing the Act. As outlined above, the FCC's authorization of "sham unbundling" — allowing an entrant to order finished service through the fiction of purchasing *all* the elements of the network already preassembled into a functioning platform — would have given entrants an irresistible choice. Either they

could purchase service for resale at a price that contributes to universal service and fully compensates the incumbent (*i.e.*, the wholesale price under § 252(d)(3)), or they could purchase it *for a fraction of that price* through a rate that evades any contribution to universal service and fails to compensate the incumbent.

That is some choice! It would allow new entrants to pay a fraction of the price of wholesale service through the expedient of invoking sham unbundling and ordering the network element "platform." Perhaps most outrageous of all, this government-sponsored system of regulatory arbitrage would have allowed entrants not merely to avoid contributing to universal service, but — while doing nothing but reselling service provided entirely over an incumbent's network — to pocket for themselves the revenues from business and urban customers that currently maintain low residential rates. In that way, sham unbundling would effectively convert what had been a subsidy for consumers into a subsidy attracting arbitrageurs.

Not surprisingly, the FCC and its allies recognize that a candid examination of the effects of these rules provides the greatest threat to sham unbundling. Thus, they hope to divert attention from the complete picture in two ways.

First, they decry any effort to examine the statutory structure as an extra-textual foray into "policy." *See, e.g.*, FCC Br. 47; MCI Br. 21-22. The FCC no doubt would prefer to restrict this Court to viewing in isolation each of the discrete terms the agency purported to interpret. In that way, the FCC could attempt to squeeze some ambiguity out of the text and rush to claim deference for its construction. *See* FCC Br. 48; MCI Br. 14-15.

But this "divide and conquer" approach to statutory interpretation is impermissible. The FCC cannot jump to *Chevron* to shore up its rules while hiding the overall impact of

its regulatory scheme. To the contrary, before there can be any question of deferring to an agency, a court must endeavor to determine the intent of Congress by examining both "the particular statutory language at issue *as well as the language and design of the statute as a whole*." *Sullivan v. Everhart*, 494 U.S. 83, 89 (1990) (emphasis added); *United States Sav. Ass'n v. Timbers of Inwood Forest Assocs., Ltd.*, 484 U.S. 365, 371 (1988). As the Court has warned, individual provisions are "often clarified by the remainder of the statutory scheme," in particular where "only one of the permissible meanings produces a substantive effect that is compatible with the rest of the law." *Timbers of Inwood*, 484 U.S. at 371. *Chevron* cannot be applied, so to speak, on an "unbundled basis."

Nor can the FCC bolster its attacks on the Eighth Circuit's construction of the Act with its vitriolic rhetoric. What the FCC and its supporters vilify as anticompetitive increases in costs that the Eighth Circuit imposed due to its "policy" views, *see, e.g.*, MCI Br. 22, AT&T Br. 46, involve nothing more than enforcing the balanced restraints Congress imposed on access to elements.

MCI attempts a second, more focused effort to impose blinders on any analysis of the Act by insisting that the impact of the FCC's sham unbundling on universal service must be ignored. Universal service, MCI claims, is an entirely separate concern addressed elsewhere in the Act. Thus, pointing to the mandate for new "explicit" subsidies, *see* § 254, MCI claims that Congress refused to link such reforms in any way to competitors' ability to enter the market. MCI would brand any effort to show that the FCC's rules would exempt entrants from the burdens of existing implicit subsidies as a misguided effort to "preserve" the subsidies Congress wanted replaced. MCI Br. 25. But MCI well knows that GTE and other incumbents have no desire to preserve implicit subsidies. Rather, they would prefer a rapid transfer to the explicit funding systems that will ensure that all carriers bear an equal burden. But what

Congress explicitly forbade is a system in which incumbents continue to bear *all* the burdens of paying for universal service while entrants are freed from *any* universal service obligations and can undercut incumbents' rates simply by reselling use of the incumbent's own network. That result patently conflicts with Congress's repeated efforts to preserve universal service funding — including the unequivocal command that "[e]very telecommunications carrier . . . *shall contribute, on an equitable and nondiscriminatory basis*" to universal service. § 254(f). *See also* § 253(b) (preserving States' authority to impose "competitively neutral" means for advancing universal service). Despite MCI's hopes, that unqualified command does not permit competitors to enter the market for *any period* without contributing to universal service.

MCI desperately claims that Congress required *no* coordination between introducing competition and spreading universal service burdens equitably to entrants for one reason — MCI cannot deny that sham unbundling will have precisely the effect of promoting arbitrage and freeing entrants from any obligation to contribute to universal service. MCI thus strains to reconcile the statutory plan with the windfall promised by the FCC by ignoring Congress's commands requiring *all* carriers to bear the load of universal service.

These attempts to divert attention from the cumulative effects of the FCC's actions should fail. As detailed below, the conflicts between each of the FCC's rules and the terms of the Act provide ample reason for vacating the agency's actions. But the overall impact of the FCC's rules on unraveling the plan crafted by Congress also provides an important part of the picture demonstrating that the agency's actions cannot be reconciled with the language and structure of the Act.

B. The Court of Appeals Erred in Upholding Three of the FCC's Improper Expansions of the Duty To Provide Unbundled Network Elements.

While it prevented the worst harm that would result from the FCC's expansions of the duty to unbundle by vacating the rule requiring incumbents to provide elements preassembled, the Court of Appeals erred in upholding three of the FCC's major decisions broadening the unbundling duty.

1. The FCC Improperly Expanded the Definition of Network Elements.

The FCC erred first and foremost by ignoring the express limits in the definition of "network elements" and expanding the term beyond all rational bounds. Congress restricted the term so that entrants could obtain parts of the incumbent's call-routing network. The plain and ordinary meaning of the term "network element" itself, after all, denotes a "piece" of the "network" — that is, the system of lines and switches that makes up the local exchange. The statutory definition confirms that commonsense understanding as it restricts a network element to a "facility or equipment," § 153(29) — that is, a physical piece of the network. While the definition also encompasses "features, functions, and capabilities" of these network parts, it includes only features or functions that are "provided *by means of such facility or equipment*." *Id.* (emphasis added). Congress thus established network elements as items that are unalterably rooted in discrete physical parts of the local exchange.

The Act also restricts "network elements" by requiring that an element be "used in the provision of a telecommunications service." *Id.* "Telecommunications," in turn, is defined as the "transmission, between or among points specified by the user, of information of the user's choosing." § 153(46). Network elements, therefore, are the pieces of "equipment" that make up the incumbent's "network" for call delivery — the system used

to transmit calls from one point to another. Not surprisingly, this definition effectively makes network elements correspond to the so-called "bottleneck" facilities of the local exchange that are necessary for any carrier to use to get calls to and from every customer in a local exchange area. It is precisely that type of capital-intensive infrastructure owned by the incumbent that entrants might find difficult to duplicate in the near term when first starting their own local telephone businesses.

Both the FCC and the Eighth Circuit, however, removed any constraints limiting what might count as a network element and converted the term into an avenue for entrants effectively to rent any part of an incumbent's business. Following the FCC, the court emphasized that elements were facilities used in providing "telecommunications *service*," and that telecommunications service is the "'offering of telecommunications . . . to the public.'" Pet. App. 42a (emphasis added) (quoting § 153(46)). In the court's view, "offering" service to the public encompassed many functions beyond routing calls, and thus "network elements" were not limited to parts of the actual call-routing network at all. *Id.*

But that expansive gloss cuts the term loose from any plausible connection to the text. Indeed, it removes any constraint at all on what can be a network element. Everything that a LEC does and everything that it uses in its business is, in some sense, part of the "overall commercial offering" of service to the public. Pet. App. 43a. By making anything used in the offering of service the only touchstone for deciding what is an element, the court endorsed an FCC construction that guarantees absurd results. Under the FCC's reading, an incumbent's entire billing department and all the software and "equipment" it uses would be an "element" subject to being rented out to entrants on an "unbundled basis."

The terms of the definition, moreover, make it plain that the reference to the "provision of telecommunications service" — the phrase on which the FCC so heavily relies — was not

designed to decouple "network elements" from the familiar and concrete concept of the call-routing network. The definition refers to facilities (including their features) "used in the transmission, routing, or other provision of a telecommunications service." § 153(29). That listing shows that, far from straining to sweep in every function performed by a LEC to operate a profitable business, Congress was referring to basic steps in call delivery. The specific functions Congress described — "transmission" and "routing" — both refer to physical delivery of calls. The concluding term in the list referring to "other provision" of service does not suddenly expand the sentence to encompass every aspect of running a local exchange business. To the contrary, under the principle of *ejusdem generis*, such a general term concluding a list is limited by the more specific terms that precede it. *See, e.g.*, *Breininger v. Sheet Metal Workers*, 493 U.S. 67, 91-92 (1989). The FCC's contrary reading is utterly at odds with the text.[22]

By automatically treating as "network elements" everything that a LEC uses in any aspect of its business, the FCC absolved itself of the responsibility of ever applying the terms actually set by Congress. Before requiring unbundling, the FCC never even considered whether a given item at issue was actually a "facility or equipment" that was a part of the network (or a "featur[e], functio[n], or capabilit[y]" of such a facility). This approach makes "network elements" infinitely expandable, and the Eighth Circuit applied this reading to uphold two FCC errors.

---

[22] The FCC itself, moreover, has interpreted the same terms in another section of the Act to mean precisely what we suggest. Under § 214(e), a carrier's eligibility for a new federal support mechanism hinges, in part, upon whether the carrier is "using its own facilities" to "offer" certain telecommunications "services." § 214(e)(1)(A). The FCC has squarely ruled that under that section the term "facilities" is limited to "physical components of the telecommunications network that are used in the transmission or routing" of calls. Universal Service Order ¶ 151.

(a) The FCC Erred By Treating Discrete Services as Network Elements.

First, the FCC concluded not only that "network elements" could include any equipment used in any aspect of the LEC's business, but also that an entire branch of the business might be treated as an "element." The agency thus decided that operator and directory assistance services would be treated as network elements — producing the absurdity that live operators are deemed "elements" of the network subject to unbundling.[23] J.A. 125-29 (¶¶ 534-40). Such an outcome cannot be squared with the terms of the statute. Operators providing directory assistance or other service to customers cannot be forced into the statutory categories of a "facility" or "equipment" or even "features, functions, or capabilities provided by means of such facility or equipment." § 153(29). To the contrary, they are *people* fulfilling a role in running one aspect of the LEC's business.

Operators, moreover, are used to provide a distinct *service*, and the Act provides a separate means for entrants to obtain services from an incumbent under the resale provisions of § 251(c)(4). The Eighth Circuit's bald conclusion that § 251(c)(4) does not provide the "exclusive means" for entrants to obtain services for resale, Pet. App. 45a, but that services should *also* be available as "network elements," ignores both the text and legislative history. Where a statute addresses discrete, defined terms such as finished "services" and "network elements" in separate provisions, the inclusion of one term in a given provision necessarily implies exclusion of the

---

[23] Indeed, as if to pursue its own *reductio ad absurdum*, the FCC suggested that, where technically feasible, when an entrant such as AT&T "leases" a GTE operator on an "unbundled basis," that operator should be "rebranded" — *i.e.*, the operator should selectively identify himself or herself as an AT&T operator when answering a call from an AT&T customer. J.A. 127-28 (¶ 537).

other. *See, e.g., O'Melveny & Myers v. FDIC*, 512 U.S. 79, 86 (1994) ("*Inclusio unius, exclusio alterius.*").

Here the evolution of the Act strongly confirms that reading since Congress consciously eliminated any reference to "services" in the definition of network elements. Both the House and Senate bills had referred to unbundled access to "services" — indeed, the Senate bill did not even contain a separate provision on resale of services. *See* S. 652, 104th Cong., 1st Sess. § 251(b)(1) (1995); H.R. 1555, 104th Cong., 1st Sess. § 242(a)(2) (1995). In the Act, however, any mention of services was eliminated from both the definition of network elements and the section outlining the unbundling duty, *see* § 251(c)(3). Instead, "services" were addressed solely in the separate resale provision, § 251(c)(4). The FCC's expansion of elements to include operator and directory assistance services is thus wholly at odds with the Act.

(b) The FCC Improperly Expanded the Definition of Elements To Include OSS.

Second, the FCC determined that background software systems used by an incumbent to run its business, known as operation support systems (OSS), would qualify as elements. OSS perform a number of functions. The vast majority are software systems designed to maximize the efficiency of the LEC's operations, and in particular its customer service operations. Thus, such software manages billing functions, automatically routes service requests entered by a customer service operator to the appropriate personnel, allows scheduling of repair visits, and provides access to customer information relevant to the process of ordering services or repairs.

None of these systems is part of the call-routing network. By limitlessly expanding the definition of network elements, however, the FCC eliminated any need even to *consider* whether a particular software system actually has anything to

do with the "network" itself. Instead, it treated all OSS as "elements" of the "network" subject to unbundling without any further inquiry.

But OSS are not "facilities" or "equipment" used in the routing or transmission of a telephone call. Nor are they "features, functions, [or] capabilities that are provided by means of such facility or equipment." § 153(29). The FCC, moreover, made no effort to claim that OSS played a part in routing a call. Rather, the agency asserted that access to OSS was necessary to ensure that entrants could accomplish "pre-ordering, ordering . . . and billing," J.A. 118 (¶ 518), as well as "service functions [such] as scheduling customer appointments," *id.* at 118-19 (¶ 519), in "substantially the same time and manner that an incumbent can for itself," *id.* at 118 (¶ 518). The agency thus sought to ensure, through access to software, that entrants would be able to run the business aspects of their ventures just as efficiently as incumbents. The duty Congress imposed to provide "elements" of a telecommunications "network," however, had nothing to do with making such business skills of an incumbent available for its competitors.

(c) Expanding "Network Elements" to All Important Parts of a LEC's Business Defeats the Objectives of the Act.

The FCC's expansion of the definition of "network elements" is not only inconsistent with the terms of the Act, it is also wholly at odds with the statute's purposes. The Act is meant to promote competition by allowing new entrants to use the essential facilities of an incumbent — those aspects of the LEC's infrastructure that cannot reasonably be duplicated in the near term. But it does not foster competition to allow a competitor to purchase *all* significant parts of a LEC's business (especially at rates based on the costs of a hypothetical, most-efficient provider). Rather, true competition is promoted (and the benefits of innovation and improved efficiency are obtained) when an entrant has an incentive to provide some

aspects of a local exchange business more efficiently than the incumbent.

The FCC, however, requires a LEC to turn over to its competitors precisely those aspects of its business in which competitors should be attempting to differentiate themselves. In a competitive marketplace where a basic set of essential facilities was provided to all comers by the incumbent, competition would occur precisely on such non-essential aspects of the business as operator services, directory assistance, and operation support systems. By treating such parts of the business as "essential facilities," the FCC ensures that there will be no competition on these aspects of the business and limits competition merely to marketing functions.

2. The FCC Improperly Diluted the Standards Limiting What Elements Must Be Unbundled.

The FCC compounded its errors by eviscerating the standards in § 251(d)(2) limiting the obligation to unbundle even items that come within the definition of "network elements." Congress insisted that there be an evaluation of *need* before entrants would be granted forced access to the facilities of an incumbent's existing network. Thus, Congress directed that "in determining what network elements should be made available," the FCC "*shall consider*, at a minimum," whether access to proprietary elements was "necessary" and whether the failure to provide access to a non-proprietary element would "impair" an entrant's ability to provide service. § 251(d)(2) (emphasis added).

The FCC followed a two-step approach to read those limitations out of the Act. To start, the agency misinterpreted § 251(c)(3)'s direction concerning *where* an incumbent had to provide access to elements ("at any technically feasible point") as a command defining *what* had to be unbundled. The agency thus created an extra-statutory presumption that any element

that could technically be unbundled must be unbundled. J.A. 49 (¶ 278). The Eighth Circuit rightly vacated that presumption as contrary to the text, Pet. App. 46a-47a, and the FCC has not even attempted to seek review of that ruling. The Eighth Circuit failed to appreciate, however, that the agency's erroneous presumption fundamentally clouded the rest of the FCC's approach to the statutory terms limiting unbundling.

Specifically, when the FCC turned to § 251(d)(2), it perceived a false tension between the restrictions in that section and the blanket presumption it had mistakenly created under § 251(c)(3). To resolve that tension, the FCC gave primacy to its misconstruction of § 251(c)(3) and sought to read § 251(d)(2) in a way that would not "significantly diminish the obligation imposed by section 251(c)(3)." J.A. 53-54 (¶ 286). As a result, the FCC watered down the standards of § 251(d)(2) into meaninglessness by concluding that any assessment of the "necessary" and "impair" standards should proceed solely by looking to the availability of alternative facilities *from within the incumbent's own network*. J.A. 51-52, 54-55 (¶¶ 283, 287). Thus, irrespective of cost or other considerations, the FCC rejected the suggestion that access to a proprietary element should not be considered "necessary" if a requesting carrier "can obtain the requested proprietary element from a source other than the incumbent." *Id.* at 51-52 (¶ 283). That approach to the text is insupportable. It defies the ordinary English meaning of the terms to pretend that an element from an incumbent's network is "necessary" (or that failure to provide it would "impair" one's ability to provide service) if it is readily available "from a source other than the incumbent."

In upholding this approach, the Eighth Circuit simply echoed the FCC's claim that if incumbents could "evade their unbundling duties whenever a network element could be obtained elsewhere," the use of elements for entry would be crippled because almost every element "could *theoretically* be duplicated *eventually*." Pet. App. 48a (emphasis added). But

that begs the question in two respects. First, the FCC did not preclude consideration only of *theoretical* facilities that did not exist and were not readily available. Rather, it categorically precluded all consideration of alternatives — even those that exist and are readily available (including deployed facilities such as the fiber optic cables used by cable television providers or the switches deployed by competitive access providers).

Second, the suggestion that looking to facilities outside the network would allow incumbents to "evade their unbundling duties" just assumes the answer to the question. Section 251(d)(2) *limits* the duty by restricting when elements must be provided. To suggest that incumbents "evade" their "dut[y]" if access is not required where there are readily available alternatives assumes that the obligation is to provide completely unfettered access to all parts of the network at all times. That is simply not the duty Congress established.

The FCC also sought to justify its approach by declaring that considering alternative facilities outside the network might require entrants to "duplicate unnecessarily" a part of the network. J.A. 51-52 ¶ 283). That purported rationale brazenly rejects the policies Congress sought to promote. "Unnecessary" "duplication" is simply the FCC's denigrating term for deploying competing facilities. But Congress required an evaluation of need before elements would be provided precisely to encourage the use of non-incumbent facilities and thereby to preserve the incentives for innovation and increased efficiency that come with facilities-based competition. The FCC derided that goal and proceeded to grant exactly the unlimited access Congress had forbidden.

3. The FCC Improperly Ruled that Entrants Could Provide Service Using *Solely* Network Elements.

The FCC continued its drive to expand the unbundling duty by determining that entrants could rely *solely* on network

elements to provide local service. In other words, without supplying any facilities of its own, an entrant could order the entire network from end to end as supposedly discrete, "unbundled" elements and rely on those facilities to offer service. J.A. 63-65 (¶¶ 338-41).

Section 251(c)(3) rules out the FCC's approach. The section requires incumbents to provide "access" to "elements" of the network at any "technically feasible point." It is directed at ensuring physical access to discrete pieces of the network at various points of possible connection so that entrants can use limited portions of the network — not at simply allowing an entrant to order the whole network, lock, stock and barrel. Turning that requirement for incumbents to split up the network and provide different pieces at various points into an obligation to provide everything an entrant might need to provide service, from start to finish, rewrites the Act.

The FCC's approach would also undermine the basic distinction Congress crafted between resale and network elements as modes of entry. In § 251(c)(4), Congress created a distinct method of entry that would allow competitors with no facilities to rely solely on the incumbent's network and to resell the incumbent's own service. Network elements, in contrast, provided a means for those with some facilities of their own to enter immediately by filling gaps in their networks with leased equipment. It reflected Congress's understanding that "*[s]ome* facilities and capabilities (*e.g.*, central office switching) will likely need to be obtained from the incumbent . . . as network elements." Conf. Rep. at 148. By instead converting network elements into a second route for obtaining from the incumbent everything needed to run a local exchange (including, under the FCC's erroneous definition, such added services as operators and directory assistance), the FCC undermined a critical protection built into the structure of the Act to promote the development of competing facilities.

The resale route Congress established was also carefully restricted to ensure that the quick and easy way to enter the market by completely piggy-backing on the incumbent would not lead to regulatory distortions. The FCC's conversion of access to selected network elements into a route for effectively renting everything needed to run a local exchange business improperly allows entrants to circumvent those protections.

For example, Congress set the wholesale pricing rule to ensure that entrants acting as middlemen will incorporate the *same* subsidy structure in their rates that an incumbent faces in its retail rates. Section 252(d)(3) thus requires wholesale rates "based on the retail rate" — a standard that "reflect[s] whether, and to what extent, the local dialtone service is subsidized by other services." H.R. Rep. No. 104-204, at 72 (1995). The FCC's conversion of access to parts into an obligation to provide the *entire* network, however, largely destroys that fundamental protection. The FCC would make it possible to rely solely on elements to provide service, thus converting network elements effectively into a second avenue for using the incumbent's network to resell the incumbent's service, but at a price different from the wholesale price.

Similarly, the FCC would allow entrants to circumvent restrictions Congress imposed on the use of resold service. Congress sought to ensure that large long distance companies would not be given an immediate advantage in seizing market share by being able to market their own long distance service jointly with local service resold from a Bell company — at least not until the Bell company would be able to compete effectively by providing long distance service in its own region. *See* 47 U.S.C. § 271(e)(1). That restriction was expressly designed "to provide parity between the Bell operating companies and other telecommunications carriers in their ability to offer 'one stop shopping' for telecommunications services." S. Rep. No. 104-23, at 43 (1995). The FCC, however, would allow entrants to evade that

limitation completely by relying solely on network elements effectively to resell an incumbent's service. J.A. 61-62 (¶ 335).

C. The Eighth Circuit Rightly Vacated the FCC's Rule Requiring Incumbents to Provide Elements Already Assembled into Platforms.

Finally, as if to guarantee that its rules would provide an absolute end-run around the protections Congress built into the Act's resale provisions, the FCC capped off its multi-step expansion of the unbundling duty by ruling that incumbents would be required to provide elements *already preassembled* into functioning platforms whenever the elements were already connected in the incumbent's own network. *See* 47 C.F.R. § 51.315(b). That rule completed the FCC's conversion of unbundled elements into a second route for obtaining finished service to resell, since it guarantees that an entrant would not have to do anything for itself to turn disparate elements into a fully functioning service. By allowing entrants to engage in the fiction of labeling a request for use of the entire network as a request for "access" to "unbundled" elements, the FCC created a new, wholly extra-statutory duty and turned ordering "unbundled" elements into a sham. By imposing a duty to provide discrete, separate *parts* of the network, Congress did not require incumbents to turn over a *fully preassembled*, functioning network. The FCC's approach is akin to turning a requirement that a company provide entrants spare auto parts "on an unbundled basis" into a duty instead to provide entire automobiles ready to drive off the lot.

Creating that sweeping obligation is flatly contrary to the Act in its own right, but it is an even more egregious violation when combined with the pricing standard applied to network elements. As explained above, the pricing terms for network elements have been construed by regulators to exclude any consideration of the costs of universal service. By labeling its request to use the entire network as a fictional purchase of fully pre-assembled "elements," an entrant can effectively obtain the

same ability to resell an incumbent's service that it would get under the Act's resale provisions, but at a price that eliminates any contribution to universal service. The entrant thereby receives an automatic ability to undercut an incumbent's retail rates. The entrant would be assured of a chance to strip away the customers that currently support universal service and simultaneously to pocket for itself the funds those customers provided to subsidize low rates for the average consumer. The FCC's scheme would thus scuttle all the protections Congress built into the Act to ensure that allowing entrants a chance to piggy-back on an incumbent's network would *not* undermine the goal of universal service.

As the Eighth Circuit rightly held, the FCC's rule disregards the terms of § 251(c)(3). To start, that section expressly requires incumbents to provide "access to network elements" at "any technically feasible point" within the network. With those terms, Congress plainly cast the duty it imposed in terms of physical "access" to *pieces* of the network at different physical locations where connection might be feasible. The language plainly denotes a duty to provide access to multiple different parts of the network, not an obligation to turn over the entire network as one integrated, functioning unit. The section goes on, moreover, to specify that elements are to be provided on an "unbundled basis," again reinforcing the conclusion that Congress was requiring incumbents to provide *parts* of their network separated out for individual purchase.

Finally, as the Eighth Circuit emphasized, the section concludes by specifying that incumbents are required to provide elements only "'in a manner that allows *requesting carriers to combine* such elements in order to provide such telecommunications service." Pet. App. 70a (quoting 47 U.S.C. § 251(c)(3) (emphasis added by court)). As the court explained, "[t]his sentence unambiguously indicates that requesting carriers will combine the unbundled elements themselves." *Id.* That in itself makes it crystal clear that

Congress did not require incumbents to shoulder the burden of "combining" elements. Moreover, the section makes clear that entrants will have to go through this process of "combin[ing]" elements "in order to provide" service. "Elements" are thus the building blocks that must be put together to create a service that can be marketed to customers — elements in themselves do not come ready-made as services ready for entrants to turn around and resell.

The FCC tries in vain to avoid the plain terms chosen by Congress to define the unbundling duty. First, to divert attention from the language emphasized by the court below — which states that "requesting carriers" will "combine" network elements — the FCC casts its attack as if the judgment rested solely on the meaning of the term "unbundled." *See* FCC Br. at 44; *see also* MCI Br. 18-19. The FCC and its supporters thus claim that providing "elements" on an "unbundled basis" means only providing separate *prices* for elements and cannot imply that elements are actually to be sold on a physically separated basis.

That approach, however, ignores the context provided by the rest of the section. Section 251(c)(3) describes providing physical "access" to discrete "elements" of the network and dividing up the network into distinct parts where it will be "technically feasible" to connect to each separate element. In that context, providing this physical access "on an unbundled basis" necessarily requires separating out the parts of the network into distinct pieces.

Indeed, the FCC's approach to the phrase "on an unbundled basis" is incoherent. The FCC and its allies claim that "unbundling" goods means providing separate prices. But even in the antitrust and related contexts that they emphasize, requiring unbundling of goods does not imply simply the empty formality of creating a price list. To the contrary, it means requiring a firm to provide goods on a separated basis. Thus, even accepting the FCC's frame of reference, by

requiring "unbundling" the Act merely mandates that an incumbent cannot force a new entrant to purchase the entire network bundled together into completed telephone service. Rather, the LEC must also sell *pieces* of its network separately, at separate prices. But granting entrants the right to buy *pieces* of the network *not bundled* together is not the same as granting them the right to buy all the pieces of the network *already bundled together* into completed service.

In the end, even the FCC cannot avoid the plain import of the words of the Act. It explains in its brief, for example, that the point of the unbundling is to allow entrants "to lease *individual network elements*," FCC Br. 5 (emphasis added) — in other words, not the *whole network* already preassembled. Similarly, in its orders the FCC has repeatedly referred to "unbundling" an element to describe "physically separating" it from the rest of the network.[24] Given the context in which the term is used, in fact, it would be virtually impossible to discuss implementation of § 251(c)(3) without giving the term that connotation.

The FCC and its allies also place tremendous weight on dictionary definitions that appear to support the FCC's emphasis on separate prices. But as noted above, attempting to limit "unbundling" to imply solely a pricing constraint is illogical. In any event, AT&T and MCI wholly overplay their hand in claiming that merely citing dictionaries that appear to support the FCC's interpretation "is itself conclusive of its reasonableness." AT&T Br. 39; MCI Br. 19. Even the case cited by AT&T makes clear that the existence of a dictionary definition does not insulate an agency rule from review; rather,

---

[24] *See, e.g.*, Third Order on Reconsideration, In the Matter of Implementation of the Local Competition Provisions in the Telecommunications Act of 1996, FCC 97-295, at 8 (Aug. 18, 1997) (stating that "transport is physically severable from switching" but that LECs "may not unbundle switching and transport facilities that are already combined").

the agency must still apply a definition that "mak[es] some sense under the statute." *National R.R. Passenger Corp. v. Boston & Me. Corp.*, 503 U.S. 407, 418 (1992). The Court, in fact, has rejected the view that "the courts must defer to the agency's choice among available dictionary definitions." *MCI v. AT&T*, 512 U.S. 218, 226 (1994). To the contrary, a choice among alternative dictionary definitions must be supported by "contextual indications" from the statute. *Id.* Here, the FCC's reading conflicts with the context of the Act. And in any event, even a dictionary cited by petitioners makes it plain that the term "unbundled" describes goods sold on a separate basis. *See* Random House Dictionary of the English Language 2055 (2d ed. 1987) ("(of related products or services) sold separately rather than as a package").

Nor can the FCC support its interpretation with its assertion that one network element — the signaling system — cannot be physically disconnected and provided separately to entrants. FCC Br. 45. The FCC's own Order undermines this claim. The FCC addressed explicitly the task of providing access to signaling, separate from the rest of the network, and ruled that "[c]arriers that provide their own switching facilities should be able to access the incumbent LEC's [signaling] network via a signaling link between their switch and the incumbent LEC's [signaling transfer point]" — a particular facility in the signaling network. J.A. 99-100 (¶ 483). Indeed, the FCC elaborated that "[t]his could be accomplished by the incumbent providing an unbundled signaling link from its [signaling transfer point] to the competitor's switch." Moreover, to the extent that the switching function cannot be separated from signaling associated with it, the FCC defined signaling to be part of the "switching" network element -- not a separate element at all. See 47 C.F.R. § 51.319(c)(1)(C)(2).

The FCC's purportedly "textual" arguments ring particularly hollow, moreover, since the FCC has not even attempted to resuscitate its vacated rules requiring incumbents

to combine elements in *new* ways upon an entrant's request. *See* 47 C.F.R. § 51.315(c)-(f). After conceding that § 251(c)(3) means that incumbents cannot be forced to do *additional* combining of elements, the FCC cannot point to any basis for requiring incumbents to provide *existing* combinations. The distinction between what *has been* combined and what *might be* combined brings the FCC's rule no closer to the text of the Act. The Act does not require incumbents to do combining for entrants, and the fact that an incumbent may have already added value to one set of elements by combining them for itself does not mean that entrants automatically get to free-ride on the incumbent's efforts. To the contrary, § 251(c)(3) sets a duty to turn over discrete pieces of the network, without the added benefit of combinations, and that is all it requires. The facile protest that incumbents will be "taking apart" their networks to provide those pieces cannot change the contours of that duty.

Next, the FCC and its supporters claim that in requiring incumbents to provide elements "in a manner that allows requesting carriers to combine" them, the Act imposes a "duty," and that "as a matter of grammar," a "duty" cannot be read to create a "right" for incumbents to insist on providing elements on a physically separated basis. FCC Br. 45. But this is nothing more than a semantic game. The terms of § 251(c)(3) necessarily *limit* the extent of the duty imposed by the Act. Because Congress has directed that incumbents are required to provide elements "in a manner that allows requesting carriers to combine" them, the necessary result is that incumbents remain free to insist that they will not provide elements in any other manner.

Lastly, the FCC appeals to § 251(c)(3)'s command for "nondiscriminatory access" to elements. FCC Br. 46. In the FCC's view, an entrant will have equal access to *all* an incumbent's elements only if it has the exact same ability as an incumbent to use the elements already connected together into

a functioning network. But using the nondiscrimination principle to unravel all the other limitations in the section would plainly prove too much. It is simply not discriminatory for an incumbent to fulfill its duty to provide elements "in a manner that allows the requesting carrier to combine" them by actually providing separate elements that entrants can combine — even if it means separating the individual elements. To use the analogy from above, a firm with a duty to provide spare auto parts does not "discriminate" against entrants by providing perfectly good parts instead of fully assembled cars.

Finally, the FCC and its allies again appeal to purported policy concerns as they complain that, in their view, the elimination of the network element "platform" has destroyed the utility of elements as a means of entry. That is nonsense. Nothing in the Eighth Circuit's decision undermines the efficiency of network elements as a means of entry. The Eighth Circuit merely put an end to the fiction of a pre-combined network element platform that would allow entrants to buy completed services for two to three times the discount required under the statutory pricing standard. Despite their complaints, there can be no serious doubt about what has slowed the advance of competition since the passage of the Act. As long as the option of sham unbundling was dangled before entrants, no rational firm would dare attempt either deploying its own facilities or reselling service under the Act's wholesale provisions. In short, the FCC's own implausible and yet irresistible offer of windfall profits through sham unbundling brought any plans for genuine entry — either facilities-based or through resale — effectively to a halt.

III. THE EIGHTH CIRCUIT PROPERLY VACATED THE "PICK-AND-CHOOSE" RULE AS AN UNREASONABLE CONSTRUCTION OF THE ACT.

Section 252(i) sets forth an unremarkable nondiscrimination principle designed to allow later entrants to obtain in negotiations the same terms for their agreements as carriers

who have gone before them, as long as they are willing to accept *all* the terms that formed the earlier bargain. The Act provides only that an incumbent "shall make available any interconnection, service, or network element provided under an agreement" to "any other requesting telecommunications carrier *upon the same terms and conditions as those provided in the agreement*." § 252(i) (emphasis added).

In framing the issue under this section, the FCC conveniently omits the terms limiting incumbents' duty to providing "the same terms and conditions" as in an earlier agreement. *See* FCC Br. (I). That is hardly surprising, since the FCC's rules read that limitation out of the statute.

In the FCC's view, § 252(i) entitled a carrier "to choose among individual provisions" in an earlier agreement, J.A. 1044-45 (¶ 1310), and obtain those terms without even entering the standard negotiation process under § 252(a). *Id.* at 1048 (¶ 1321). Indeed, the FCC ruled that a carrier with a supposedly "binding" agreement in place could selectively jettison individual terms in favor of more advantageous terms subsequently negotiated by others. *Id.* at 1046-47 (¶ 1316). The FCC also ensured that a carrier could "choose" the terms it desired without having to accept corresponding tradeoffs elsewhere in the agreement that may have made those terms possible. Rather, to limit itself to providing the "same terms and conditions" as in an earlier agreement, an incumbent would have to "prove" that the terms were "*legitimately related* to the purchase of the individual element being sought." *Id.* at 1046 (¶ 1315). The FCC flatly determined that an incumbent "*may not*" treat terms governing sale of one element or service as part of the terms that produced agreement on another element or service. *Id.* (emphasis added). The FCC thus categorically rejected the possibility that concessions on their face related to

one particular piece of an agreement could have been a crucial *quid pro quo* for better terms on another.[25]

By artificially compartmentalizing every issue, the FCC's rule ignores the reality of bargaining and would make the give-and-take of negotiations impossible. An incumbent could never make a concession on one issue in return for a concession on another matter, because its own concession would automatically become available to all carriers without the need for others to accept the trade-off that made the term possible.

The Eighth Circuit rightly recognized this inherent conflict between the FCC's approach and Congress's design for implementing the Act. Despite the clear tension between the FCC's rule and the Act's unqualified requirement that incumbents need only offer "the same terms and conditions," the Eighth Circuit concluded that "the language of subsection 252(i) *in isolation*," did not prohibit the FCC's approach. Pet. App. 25a (emphasis added). Pursuing standard *Chevron* analysis, therefore, the court proceeded to "'look to the structure and language of the statute as a whole' to determine if the FCC's interpretation of this ambiguous provision is a reasonable one." *Id.* (quoting *National R.R. Passenger Corp. v. Boston & Maine Corp.*, 503 U.S. 407, 417 (1992)).[26] Despite the FCC's effort to label this approach pejoratively as a resort

---

[25] The FCC's claim that it "protect[ed]" incumbents by requiring entrants using § 252(i) to adopt to the existing terms and conditions "*relating to the particular service or element*," FCC Br. 48 n.15 (emphasis added), is thus carefully worded to disguise the gaping hole in the supposed "protection" offered by the FCC's rule.

[26] While the court cast its analysis under the second step of *Chevron*, it would also have properly fit under the first. Examination of the structure and purposes of a statute is one of the "traditional tools of statutory construction," *Regions Hospital v. Shalala*, 118 S. Ct. 909, 915 (1998), to be employed before a statute is deemed ambiguous. *See also supra* p. 52.

to "policy," FCC Br. 49, consideration of the structure of the Act was a routine part of the process for determining whether an agency's action is "reasonable in light of the legislature's revealed design." *Nationsbank v. Variable Annuity Life Ins. Co.*, 513 U.S. 251, 257 (1995).

As the court explained, the "structure of the Act reveals Congress's preference for voluntarily negotiated interconnection agreements," Pet. App. 25a, and the FCC's rule would "thwart" that process, *id.* 26a. It would also conflict with the requirement that negotiated agreements be "binding," § 252(a)(1), because entrants could "unilaterally incorporate more advantageous provisions contained in subsequent agreements negotiated by other carriers." Pet. App. 26a. The Eighth Circuit thus correctly ruled that the FCC's approach to § 252(i) could not be reconciled with the Act.

As this Court has explained, "we should not impute to Congress a purpose to paralyze with one hand what it sought to promote with the other." *American Textile Mfrs. Inst., Inc. v. Donovan*, 452 U.S. 490, 513 (1981) (citations omitted). The FCC's rule would have achieved precisely that illogical result by undermining the process that Congress made the centerpiece for implementing the local competition terms of the Act.

CONCLUSION

For the foregoing reasons, the Court should resolve this case as follows:

First, the Court should affirm the Court of Appeals' judgments concerning both (i) the FCC's lack of authority over the pricing terms of the Act and (ii) the FCC's lack of authority over non-pricing intrastate matters covered by the Act.

Second, the Court should reverse the Court of Appeals' judgments upholding the FCC's rules (i) expanding the definition of network elements to include OSS and services such as directory assistance and operator services; (ii) diluting the "necessary" and "impair" standards of § 251(d)(2); and

(iii) declaring that entrants could rely solely on network elements to provide service.

Third, the Court should affirm the Court of Appeals' judgment vacating the FCC's rule requiring incumbents to provide network elements pre-assembled into combinations.

Fourth, the Court should affirm the Court of Appeals' judgment vacating the FCC's pick-and-choose rule.

* * *

(b) Except as provided in sections 223 through 227, inclusive, and section 332, and subject to the provisions of section 301 and title VI, nothing in this Act shall be construed to apply or to give the Commission jurisdiction with respect to (1) charges, classifications, practices, services, facilities, or regulations for or in connection with intrastate communication service by wire or radio of any carrier . . . .

* * *

47 U.S.C. § 153 DEFINITIONS

* * *

(29) NETWORK ELEMENT.- The term "network element" means a facility or equipment used in the provision of a telecommunications service. Such term also includes features, functions, and capabilities that are provided by means of such facility or equipment, including subscriber numbers, databases, signaling systems, and information sufficient for billing and collection or used in the transmission, routing, or other provision of a telecommunications service.

* * *

(43) TELECOMMUNICATIONS.- The term "telecommunications" means the transmission, between or among points specified by the user, of information of the user's choosing, without change in the form or content of the information as sent and received.

* * *

(46) TELECOMMUNICATIONS SERVICE.- The term "telecommunications service" means the offering of telecommunications for a fee directly to the public, or to such classes of users as to be effectively available directly to the public, regardless of the facilities used.

* * *

47 U.S.C. § 251 INTERCONNECTION.

(a) GENERAL DUTY OF TELECOMMUNICATIONS CARRIERS. - Each telecommunications carrier has the duty -

(1) to interconnect directly or indirectly with the facilities and equipment of other telecommunications carriers; and

(2) not to install network features, functions, or capabilities that do not comply with the guidelines and standards established pursuant to section 255 or 256.

(b) OBLIGATIONS OF ALL LOCAL EXCHANGE CARRIERS. - Each local exchange carrier has the following duties:

(1) RESALE. - The duty not to prohibit, and not to impose unreasonable or discriminatory conditions or limitations on, the resale of its telecommunications services.

(2) NUMBER PORTABILITY. - The duty to provide, to the extent technically feasible, number portability in accordance with requirements prescribed by the Commission.

(3) DIALING PARITY. - The duty to provide dialing parity to competing providers of telephone exchange service and telephone toll service, and the duty to permit all such providers to have nondiscriminatory access to telephone numbers, operator services, directory assistance, and directory listing, with no unreasonable dialing delays.

(4) ACCESS TO RIGHTS- OF- WAY. - The duty to afford access to the poles, ducts, conduits, and rights-of-way of such carrier to competing providers of telecommunications services on rates, terms, and conditions that are consistent with section 224.

(5) RECIPROCAL COMPENSATION. - The duty to establish reciprocal compensation arrangements for the transport and termination of telecommunications.

(c) ADDITIONAL OBLIGATIONS OF INCUMBENT LOCAL EXCHANGE CARRIERS. - In addition to the duties contained in subsection (b), each incumbent local exchange carrier has the following duties:

(1) DUTY TO NEGOTIATE. - The duty to negotiate in good faith in accordance with section 252 the particular terms and conditions of agreements to fulfill the duties described in paragraphs (1) through (5) of subsection (b) and this subsection. The requesting telecommunications carrier also has the duty to negotiate in good faith the terms and conditions of such agreements.

(2) INTERCONNECTION. - The duty to provide, for the facilities and equipment of any requesting telecommunications carrier, interconnection with the local exchange carrier's network-

(A) for the transmission and routing of telephone exchange service and exchange access;

(B) at any technically feasible point within the carrier's network;

(C) that is at least equal in quality to that provided by the local exchange carrier to itself or to any subsidiary, affiliate, or any other party to which the carrier provides interconnection; and

(D) on rates, terms, and conditions that are just, reasonable, and nondiscriminatory, in accordance with the terms and conditions of the agreement and the requirements of this section and section 252.

(3) UNBUNDLED ACCESS. - The duty to provide, to any requesting telecommunications carrier for the

provision of a telecommunications service, nondiscriminatory access to network elements on an unbundled basis at any technically feasible point on rates, terms, and conditions that are just, reasonable, and nondiscriminatory in accordance with the terms and conditions of the agreement and the requirements of this section and section 252. An incumbent local exchange carrier shall provide such unbundled network elements in a manner that allows requesting carriers to combine such elements in order to provide such telecommunications service.

(4) RESALE. - The duty -

(A) to offer for resale at wholesale rates any telecommunications service that the carrier provides at retail to subscribers who are not telecommunications carriers; and

(B) not to prohibit, and not to impose unreasonable or discriminatory conditions or limitations on, the resale of such telecommunications service, except that a State commission may, consistent with regulations prescribed by the Commission under this section, prohibit a reseller that obtains at wholesale rates a telecommunications service that is available at retail only to a category of subscribers from offering such service to a different category of subscribers.

(5) NOTICE OF CHANGES. - The duty to provide reasonable public notice of changes in the information necessary for the transmission and routing of services using that local exchange carrier's facilities or networks, as well as of any other changes that would affect the interoperability of those facilities and networks.

(6) COLLOCATION. - The duty to provide, on rates, terms, and conditions that are just, reasonable,

and nondiscriminatory, for physical collocation of equipment necessary for interconnection or access to unbundled network elements at the premises of the local exchange carrier, except that the carrier may provide for virtual collocation if the local exchange carrier demonstrates to the State commission that physical collocation is not practical for technical reasons or because of space limitations.

(d) IMPLEMENTATION. -

(1) IN GENERAL. - Within 6 months after the date of enactment of the Telecommunications Act of 1996, the Commission shall complete all actions necessary to establish regulations to implement the requirements of this section.

(2) ACCESS STANDARDS. - In determining what network elements should be made available for purposes of subsection (c)(3), the Commission shall consider, at a minimum, whether -

(A) access to such network elements as are proprietary in nature is necessary; and

(B) the failure to provide access to such network elements would impair the ability of the telecommunications carriers seeking access to provide the services that it seeks to offer.

(3) PRESERVATION OF STATE ACCESS REGULATIONS. - In prescribing and enforcing regulations to implement the requirements of this section, the Commission shall not preclude the enforcement of any regulation, order, or policy of a State commission that -

(A) establishes access and interconnection obligations of local exchange carriers;

(B) is consistent with the requirements of this section; and

(C) does not substantially prevent implementation of the requirements of this section and the purposes of this part.

(e) NUMBERING ADMINISTRATION. -

(1) COMMISSION AUTHORITY AND JURISDICTION. - The Commission shall create or designate one or more impartial entities to administer telecommunications numbering and to make such numbers available on an equitable basis. The Commission shall have exclusive jurisdiction over those portions of the North American Numbering Plan that pertain to the United States. Nothing in this paragraph shall preclude the Commission from delegating to State commissions or other entities all or any portion of such jurisdiction.

(2) COSTS. - The cost of establishing telecommunications numbering administration arrangements and number portability shall be borne by all telecommunications carriers on a competitively neutral basis as determined by the Commission.

(f) EXEMPTIONS, SUSPENSIONS, AND MODIFICATIONS. -

(1) EXEMPTION FOR CERTAIN RURAL TELEPHONE COMPANIES. -

(A) EXEMPTION. - Subsection (c) of this section shall not apply to a rural telephone company until (i) such company has received a bona fide request for interconnection, services, or network elements, and (ii) the State commission determines (under subparagraph (B)) that such request is not unduly economically burdensome, is technically feasible, and is consistent with section 254 (other than subsections (b)(7) and (c)(1)(D) thereof).

(B) STATE TERMINATION OF EXEMPTION AND IMPLEMENTATION SCHEDULE. - The party

making a bona fide request of a rural telephone company for interconnection, services, or network elements shall submit a notice of its request to the State commission. The State commission shall conduct an inquiry for the purpose of determining whether to terminate the exemption under subparagraph (A). Within 120 days after the State commission receives notice of the request, the State commission shall terminate the exemption if the request is not unduly economically burdensome, is technically feasible, and is consistent with section 254 (other than subsections (b)(7) and (c)(1)(D) thereof). Upon termination of the exemption, a State commission shall establish an implementation schedule for compliance with the request that is consistent in time and manner with Commission regulations.

(C) LIMITATION ON EXEMPTION. - The exemption provided by this paragraph shall not apply with respect to a request under subsection (c) from a cable operator providing video programming, and seeking to provide any telecommunications service, in the area in which the rural telephone company provides video programming. The limitation contained in this subparagraph shall not apply to a rural telephone company that is providing video programming on the date of enactment of the Telecommunications Act of 1996.

(2) SUSPENSIONS AND MODIFICATIONS FOR RURAL CARRIERS. - A local exchange carrier with fewer than 2 percent of the Nation's subscriber lines installed in the aggregate nationwide may petition a State commission for a suspension or modification of the application of a requirement or requirements of

subsection (b) or (c) to telephone exchange service facilities specified in such petition. The State commission shall grant such petition to the extent that, and for such duration as, the State commission determines that such suspension or modification -

(A) is necessary -

(i) to avoid a significant adverse economic impact on users of telecommunications services generally;

(ii) to avoid imposing a requirement that is unduly economically burdensome; or

(iii) to avoid imposing a requirement that is technically infeasible; and

(B) is consistent with the public interest, convenience, and necessity.

The State commission shall act upon any petition filed under this paragraph within 100 days after receiving such petition. Pending such action, the State commission may suspend enforcement of the requirement or requirements to which the petition applies with respect to the petitioning carrier or carriers.

(g) CONTINUED ENFORCEMENT OF EXCHANGE ACCESS AND INTERCONNECTION REQUIREMENTS. - On and after the date of enactment of the Telecommunications Act of 1996, each local exchange carrier, to the extent that it provides wireline services, shall provide exchange access information access, and exchange services for such access to interexchange carriers and information service providers in accordance with the same equal access and nondiscriminatory interconnection restrictions and obligations (including receipt of compensation) that apply to such carrier on the date immediately preceding the date of enactment of the Telecommunications Act of 1996 under any court order, consent decree, or regulation, order, or policy of the Commission, until such restrictions and

obligations are explicitly superseded by regulations prescribed by the Commission after such date of enactment. During the period beginning on such date of enactment and until such restrictions and obligations are so superseded, such restrictions and obligations shall be enforceable in the same manner as regulations of the Commission.

(h) DEFINITION OF INCUMBENT LOCAL EXCHANGE CARRIER. -

(1) DEFINITION. - For purposes of this section, the term "incumbent local exchange carrier" means, with respect to an area, the local exchange carrier that -

(A) on the date of enactment of the Telecommunications Act of 1996, provided telephone exchange service in such area; and

(B)(i) on such date of enactment, was deemed to be a member of the exchange carrier association pursuant to section 69.601(b) of the Commission's regulations (47 C.F.R. 69.601(b)); or

(ii) is a person or entity that, on or after such date of enactment, became a successor or assign of a member described in clause (i).

(2) TREATMENT OF COMPARABLE CARRIERS AS INCUMBENTS. - The Commission may, by rule, provide for treatment of a local exchange carrier (or class or category thereof) as an incumbent local exchange carrier for purposes of this section if -

(A) such carrier occupies a position in the market for telephone exchange service within an area that is comparable to the position occupied by a carrier described in paragraph (1);

(B) such carrier has substantially replaced an incumbent local exchange carrier described in paragraph (1); and

(C) such treatment is consistent with the public interest, convenience, and necessity and the purposes of this section.

(i) SAVINGS PROVISION. - Nothing in this section shall be construed to limit or otherwise affect the Commission's authority under section 201.

47 U.S.C. § 252 PROCEDURES FOR NEGOTIATION, ARBITRATION, AND APPROVAL OF AGREEMENTS.

(a) AGREEMENTS ARRIVED AT THROUGH NEGOTIATION. -

(1) VOLUNTARY NEGOTIATIONS. - Upon receiving a request for interconnection, services, or network elements pursuant to section 251, an incumbent local exchange carrier may negotiate and enter into a binding agreement with the requesting telecommunications carrier or carriers without regard to the standards set forth in subsections (b) and (c) of section 251. The agreement shall include a detailed schedule of itemized charges for interconnection and each service or network element included in the agreement. The agreement, including any interconnection agreement negotiated before the date of enactment of the Telecommunications Act of 1996, shall be submitted to the State commission under subsection (e) of this section.

(2) MEDIATION. - Any party negotiating an agreement under this section may, at any point in the negotiation, ask a State commission to participate in the negotiation and to mediate any differences arising in the course of the negotiation.

(b) AGREEMENTS ARRIVED AT THROUGH COMPULSORY ARBITRATION. -

(1) ARBITRATION. - During the period from the 135th to the 160th day (inclusive) after the date on

which an incumbent local exchange carrier receives a request for negotiation under this section, the carrier or any other party to the negotiation may petition a State commission to arbitrate any open issues.

(2) DUTY OF PETITIONER. -

(A) A party that petitions a State commission under paragraph (1) shall, at the same time as it submits the petition, provide the State commission all relevant documentation concerning -

(i) the unresolved issues;

(ii) the position of each of the parties with respect to those issues; and

(iii) any other issue discussed and resolved by the parties.

(B) A party petitioning a State commission under paragraph (1) shall provide a copy of the petition and any documentation to the other party or parties not later than the day on which the State commission receives the petition.

(3) OPPORTUNITY TO RESPOND. - A non-petitioning party to a negotiation under this section may respond to the other party's petition and provide such additional information as it wishes within 25 days after the State commission receives the petition.

(4) ACTION BY STATE COMMISSION. -

(A) The State commission shall limit its consideration of any petition under paragraph (1) (and any response thereto) to the issues set forth in the petition and in the response, if any, filed under paragraph (3).

(B) The State commission may require the petitioning party and the responding party to provide such information as may be necessary for the State commission to reach a decision on the unresolved issues. If any party

refuses or fails unreasonably to respond on a timely basis to any reasonable request from the State commission, then the State commission may proceed on the basis of the best information available to it from whatever source derived.

(C) The State commission shall resolve each issue set forth in the petition and the response, if any, by imposing appropriate conditions as required to implement subsection (c) upon the parties to the agreement, and shall conclude the resolution of any unresolved issues not later than 9 months after the date on which the local exchange carrier received the request under this section.

(5) REFUSAL TO NEGOTIATE. - The refusal of any other party to the negotiation to participate further in the negotiations, to cooperate with the State commission in carrying out its function as an arbitrator, or to continue to negotiate in good faith in the presence, or with the assistance, of the State commission shall be considered a failure to negotiate in good faith.

(c) STANDARDS FOR ARBITRATION. - In resolving by arbitration under subsection (b) any open issues and imposing conditions upon the parties to the agreement, a State commission shall -

(1) ensure that such resolution and conditions meet the requirements of section 251, including the regulations prescribed by the Commission pursuant to section 251;

(2) establish any rates for interconnection, services, or network elements according to subsection (d); and

(3) provide a schedule for implementation of the terms and conditions by the parties to the agreement.

(d) PRICING STANDARDS. -

(1) INTERCONNECTION AND NETWORK ELEMENT CHARGES. - Determinations by a State commission of the just and reasonable rate for the interconnection of facilities and equipment for purposes of subsection (c)(2) of section 251, and the just and reasonable rate for network elements for purposes of subsection (c)(3) of such section -

(A) shall be -

(i) based on the cost (determined without reference to a rate-of-return or other rate-based proceeding) of providing the interconnection or network element (whichever is applicable), and

(ii) nondiscriminatory, and

(B) may include a reasonable profit.

(2) CHARGES FOR TRANSPORT AND TERMINATION OF TRAFFIC. -

(A) IN GENERAL. - For the purposes of compliance by an incumbent local exchange carrier with section 251(b)(5), a State commission shall not consider the terms and conditions for reciprocal compensation to be just and reasonable unless -

(i) such terms and conditions provide for the mutual and reciprocal recovery by each carrier of costs associated with the transport and termination on each carrier's network facilities of calls that originate on the network facilities of the other carrier; and

(ii) such terms and conditions determine such costs on the basis of a reasonable approximation of the

additional costs of terminating such calls.

(B) RULES OF CONSTRUCTION. - This paragraph shall not be construed -

(i) to preclude arrangements that afford the mutual recovery of costs through the offsetting of reciprocal obligations, including arrangements that waive mutual recovery (such as bill-and-keep arrangements); or

(ii) to authorize the Commission or any State commission to engage in any rate regulation proceeding to establish with particularity the additional costs of transporting or terminating calls, or to require carriers to maintain records with respect to the additional costs of such calls.

(3) WHOLESALE PRICES FOR TELECOMMUNICATIONS SERVICES. - For the purposes of section 251(c)(4), a State commission shall determine wholesale rates on the basis of retail rates charged to subscribers for the telecommunications service requested, excluding the portion thereof attributable to any marketing, billing, collection, and other costs that will be avoided by the local exchange carrier.

(e) APPROVAL BY STATE COMMISSION. -

(1) APPROVAL REQUIRED. - Any interconnection agreement adopted by negotiation or arbitration shall be submitted for approval to the State commission. A State commission to which an agreement is submitted shall approve or reject the agreement, with written findings as to any deficiencies.

(2) GROUNDS FOR REJECTION. - The State commission may only reject -

(A) an agreement (or any portion thereof) adopted by negotiation under subsection (a) if it finds that -

(i) the agreement (or portion thereof) discriminates against a telecommunications carrier not a party to the agreement; or

(ii) the implementation of such agreement or portion is not consistent with the public interest, convenience, and necessity; or

(B) an agreement (or any portion thereof) adopted by arbitration under subsection (b) if it finds that the agreement does not meet the requirements of section 251, including the regulations prescribed by the Commission pursuant to section 251, or the standards set forth in subsection (d) of this section.

(3) PRESERVATION OF AUTHORITY. - Notwithstanding paragraph (2), but subject to section 253, nothing in this section shall prohibit a State commission from establishing or enforcing other requirements of State law in its review of an agreement, including requiring compliance with intrastate telecommunications service quality standards or requirements.

(4) SCHEDULE FOR DECISION. - If the State commission does not act to approve or reject the agreement within 90 days after submission by the parties of an agreement adopted by negotiation under subsection (a), or within 30 days after submission by the parties of an agreement adopted by arbitration under subsection (b), the agreement shall be deemed approved. No State court shall have jurisdiction to review the action of a State commission in approving or rejecting an agreement under this section.

(5) COMMISSION TO ACT IF STATE WILL NOT ACT. - If a State commission fails to act to carry out its responsibility under this section in any proceeding or other matter under this section, then the Commission shall issue an order preempting the State commission's jurisdiction of that proceeding or matter within 90 days after being notified (or taking notice) of such failure, and shall assume the responsibility of the State commission under this section with respect to the proceeding or matter and act for the State commission.

(6) REVIEW OF STATE COMMISSION ACTIONS. - In a case in which a State fails to act as described in paragraph (5), the proceeding by the Commission under such paragraph and any judicial review of the Commission's actions shall be the exclusive remedies for a State commission's failure to act. In any case in which a State commission makes a determination under this section, any party aggrieved by such determination may bring an action in an appropriate Federal district court to determine whether the agreement or statement meets the requirements of section 251 and this section.

(f) STATEMENTS OF GENERALLY AVAILABLE TERMS. -

(1) IN GENERAL. - A Bell operating company may prepare and file with a State commission a statement of the terms and conditions that such company generally offers within that State to comply with the requirements of section 251 and the regulations thereunder and the standards applicable under this section.

(2) STATE COMMISSION REVIEW. - A State commission may not approve such statement unless such statement complies with subsection (d) of this section and section 251 and the regulations thereunder. Except as provided in section 253, nothing in this section shall prohibit a State commission from establishing or enforcing other requirements of State

law in its review of such statement, including requiring compliance with intrastate telecommunications service quality standards or requirements.

(3) SCHEDULE FOR REVIEW. - The State commission to which a statement is submitted shall, not later than 60 days after the date of such submission -

(A) complete the review of such statement under paragraph (2) (including any reconsideration thereof), unless the submitting carrier agrees to an extension of the period for such review; or

(B) permit such statement to take effect.

(4) AUTHORITY TO CONTINUE REVIEW. - Paragraph (3) shall not preclude the State commission from continuing to review a statement that has been permitted to take effect under subparagraph (B) of such paragraph or from approving or disapproving such statement under paragraph (2).

(5) DUTY TO NEGOTIATE NOT AFFECTED. - The submission or approval of a statement under this subsection shall not relieve a Bell operating company of its duty to negotiate the terms and conditions of an agreement under section 251.

(g) CONSOLIDATION OF STATE PROCEEDINGS. - Where not inconsistent with the requirements of this Act, a State commission may, to the extent practical, consolidate proceedings under sections 214(e), 251(f), 253, and this section in order to reduce administrative burdens on telecommunications carriers, other parties to the proceedings, and the State commission in carrying out its responsibilities under this Act.

(h) FILING REQUIRED. - A State commission shall make a copy of each agreement approved under subsection (e) and each statement approved under subsection (f) available for public inspection and copying within 10 days after the agreement or statement is approved. The State commission

may charge a reasonable and nondiscriminatory fee to the parties to the agreement or the party filing the statement to cover the costs of approving and filing such agreement or statement.

(i) AVAILABILITY TO OTHER TELECOMMUNICATIONS CARRIERS. - A local exchange carrier shall make available any interconnection, service, or network element provided under an agreement approved under this section to which it is a party to any other requesting telecommunications carrier upon the same terms and conditions as those provided in the agreement.

(j) DEFINITION OF INCUMBENT LOCAL EXCHANGE CARRIER. - For purposes of this section, the term "incumbent local exchange carrier" has the meaning provided in section 251(h).

47 U.S.C. § 253 REMOVAL OF BARRIERS TO ENTRY.

(a) IN GENERAL. - No State or local statute or regulation, or other State or local legal requirement, may prohibit or have the effect of prohibiting the ability of any entity to provide any interstate or intrastate telecommunications service.

(b) STATE REGULATORY AUTHORITY. - Nothing in this section shall affect the ability of a State to impose, on a competitively neutral basis and consistent with section 254, requirements necessary to preserve and advance universal service, protect the public safety and welfare, ensure the continued quality of telecommunications services, and safeguard the rights of consumers.

(c) STATE AND LOCAL GOVERNMENT AUTHORITY. - Nothing in this section affects the authority of a State or local government to manage the public rights-of-way or to require fair and reasonable compensation from telecommunications providers, on a competitively neutral and nondiscriminatory basis, for use of public rights-of-way on a nondiscriminatory

basis, if the compensation required is publicly disclosed by such government.

(d) PREEMPTION. - If, after notice and an opportunity for public comment the Commission determines that a State or local government has permitted or imposed any statute, regulation, or legal requirement that violates subsection (a) or (b), the Commission shall preempt the enforcement of such statute, regulation, or legal requirement to the extent necessary to correct such violation or inconsistency.

(e) COMMERCIAL MOBILE SERVICE PROVIDERS. - Nothing in this section shall affect the application of section 332(c)(3) to commercial mobile service providers.

(f) RURAL MARKETS. - It shall not be a violation of this section for a State to require a telecommunications carrier that seeks to provide telephone exchange service or exchange access in a service area served by a rural telephone company to meet the requirements in section 214(e)(1) for designation as an eligible telecommunications carrier for that area before being permitted to provide such service. This subsection shall not apply-

(1) to a service area served by a rural telephone company that has obtained an exemption, suspension, or modification of section 251(c)(4) that effectively prevents a competitor from meeting the requirements of section 214(e)(1); and

(2) to a provider of commercial mobile services.

47 U.S.C. § 254 UNIVERSAL SERVICE.

(a) PROCEDURES TO REVIEW UNIVERSAL SERVICE REQUIREMENTS. -

(1) FEDERAL-STATE JOINT BOARD ON UNIVERSAL SERVICE. - Within one month after the date of enactment of the Telecommunications Act of 1996, the Commission shall institute and refer to a Federal-State Joint Board under section 410(c) a proceeding to

recommend changes to any of its regulations in order to implement sections 214(e) and this section, including the definition of the services that are supported by Federal universal support mechanisms and a specific timetable for completion of such recommendations. In addition to the members of the Joint Board required under section 410(c), one member of such Joint Board shall be a State-appointed utility consumer advocate nominated by a national organization of State utility consumer advocates. The Joint Board shall, after notice and opportunity for public comment, make its recommendations to the Commission 9 months after the date of enactment of the Telecommunications Act of 1996.

(2) COMMISSION ACTION. - The Commission shall initiate a single proceeding to implement the recommendations from the Joint Board required by paragraph (1) and shall complete such proceeding within 15 months after the date of enactment of the Telecommunications Act of 1996. The rules established by such proceeding shall include a definition of the services that are supported by Federal universal service support mechanisms and a specific timetable for implementation. Thereafter, the Commission shall complete any proceeding to implement subsequent recommendations from any Joint Board on universal service within one year after receiving such recommendations.

(b) UNIVERSAL SERVICE PRINCIPLES. - The Joint Board and the Commission shall base policies for the preservation and advancement of universal service on the following principles:

(1) QUALITY AND RATES. - Quality service should be available at just, reasonable, and affordable rates.

(2) ACCESS TO ADVANCED SERVICES. - Access to advanced telecommunications and information services should be provided in all regions of the Nation.

(3) ACCESS IN RURAL AND HIGH COST AREAS. - Consumers in all regions of the Nation, including low-income consumers and those in rural, insular, and high cost areas, should have access to telecommunications and information services, including interexchange services and advanced telecommunications and information services, that are reasonably comparable to those services provided in urban areas and that are available at rates that are reasonably comparable to rates charged for similar services in urban areas.

(4) EQUITABLE AND NONDISCRIMINATORY CONTRIBUTIONS. - All providers of telecommunications services should make an equitable and nondiscriminatory contribution to the preservation and advancement of universal service.

(5) SPECIFIC AND PREDICTABLE SUPPORT MECHANISMS. - There should be specific, predictable and sufficient Federal and State mechanisms to preserve and advance universal service.

(6) ACCESS TO ADVANCED TELECOMMUNICATIONS SERVICES FOR SCHOOLS, HEALTH CARE, AND LIBRARIES. - Elementary and secondary schools and classrooms, health care providers, and libraries should have access to advance telecommunications services as described in subsection (h).

(7) ADDITIONAL PRINCIPLES. - Such other principles as the Joint Board and the Commission determine are necessary and appropriate for the protection of the public interest, convenience, and necessity and are consistent with this Act.

(c) DEFINITION. -

(1) IN GENERAL. - Universal service is an evolving level of telecommunications services that the Commission shall establish periodically under this section, taking into account advances in telecommunications and information technologies and services. The Joint Board in recommending, and the Commission in establishing, the definition of the services that are supported by Federal universal service support mechanisms shall consider the extent to which such telecommunications services-

(A) are essential to education, public health, or public safety;

(B) have, through the operation of market choices by customers, been subscribed to by a substantial majority of residential customers;

(C) are being deployed in public telecommunications networks by telecommunications carriers; and

(D) are consistent with the public interest, convenience, and necessity.

(2) ALTERATIONS AND MODIFICATIONS. - The Joint Board may, from time to time, recommend to the Commission modifications in the definition of the services that are supported by Federal universal service support mechanisms.

(3) SPECIAL SERVICES. - In addition to the services included in the definition of universal service under paragraph (1), the Commission may designate additional services for such support mechanisms for schools, libraries, and health care providers for the purposes of subsection (h).

(d) TELECOMMUNICATIONS CARRIER CONTRIBUTION. - Every telecommunications carrier that provides interstate telecommunications services shall contribute, on an equitable and nondiscriminatory basis, to the specific, predictable, and

sufficient mechanisms established by the Commission to preserve and advance universal service. The Commission may exempt a carrier or class of carriers from this requirement if the carrier's telecommunications activities are limited to such an extent that the level of such carrier's contribution to the preservation and advancement of universal service would be de minimis. Any other provider of interstate telecommunications may be required to contribute to the preservation and advancement of universal service if the public interest so requires.

(e) UNIVERSAL SERVICE SUPPORT. - After the date on which Commission regulations implementing this section take effect, only an eligible telecommunications carrier designated under section 214(e) shall be eligible to receive specific Federal universal service support. A carrier that receives such support shall use that support only for the provision, maintenance, and upgrading of facilities and services for which the support is intended. Any such support should be explicit and sufficient to achieve the purposes of this section.

(f) STATE AUTHORITY. - A State may adopt regulations not inconsistent with the Commission's rules to preserve and advance universal service. Every telecommunications carrier that provides intrastate telecommunications services shall contribute, on an equitable and nondiscriminatory basis, in a manner determined by the State to the preservation and advancement of universal service in that State. A State may adopt regulations to provide for additional definitions and standards to preserve and advance universal service within that State only to the extent that such regulations adopt additional specific, predictable, and sufficient mechanisms to support such definitions or standards that do not rely on or burden Federal universal support mechanisms.

(g) INTEREXCHANGE AND INTERSTATE SERVICES. - Within 6 months after the date of enactment of the Telecommunications Act of 1996, the Commission shall adopt rules to require that the rates charged by providers of

interexchange telecommunications services to subscribers in rural and high cost areas shall be no higher than the rates charged by each such provider to its subscribers in urban areas.

Such rules shall also require that a provider of interstate interexchange telecommunications services shall provide such services to its subscribers in each State at rates no higher than the rates charged to its subscribers in any other State.

(h) TELECOMMUNICATIONS SERVICES FOR CERTAIN PROVIDERS. -

(1) IN GENERAL

(A) HEALTH CARE PROVIDERS FOR RURAL AREAS. - A telecommunications carrier shall, upon receiving a bona fide request, provide telecommunications services which are necessary for the provision of health care services in a State, including instruction relating to such services, to any public or nonprofit health care provider that serves persons who reside in rural areas in that State at rates that are reasonably comparable to rates charged for similar services in urban areas in that State. A telecommunications carrier providing service under this paragraph shall be entitled to have an amount equal to the difference, if any, between the rates for services provided to health care providers for rural areas in a State and the rates for similar services provided to other customers in comparable rural areas in that State treated as a service obligation as a part of its obligation to participate in the mechanisms to preserve and advance universal service.

(B) EDUCATIONAL PROVIDERS AND LIBRARIES. - All telecommunications carriers serving a geographic area shall, upon a bona fide request for any of its services that are

within the definition of universal service under subsection (c)(3), provide such services to elementary schools, secondary schools, and libraries for educational purposes at rates less than the amounts charged for similar services to other parties. The discount shall be an amount that the Commission, with respect to interstate services, and the State, with respect to intrastate services, determine is appropriate and necessary to ensure affordable access to and use of such services by such entities. A telecommunications carrier providing service under this paragraph shall -

(i) have an amount equal to the amount of the discount treated as an offset to its obligation to contribute to the mechanisms to preserve and advance universal service, or

(ii) notwithstanding the provisions of subsection (e) of this section, receive reimbursement utilizing the support mechanisms to preserve and advance universal service.

(2) ADVANCED SERVICES. - The Commission shall establish competitively neutral rules-

(A) to enhance, to the extent technically feasible and economically reasonable, access to advanced telecommunications and information services for all public and nonprofit elementary and secondary school classrooms, health care providers, and libraries; and

(B) to define the circumstances under which a telecommunications carrier may be required to connect its network to such public institutional telecommunications users.

(3) TERMS AND CONDITIONS.- Telecommunications services and network capacity provided to a public institutional telecommunications user under this subsection may not be sold, resold, or otherwise transferred by such user in consideration for money or any other thing of value.

(4) ELIGIBILITY OF USERS. - No entity listed in this subsection shall be entitled to preferential rates or treatment as required by this subsection, if such entity operates as a for-profit business, is a school described in paragraph (5)(A) with an endowment of more than $50,000,000, or is a library not eligible for participation in State-based plans for funds under title III of the Library Services and Construction Act (20 U.S.C. 335c et seq.).

(5) DEFINITIONS.- For purposes of this subsection:

(A) ELEMENTARY AND SECONDARY SCHOOLS.- The term "elementary and secondary schools" means elementary schools and secondary schools, as defined in paragraphs (14) and (25), respectively, of section 14101 of the Elementary and Secondary Education Act of 1965 (20 U.S.C. 8801).

(B) HEALTH CARE PROVIDER.- The term "health care provider" means-

(i) post-secondary educational institutions offering health care instruction, teaching hospitals, and medical schools;

(ii) community health centers or health centers providing health care to migrants;

(iii) local health departments or agencies;

(iv) community mental health centers;

(v) not-for-profit hospitals

(vi) rural health clinics; and

(vii) consortia of health care providers consisting of one or more entities described in clauses (i) through (vi).

(C) PUBLIC INSTITUTIONAL TELECOMMUNICATIONS USER.- The term "public institutional telecommunications user" means an elementary or secondary school, a library, or a health care provider as those terms are defined in this paragraph.

(i) CONSUMER PROTECTION. - The Commission and the States should ensure that universal service is available at rates that are just, reasonable, and affordable.

(j) LIFELINE ASSISTANCE. - Nothing in this section shall affect the collection, distribution, or administration of the Lifeline Assistance Program provided for by the Commission under regulations set forth in section 69.117 of title 47, Code of Federal Regulations, and other related sections of such title.

(k) SUBSIDY OF COMPETITIVE SERVICES PROHIBITED. - A telecommunications carrier may not use services that are not competitive to subsidize services that are subject to competition. The Commission, with respect to interstate services, and the States, with respect to intrastate services, shall establish any necessary cost allocation rules, accounting safeguards, and the guidelines to ensure that services included in the definition of universal service bear no more than a reasonable share of the joint and common costs of facilities used to provide those services.

QUESTIONS PRESENTED

1. Whether the Communications Act of 1934, as amended—which gives States sole authority to "establish" and "determine" just and reasonable rates for local interconnection arrangements (47 U.S.C. § 252(c), (d)) and which provides that "nothing in this Act shall be construed . . . to give the [Federal Communications] Commission jurisdiction" with respect to intrastate matters (*id.* § 152(b))—forecloses the FCC's assertion of preemptive jurisdiction to regulate the rates and certain other terms of local interconnection arrangements.

2. Whether FCC rules requiring incumbent telephone companies to provide their competitors with preassembled combinations of "unbundled network elements" conflict with statutory text stating that unbundled network elements need only be provided "in a manner that allows *requesting carriers* to combine such elements" (47 U.S.C. § 251(c)(3) (emphasis added)).

3. Whether FCC rules requiring incumbents to provide their competitors, in fully preassembled form and at cost-based rates, a "platform" of all the network elements needed to duplicate the incumbent's finished telecommunications service violate the wholesale pricing requirements and marketing restrictions governing a competitor's resale of the incumbent's telecommunications services (47 U.S.C. §§ 252(d)(3), 271(e)(1)).

4. Whether the FCC improperly expanded an incumbent's obligation to provide access to essential "network elements" (a) by ignoring the statute's threshold requirement that access to network elements is required only when such access is "necessary" or when the incumbent's failure to provide such access would "impair" a competitor's ability to provide service (47 U.S.C. § 251(d)(2)), and (b) by expanding the definition of "network element" (*id.* § 153(29)) to include assets extrinsic to an incum-

bent's transmission network and complete telecommunications services that incumbents offer at retail.

5. Whether FCC rules allowing a competitor to force upon an incumbent carrier any isolated provision from any of the incumbent's approved interconnection agreements conflicts with the Act's reliance on private negotiations and binding agreements and with statutory text providing that an incumbent carrier must make such provisions available to other carriers only "upon the same terms and conditions" as in the original agreement (47 U.S.C. § 252(i)).

LIST OF PARTIES AND AFFILIATES

Pursuant to Supreme Court Rule 29.6, the parties to this brief submit the following statement concerning parent companies and non-wholly owned subsidiaries:

Bell Atlantic Corporation has no parent companies. It owns the following subsidiaries having securities in the hands of the public: Bell Atlantic-Delaware, Inc., Bell Atlantic-Maryland, Inc., Bell Atlantic-New Jersey, Inc., Bell Atlantic-Pennsylvania, Inc., Bell Atlantic-Virginia, Inc., Bell Atlantic-Washington, D.C., Inc., Bell Atlantic-West Virginia, Inc., Bell Atlantic Financial Services, Inc., NYNEX Corporation, New York Telephone Company, New England Telephone and Telegraph Company, Bell Atlantic Credit Corporation, and Bell Atlantic Global Funding Corporation. In addition Bell Atlantic has the following non-wholly owned subsidiaries: One Parkway, Inc., ICA Foreign Financial, Inc., Chesapeake Directory Sales Company, Atlantic West B.V., Grupo Iusacell, S.A. de C.V., Bell Atlantic New Zealand Holdings, Inc., PrimeCo Personal Communications, L.P., Washington, D.C. SMSA Limited Partnership, New York SMSA Limited Partnership, Upstate Cellular Network, Orange County Poughkeepsie MSA Limited Partnership, Pittsfield Cellular Telephone Company, Allentown SMSA Limited Partnership, Reading SMSA Limited Partnership, Pittsburgh SMSA Limited Partnership, Pennsylvania RSA No. 6(II) Limited Partnership, Columbia Cellular Telephone Company, Anderson Cellular Telephone Company, Las Cruces Cellular Telephone Company, TELE-TV, TELE-TV Media, L.P., TELE-TV Systems, L.P., NYNEX Master Lease Partners, Global Directory Services Company, MEDIATEL spol. s.r.o., Bell Atlantic Information Services Hellas S.A., Polskie Ksiazki Telefoniczne Sp. z o. o., Nord Trans Biuro Reklam Sp. z o. o., NYNEX Worldwide Directories Company, Kipling Associates L.L.C., NYNEX International (Asia) Ltd., and Gibraltar NYNEX Communications Limited.

BellSouth Corporation has no parent companies. BellSouth Corporation's non-wholly owned subsidiaries are 1155 Peachtree Associates, BellSouth New Zealand, Compania de Radiocomunicaciones Moviles S.A., Telcel Celular C.A., Tele 2000, S.A., BellSouth Wireless Data, L.P., RAM Mobile Data Belgium, S.C.S., RAM Mobile Data C.V., BellSouth Carolinas PCS, L.P. (d/b/a BellSouth Mobility DCS in NC & SC), Bloomington Cellular Telephone Company, Chattanooga MSA Limited Partnership, Decatur RSA Limited Partnership, Florida RSA #2B (Indian River) Limited Partnership, Georgia RSA No. 1 Limited Partnership, Georgia RSA No. 2 Limited Partnership, Georgia RSA No. 3 Limited Partnership, Gulf Coast Cellular Telephone Company, Jacksonville MSA Limited Partnership, Lafayette MSA Limited Partnership, Los Angeles Cellular Telephone Company, Louisiana RSA No. 7 Cellular General Partnership, MCTA, Memphis SMSA Limited Partnership, Muncie Cellular Telephone Company, Inc., Orlando SMSA Limited Partnership, Richmond Cellular Telephone Company, Tennessee RSA Limited Partnership, and Terre Haute Cellular Telephone Company, Inc.

SBC Communications Inc., which has shares outstanding in the hands of the public, is the parent company of Southwestern Bell Telephone Company and Southwestern Bell Yellow Pages, Inc. SBC Communications Inc. has the following non-wholly owned subsidiaries which have shares or partnership interests outstanding in the hands of the public: Abilene SMSA Limited Partnership, Amarillo SMSA Limited Partnership, Buffalo Telephone Company, Cellular Mobile Corporation, Champaign CellTelco, Dallas SMSA Limited Partnership, Decatur Cellular Telephone Company, Inc., Eastern Missouri Cellular Limited Partnership, Gainesville Development Associates Limited, Gary Cellular Telephone Company, Kansas City SMSA Limited Partnership, Lubbock SMSA Limited Partnership, McAllen/Edinburgh SMSA Limited

Partnership, Midland-Odessa SMSA Limited Partnership, Missouri RSA 8 Limited Partnership, Missouri RSA 9 B1 Limited Partnership, Oklahoma City SMSA Limited Partnership, Oklahoma RSA 3 Limited Partnership, Oklahoma RSA 9 Limited Partnership, PTF/FCLC Associates (LP), PTF/GECC (California) Associates (LP), San Antonio SMSA Limited Partnership, SBMS Cellular Telecommunications Bloomington, Inc., SBMS Cellular Telecommunications Springfield, Inc., S.T.L.M. Programming Services Limited, St. Joseph SMSA Limited Partnership, Texas RSA 9B4 Limited Partnership, Texas RSA 10B1 Limited Partnership, Texas/Illinois Cellular Limited Partnership, Topeka SMSA Limited Partnership, Washington/Baltimore Cellular Limited Partnership, Wichita SMSA Limited Partnership, and Worcester Telephone Company.

On April 1, 1997, SBC Communications Inc., Pacific Telesis Group ("PAC"), and SBC Communications (NV) Inc., a wholly owned subsidiary of SBC Communications Inc., completed an agreement and plan of merger by the means of which PAC and SBC Communications (NV) Inc. were merged into PAC, and PAC became a wholly owned subsidiary of SBC Communications Inc. PAC, formerly a publicly held corporation, and its wholly owned subsidiaries, Pacific Bell and Nevada Bell, provide telecommunications services subject to the general jurisdiction of the Federal Communications Commission.

BRIEF OF BELL ATLANTIC CORPORATION, BELLSOUTH CORPORATION, AND SBC COMMUNICATIONS INC.

STATEMENT OF THE CASE

This case presents two sets of questions triggered by the FCC's misguided attempt to reconfigure the Telecommunications Act of 1996 (the "1996 Act").[1]

---

[1] Relevant provisions of the Communications Act of 1934, as amended by the Telecommunications Act of 1996, are set forth in the addendum to this brief.

First, breaching a 60-year old statutory barrier that Congress had purposely left in place, the Commission asserted authority to superintend nearly every aspect of competition in local telephone markets—including, in particular, the prices that incumbent local carriers may charge their competitors for access to local networks. The FCC made that unprecedented claim despite Congress's express directive that "State commissions," not the FCC, shall "establish" and "determine" the relevant prices according to standards set forth in the 1996 Act itself (47 U.S.C. § 252(c) and (d)); despite the FCC's frank admission that the new statute "do[es] not contain an explicit grant of intrastate authority to the Commission" (J.A. 448 (¶ 84)); and despite the deeply rooted principle that only the most direct and unambiguous statutory language can override the Communications Act's express prohibition against any such FCC assertion of intrastate jurisdiction.

Second, the FCC's substantive rules effectively nullified the Act's fundamental distinction between two discrete paths by which a competitor may enter local service: leasing unbundled portions of an incumbent carrier's local network at cost-based rates, and purchasing for resale a finished telecommunications service at the incumbent's retail rate less a wholesale discount. The FCC sanctioned a scheme of sham unbundling, under which a competitor could purchase a finished service for resale, *not* at the wholesale discount specified in the Act, but at the cost-based price reserved for unbundled network elements. The competitor could do so merely by relabeling its request for the incumbent's finished service as a request for a fully preassembled package of all the elements of an incumbent's network needed to provide the identical finished service that the incumbent itself provides. That result not only destroyed the statutory distinction between resale and unbundled network elements, but also subverted the important goal of preserving universal telephone service. Regulators require incumbent carriers to keep their

rates for local residential service artificially low and allow them to recover their losses elsewhere. If new entrants could obtain at cost-based rates the services that incumbents necessarily provide above cost, they could cherry-pick the incumbent's profitable customers, leaving the incumbent with no way to recover its losses on basic residential service.

1. Background. For over 60 years, since the enactment of the Communications Act of 1934, Congress has expressly confined the FCC's jurisdiction to interstate and foreign communications and has reserved for the States exclusive jurisdiction over intrastate communications. Section 2(b) of the Act provides (with exceptions not relevant here) that "*nothing* in this [Act] shall be construed to apply *or to give the Commission jurisdiction* with respect to . . . charges, classifications, practices, services, facilities, or regulations for or in connection with intrastate communication service by wire or radio of any carrier." 47 U.S.C. § 152(b) (emphasis added). This Court has squarely held that section 2(b) "fence[s] off from FCC reach or regulation intrastate matters," and that only an "unambiguous" and "straightforward" grant of specific intrastate jurisdiction to the FCC can "override the command of [§ 2(b)]." *Louisiana Pub. Serv. Comm'n v. FCC*, 476 U.S. 355, 370, 377 (1986).

Until recently, most States exercised their federally guaranteed authority over local telephone service by granting exclusive franchises in each local service area and pervasively regulating these franchised "local exchange carriers" (or "LECs") with an eye to securing affordable "universal service." To keep prices low even for high-cost customers, the States mandated an extensive system of interservice subsidies under which LECs were typically required to charge below-cost rates for basic residential service and above-cost rates for business and other services. The level and structure of these subsidies naturally varied throughout the country depending on each State's local conditions and prevailing social policies.

Interservice subsidy arrangements were economically sustainable only because the States preserved certain legal barriers to entry that prevented competitors from cherry-picking LEC business customers whose above-cost rates fund universal service. In the years leading up to the 1996 Act, however, a number of States began to depart from the exclusive franchise model. These States took the lead in the difficult and inherently localized process of opening up local telephone markets to competition while still ensuring affordable, high-quality service to all consumers. *See* J.A. 241 (*Iowa Utils. Bd. v. FCC*, 109 F.3d 418, 427 n.7 (8th Cir. 1996)).

2. The 1996 Act. Building significantly on the work already done by the States, Congress crafted in the 1996 Act a "pro-competitive, de-regulatory national policy framework" designed to "open[] all telecommunications markets to competition." S. Conf. Rep. No. 104-230, at 113 (1996) ("Conf. Rep."). With respect to local service markets, Congress expressly preempted all State and local legal barriers to entry, such as exclusive franchises. *See* 47 U.S.C. § 253(a).

Congress also imposed on incumbent local exchange carriers several affirmative duties. First, an incumbent carrier must allow competitors to interconnect with the incumbent's network in order to complete calls to and from that network. *Id.* § 251(c)(2). Second, an incumbent must sell competitors access to "network elements" on an "unbundled basis"—that is, allow competitors to supplement their own network facilities by leasing individual pieces of "equipment" or a "facility" from the incumbent's transmission network. *Id.* § 251(c)(3); *see also id.* §153(29). Third, an incumbent must sell competitors its retail telephone services at wholesale prices so that competitors can resell those complete, finished services to their own customers. *Id.* § 251(c)(4). These duties ensure that, instead of having to build a complete network from scratch before entering the local market, a com-

petitor will be able to enter gradually by leasing individual facilities to fill in gaps in its own network or by reselling the incumbent's existing services.

Recognizing, however, that these steps implicated the intensely local concerns of 50 different jurisdictions—each with its own system of rate structures, regulations, and subsidies—Congress enlisted the State public utility commissions to ensure that local competition would be implemented fairly and with due regard to local conditions. In keeping with its deregulatory purposes, Congress chose to rely in the first instance on private party negotiations to reach interconnection agreements consistent with the 1996 Act.[2] But where the parties cannot agree on all issues within a prescribed bargaining period, Congress provided that either party may petition the State commission "to arbitrate any open issues." 47 U.S.C. § 252(b)(1). Most significantly for present purposes, the Act entrusts solely to State commissions the resolution of disputes concerning the crucial question of pricing. It provides that "*a State commission* shall . . . establish any rates for interconnection, services, or network elements," in accordance with the pricing standards spelled out in the statute. *Id.* § 252(c)(2) (emphasis added); *see also id.* § 252(d)(1) (specifying that "a State commission" shall "determin[e]" just and reasonable rates).

Congress provided for ultimate federal oversight of State arbitrations, but it chose a judicial, not an administrative, mechanism for this oversight. Once an arbitrated agreement has been finally approved by a State commission, any aggrieved party may bring an action in federal district court to determine whether the decision

---

[2] Incumbent carriers have signed more than 2,400 voluntary agreements with 280 local service competitors. *See* Roy Neel, President, United States Telephone Association, En Banc Presentation on Local Competition before the FCC, Jan. 29, 1998; USTA Competition Report (Nov. 3, 1997).

"meets the requirements of section 251 . . . and [section 252]." *Id.* § 252(e)(6).

In contrast to its broad reliance on private negotiations, State-supervised arbitrations, and federal judicial review, Congress assigned the FCC a limited role under the Act's local competition provisions. The statute provides that, if a State commission actually declines to carry out its responsibilities under section 252, the FCC "shall assume the responsibility of the State commission . . . with respect to the proceeding or matter." *Id.* § 252(e)(5). Otherwise, with a few specifically stated exceptions,[3] Congress scrupulously avoided authorizing the FCC to intrude on the States' jurisdiction to oversee intrastate telephone service. In particular, while directing the FCC to issue within six months regulations implementing the provisions for which it was assigned specific responsibility (*id.* § 251(d)(1)), Congress gave the FCC *no* role with respect to the pricing of interconnection arrangements.

3. The FCC's Order. Unwilling to accept its circumscribed role under the new statute, the FCC moved aggressively to transform the deregulatory, State-centered plan Congress enacted into a massive new federal regulatory program. In its First Report and Order—a 700-page, 3,200-footnote opus—the Commission undertook to promulgate "uniform, national rules" addressing every conceivable local interconnection issue (J.A. 431 (¶ 53)), and it declared those rules "binding on the states, even with respect to intrastate issues" (*id.* at 455 (¶ 101)).

---

[3] For example, Congress gave the FCC "exclusive jurisdiction" over the administration of "telecommunications numbering," including the responsibility to make numbers available "on an equitable basis." 47 U.S.C. § 251(e)(1). It also gave the FCC a role in defining a carrier's duty to provide "number portability" (*id.* § 251(b)(2)); in determining what network elements should be unbundled (*id.* § 251(d)(2)); in prescribing permissible resale restrictions (*id.* § 251(c)(4)(B)); and in providing for the treatment of comparable carriers as "incumbents" (*id.* § 251(h)(2)).

Although the FCC conceded that the 1996 Act "do[es] not contain an explicit grant of intrastate authority to the Commission" (*id.* at 448 (¶ 84)), it nevertheless proclaimed that it had authority "without limitation" (*id.* at 463-64 (¶ 115)) to issue such binding rules because, in its view, the "1996 Act moves beyond the distinction between interstate and intrastate matters that was established in the 1934 Act" (*id.* at 417 (¶ 24)). As the FCC's Chairman declared in plainer terms, the 1996 Act threw the States' traditional intrastate authority into "the trash can of history."[4]

Having asserted unconstrained intrastate authority, the FCC turned its attention to the pricing of local interconnection arrangements. Even though section 252(d) expressly assigns to "State commission[s]" the authority to determine "just and reasonable" rates, the FCC declared that Congress intended the *federal* agency to take the lead role in implementing the statutory pricing provisions. Divining a jurisdictional dichotomy nowhere expressed in the statutory text, the Commission asserted jurisdiction to adopt "national pricing rules" and to relegate the States to the subordinate and largely ministerial role of mechanically applying those rules. J.A. 448-49, 461-62 (¶¶ 85, 111).

In particular, the Commission mandated a new pricing methodology known as "total element long run incremental cost" (or "TELRIC"), which required States to set prices based solely on the incremental, forward-looking cost of an ideally efficient network—a hypothetical network that, by design, ignored nearly every aspect of an incumbent's actual current "cost . . . of providing the interconnection or network element" (47 U.S.C. § 252(d)(1)). *See* J.A. 419 (¶ 29). The FCC then defined in elaborate detail the steps that State commissions must take

---

[4] *Hundt Looks toward 'Radical' Overhaul of Regulatory Regimes, Major Business Moves*, Telecommunications Reports, at 6 (July 15, 1996).

to adhere to the TELRIC standard. *See, e.g.*, J.A. 751-69 (¶¶ 672-715); 47 C.F.R. §§ 51.501 *et seq.* The Commission further specified the result that States must reach as to every other pricing issue of consequence, from the extent of geographical rate "deaveraging" (at least three different rate zones in each State) to the appropriate divisions between recurring and non-recurring charges. *See* 47 C.F.R. §§ 51.505(b)(3), 51.507(f). The FCC even ordered each State to apply specific FCC-prescribed rates (known as "proxy" prices) until the State could conduct a detailed cost study in compliance with the FCC's newly minted TELRIC methodology. J.A. 419, 790-91 (¶¶ 29, 767-770).[5]

In addition to these intricate pricing rules, the FCC's First Report and Order also contained lengthy and detailed regulations governing non-pricing aspects of the 1996 Act. Of particular importance here, the FCC's order completely dismantled the statute's distinction between access to an incumbent carrier's unbundled network elements—which must be priced at "cost" plus "a reasonable profit" (47 U.S.C. § 252(d)(1))—and the provision of finished services for resale—which must be priced at the incumbent's "retail rates" less "avoided" costs (*id.* § 252(d)(3)). Because States have set above-cost rates for business and advanced services to fund affordable, below-cost service for basic residential service, the retail-less-avoided-cost standard of section 252(d)(3) ensures that the wholesale price paid by a resale competitor reflects the same contribution toward the cost of providing universal service that is contained in

---

[5] In a separate order in the same proceeding (J.A. 1161-357 (Second Report and Order)), the FCC also asserted power to dictate to the States the terms and conditions for implementing intrastate "toll" (*i.e.*, short-haul long-distance) "dialing parity"—a system that allows callers to choose a carrier other than their local telephone company for such service without dialing extra digits. *See* 47 U.S.C. §§ 153(15), 251(b)(3). The FCC asserted this power even though Congress directed the States, not the FCC, to implement dialing parity for such intrastate calls. *See id.* § 271(e)(2)(B).

the incumbent's retail rates.[6] By contrast, because regulators generally have refused to consider these interservice subsidies as part of the "cost" of unbundled network elements under section 252(d)(1), the actual prices for network elements provide no support for universal service.

The Commission nonetheless ruled that a competitor could purchase at cost-based rates *all* the elements needed to provide a complete service. And despite the statute's express statement that incumbents need provide access only "in a manner that allows *requesting carriers* to combine such elements" (47 U.S.C. § 251(c)(3) (emphasis added)), the Commission ruled that a competitor could even require the incumbent to provide those elements in *pre-combined, fully bundled form*. J.A. 551-54, 571-76 (¶¶ 292-297, 328-340). The FCC's rules therefore allowed a competitor to obtain a finished service at cost-based, unbundled element rates—thereby negating the statutory pricing structure—merely by framing its request in different terms: instead of requesting the incumbent's retail service for resale at a wholesale discount off the regulated retail rate, the competitor could simply demand, in fully preassembled form and at cost-based prices, all the supposedly "unbundled" network elements needed to provide that same retail service.

The FCC exacerbated the problem by twisting the definition of "network elements" beyond all recognition. In the Commission's view, an incumbent must provide its competitors with access, not only to the essential physical facilities that a competitor might need to fill out its own local network, but also to essentially *all* of the incumbent's assets and operations, including even its back-office support systems and live operators—hardly "network elements" in any common understanding of that term. J.A.

---

[6] *See* H.R. Rep. No. 104-204, at 72 (1995) (in recognition of the "pricing structures for telephone exchange service in the State," the resale rate "should reflect whether, and to what extent, the local dialtone service is subsidized by other services").

670, 679-80 (¶¶ 516, 536). The FCC also swept within its definition of unbundled network elements such optional retail services as Caller ID and Call Waiting, which provide significant universal service contributions. Under the Commission's rules they, too, must be offered to competitors at cost-based rates. *See* J.A. 538-39, 612 (¶¶ 263, 413).

In the process, the Commission essentially read out of the statute a restrictive provision directing the FCC to consider, in determining what network elements must be made available, whether lack of access to a particular element would "impair" a competitor's ability to provide telecommunications services and, in the case of proprietary elements, whether such access is "necessary." 47 U.S.C. § 251(d)(2). In the Commission's view, the "necessary" and "impair" standards have nothing to do with whether a requesting carrier can "obtain an element from a source other than the incumbent"; instead, an element qualifies under both standards unless a requesting carrier can offer the same service using other "elements *within an incumbent LEC's network,*" without experiencing any decrease in quality or increase in cost. J.A. 547, 548, 549 (¶¶ 283, 285, 287) (emphasis added).

Finally, the FCC transformed the 1996 Act's unexceptional most-favored-nation requirement—under which an incumbent must make available to requesting carriers, "upon the same terms and conditions," any interconnection arrangement contained in an approved agreement (47 U.S.C. § 252(i))—into an extreme "pick-and-choose" rule that subverts voluntary negotiations and undermines binding agreements. Under the FCC's order, a competitor may pluck any isolated provision from an approved agreement and force it upon the incumbent carrier without accepting the other "terms and conditions" negotiated as part of the same agreement. J.A. 1044-46 (¶¶ 1309-1315). A competitor may even unilaterally revise a signed, State-approved agreement by "avail[ing] itself of more advantageous terms and conditions *subsequently* negotiated by

any other carrier." J.A. 1046-47 (¶ 1316) (emphasis added).

4. The Stay Proceedings. Numerous parties, including many State commissions and incumbent carriers, petitioned for review of the FCC's order. Those petitions were consolidated in the Eighth Circuit pursuant to 28 U.S.C. § 2112(a)(3).

Because the FCC's arrogation of pricing jurisdiction seemed so clearly to usurp authority that Congress granted to the States, a number of States, as well as some private petitioners, sought an interim stay of the FCC's rules pending judicial review. After full briefing and oral argument, the Eighth Circuit granted the requested stay in October 1996 because of what "appear[ed] to be the rather clear and direct indication [in the statutory text] that the state commissions"—not the FCC—"should establish prices." J.A. 236 (109 F.3d at 424).

The FCC, AT&T, and MCI filed applications to vacate the stay. Justice Thomas denied those applications. 117 S. Ct. 378; 117 S. Ct. 379 (1996). The FCC immediately reapplied to Justice Ginsburg, and AT&T and MCI reapplied to Justice Stevens. The renewed applications were referred to the full Court, which likewise denied them. 117 S. Ct. 429 (1996).

5. The Decision Below. After further briefing and oral argument, the court of appeals confirmed its earlier tentative holding that the plain language of section 252(c) and (d) "directly and straightforwardly assigns to the states the authority to set . . . prices." Pet. App. 17a. Those specific congressional directives were entirely sufficient to resolve the issue of pricing jurisdiction. The court made plain, however, that, even if there were "[a]ny ambiguity," it would be resolved against the FCC because of the jurisdictional proscription of section 2(b), as interpreted by this Court in *Louisiana PSC*. Pet. App. at 15a. As the court of appeals explained, "the prices that incumbent local exchange carriers may charge their new competitors for interconnection, unbundled access, and resale . . . qualify as 'charges . . . for or in connection

with intrastate communications service.'" *Id.* at 15a (quoting section 2(b)).[7]

The Eighth Circuit also addressed a lengthy series of non-jurisdictional challenges to the substance of the FCC's rules. First, the court set aside the FCC's "pick-and-choose" rule because, contrary to the Act's terms and structure, it "would thwart the negotiation process and preclude the attainment of binding negotiated agreements." Pet. App. 26a. The court then turned to the various issues concerning unbundled network elements. It denied challenges to both the FCC's all-encompassing definition of "network element[s]" and its lax understanding of the "necessary" and "impair" standards. *Id.* at 41a-45a, 47a-50a. The court ruled, however, that the FCC's attempt to collapse the fundamental statutory distinction between resale and access to unbundled elements conflicted with both the language and the structure of the Act.

In particular, the court concluded that "the FCC's rule requiring incumbent LECs, rather than the requesting carriers, to recombine network elements that are purchased . . . on an unbundled basis . . . cannot be squared with the terms of subsection 251(c)(3)" (*id.* at 52a), which states that "requesting carriers" are to "combine such elements" to provide telecommunications services. In light of that holding, the court concurrently rejected the incumbents' contention that new entrants cannot obtain access to all of the network elements that, when combined by the requesting carrier, are sufficient to provide service. *Id.* at 54a-58a. Because entrants must

---

[7] In a separate appeal that was briefed and argued independently of the main appeal and that the court decided in a separate opinion, the Eighth Circuit concluded that the FCC lacked jurisdiction to issue mandatory rules governing the States' implementation of "intraLATA toll [*i.e.*, short-haul long-distance] dialing parity." Pet. App. 81a-89a. The court of appeals relied on the express terms of section 271(e)(2)(B)—which "indicates that state commissions, not the FCC, have the authority to issue intraLATA dialing parity rules" (Pet. App. 88a)—as well as on this Court's analysis of section 2(b) in *Louisiana PSC*.

make an "up-front investment" and incur additional "costs and risks" in combining the elements themselves, the Eighth Circuit reasoned, recombining all the elements needed to provide a complete service would not simply be resale under another name. *Id.* at 56a-57a.

AT&T and others immediately sought to sidestep the Eighth Circuit's ruling on the issue of combining network elements. Citing the court's failure to vacate a particular subsection of the FCC's rules (47 C.F.R. § 51.315(b))—which provided that, "[e]xcept upon request, an incumbent [carrier] shall not separate requested network elements that the incumbent [carrier] currently combines" (Pet. App. 294a)—AT&T argued in proceedings around the country that it could still skirt the resale pricing rules by obtaining at cost-based prices a "platform" of all the necessary network elements already combined into a complete service by the incumbent.

Once it was alerted to these attempted evasions of its ruling, the Eighth Circuit granted rehearing and vacated the FCC rule at issue as inconsistent with the plain statutory text. The court stated that "§ 251(c)(3) does not permit a new entrant to purchase the incumbent [carrier's] assembled platform(s) of combined network elements"; indeed, if that were allowed, it would "obliterate the careful distinctions Congress has drawn" between resale and unbundled elements. Pet. App. 71a.

SUMMARY OF ARGUMENT

I. Despite the tortuous complexity of the FCC's regulations, the primary legal issue here is actually quite simple. At bottom, the question of pricing jurisdiction turns on the plain language of the specific statutory provisions in which Congress assigned pricing authority. Those provisions make clear that Congress intended State commissions to "establish" and "determine" rates in accordance with the pricing standards expressly laid out in the statute. 47 U.S.C. § 252(c), (d). The text of these provisions could not be clearer, and it leaves no room for the FCC's assertion of broad federal pricing authority. Simply put, Con-

gress considered this precise issue and determined that State commissions, not the FCC, should determine rates. That should be the end of the matter.

In the teeth of these directly applicable statutory provisions, the FCC claims that it has authority to issue enormously complex pricing rules that would turn State commissions into nothing more than "field agents" of the Washington bureaucracy, "sent out to execute the will of FCC officials."[8] That result simply cannot be squared with Congress's decision to assign expressly to State commissions the authority to determine rates according to the statutory standards.

Nor is it in any way supported by the ambiguous, general statutory provisions on which the FCC places exclusive reliance. Even if such general provisions could override a specific assignment of pricing jurisdiction—which they cannot—the provisions cited by the FCC have no applicability here. In particular, by its plain terms, section 251(d)(1)—on which the FCC rests most heavily—directs the agency merely to prescribe within six months whatever rules may be necessary to implement the specific requirements in *section 251* for which the FCC was given express responsibility, not the separate pricing standards in section 252 for which the States were given express responsibility. Nothing in this procedural provision confers any new substantive jurisdiction on the FCC, and certainly nothing in it can be read to override section 252's express grant of pricing jurisdiction to the States. Congress plainly knows how to give the FCC substantive jurisdiction over intrastate communications: it did precisely that in other portions of section 251, in other sections of the 1996 Act, and in the analogous Cable Act. The crucial language found in each of those provisions is altogether missing from section 251(d)(1).

Even if the Court were to find some ambiguity here, that would not change the result. Section 2(b), as a spe-

---

[8] Joint Reply Brief for the State Commission Parties at 2 (8th Cir. No. 96-3321, filed Jan. 6, 1997).

cial rule of construction, reverses the usual principle of *Chevron* deference, so that any jurisdictional ambiguity is fatal to the FCC's position. As this Court explained in *Louisiana PSC*, only the most straightforward and unambiguous assignment of intrastate jurisdiction to the FCC can overcome the jurisdictional bar of section 2(b). Petitioners cannot sweep aside *Louisiana PSC* on the theory that section 251 *applies* to intrastate matters and that the FCC's jurisdiction is necessarily coextensive with the scope of the Act's provisions. As the FCC acknowledges, section 2(b) is written in the disjunctive—"nothing in this Act shall be construed to apply *or to give the Commission jurisdiction*" with respect to intrastate communications. As a result, it is not enough under section 2(b) that a provision of the Act applies to intrastate matters; the Act also must clearly and unambiguously give the FCC jurisdiction with respect to those matters. Petitioners have offered no plausible justification for ignoring the plain text of that provision.

The FCC argues that this Court should disregard section 2(b) in this case. Its theory, drawn from an "impossibility" doctrine developed by some courts of appeals, is that the local network is used for both intrastate and interstate calls, that only one regulatory authority can exercise pricing power over such indivisible facilities, and that Congress must have intended the FCC to be that regulatory authority. But the FCC relied on no such theory in its order, and for good reason: it is wrong. To begin with, most of the issues dealt with in the 1996 Act and addressed by the FCC's pricing rules are purely intrastate in nature and have no interstate component at all. Even where there is an interstate component, moreover, the settled jurisprudence is that the FCC may not preempt State price regulation merely because the same facility is used for both interstate and intrastate calls; rather, preemption is permissible only when the FCC can demonstrate with precision that State regulation negates the FCC's exercise of its own lawful interstate authority. And here, where the FCC has continued to exercise jurisdiction

over the pricing of interstate calls, the agency has not made—and cannot make—any such showing.

Finally, the FCC asks the Court to indulge the agency's attenuated jurisdictional inferences on the ground that it would be inefficient for 50 different States to apply the statute's pricing standards in disparate fashion. It claims that Congress must have expected the federal agency to issue general rules prescribing basic pricing methodologies, and must have intended the States to apply those rules in setting specific rates. But that is not what Congress said. On the contrary, Congress specifically *protected* the States' authority to issue rules implementing the Act's provisions. 47 U.S.C. § 261(b). And, in any event, the FCC's order goes far beyond the boundaries marked out by its lawyers in this Court: not only did the agency itself mandate specific "proxy" prices that States *must* apply, but also its extraordinarily detailed rules dictate specific results as to every other significant pricing matter, leaving the States with barely more than a ministerial role.

II. A number of the FCC's non-jurisdictional determinations are also incompatible with the 1996 Act. Most important, the Commission abrogated the statute's clear distinction between resale of an incumbent's finished telecommunications services and access to an incumbent's unbundled network elements. The 1996 Act permits resellers to purchase an incumbent's services only at rates based on the incumbent's retail price less any avoided costs. This pricing scheme ensures that the incumbent will continue to recover any universal service subsidy built into its retail rates; it also preserves incentives for new entrants to build facilities of their own.

The FCC's rules cut the legs out from under this statutory scheme. Those rules allow a competitor to obtain a finished service *not* at the wholesale rate required by statute, but at the cost-based rates reserved for unbundled network elements. Under the FCC's sham-unbundling theory, a reseller who wants to offer exactly the same service provided by an incumbent may freely circumvent the statutory scheme by requesting, on a fully pre-

combined and bundled basis, all of the "unbundled" network elements that the incumbent uses to provide the retail service.

That approach suffers from multiple flaws. First, the statute makes abundantly clear that unbundled elements, unlike resold services, need not be provided on a pre-combined basis. Congress required an incumbent to provide network elements only in a manner that allows "*requesting carriers* to combine such elements." 47 U.S.C. § 251(c)(3) (emphasis added). There is no ambiguity in that language, and it provides a complete response to the FCC's misguided attempt to require incumbents to provide pre-combined packages of elements to competitors.

Second, even if the Commission could properly ignore the terms of section 251(c)(3) and force incumbents, rather than "requesting carriers," to "combine" unbundled elements, the FCC's rules still violate the Act by allowing requesting carriers to obtain, at cost-based rates, *all* the pre-combined network elements needed to provide a service. Access to all those pre-combined elements is resale, plain and simple, and the statutory resale rules must apply if they are to have any meaning at all. Indeed, the FCC itself has recognized that this use of network elements must be distinguished from resale, and it has struggled in vain to find a substantive distinction of any significance. None exists. Further, the language of the 1996 Act expressly contemplates that a user of unbundled network elements will have a network of its own and that an incumbent will allow that user physical access to its facilities to connect the two networks. *See* 47 U.S.C. § 251(c)(2), (c)(3). Those statutory provisions would serve little purpose if access to unbundled elements were simply a way to requisition an incumbent's complete network.

The FCC also expanded beyond all recognition the statutory obligation to provide unbundled network elements. Congress directed the FCC, in determining what network elements should be made available, to consider whether the unavailability of such elements would "impair" the competitor's ability to provide service or, in the

case of proprietary elements, whether access to such elements is "necessary." 47 U.S.C. § 251(d)(2). The Commission simply read those requirements out of the 1996 Act. It determined that incumbents must allow competitors to lease their network elements even if equivalent facilities are freely available from sources other than the incumbent. That result cannot be squared with any reasonable understanding of "necessary" or "impair." Similarly, while Congress defined network elements in terms of the incumbent's "facilit[ies] or equipment" used to complete calls, the FCC expanded that rule to require incumbents to provide their competitors with assets, including their live operators, that have nothing to do with the incumbent's essential physical facilities.

III. Finally, the FCC grossly misread the Act's most-favored-nation provision in a manner that undermines Congress's reliance on private negotiations and binding agreements as the principal means of opening local telephone markets to competition. The statute provides that an incumbent must make available to a requesting carrier, "upon the *same terms and conditions*," any interconnection, service, or network element provided under a prior agreement to which the incumbent is a party. 47 U.S.C. § 252(i) (emphasis added). Under the Commission's "pick-and-choose" rule, however, a competitor may lift out of any of the incumbent's prior interconnection agreements the single term in each that is most disadvantageous to the incumbent, may leave behind the other terms and conditions in each such agreement, may stitch these unfavorable terms together, and may force the resulting agreement on the incumbent. That rule would preclude any semblance of free negotiation between incumbents and potential entrants. Any provision to which an incumbent agrees would immediately become a new high-water mark that could be selected by all other competitors—*even those who have already agreed to less favorable terms*—wholly without regard to the countervailing trade-offs embodied in the agreement as a whole. Nothing in section 252(i) can possibly be understood to justify this absurd result.

ARGUMENT

I. CONGRESS EXPRESSLY ASSIGNED PRICING JURISDICTION EXCLUSIVELY TO THE STATES AND DELIBERATELY PRESERVED THE STATUTE'S HISTORICAL PROHIBITION AGAINST FCC CLAIMS OF INTRASTATE JURISDICTION.

The FCC's jurisdictional argument is fundamentally misconceived. The agency starts from the premise that it has generic authority to implement every provision of the Communications Act, whether interstate *or* intrastate, because Congress could not possibly have enacted a statute that did not authorize FCC micro-management of every last interpretive issue. *See* FCC Br. 20-21. The agency then scours the statute looking for any general provision that could conceivably be read to support—however vaguely or inferentially—the agency's egocentric view that Congress has given it plenary authority over all intrastate matters.

But the FCC approaches the issue from precisely the wrong direction. First, contrary to the agency's argument, the strong presumption here—a presumption written into the very text of the Communications Act—is that Congress has "fence[d] off" intrastate matters "from FCC reach or regulation." *Louisiana PSC*, 476 U.S. at 370. As we discuss below, nothing in section 251(d)(1), section 201(b), or the grab-bag of other provisions on which the FCC relies overcomes that controlling principle. Even more to the point, Congress left nothing to the imagination on the crucial question of pricing jurisdiction: it *specifically* assigned that authority to the States. That express grant of authority would be decisive here even without section 2(b). In tandem with section 2(b), it provides overwhelming support for the Eighth Circuit's conclusion. Accordingly, it is with those directly relevant—indeed, dispositive—provisions that we begin.[9]

---

[9] This brief focuses principally on the question of pricing authority, the lead jurisdictional issue presented in this case. The separate briefs of the Mid-Sized LECs and the United States Telephone

A. The Plain Language of the 1996 Act Grants Pricing Jurisdiction to the States.

1. There is nothing ambiguous about the 1996 Act's assignment of pricing authority. Section 252(c)(2) empowers "a State commission" to "establish any rates . . . according to subsection (d)." In turn, section 252(d), entitled "Pricing Standards," specifies that "a State commission" is to "determin[e]" the relevant rates in accordance with the standards spelled out in the Act itself. Thus, section 252(d)(1) provides that "a *State commission*" shall determine the "just and reasonable rate" for interconnection and access to network elements based on the "cost . . . of providing" the interconnection or network elements. Section 252(d)(2) provides that "a *State commission*" shall consider reciprocal compensation for the transport and termination of traffic to be "just and reasonable" only if certain criteria are satisfied. Finally, section 252(d)(3) provides that "a *State commission* shall determine wholesale rates" for resale of complete telecommunications services by deducting from the current retail rate the "costs that will be avoided" by the incumbent carrier by selling at wholesale.

For all the ink that has been spilled, the question of pricing jurisdiction is ultimately just that simple. Sections 252(c) and (d) unambiguously give State commissions the authority to determine appropriate rates pursuant to the statutory pricing standards. Congress provided the pricing rules that it wanted followed, and it entrusted State commissions with the responsibility to determine rates in accordance with those rules. That express assignment of pricing jurisdiction to State commissions resolves the primary issue in dispute here. *See, e.g., Estate of Cowart v. Nicklos Drilling Co.*, 505 U.S. 469, 475 (1992) ("when a statute speaks with clarity to an issue judicial inquiry into the statute's meaning, in all but the most extraordinary circumstances, is finished").

Association expose flaws in other aspects of the FCC's jurisdictional assertions.

2. Given the lucidity of this directly relevant statutory language—and the absence of any statement in the 1996 Act suggesting that the FCC was to have a role in pricing —the FCC can defend its assertion of pricing authority only by speculating that Congress intended to divide pricing authority in a manner that is nowhere evident on the face of the statute. The FCC conjectures that, notwithstanding the plain directives of sections 252(c) and (d), Congress gave it "concurrent" jurisdiction over pricing. FCC Br. 26. In particular, the Commission asserts that Congress expected the FCC to issue pricing rules governing "general methodological issues," even if it left to the States "considerable discretion" in applying those federal rules to particular cases. FCC Br. 26; MCI Br. 30.

That argument is remarkable for several reasons. Most fundamentally, the "concurrent" jurisdictional scheme exists only in the imagination of the FCC and its supporting petitioners. Congress told the *States* to "establish" and "determine" rates according to the standards set forth in section 252(d); it did not say that the *FCC* was to take the lead role in determining prices and that the States were merely to apply FCC-derived formulas to individual cases. The responsibility to "establish" and "determine" rates, under any natural reading of those terms, encompasses more than the rote application of detailed rules formulated by a different body. It necessarily subsumes as well the authority to develop pricing methodologies sufficient to satisfy the statutory standards. And, as we explain further below, nothing in section 251(d)(1) suggests that, despite the clear directives of section 252, Congress in fact intended to subordinate the States to the federal bureaucracy on pricing matters—indeed, nothing in even the most generous reading of section 251(d)(1) gives the FCC authority over any part of section 252.

In any event, the FCC's order belies the very theory of concurrent jurisdiction that its lawyers espouse in this Court. In a portion of the order that the FCC never even mentions in its brief, the Commission prescribed a set of *specific rates* (dubbed "proxy prices"), and it purported

to *require* State commissions to apply those specific rates until they could complete detailed cost studies sufficient to satisfy the FCC's TELRIC cost standards. *See* J.A. 719, 801-04, 867-70 (¶¶ 619, 792-794, 925-932).

Even apart from these specific proxy prices, the FCC's pricing rules were far more intrusive than its brief implies. It is simply inaccurate to say, as the Commission now insists, that the agency confined itself to "general methodological rules" and allowed the States "considerable discretion" in determining actual rates. In fact, the FCC promulgated detailed pricing standards that covered every rate issue of significance and that consigned the States to a subordinate role consisting largely of plugging numbers into FCC-generated formulas. Indeed, the FCC's explanation of its determinations as to pricing of interconnection, network elements, resale, and transportation and termination consumes more than 370 paragraphs of the agency's order. J.A. 719-836, 843-71, 925-65 (¶¶ 618-862, 878-934, 1046-1118). In short, the FCC left no pricing issue of significance to the discretion of the very State commissions to whom Congress expressly assigned pricing authority.

For that reason, the States themselves have understandably been much less sanguine than the FCC about the effect of the Commission's pricing rules on their traditional authority. As 30 States jointly explained to the Eighth Circuit, "[t]he detail in the [FCC's] rules offer little discretion to the states to use their knowledge of local conditions to 'establish' the actual rates that will be paid to the [incumbent carriers]. . . . [Under the federal agency's rules], [t]he States do not share an 'essential, overlapping role' with the FCC, but become field agents sent out to execute the will of FCC officials." [10] Nothing in the statute supports—and nothing in the FCC's brief comes close to justifying—the agency's arrogation of power to conscript

---

[10] Joint Reply Brief for the State Commission Parties at 2 (8th Cir. No. 96-3321, filed Jan. 6, 1997).

these State regulators as foot soldiers for the federal bureaucracy.[11]

3. The structure of section 252(c) fortifies the conclusion that Congress entrusted pricing authority solely to the States. In defining the State commissions' arbitration responsibilities, section 252(c) creates a clear dichotomy between pricing and other matters. Subsection (c)(1) provides that, when States arbitrate "open issues" within the bounds of the matters assigned to the FCC, they must ensure that the result meets both "the requirements of section 251" *and* "the regulations prescribed by the [FCC] pursuant to section 251." Subsection (c)(2), by contrast, addresses pricing as a separate matter and makes *no* reference to any FCC rules. It provides only that States shall "establish rates . . . *according to subsection (d).*" Where Congress intended the State commissions to conform their arbitration decisions to FCC rules, it expressly said so. Congress said nothing about the State commissions following FCC *pricing* rules, precisely because no such FCC rules were contemplated. On the contrary, Congress intended the States alone to implement the Act's pricing standards, and that is why the only command to the States in section 252(c)(2) is that they set rates according to section 252(d). *See* Pet. App. 13a-14a.[12]

---

[11] AT&T mistakenly asserts that this Court, in *Wilder v. Virginia Hospital Association*, 496 U.S. 498 (1990), inferred a federal rulemaking role despite a clear grant of authority to the States to develop methods and standards. AT&T Br. 26. AT&T overlooks a pivotal fact: the statute at issue in *Wilder* expressly gave the Secretary of Health and Human Services a supervisory role over the States' formulation of the relevant standards. In the very provision AT&T cites, Congress specified that each State must "'mak[e] assurances satisfactory to the Secretary'" concerning the adequacy of the "'standards'" it develops. *See* 496 U.S. at 503 (quoting 42 U.S.C. § 1396(a)(13)(A) (Supp. 1982)). It is the absence of any comparable language in section 252(d) of the 1996 Act that dooms AT&T's argument and validates the Eighth Circuit's jurisdictional holding.

[12] The same dichotomy is echoed elsewhere in section 252. Congress provided that a State commission may reject an agreement

The FCC argues that the Court should disregard this important textual evidence because the "open issues" with which subsection (c)(1) is concerned necessarily include open *rate* issues. But rate issues are dealt with specifically in section 252(c)(2), and for several reasons it would make no sense to subject those issues *also* to section 252(c)(1). First, the regulations to which section 252(c)(1) refers are those implementing section 251; they can have nothing to do with pricing, which is dealt with in section 252. Second, if section 252(c)(1) could nonetheless be read to mandate adherence to FCC pricing rules, section 252(c)(2) would be rendered wholly superfluous. But "[s]tatutes must be interpreted, if possible, to give each word some operative effect." *Walters v. Metropolitan Educ. Enters., Inc.*, 117 S. Ct. 660, 664 (1997). An interpretation that renders an entire provision superfluous is presumptively unreasonable. *See Lane v. Pena*, 116 S. Ct. 2092, 2100 (1996).

Finally, the FCC's argument ignores the 1996 Act's drafting history, which confirms that Congress separated out section 252(c)(2) as part of its effort to preserve State authority over the pricing of local interconnection arrangements. The predecessor to what is now section 252(c) was part of section 251 in the Senate bill that reached the Conference Committee. That predecessor provision, however, did *not* include the dichotomy now contained in section 252(c) and thus could have been read to require States to adhere to all FCC rules, including pricing rules. *See* S. 652, 104th Cong., 1st Sess. § 251(d)(5)(D) (1995) ("In resolving any open issues and imposing conditions upon the parties to the agree-

---

adopted by arbitration only if it finds that the agreement "does not meet the requirements of section 251 . . ., including the regulations prescribed by the Commission pursuant to section 251 . . ., *or the standards set forth in subsection (d) of this section.*" 47 U.S.C. § 252(e)(2)(B) (emphasis added). As in section 252(c), Congress specifically differentiated between the statute's pricing standards and the FCC's regulations—further confirmation that the two things are separate from and unrelated to each other.

ment, a State shall ensure that the requirements of this section are met by the solution imposed by the State and are consistent with the Commission's rules defining minimum standards.").

In response to objections from the States,[18] however, the Conference Committee took several actions to revise the bill to protect traditional State authority over intrastate communications. First, the Conference Committee created a whole new statutory section, section 252, that treated pricing as a distinct issue entrusted exclusively to State authority. Then, to accommodate that important change, the Committee concurrently moved what had been part of section 251 to section 252(c) and, for the first time, bifurcated that provision to make clear that, as to pricing issues in particular, States need adhere only to the standards set forth in section 252(d) of the statute, not to any FCC regulations. *See* Conf. Rep. at 13. In combination with the plain language of sections 252(c) and 252(d), that history confirms that Congress affirmatively rejected a statutory scheme that would give the FCC the pricing authority it now claims and instead created one under which State commissions retain exclusive authority to set rates according to the statutory standards.

B. Section 2(b) and this Court's Decision in *Louisiana Public Service Commission* Confirm That the States Retain Exclusive Authority over Pricing.

1. Even if the Court were to determine that section 252(c) and (d) leave some doubt about whether Congress decided to retain State authority over pricing mat-

---

[18] *See, e.g.*, Initial Comments of National Association of Regulatory Utility Commissioners, *Implementation of the Local Competition Provisions of the Telecommunications Act of 1996*, CC Docket No. 96-98, at 10 (FCC May 16, 1996) (describing States' efforts to influence the Act before the Conference Committee); Comments of the Florida Public Service Commission, *Implementation of the Local Competition Provisions of the Telecommunications Act of 1996*, CC Docket No. 96-98, at 8 (FCC May 15, 1996).

ters, the result here would be no different. For over 60 years, Congress has confined the FCC's jurisdiction to interstate and foreign communications and has reserved for the States jurisdiction over intrastate communications. Section 2(b) of the Act, which was part of the original Communications Act of 1934, states that "*nothing* in this [Act] shall be construed to apply *or to give the Commission jurisdiction* with respect to . . . charges, classifications, practices, services, facilities, or regulations for or in connection with intrastate communication service by wire or radio of any carrier." 47 U.S.C. § 152(b) (emphasis added).

As this Court explained in *Louisiana PSC*, section 2(b) "defines the jurisdictional reach" of the FCC. 476 U.S. at 370. It "fences off" intrastate matters from the federal agency's authority, and its express limitations may be overcome only by an "unambiguous" and "straightforward" grant of specific intrastate jurisdiction to the Commission. *Id.* at 377. Section 2(b) thus functions both as a "jurisdictional limit[ation] on the power of [the] federal agency" and as a "rule of statutory construction" that prevents the FCC from asserting authority in any case where it is "*at least possible*" that Congress intended to withhold such power. 476 U.S. at 376 n.5, 377 (emphasis added); *see id.* at 379 (where the Communications Act was not a "perfect puzzle" providing "crisp answers to all of the contentions of either party," section 2(b) mandated rejection of the FCC's assertion of intrastate authority).[14]

---

[14] Section 2(b) reinforces an already powerful presumption against federal preemption of State public utility regulation—an area that this Court has recognized is traditionally a State concern. *See Arkansas Elec. Coop. Corp. v. Arkansas Pub. Serv. Comm'n*, 461 U.S. 375, 377 (1983) ("the regulation of utilities is one of the most important of the functions traditionally associated with the police power of the States"). As the Court has explained, such "historic police powers of the States" may not be "superseded . . . unless that [is] the clear and manifest purpose of Congress." *Rice v. Santa Fe Elevator Corp.*, 331 U.S. 218, 230 (1947).

Moreover, because section 2(b) provides its "own specific instructions regarding the correct approach to the statute" (476 U.S. at 376 n.5), it necessarily prevents the FCC from claiming deference under *Chevron U.S.A. Inc. v. Natural Resources Defense Council*, 467 U.S. 837 (1984). *Compare* FCC Br. 17, 42; AT&T Br. 19. The *Chevron* rule is intended to honor a presumed congressional intention to delegate to a federal agency the policy-making authority to interpret an ambiguous statute. *See, e.g., Pauley v. BethEnergy Mines, Inc.*, 501 U.S. 680, 696 (1991). But when Congress itself spells out the governing interpretive principles—as it has done in the plain text of section 2(b)—its specific intentions necessarily override any discretion the agency might have to apply any "reasonable" construction of a provision. Were it otherwise, a tool designed to implement an unstated congressional delegation of interpretive authority would operate perversely to frustrate an *express* interpretive principle contained in the statute itself.

2. The 1996 Act did nothing to undermine section 2(b)'s well-established role as a guarantor of federalism. The 1996 Act is an amendment to the Communications Act—the "Act" to which section 2(b) applies—and the new statute does not purport to supersede section 2(b)'s directive that "nothing" in the Communications Act shall be construed to give the FCC intrastate authority.

In fact, Congress expressly rejected attempts to strip States of the jurisdictional protections that section 2(b) provides. Just as the Conference Committee restored State pricing authority by creating a separate section 252 and introducing the important dichotomy between section 252(c)(1) and (c)(2), that Committee also ensured that section 2(b) would apply with full force to the 1996 Act. Both bills that reached the Conference Committee would have added "part II of title II"—that is, the local competition provisions of the 1996 Act—to the list of provisions exempted from section 2(b). *See* S. 652, 104th Cong., 1st Sess. § 101(c)(2) (1995); H.R. 1555, 104th

Cong., 1st Sess. § 101(e)(1) (1995). But, again to address State concerns, the Conference Committee deleted the proposed amendment of section 2(b).[15]

Because of that revision, the statute as enacted leaves the traditional interstate-intrastate division wholly intact except where section 251 or 252 clearly provides otherwise. And, for all the reasons we have discussed, far from providing the kind of "straightforward" or "unambiguous" assignment of pricing authority to the FCC that would be necessary to overcome section 2(b), the 1996 Act expressly indicates that the *States* are to have authority over such matters. Given the language of section 252(c) and (d), one cannot sensibly deny that "[i]t is . . . at least *possible*" (*Louisiana PSC*, 476 U.S. at 377 (emphasis added)) that Congress intended States to retain their longstanding authority. In the face of any such uncertainty, section 2(b) precludes an interpretation that would give the FCC the intrusive intrastate pricing jurisdiction it here demands.[16]

---

[15] The FCC responds to this significant legislative history by relying on an exceedingly strained inference from the *absence* of explanatory discussion in the Conference Committee's Report. But, contrary to the Commission's suggestion, the Conference Committee nowhere indicated that its removal of these revisions to section 2(b) was "a technical, non-substantive change." FCC Br. 33 n.13; *see* MCI Br. 32-33. On the contrary, the Committee made clear that alterations which, like this one, were not specifically discussed in the Conference Report included not merely "minor drafting and clerical changes," but also "conforming changes made necessary by agreements reached by the conferees." Conf. Rep. at 113. Because the conferees did make a number of significant changes in the statute to preserve State authority—changes that *were* discussed in the Report (*id.* at 117-26)—it was inevitable that the revisions to section 2(b) would be deleted to conform to those changes.

[16] The same jurisdictional analysis applies to the dialing parity issue addressed in the Eighth Circuit's separate ruling (and covered thoroughly in California's brief in this Court). As in the lead case, the statutory language indicates that intrastate dialing parity issues were within the jurisdiction of the States, not the FCC. *See* 47 U.S.C. § 271(e)(2)(B) (specifying the dates by which "a State"

3. The FCC and its supporting petitioners make two attempts to avoid the clear import of section 2(b) and this Court's decision in *Louisiana PSC*. Neither has merit.

a. First, the Commission invites the Court to disregard the plain language of section 2(b). Despite the acknowledged fact (FCC Br. 34) that section 2(b) speaks in the disjunctive—it states that "nothing in this Act shall be construed to apply *or* to give the Commission jurisdiction with respect to" intrastate matters—the FCC contends that it is simply inconceivable that Congress meant what it said. Working from the Washington-centric, and entirely counter-textual, assumption that Congress would *never* pass a communications statute without intending the FCC to superintend every aspect—even every *intrastate* aspect—of that law, the agency argues that section 2(b) cannot "logically" be read to "detach" the scope of the statute from the scope of FCC authority. *See* FCC Br. 34; MCI Br. 43-44.

But that argument cannot be squared with the language Congress enacted. This Court has "refused to ignore the statutory meaning which would be presumed from . . . disjunctive language," explaining that "the use of the term 'or' indicates an intent to give the nouns their separate, normal meanings." *Garcia v. United States*, 469 U.S. 70, 73 (1984); *see also Reiter v. Sonotone Corp.*, 442 U.S. 330, 339 (1979). As this Court recently admonished: " 'Where there is no ambiguity in the words, there is no room for construction. The case must be a strong one indeed, which would justify a court in departing from the plain meaning of words . . . in search of an intention which the words themselves did not suggest.' "

---

may or may not order dialing parity). Furthermore, the FCC cannot point to any unambiguous grant of dialing parity jurisdiction sufficient to overcome section 2(b). Indeed, the FCC expressly acknowledged in its dialing parity order that the interstate and intrastate aspects of dialing parity could easily be regulated separately. *See* J.A. 1183 (Second Report and Order, ¶ 37). That concession in itself is fatal to the Commission's jurisdictional assertion in this Court.

United States v. Gonzales, 117 S. Ct. 1032, 1036 (1997) (quoting *United States v. Wiltberger*, 18 U.S. (5 Wheat.) 76, 95-96 (1820) (Marshall, C.J.)). Indeed, the language of section 2(b) is so free of ambiguity that the FCC hazards no textual argument at all to support its interpretation of the statute.

The only argument the FCC *does* make to support its idiosyncratic understanding of section 2(b) has already been rejected by this Court. The FCC contends that section 2(b) was intended exclusively to overturn the ruling in the so-called *Shreveport Rate Case* (*Houston, E. & W. Tex. Ry. v. United States*, 234 U.S. 342 (1914)). In the Commission's view, because that case dealt only with "ancillary" FCC jurisdiction over topics not expressly covered by the statute, section 2(b) cannot be understood to extend beyond that context. FCC Br. 34-35; MCI Br. 44-45. The argument crashes head-on into this Court's decision in *Louisiana PSC*. The respondents there, like petitioners here, argued that section 2(b) should be read narrowly as merely an attempt to overturn the *Shreveport Rate Case*. But the Court squarely rejected that assertion, holding that "the *Shreveport Rate Case* [does not] carry the load that respondents ask of it." 476 U.S. at 372. The Court concluded that, "given the breadth of [its] language," section 2(b) *cannot* be cabined in the very manner that the FCC suggests here. *Id.* at 373.

b. The Commission's other argument as to why the Court should not give effect to section 2(b)'s plain language is no more compelling. The FCC contends that, under a narrow exception recognized in some court of appeals decisions, it may use its *inter*state authority as an entering wedge to usurp control over all aspects of local, *intra*state communications.

The short—and conclusive—answer to this argument is that it appears *nowhere* in the FCC's 700-page First Report and Order. That is not surprising, because the Commission could not possibly have justified its jurisdictional claims on the basis of that theory.

The governing rule, under the cases the FCC itself invokes, is that the agency must demonstrate "with some specificity" that it is *"impossib[le]"* for both the FCC and a State to regulate a facility used jointly for interstate and intrastate calls and that the State's regulation "negates the exercise by the FCC of its own lawful authority over *interstate* communication." *NARUC v. FCC*, 880 F.2d 422, 429-30 (D.C. Cir. 1989) (emphasis added); *accord California v. FCC*, 905 F.2d 1217, 1243 (9th Cir. 1990). The First Report and Order contains no discussion at all of the impossibility doctrine, much less a showing of how the strict requirements of that preemption doctrine can be satisfied here.[17] That deficiency is fatal, because this Court has said repeatedly that courts may not accept "*post hoc* rationalizations for agency action." *Motor Vehicle Mfrs. Ass'n v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 50 (1983). An agency's order must be upheld, if at all, on "the basis upon which it purports to rest." *SEC v. Chenery Corp.*, 332 U.S. 194, 196 (1947).

The FCC had good reason not to rely on any such analysis in its order. In the first place, this after-the-fact justification does not even support what the agency actually did in its order. The bulk of the matters for which the FCC purported to create pricing rules include services that have *no interstate component at all.* Resale of an incumbent's existing local services and reciprocal compensation for the transport and termination of local calls, for example, are purely intrastate matters. Indeed, although the FCC's brief to this Court completely ignores this in-

---

[17] The portions of the agency's order cited in the FCC's brief are not to the contrary. *See* FCC Br. 36-37 (citing Pet. App. 191a, 194a-95a, which reprint ¶¶ 84-85 and 90-93 of the First Report and Order (J.A. 448-49, 450-52. Those paragraphs merely explain the FCC's jurisdictional theory, including why it believed that a dual federal-State pricing regime for interconnection agreements would be inconsistent with sections 251 and 252. What is missing is any analysis of the sort necessary to sustain, in the face of section 2(b), an assertion of intrastate pricing jurisdiction.

convenient fact, the Commission actually *conceded* the point in the Eighth Circuit. *See* Brief for Respondents FCC and the United States at 30 (8th Cir. No. 96-3321, filed Dec. 23, 1996) (noting that certain matters covered by the agency's pricing rules, including the "resale of local exchange service," are "admittedly solely intrastate"). That alone is fatal to the FCC's impossibility claim. It is untenable to suggest that the 1996 Act tacitly lifts the section 2(b) bar as to some, but not all, of these pricing issues.

Even as to the one significant aspect of the pricing rules for which the FCC can plausibly identify an interstate component—access to unbundled network elements that may be used to deliver long-distance calls—the agency's theory plainly proves too much. Under the FCC's logic, the Commission would have had jurisdiction to impose every single one of its rules governing access to these local facilities, including its pricing rules, based entirely on its jurisdiction over interstate communications, *even before Congress adopted the 1996 Act*. Sections 251 and 252 were largely superfluous, in the FCC's view, because under the Communications Act the agency has had latent power for six decades to regulate intrastate rates for every aspect of the local network.

This Court rejected essentially the same argument in *Louisiana PSC*. The FCC there sought to preempt State depreciation rules and to substitute its own nationally uniform rules on the theory (echoed almost verbatim here) that the telephone equipment at issue was used for both interstate and intrastate calls and that "it makes no sense within the context of the Act to depreciate one piece of property two ways." 476 U.S. at 375. But, observing that "virtually *all* telephone plant that is used to provide intrastate service is also used to provide interstate service" (*id.* at 360 (emphasis added)), the Court *refused* to "confine[]" State regulation (as the FCC again asks the Court to do) "to intrastate matters which are separable from and do not substantially affect interstate communication" (*id.* at 373 (internal quotation marks omitted)).

After *Louisiana PSC*, the courts of appeals have consistently rejected similar FCC arguments in other contexts. The settled rule is that preemption may "*not* be justified merely by the dual intrastate and interstate aspects of [a particular service]; the FCC [has] to show that it [can]not separate the interstate and intrastate components of its regulation." *Public Util. Comm'n of Texas v. FCC*, 886 F.2d 1325, 1333 (D.C. Cir. 1989) (emphasis added); *see also Public Serv. Comm'n of Maryland v. FCC*, 909 F.2d 1510, 1516 (D.C. Cir. 1990). No such showing could be made here. The simple fact is that the FCC and the States have separately determined the prices for interstate and intrastate calls delivered over local telephone networks for more than 60 years, and the impossibility exception has never been applied in this context. And here, far from being powerless to regulate interstate aspects of unbundled network elements, the FCC has continued to issue regulations governing the interstate charges that incumbents may levy (or not levy) when competitors deliver long-distance calls over those elements. *See Competitive Telecom. Ass'n v. FCC*, 117 F.3d 1068 (8th Cir. 1997) (upholding FCC rules on payment of interstate access charges by purchasers of network elements).

Nor can the FCC demonstrate that a State commission's regulation of the rates for local interconnection would "negate" the federal agency's exercise of its own lawful interstate authority. In particular, while the FCC *assumes* that it has some sort of interstate pricing authority with respect to unbundled network elements beyond its traditional authority over charges assessed for the delivery of long-distance calls over the local network, that assumption begs the very question before the Court. Contrary to the FCC's supposition, it can point to *no* lawful pricing jurisdiction of its own that is even arguably negated by State pricing regulation, because Congress expressly assigned only to the States the authority to determine rates for access to network elements.

C. Neither Section 251(d)(1) Nor Any of the Other Provisions Cited by the Commission Justifies the FCC's Assertion of Pricing Authority.

Unable to ground its argument in the directly applicable pricing provisions of the 1996 Act, and unable to circumvent the jurisdictional barrier of section 2(b), the FCC seeks support for its expansive jurisdictional aspirations elsewhere in the statute. But none of the provisions to which the Commission points gives the FCC supervisory power to regulate the pricing of local interconnection arrangements.

1. The FCC rests principally on section 251(d)(1). FCC Br. 18-20. That provision—which directs the agency to complete, within six months of enactment, all actions necessary "to establish regulations to implement the requirements of this section"—does not support the Commission's jurisdictional theory.

First, when Congress issues clear directions on a specific subject—as it did in authorizing State commissions to "determine" appropriate rates under the standards of section 252(d)—that specific directive takes precedence over a general provision like section 251(d)(1). "However inclusive may be the general language of a statute, it will not be held to apply to a matter specifically dealt with in another part of the same enactment. . . . Specific terms prevail over the general in the same or another statute which otherwise might be controlling." *Fourco Glass Co. v. Transmirra Products Corp.*, 353 U.S. 222, 228-29 (1957) (internal quotation marks omitted).

Second, section 251(d)(1) does not even purport to encompass the pricing provisions of section 252. Rather, its scope is confined, by its plain terms, to "the requirements of *this section*"—that is, section 251. The statutory pricing rules are not in "this section"—they are in section 252(d). Accordingly, the FCC's lead argument invites this Court to ignore the statute's specific assignment of pricing jurisdiction to the States in section 252 as well as the jurisdictional prohibition of section 2(b), in favor of

a general rulemaking provision that, on its face, imposes a time-limit for the FCC to implement *a different statutory section*. That approach does violence to the ordinary rules of statutory interpretation.

In an attempt to plug the holes in its argument, the FCC says that subsections 251(c)(2) and (c)(3), which impose interconnection and unbundling obligations on incumbents, refer to "the requirements of this section and section 252." FCC Br. 28 n.10. From that premise, it argues that its authority to implement section 251 extends by implication to section 252. But if Congress had intended the FCC to implement section 251 *and* section 252, it could easily have said so in section 251(d)(1). It had no reason to express such an intention in the circuitous fashion reflected in the FCC's reading.

Furthermore, the FCC's theory does not support what the agency actually did. The FCC's order claimed authority to set prices not only for interconnection and network elements under subsections (c)(2) and (c)(3)—the two provisions that mention section 252—but also for the purchase of services for resale under subsection (c)(4). In its argument here, however, the Commission neglects to mention that subsection (c)(4) contains no such reference to section 252. Even on its own terms, therefore, the FCC's argument falls short of its target: the agency has no textual foundation at all for its arrogation of authority to dictate pricing principles for resale. And this flaw in its analysis undermines the Commission's improbable theory that, despite the restrictive language of section 251(d)(1), "this section" must be understood to signify *both* section 251 *and* section 252.

Even if the FCC's analysis were not deficient on its face, it would be thoroughly discredited by section 252(d). That section demonstrates the real meaning of the references to section 252: it specifies in plain language that "a State commission" is to determine the just and reasonable rates "*for purposes of*" section 251(c)(2) and section 251(c)(3)—the very sections on which the FCC

relies for its appropriation of the States' ratemaking function. That specific and unambiguous provision closes the loop between section 251 and section 252 and makes clear that a State commission, not the FCC, has jurisdiction to determine prices. It therefore stands squarely in the path of the FCC's theory: one cannot plausibly infer from section 251's references to section 252 that Congress intended to give the FCC indirectly pricing authority that it withheld from section 251(d)(1) and that it conferred expressly on the States in section 252(d).

In any event, section 251(d)(1) actually has no bearing at all on the scope of the FCC's jurisdiction. As its plain language suggests, subsection (d)(1) deals not with jurisdiction, but with the distinct question of rulemaking power—and, as the Eighth Circuit held, it operates to restrict rather than expand that power. The section directs the FCC, "[w]ithin 6 months [after the date of enactment]," to "complete all actions *necessary to establish regulations* to implement the requirements of this section." 47 U.S.C. § 251(d)(1) (emphasis added). Nothing in that procedural mandate delegates substantive authority to the FCC, and it certainly does not do so in the unambiguous manner required to surmount the section 2(b) hurdle.

When Congress wanted to extend the FCC's authority to intrastate matters, it did so explicitly. In section 276 of the 1996 Act, for example, Congress not only directed the FCC to prescribe payphone regulations within nine months using terms nearly identical to those in section 251(d)(1),[18] but also separately gave the FCC substantive jurisdiction with respect to "each and every completed *intrastate and interstate* call," and expressly preempted any contrary state regulations. 47 U.S.C. § 276(b), (c) (emphasis added). Similarly, in section 225, a provision that predates the 1996 Act, Congress not only instructed the FCC to issue regulations within one year to implement the requirements

---

[18] "[W]ithin 9 months [of enactment of the Telecommunications Act of 1996], the Commission shall take all actions necessary (including any reconsideration) to prescribe regulations that— . . . ." 47 U.S.C. § 276(b)(1).

of that section (*id.* § 225(d)(1)), but also provided that the Commission "shall have the same authority, power, and functions with respect to . . . *intrastate* communications" as it does with respect to interstate communications. *Id.* § 225(b)(2) (emphasis added).

And the Cable Act—to which the FCC itself pointed as a jurisdictional analog in the court of appeals—provides an even more vivid illustration. There, as in section 251(d)(1), Congress directed the Commission to prescribe regulations within 180 days to carry out its responsibilities under the Act. 47 U.S.C. § 543(b)(2). Unlike the 1996 Act, however, the Cable Act also assigned the Commission *substantive jurisdiction* over the rates to be charged by cable systems. The Cable Act provides that "[t]he Commission shall, by regulation, ensure that [cable] rates . . . are reasonable" (*id.* § 543(b)(1)), and it enumerates seven "factors" that the FCC is required to "take into account" in prescribing its rate regulations (*id.* § 543(b)(2)). Also unlike the 1996 Act, the Cable Act expressly directed State regulators to follow the FCC's rate regulations: "the rates for the provision of basic cable service shall be subject to regulation by a franchising authority . . . *in accordance with the regulations prescribed by the Commission.*" *Id.* § 543(a)(2)(A) (emphasis added).

These provisions bring sharply into focus the missing links in the FCC's statutory argument. The 1996 Act assigns the FCC *no* substantive pricing jurisdiction. Instead, Congress entrusted pricing authority entirely to State commissions. 47 U.S.C. § 252(c), (d). Nor does the 1996 Act require States to follow any FCC pricing rules. On the contrary, as we have discussed, Congress went out of its way in section 252(c) to specify separately that States are to set rates only "according to subsection (d)."

The FCC would have this Court treat section 251 as if it contained the same terms found in these other provisions, an approach that cannot be squared with fundamental canons of statutory interpretation. As this Court

has said repeatedly, " '[w]here Congress includes particular language in one section of a statute but omits it in another section of the same Act, it is generally presumed that Congress acts intentionally and purposely in the disparate inclusion or exclusion.' " *Bates v. United States*, 118 S. Ct. 285, 290 (1997) (quoting *Russello v. United States*, 464 U.S. 16, 23 (1983)).

2. Because the language of section 251(d)(1) is so different from the text of these other provisions—and so clearly fails to provide the requisite straightforward grant of pricing jurisdiction—the FCC must rummage through the statute searching for other shreds of supporting evidence. Its quest is fruitless.

The FCC argues most strenuously that, unless section 251(d)(1) provides sweeping jurisdiction over *every* local competition issue, including pricing, there is no way to explain how the FCC obtains authority over other specific issues as to which all parties agree that the FCC has some role. According to the FCC, these other provisions "assume[]" a separate assignment of pricing authority that can come only from section 251(d)(1). FCC Br. 22.

But no such inference is required to make sense of these other provisions. On the contrary, where Congress wanted the FCC to exercise authority over a specific matter, it made that quite clear on the face of the statute. Section 251(e)(1), for example, grants the FCC "exclusive jurisdiction" over the administration of "telecommunications numbering." Similarly, section 251(h) states that "[t]he Commission may, by rule, provide for the treatment of a local exchange carrier (or class or category thereof) as an incumbent local exchange carrier." And section 251(b)(2) makes plain that the Commission is to "prescribe" the "requirements" for "number portability." There is nothing either equivocal or obscure about these specific grants of jurisdiction, and there is consequently no need at all to invest section 251(d)(1) with

an importance that its plain language will not support. Indeed, the real question here is this: if section 251(d)(1) *already* provided the FCC with generic authority over all of sections 251 and 252, why would Congress have included these specific delegations of authority to the FCC?

Section 251(d)(2), on which the FCC places particular reliance, does not differ meaningfully from these other grants of authority. By stating that the FCC must consider certain factors "in determining what network elements should be made available," that provision *itself* necessarily authorizes the FCC to make such a "determina[tion]" in the first place. Indeed, the FCC has read the provision in precisely that fashion. *See* J.A. 546 (¶ 279) (discussing the "authority we derive from section 251(d)(2)").[19] There is simply no basis for the Commission's theory that the syntax of section 251(d)(2) bears significant jurisdictional implications that dictate a reading of section 251(d)(1) not supported by the plain terms of that provision.

In any event, the fact that the FCC is driven to rely on such tenuous implications from statutory provisions having nothing to do with pricing demonstrates just how far the agency has strayed from establishing that Congress straightforwardly and unambiguously granted it intrastate jurisdiction. Indeed, the FCC's arguments on this score again conflict with *Louisiana PSC*, where this Court concluded that much stronger—and more directly applicable—implications in the statutory text fell short of the clear

---

[19] The FCC has similarly relied upon the other specific provisions in section 251 as sources of authority. *See, e.g.*, First Report and Order and Further Notice of Proposed Rulemaking, *Telephone Number Portability*, 11 FCC Rcd 8352, 8370, 8411 (¶¶ 36, 114) (1996) ("section[] 251(b)(2) . . . give[s] to the Commission the authority . . . ."); *id.* at 8417 (¶ 126) ("section 251(e)(2) gives us specific authority"); *id.* at 8464 (¶ 220) ("section 251(e)(2) gives the Commission the authority").

congressional directive necessary to overcome section 2(b).[20]

The other provisions on which the FCC relies provide even weaker evidence of a congressional design to subject States to all-encompassing supervision by the federal bureaucracy. Contrary to the FCC's argument, section 251(d)(3) is an *anti*-preemption provision which limits the FCC's ability to "preclude the enforcement" of any *State* access or interconnection regulations. That subsection, like the many other anti-preemption provisions in the statute,[21] is intended to preserve State authority and presumes that the States, not the FCC, have authority to adopt intrastate access and interconnection regulations in the first instance. Section 253(d), another provision cited by the Commission, also undermines the

---

[20] In *Louisiana PSC*, respondents asked the Court to infer from indications in section 220 that Congress "'clearly intended'" to give the FCC authority over depreciation issues for both interstate and intrastate purposes. *See* 476 U.S. at 367-68 (quoting respondents' brief). Respondents stressed, among other things, (1) that a subsection of section 220 made it unlawful to "keep *any* other accounts" apart from those mandated by the FCC, (2) that another part of section 220 required all carriers to adhere to FCC rules over any contrary State rules unless the FCC specifically "except[s]" them from federal regulation, and (3) that the FCC must have been given intrastate authority because a provision authorized the States only to "present [their] views" to the federal agency. *See id.* This Court found that these provisions, even in combination, were not sufficient to grant the FCC intrastate authority. *Id.*

[21] *See, e.g.*, 47 U.S.C. 261(b) ("Nothing in this part shall be construed to prohibit any State commission from . . . prescribing regulations . . . in fulfilling the requirements of this part, if such regulations are not inconsistent with the provisions of this part."); 1996 Act § 601(c) ("This Act and the amendments made by this Act shall not be construed to modify, impair, or supersede Federal, State, or local law unless expressly so provided in such Act or amendments." (reprinted at 47 U.S.C. § 152 note)).

FCC's claim. Section 253(d) again assumes that the States, not the FCC, will issue rules in the first instance. It authorizes the FCC to preempt such rules only where it determines, on a case-by-case basis and "after notice and an opportunity for public comment," that a State "has permitted or imposed" an offending legal requirement. 47 U.S.C. § 253(d). That case-specific, after-the-fact preemption authority does not empower the Commission, acting in advance and without reference to any particular requirements, broadly to displace the States from their historical regulatory domain.[22]

3. The FCC also suggests that section 271 provides "compelling evidence" of the federal agency's pricing authority. *See* FCC Br. 29-31; AT&T Br. 31-32. In the FCC's view, because section 271 authorizes the FCC to assess a Bell company's compliance with section 271's "competitive checklist" in order to determine whether the company may provide long-distance service, and because the checklist requires interconnection "in accordance with the requirements of sections 251(c)(2) and 252(d)(1)"

---

[22] The final item on the FCC's laundry list of inapplicable 1996 Act provisions is section 160, the statutory "forbearance" provision. Because the FCC and its supporters failed to present this argument in their briefs below, the court of appeals refused to consider it (Pet. App. 13a n.11), and this Court should do likewise. In any event, it has no merit. As the FCC notes (FCC Br. 24-25), section 160 states that the FCC may not forbear from applying *"the requirements* of section 251(c)," which impose obligations on incumbent LECs. 47 U.S.C. § 160(d). But there is no dispute here that the FCC has authority over certain aspects of section 251(c): Congress expected the FCC to impose appropriate limitations on resale (*see* 47 U.S.C. § 251(c)(4)(B)) and to determine "what network elements should be made available for purposes of subsection (c)(3)" (*see* 47 U.S.C. § 251(d)(2)). Contrary to the FCC's claim, it would not have "made little sense" for Congress to preclude the forbearance of these provisions until section 251(c) is "fully implemented." FCC Br. 24-25. What *does* make little sense is to read into this forbearance provision an implication that the FCC must have pricing jurisdiction nowhere granted in the Act's substantive provisions.

(47 U.S.C. § 271(c)(2)(B)(i)),[23] section 271 necessarily authorizes the agency to formulate substantive pricing standards. *See* FCC Br. 29-31.

That inference is unwarranted. Section 271 by its terms neither creates pricing standards nor empowers the FCC to define any such standards. Instead, it incorporates the substantive pricing determinations that the statute entrusts to State commissions: the pricing "requirements" to which section 271 refers are the "just and reasonable rate[s]" that are "[d]etermin[ed] by a *State commission*." 47 U.S.C. § 252(d)(1) (emphasis added). With respect to pricing, therefore, it necessarily follows that the FCC, in passing on a section 271 application, can require no more than interconnection in accordance with the pricing principles promulgated *by the States* pursuant to sections 251 and 252.

Contrary to the FCC's supposition, this conclusion does not force the FCC to "abdicate [its] compliance inquiry to each of 50 state commissions." FCC Br. 30. On the contrary, the FCC still has the ultimate responsibility to "find[]" (47 U.S.C. § 271(d)(3)) whether a Bell company is in *compliance* with the relevant pricing requirements—in statutory terms, the Bell company has "fully implemented" its obligations. The State commissions' responsibility, by contrast, is to *define* the pricing obligations with which the Bell company must comply. Those discrete roles are wholly compatible and complementary.[24]

---

[23] *See also* 47 U.S.C. § 271(c)(2)(B)(ii), (xiii), (xiv).

[24] Nor does the existence of the Communications Act's administrative complaint provision, 47 U.S.C. § 208, provide any support for the notion that the FCC is expected to play a role in reviewing State pricing determinations. *See* AT&T Br. 29, 30; MCI Br. 38. On the contrary, as the Eighth Circuit correctly held (Pet. App. 31a-34a), Congress prescribed a carefully tailored review mechanism under which any aggrieved party may seek relief only from a *federal district court*, not from the FCC. *See* 47 U.S.C. § 252(e)(6). Nothing in section 208 permits the FCC to override that congres-

4. Finally, section 201(b) does not fill the FCC's jurisdictional void. Wrenching the last sentence of section 201(b) entirely out of context, the FCC claims that section 201 allows the FCC to exercise jurisdiction over every section of the Communications Act, whether interstate or intrastate. *See* FCC Br. 19-20. But section 201, by its plain terms, involves only the FCC's authority over "*interstate or foreign* communication" services. 47 U.S.C. § 201(a) (emphasis added). It is altogether implausible to infer that section 201(b) provides "unqualified textual authority" (FCC Br. 20) wholly detached from the limitations contained in section 201(a). On the contrary, section 201(b) uses the phrase "*such* communication service," and the word "such" plainly refers to the "*interstate or foreign* communication" services mentioned in the immediately preceding sentence in section 201(a). Thus, the FCC's argument ultimately boils down to the improbable proposition that, unlike every other aspect of section 201, the last sentence of section 201(b)—the sentence that gives the FCC authority over the "provisions of this Act"—applies to intrastate as well as interstate matters. But all statutory language, "plain or not," must be read in context. *King v. St. Vincent's Hosp.*, 502 U.S. 215, 221 (1991). And the context here plainly forecloses the FCC's understanding.

Furthermore, Congress does not legislate in a vacuum. Section 201(b), like every other provision of the Act, must be read in light of section 2(b), which establishes the jurisdictional framework on which Congress has built the statute. If an isolated sentence in a provision dealing exclusively with interstate and foreign communications can be ripped out of that provision and construed to

---

sional determination by holding itself out as an alternative forum for reviewing precisely the same State determinations. *Cf. Thunder Basin Coal Co. v. Reich*, 510 U.S. 200, 209 (1994). That conclusion is fortified by the fact that the FCC's jurisdiction to hear complaints under section 208 is necessarily limited by the proscription of section 2(b). *See* Pet. App. 33a-34a.

give the FCC intrastate jurisdiction denied to the agency by section 2(b), then Congress truly wasted its breath when it stated that "nothing in [the Communications Act] shall be construed . . . to give the Commission jurisdiction with respect to" intrastate matters. The Court should reject this distorted reading of the statute. *See Louisiana PSC*, 476 U.S. at 369-70 (refusing to read 47 U.S.C. § 151, which sets forth the purposes of the Communications Act, in a manner inconsistent with section 2(b)).[25]

D. The FCC's Policy Arguments Do Not Support a Different Result.

In perhaps its most audacious argument, the FCC, joined by AT&T and MCI, presumes to second-guess the litigation judgment of the State commissions that have expended considerable resources vindicating their jurisdictional prerogatives. The FCC claims that the State commissions are wasting their time and money, because even if they prevail in this case, they will have gained no greater authority. As the FCC sees the matter, the federal courts will ultimately dictate the proper results to the States in reviewing arbitration decisions under section 252(e)(6). To the FCC, the only question here is not "whether" the States will be put in a federal straitjacket but "when." FCC Br. 40.

The FCC is wrong in all respects. To begin with, the decentralized, State-centered scheme the FCC decries as

---

[25] Nor does section 4(i) advance the FCC's position. *Compare* FCC Br. 19-20 n.5; MCI Br. 28 n.19. It is merely a generic "necessary and proper" clause empowering the FCC to execute the substantive authority granted elsewhere in the statute; it confers no added jurisdiction itself. *California v. FCC*, 905 F.2d 1217, 1241 n.35 (9th Cir. 1990); *AT&T v. FCC*, 487 F.2d 865, 877 (2d Cir. 1973). The same is true of section 303(r), which applies "*except as otherwise provided in this [Act]*" (47 U.S.C. § 303 (emphasis added)) and which appears in Title III of the Act: "Provisions Relating to Radio." Neither of these provisions can take precedence over the allocation of pricing authority in section 252 or the jurisdictional rule of section 2(b).

"cumbersome" is known as federalism, and it is the scheme that Congress believed best in these circumstances. The FCC's self-aggrandizing belief that Congress would have done better by centralizing all significant authority in Washington is an argument best made to the legislature, not this Court.

Equally important, the FCC's theory is predicated on a mistaken premise. The statute does not impose a one-size-fits-all regime in which every question has only one possible answer. Rather, the statute leaves room for differing discretionary judgments, allowing each State sufficient latitude to adapt the Act in a manner that best accommodates local needs and circumstances. That explains why Congress, perhaps anticipating the FCC's preemptive jurisdictional appetite, was so careful to protect the authority of State commissions to implement the statute's local competition provisions. It provided that "[n]othing in this part [*i.e.*, the provisions relating to local competition] shall be construed to prohibit any State commission from . . . prescribing regulations . . . in fulfilling the requirements of this part, if such regulations are not inconsistent with the provisions of this part." 47 U.S.C. § 261(b). That guarantee of State autonomy and discretion forecloses the FCC's vision of monolithic federal regulatory control and undermines its theory that the States are limited to adjudicating disputes according to rules announced in Washington.

To be sure, the statute imposes limits on the States' discretion—limits that the federal courts have authority to enforce.[26] But within the bounds of those limitations, the statute has sufficient play in its joints to permit States to

---

[26] For example, Congress meant what it said when it required prices to be based on the incumbent's "cost . . . of providing" interconnection or network elements. 47 U.S.C. § 252(d)(1). Broad though the States' leeway may be, they could not lawfully set rates that disregard an incumbent's actual costs.

resolve disputes in reasonable ways that may vary from jurisdiction to jurisdiction.[27]

II. THE FCC'S UNBUNDLING RULES CANNOT BE RECONCILED WITH THE LANGUAGE, STRUCTURE, OR PURPOSES OF THE 1996 ACT.

In the 1996 Act, Congress was careful to preserve a clear statutory distinction between resale and the purchase of unbundled network elements. It established separate pricing schemes and separate marketing rules for the two modes of entry. And it placed various limitations on the purchase and use of unbundled network elements. For example, the Act defined network elements only in terms of the incumbents' physical facilities (not its services); an incumbent must make network elements available only if their absence would otherwise impair the new entrant's ability to provide local service; and, most important, the requesting carrier, not the incumbent, has the responsibility to "combine such elements in order to provide . . . tele-

---

[27] AT&T seeks illegitimately to smuggle into this case, under cover of its jurisdictional arguments, challenges to non-jurisdictional rulings that it failed to preserve in its petition for certiorari. *See* AT&T Br. 32-34. Nothing in the questions presented or the arguments made in that petition provided either the Court or the parties with notice that AT&T intended to raise these collateral, non-jurisdictional issues. This Court therefore should not consider them. *Taylor v. Freeland & Kronz*, 503 U.S. 638, 646 (1992) ("The Court decides which questions to consider through well-established procedures; allowing the able counsel who argue before us to alter these questions or to devise additional questions at the last minute would thwart this system."). In any event, AT&T's substantive arguments are meritless. The Eighth Circuit vacated each of the rules that AT&T defends, not because of any jurisdictionally based theory concerning the FCC's interpretive authority (*see* AT&T Br. 32-33), but because each violated the plain language and structure of the 1996 Act. *See* Pet. App. 46a-47a (presumption that incumbents must provide access to network elements to the extent technically feasible is "contrary to the plain meaning of the Act"); *id.* at 51a-52a (FCC's "superior quality" rules "cannot stand in light of the plain terms of the Act"); *id.* at 52a-53a (FCC's rules on combining elements not currently linked in the incumbent's network conflicts with the statute's "plain meaning").

communications service." 47 U.S.C. § 251(c)(3). Thus, although the incumbent must make physical parts of its network available to the new entrant, it is up to the new entrant itself to incorporate those pieces into its own network in order to provide a finished service. The use of unbundled elements is therefore fundamentally different from resale, in which a competitor purchases the incumbent's finished retail service at a wholesale price for resale to the competitor's customers.

The FCC's regulations utterly obliterated the statutory distinction between resale and the use of unbundled network elements. Most egregiously, the Commission allowed new entrants to purchase all the elements necessary to provide the same finished service that the incumbent provides and required the incumbent itself to combine those network elements into such a complete service for the new entrant. Consequently, a competitor without any facilities of its own and without performing any additional work can order the functional equivalent of resale—all the incumbent's network elements pre-combined into the same finished service provided by the incumbent—under the separate pricing and marketing rules that are supposed to apply only to unbundled network elements. At the same time, the Commission expanded the definition of network elements beyond all proper bounds and vitiated statutory restrictions on the circumstances under which a new entrant can order those elements.

Each of the Commission's rules that we discuss below is contrary to the language and structure of the statute, and each is inconsistent with Congress's goals in the 1996 Act—increased competition through greater investment and innovation, the preservation of universal service, and enhanced consumer welfare. Taken together, these rules thoroughly undermine those objectives and yield a scheme that bears no resemblance to the one Congress enacted into law.

A. The FCC Has Destroyed the Statutory Distinction Between Resale and Unbundled Network Elements.

1. The 1996 Act requires incumbents to offer network elements to entrants "on an unbundled basis at any technically feasible point" and in a "manner that allows requesting carriers to combine such elements in order to provide . . . telecommunications service." 47 U.S.C. § 251(c)(3). This rule allows companies that have some network facilities of their own to fill in their networks by purchasing individual pieces of the incumbent's network. Congress understood, for example, that cable television companies planned to use their existing door-to-door networks to carry telephone calls as well as TV signals, but lacked the switches needed to direct calls from one customer to another. *See* Conf. Rep. at 148. Similarly, the press reported during consideration of the 1996 Act that AT&T had already installed local telephone switches, but would seek to buy the wires (known as "local loops") needed to connect those switches to individual homes and businesses.[28] Access to unbundled elements is a way to assist such *facilities-based* carriers by giving them access to specific elements so that they will not have to replicate the incumbent's entire network overnight. *See* Conf. Rep. at 148 (recognizing "that it is unlikely that competitors will have a *fully* redundant network in place when they initially offer local service" and that competitors may need initially to obtain "[*s*]*ome* facilities and capabilities (*e.g.*, central office switching)" from the incumbent) (emphasis added).

Resale is different. Instead of giving facilities-based competitors an opportunity to obtain and combine individual pieces of the incumbent's network, resale allows competitors *without* facilities—or without facilities sufficient to provide certain services or to meet the needs of certain customers—to obtain at wholesale prices the *complete* telecommunications services that the incumbent

---

[28] *See* John Keller, *AT&T Eagerly Plots a Strategy to Gobble Local Phone Business*, Wall St. J., Aug. 21, 1995, at A1.

currently provides at retail. *See* 47 U.S.C. § 251(c)(4)(A) (requiring incumbents "to offer for resale at wholesale rates any telecommunication service that the carrier provides at retail to subscribers who are not telecommunications carriers").

Congress did not intend these methods of entry to be interchangeable. On the contrary, the 1996 Act repeatedly distinguishes between them. Most importantly, Congress provided different pricing rules for each mode of entry. Users of network elements need pay rates based only on the incumbent's "cost . . . of providing" those elements. *See id.* § 252(d)(1)(A). By contrast, resellers pay rates based on the retail prices that the incumbent currently charges its customers for the services at issue. The statute directs State commissions to determine wholesale rates "on the basis of the [incumbent's] retail rates charged to subscribers" less only those costs that "will be avoided" by selling at wholesale. *Id.* § 252(d)(3).

Nor is that the only distinction between resale and unbundled network elements. The 1996 Act allows the major long-distance carriers to offer jointly marketed local and long-distance service *only* if they enter the local market by using some of their own facilities, supplemented as necessary by the incumbent's network elements. If these companies enter merely as resellers, they may not offer such "one-stop shopping" packages of local and long-distance services for three years or until the relevant Bell company receives long-distance authority. *See* 47 U.S.C. § 271(e)(1).

These statutory distinctions serve crucial purposes. First, as we have explained, most jurisdictions require incumments to charge below-cost rates for basic service (especially for rural and residential customers), and allow incumbents to offset those under-recoveries by charging above-cost rates to business and other customers. And, contrary to the baseless suggestion in MCI's brief (MCI Br. 25), that situation may persist indefinitely: while section 254(f) requires States with a universal service pro-

gram to ensure that all carriers contribute equitably to universal service, it does not specify a date certain for the removal of implicit *intra*state subsidies.

If, during the potentially lengthy period in which incumbents must rely on these implicit subsidies to recover their costs, new entrants may obtain complete services at cost-based rates, they will easily siphon away the incumbents' valuable business customers. They will do so *not* by providing a better or lower-cost service, but simply by undercutting the above-cost rates that incumbents must charge to subsidize their other services. Such regulatory arbitrage would take away the revenues that incumbents use to support affordable rates for rural and residential consumers, leading to massive pressure on the rates of those consumers and enormous losses for incumbents.

Simply put, the end result of such gamesmanship would be that competitors would steal incumbents' profitable customers without adding any value to the incumbents' service and would leave incumbents with the high-cost customers that competitors have no interest in serving. By tying wholesale prices to *retail* rates and thus ensuring that these prices account for universal service subsidies, Congress sought to avoid these negative effects. *See* H.R. Rep. No. 104-204, at 72 ("The [wholesale] rate should reflect whether, and to what extent, the local dialtone service is subsidized by other services . . . .").

Second, as even the FCC has recognized, "[t]he interconnection provisions of the Act, Section[s] 251 and 252, are designed to promote *facilities-based* local exchange competition." Notice of Proposed Rulemaking, Order on Remand, and Waiver Order, *Amendment of the Commission's Rules to Establish Competitive Service Safeguards for Local Exchange Carrier Provision of Commercial Mobile Radio Services*, 11 FCC Rcd 16639, 16678-79 (¶ 80) (1996) (emphasis added). Congress understood that a vigorous competitive market in local telephony will exist only when newcomers have built their own physical facilities to

compete with the incumbent's networks. The Act is thus intended to "give[] new entrants the incentive to build their own local facilities-based networks, rather than simply repackaging and reselling the local services of the local telephone company." 141 Cong. Rec. H8465 (daily ed. Aug. 2, 1995) (Rep. Goodlatte); Conf. Rep. at 1 (statute intended "to accelerate rapidly private sector deployment of advanced telecommunications and information technologies"). *See generally* 3A Philip E. Areeda & Herbert Hovenkamp, *Antitrust Law* ¶ 773b1 at 204 (revised ed. 1996) ("competition [is] increased by encouraging [firms] to [develop rival facilities], rather than taking the easier and less competitive course of obtaining access to another's facilities").

The statutory pricing rules are carefully calibrated to achieve that goal. A reseller must pay a wholesale price that reflects the universal service subsidies built into the incumbent's retail rates; it can compete with the incumbent by performing marketing and billing functions more efficiently. A facilities-based competitor, by contrast, can avoid the universal service component in the incumbent's retail rates, and it can seek efficiency advantages throughout its network. To the extent that it does not yet have a complete network of its own, moreover, it can purchase at cost-based rates the incumbent's individual network elements. The statute thus encourages a new entrant to avoid buying at wholesale, but only by building a network of its own, supplemented where necessary with the incumbent's unbundled network elements.

2. Ever since Congress enacted the 1996 Act, however, AT&T and MCI have fought to obtain the very thing that Congress denied them—the ability to obtain incumbents' complete retail services at cost-based rates instead of wholesale rates based on current retail prices.

The mechanism that AT&T and MCI have seized upon to obtain that goal is the so-called unbundled network element "platform." Under the "platform" approach, AT&T and MCI do not expressly ask an incumbent for access to a particular finished service for resale. Instead,

they ask for the same thing using different words: they request *all* the network elements needed to replicate that same service, *already combined* in the configuration necessary to provide the service. Simply by using those different words, AT&T and MCI hope to obtain the identical product—the finished retail service of the incumbent carrier—at much lower, cost-based rates. For the reasons we have discussed, if AT&T and MCI are allowed to use this "platform" approach, they will obtain enormous, guaranteed profits through regulatory arbitrage without making any contribution to universal service, without investing in any facilities, without incurring any of the ongoing costs associated with maintaining a real telecommunications network (costs related to such obligations as testing and repairing facilities and maintaining network records), and without undertaking any business risk. As AT&T's President accordingly boasted, the "platform" is simply *"another way to resell,"* but it results in discounts for AT&T that are as much as *300%* larger than those authorized under the statutory resale pricing rules.[29]

Instead of putting a stop to these improper and destructive attempts to evade the statutory resale rules, the FCC has chosen to facilitate them. The FCC's rules permit a new entrant to pay cost-based rates and to avoid the joint marketing proscription even when that entrant does nothing more than a reseller—that is, even when it (1) relies exclusively on the incumbent's network elements to recreate an existing end-to-end service and (2) obtains those elements *already combined* by the incumbent into that complete service. *See* J.A. 551-54, 571-76 (¶¶ 292-297, 328-341); 47 C.F.R. § 51.315(b)-(f).

Incumbent carriers challenged both of those determinations in the Eighth Circuit. That court upheld the rule allowing entrants to obtain all the elements needed to

---

[29] Transcript, AT&T Investment Community Meeting (March 3, 1997) (comments of John Zeglis) (attached to Petition for Rehearing of GTE entities, *et al.* (8th Cir. No. 96-3321, filed Aug. 19, 1997)).

provide service, but only because it vacated the series of FCC rules allowing entrants to obtain all of those elements on a pre-combined basis. Pet. App. 53a-58a, 70a-71a. As we now explain, both sets of FCC rules are inconsistent with the text and structure of the 1996 Act.

3. The fundamental principle here is clear—Congress placed specific limitations on the use of resale, and those limitations must be respected. Accordingly, AT&T and MCI cannot obtain all the pre-combined elements necessary to provide service and pretend that they are anything other than resellers who should be subject to the statutory resale restrictions.

a. First, it is clear from the face of the 1996 Act that one of the fundamental distinctions between resale and the use of network elements is that, unlike finished services for resale, network elements are provided on an individual piece-by-piece basis. If a competitor wants to use multiple elements, the competitor itself must combine those elements.

In particular, the 1996 Act says in no uncertain terms that incumbents need only provide "access to network elements on an unbundled basis" and only in a "manner that allows *requesting carriers* to *combine such elements*." 47 U.S.C. § 251(c)(3) (emphasis added). As the Eighth Circuit correctly stated (Pet. App. 70a), this language simply cannot "be read to levy a duty on the incumbent LECs to do the actual combining of elements." The incumbent must "provide elements in a manner that enables the competing carriers to combine them," but the "requesting carriers"—not the incumbent—are expected "to combine the unbundled elements themselves." *Id.* It is difficult to see how Congress could have been any clearer on that point.

The FCC's response to the plain language of section 251(c)(3) focuses on the word "unbundled." The agency contends that, in past orders, that word has referred

exclusively to charging separate prices for different services. FCC Br. 44. Accordingly, the FCC argues, as long as they are priced separately, network elements are still "unbundled" even if they are pre-combined by the incumbent into a complete, ready-to-use service.

As an initial matter, the FCC is wrong that, even in isolation, "separately priced" is the only reasonable, or even the most plausible, meaning of the word "unbundled." On the contrary, just last year, the Commission itself used the word "unbundle" as a synonym for "physically sever": "Although we conclude that shared transport is *physically severable* from switching, incumbent LECs may not *unbundle* switching and transport facilities that are already combined, except upon request by a requesting carrier." [30] The FCC's claim that "unbundled" has a single, predetermined meaning that contradicts the Eighth Circuit's conclusion is thus contrary to petitioners' *own* prior usage of that word.

In any event, like all statutory terms, the word "unbundled" must be understood in context. *See St. Vincent's Hosp.*, 502 U.S. at 221. Given that "requesting carriers" are to "combine such elements" under section 251(c)(3), the context here requires the conclusion that the Eighth Circuit reached. It is the responsibility of the requesting carrier physically to combine the various piece-parts that it receives from the incumbent in order to provide a finished telecommunications service. The

---

[30] J.A. 1385 (Third Order on Reconsideration, ¶ 44) (emphasis added). *See also* J.A. 597-98 (¶ 384) ("[o]*ne way to unbundle* an individual loop" is *"to separate the unbundled loop(s)* prior to connecting the remaining loops to the switch") (emphasis added); Department of Justice Reply Comments, *Implementation of the Local Competition Provisions of the Telecommunications Act of 1996*, CC Docket No. 96-98, at 28 n.33 (FCC May 30, 1996) ("[i]n jurisdictions which have begun to open up local markets by requiring the *unbundling* of the local network into the loop . . ., local switching and interoffice transport elements, a variety of problems have developed in *separating* a customer's loop . . . from the local switch") (emphasis added).

incumbent itself has no obligation to combine those elements for its competitor. In this context, the unbundled network elements are not only separately priced, but also physically separate.

Significantly, even the FCC makes no attempt in this Court to resuscitate its now-vacated rules requiring incumbents to combine elements in new ways at a competitor's request. *See* 47 C.F.R. § 51.315(c)-(f). As the FCC apparently recognizes, there is no statutory anchor for any such duty. But neither is there any textual basis—in section 251(c)(3) or elsewhere—for requiring an incumbent to provide preassembled packages of elements for a competitor merely because the incumbent happens to have combined the elements for its own use.

Nor does the FCC gain anything by engaging in word games about the "rights" and "duties" created by section 251(c)(3). The FCC argues (FCC Br. 45) that the Eighth Circuit erred in concluding that an incumbent's "duty to provide" network elements under section 251(c)(3) "encompasses a *right* . . . to disconnect those elements." According to the FCC, since "a 'duty' is an obligation, not a right, . . . the grammatical implication of the Eighth Circuit's construction . . . is that incumbent LECs *must* provide access to network elements, including shared facilities, only on a *disconnected* basis." FCC Br. 45-46 (emphasis in original); *see* AT&T Br. 46.

That analysis simply misreads the Eighth Circuit's opinion. The court of appeals' understanding of section 251(c)(3) does not give incumbents any "rights"; it simply limits the *scope* of an incumbent's "duty" in accordance with the plain text of the statute. The incumbent's duty under the statute is to provide elements in a way that allows "requesting carrier[s]" to "combine" them—no more and no less.

The FCC also errs in contending that it would somehow constitute "discrimination" for an incumbent to provide network elements on a separated basis to new en-

trants when those elements are already combined in its own network. *See* FCC Br. 46. As an initial matter, any understanding of what constitutes "discrimination" under section 251(c)(3) must take account of the rest of section 251(c)(3). And it cannot be that Congress understood it to be "discriminatory" for an incumbent to do just what section 251(c)(3) expressly requires of it—provide network elements in a manner that allows a new entrant to combine them.

In any event, the FCC's argument rests on the false premise that incumbents, unlike entrants, are not required to combine network elements. *See* FCC Br. 46. Existing network element combinations do not materialize spontaneously out of nowhere. For a combination of facilities to exist, the incumbent must have invested the time and effort to combine the constituent elements. And where a new customer seeks local telephone service, the incumbent must create the connections needed to provide service to that customer, just as a new entrant would be required to do. Accordingly, MCI is wrong in stating that the vacated FCC rule "simply placed the potential competitor in the same position as the incumbent." MCI Br. 15. Just the opposite is true: the FCC's rule gave new entrants an artificial and unjustified advantage. By vacating the FCC's rule, the Eighth Circuit ensured that competitors and incumbents would bear the same burdens and that neither would have an inherent cost advantage or disadvantage.

Finally, there is no substance to the FCC's attempt to prove that network elements must be combined by focusing on the characteristics of one particular network element, a "signalling system." According to the FCC, it is not technically feasible to "disconnect[]" that element, so a new entrant could not be expected to undertake the work necessary to combine signaling with other network elements. FCC Br. 45. But the signaling system example supports our argument, not the FCC's. In particular, because a switch cannot be separated from the signaling

associated with it, the FCC's rules consider signaling and switching to be part of the *same* element for these purposes, *not* two inseparable elements. *See* 47 C.F.R. § 51.319(c)(1)(i)(C)(2). On the other hand, because signaling *can* be provided without switching, a competitor may obtain that item separately and, in that context, must obtain access to the incumbent's network to make a physical connection between the incumbent's signaling system and the competitor's own network. *See* J.A. —— (¶ 483) ("Carriers that provide their own switching facilities should be able to access the incumbent LEC's [signaling] network for each of their switches via a signaling link between their switch and the incumbent LEC's [network] . . . . This could be accomplished by the incumbent providing an unbundled signaling link from its [network] to the competitor's switch . . . .").

b. Even if we—and the Eighth Circuit—were wrong about the evident meaning of the statutory directive that incumbents are to provide elements in a manner that allows "requesting carriers to combine such elements," the statute still would not allow competitors to obtain a "platform" containing *all* the pre-combined elements necessary to provide service.

First, the language of the individual provisions governing network elements is clear that unbundled elements may be purchased only by a competitor with at least some network facilities of its own. Thus, section 251(c)(3) states—in language that MCI (MCI Br. 14-15) and the FCC (FCC Br. 43-44) conspicuously omit from their recitations of the statute—that the incumbent's duty is to provide "access" to network elements at a "technically feasible point." Those terms plainly contemplate a physical interconnection of networks that allows the new entrant to incorporate portions of the incumbent's network. *See* S. Rep. No. 104-23, at 20 (describing "unbundled access" as a form of physical access needed to ensure "the interoperability of *both carriers' networks*") (emphasis added). The reference to providing "access" at a "point"

makes clear that competitors will receive access at a physical place in the world. And that conclusion is further reinforced by the fact that the "point" of "access" must be "technically feasible," a restriction that makes sense *only* if the statute requires a new entrant to make a physical connection.[21]

Indeed, outside of litigation, the FCC itself has recognized that the statutory reference to "technical feasibility" necessarily assumes *physical* access to the incumbent's network: "We conclude that the term 'technically feasible' refers solely to technical or operational concerns. . . . We further conclude that the obligations imposed by sections 251(c)(2) and 251(c)(3) include modifications to incumbent LEC facilities to the extent necessary to accommodate interconnection or access to network elements." J.A. 507-08 (¶ 198).

The evident meaning of section 251(c)(3) is also strongly fortified by the language of related statutory provisions. In particular, under the 1996 Act, incumbents must permit "physical collocation"—that is, installation of a competitor's equipment on the incumbent's premises—"for interconnection or access to unbundled network elements." 47 U.S.C. § 251(c)(6). Congress would have had no need to require physical collocation for this pur-

---

[21] Of all the petitioners, only AT&T even mentions this language. It argues that because the statute provides for access to "elements" at a single "point," Congress must have anticipated that elements would be provided in combination. AT&T Br. 38. But of course that argument does not dispute the basic point made in text that the entrant must have some sort of network to interconnect with the incumbent in order to obtain those elements. Thus, the entrant cannot simply buy all the elements from the incumbent; otherwise, there is no point at which two networks interconnect. As for AT&T's attempt to wring significance out of the plural "elements" and the singular "point" in that sentence, its theory doesn't work. An entrant can obtain multiple physically separated elements at a single point—typically, the "collocation cage" that it places in an incumbent's central office precisely to permit "access to unbundled network elements at the premises of the local exchange carrier." 47 U.S.C. § 251(c)(6).

pose if, as the FCC asserts, entrants would never actually be required to enter onto the incumbent's premises to connect equipment.

This notion of a physical interconnection—a technically feasible point of access—between networks is fundamentally incompatible with a system that allows the new entrant to order from the incumbent everything it needs for a finished service. If the new entrant can order a complete "platform" of network elements, then it has no network to interconnect with that of the incumbent. The only connection between the new entrant and the incumbent is a phone call to order the platform.

Indeed, even under the FCC's own argument, access to all the pre-combined elements needed to provide service is not "unbundling." In the prior decisions on which the FCC has relied, the fundamental issue was whether one part of the network could be physically "unplugged" from the rest of the incumbent's facilities and separately priced so that other companies could compete to provide just that single piece of the network (for example, customer premises equipment or inside wiring). *See, e.g., Amendment of Section 64.702 of the Commission's Rules and Regulations (Second Computer Inquiry)*, 77 F.C.C.2d 384 (1980); *Detariffing the Installation and Maintenance of Inside Wiring*, 59 Rad. Reg.2d 1143 (1986).

The "platform" approach sanctioned by the FCC turns that understanding of "unbundling" on its head. What is at issue in this case is *not* whether the network may be physically subdivided into separately priced parts so that competitors who have their own facilities (*e.g.*, their own customer premises equipment) may use those facilities to compete in the market for that network subpart. Rather, it is whether competitors who have no facilities of their own may pay a *single* price to obtain pre-combined packages of all the elements needed to reproduce the *complete* service the incumbent currently provides at retail. The FCC's prior decisions are thus directly contrary to the theory that access to such a preassembled platform may

be understood as "unbundling"—and, even more clearly, they do nothing to buttress the truly extraordinary claim, made by AT&T and MCI, that those companies may obtain all those pre-combined elements at rates that, when added together, are *below* the price at which, by statute, they may obtain the complete service.

In fact, contrary to the FCC's new-found theory, access to pre-assembled platforms has always been understood to be just what it is—resale. And that brings us to our last key point.

Congress enacted specific limitations on the use of resale, and the Commission cannot allow those restrictions to be evaded by entrants engaging in the exact equivalent of resale under another name. "[A] statute is to be considered in all its parts" (*Lexecon Inc. v. Milberg Weiss Bershad Hines & Lerach*, 118 S. Ct. 956, 962 (1998)), and a conclusion that renders important statutory limitations meaningless cannot stand. *See Colautti v. Franklin*, 439 U.S. 379, 392 (1979) (relying on the "elementary canon of construction that a statute should be interpreted so as not to render one part inoperative"); *Bennett v. Spear*, 117 S. Ct. 1154, 1166 (1997) (rejecting an interpretation that "emasculate[s] an entire section" of a statute) (internal quotation marks omitted). Thus, the FCC's attempt to allow competitors to construct an entire fictional network under the guise of purchasing unbundled network elements is contrary not only to the language of the specific provisions governing unbundling, but also to the basic statutory distinction between resale and access to unbundled network elements. As one facilities-based competitor has explained, "the careful balance crafted by Congress would be upset . . . if local entrants could undermine the comprehensive scheme of the Act by manipulating the provisions of Sections 251(c)(3) and 252(d)(1) to acquire complete services as platforms of network elements, and to have those services priced at cost rather than at wholesale rates as required by Sections

251(c)(4) and 252(d)(3)."[82] This view was echoed by a group of the key legislators who actually wrote the 1996 Act.[83]

For these reasons, this fundamental flaw in the FCC's rules cannot be brushed aside as a mere "policy concern." FCC Br. 47. The problem with the FCC's position is not simply that it is inconsistent with what the agency *concedes* are important statutory policies, such as encouraging facilities-based competition—though that is assuredly a significant problem. It is also, and more fundamentally, that the FCC's conclusion is inconsistent with the separate statutory treatment accorded resale and unbundling.

Our argument, therefore, is *not* that, as a matter of policy, the FCC should artificially make the use of unbundled elements a "less attractive entry option." FCC Br. 47. Rather, we contend that the FCC's rules must make the use of both resale and unbundled elements *only as attractive as Congress intended them to be.* And the FCC has no discretion at all to promulgate rules that disregard the limitations that the 1996 Act imposes on those entry vehicles; such rules are fundamentally inconsistent with the scheme Congress enacted into law. *See, e.g., Maislin Indus. v. Primary Steel, Inc.*, 497 U.S. 116, 131 (1990) (declining to defer to agency interpretation that was "flatly inconsistent with the statutory scheme as a whole"); *Dole v. United Steelworkers*, 494 U.S. 26, 41 (1990) (agency interpretation rejected "in light of language and structure of the Act as a whole").

In fact, the FCC itself has recognized that a reading of the statute that makes the use of unbundled elements interchangeable with resale—and thus nullifies the statutory resale restrictions—is insupportable. Accordingly, it has attempted to show that there is some real difference between resale and access to *all* the pre-combined network

elements needed to provide a service. In its First Report and Order, the Commission asserted that a carrier using unbundled elements confronts unique competitive perils. Unlike a reseller, such a carrier allegedly must make an up-front investment and thus "faces the risk that end-user customers will not demand a sufficient number of services using that facility for the carrier to recoup its costs." J.A. 573-74 (¶ 334); *see also* FCC Br. 47.

That is simply wrong. Under the FCC's own view of the 1996 Act, competitors are *not* required to make any up-front investment. Generally speaking, local telephone networks can be divided into three segments: (1) the local loop, which connects an individual customer to a central telephone switch; (2) the switch, which directs calls to their destination; and (3) the trunk connections between switching centers (and thus their associated loops), which transport calls that originate and terminate in areas served by different switches. With respect to switching and trunks, the FCC has squarely held that competitors may order whatever quantities they need to meet customer demand, even if that requires shared use of particular facilities.[34] According to the Commission, a competitor may demand that the incumbent's switch and transport facilities be "*priced on an actual usage basis*"—in other words, the competitor need make no up-front investment and need bear no risk of demand fluctuations.[35] Similarly, a competitor need make no up-front investment in loops, which are purchased individually when a customer switches providers.[36]

The FCC argued before the court of appeals that, even if considerations of investment risk would not lead a competitor to choose resale over unbundled elements, a competitor might do so with respect to some customers for

[35] Response of Federal Respondents to Petitions for Rehearing, at 12 (8th Cir. No. 96-3321, filed Oct. 1, 1997) (emphasis added).

[36] *Id.* at 13.

whom the State has set retail rates at artificially low levels to promote universal service. FCC Rehearing Response, *supra* note 35, at 13. The FCC explained that, when retail rates are low relative to costs, "the 'retail less avoided cost' standard of section 252(d)(3) will allow a new entrant to compete via resale, while access to unbundled elements at rates 'based on the cost' of those elements likely will not." *Id.*

But that, of course, is precisely the point. The FCC's rules would allow new entrants to engage in regulatory arbitrage—invoking the resale pricing rules when those are advantageous, and the network element rules when those are advantageous—without any substantive difference in the service provided, the work done, or the new entrant's up-front investment. The fact that the resale provisions of section 251(c)(4) provide a more favorable path for potential competitors in some instances does not justify creating a new extra-statutory pricing regime to address other situations in which end-to-end use of network elements is more expedient.

4. The FCC and its supporting petitioners ultimately seek shelter in policy arguments of their own. AT&T argues, for instance, that preassembled "combinations of network elements . . . are particularly critical for providing competition for residential service" and that "the Eighth Circuit's decision . . . 'effectively has killed off local competition' in much of the local market." AT&T Br. 37 (internal citation omitted).

All the Eighth Circuit has "killed off," however, is the ability of companies to do something Congress never intended—make a quick buck by gaming the regulatory system without investing in any facilities and without supporting universal service. The Eighth Circuit has done nothing to hinder competition by companies that seek to engage in real facilities-based competition.[37] For that rea-

[37] Nor has it done anything to prevent resale by companies that do not object to following the rules that Congress enacted into law. Indeed, the FCC's Chairman recently emphasized that resale is

son, many of those companies have cheered the Eighth Circuit's ruling. As one competitor stated, the Eighth Circuit "made the right decision": those demanding that incumbents provide fully preassembled sets of network elements are part of a "rear-guard action being fought by the big long distance carriers to essentially get in there and not have to make any investment." [38] Another facilities-based competitor echoed the point: true local competitors "owe[] a debt of gratitude to the Eighth Circuit. . . . The fact that there will be no free ride for interexchange carriers seeking a cheap method of local market entry is a plus for our industry." [39] Those competitors have also made clear that the result advocated by the FCC in this case would undermine facilities-based competition because "[i]f a competing carrier can obtain an entire platform at incremental cost that effectively replaces a tariffed service, it will have no incentive to invest in deploying its own facilities in the local network." [40]

By the same token, AT&T's and MCI's overheated rhetoric about incumbents gratuitously "ripping apart" their own networks is at best disingenuous. The 1996 Act itself requires incumbents to separate their networks into piece-parts so that new entrants may obtain access to those

---

"economically viable." *Kennard Targets Phone, Cable Competition in 'Very Ambitious' Agenda*, Communications Daily (Feb. 2, 1998). *See also* Krause, *Computers & Technology: Kennard's Call Is Implementing Telecom Reform*, Investor's Business Daily (Feb. 18, 1998) ("Yes, I'm aware that the large (long-distance carriers) have backed away from a resale strategy. But some smaller CLECs (competitive local exchange carriers) haven't backed away from resale, and it seems to be viable for some new entrants") (statement of Chairman Kennard).

[38] *CLECs Revenue and Market Share Predicted to Grow 60% Next Year*, Communications Daily, at 2 (Dec. 10, 1997) (quoting Royce Holland, Chairman of Allegiance Telecom).

[39] Telecommunications Reports, at 18 (Nov. 10, 1997) (quoting James Allen, CEO of Brooks Fiber Properties, Inc.).

[40] Reply Comments of Intermedia Communications, Case No. 97-C-1963, at 5 (N.Y. P.S.C. Dec. 12, 1997).

parts. But, ever since Congress passed the 1996 Act, AT&T and MCI have sought at every turn to transform that straightforward statutory requirement into something it plainly is not—a duty to provide access to complete finished services. It should be no surprise that such an attempt to misuse the statutory scheme has run into significant difficulties that derive directly from the text of the 1996 Act itself. Nor is there anything improper about the incumbents' insisting upon strict adherence to that statutory text to forestall massive losses resulting not from genuine competition, but from illegitimate regulatory arbitrage.

B. The FCC's View of the Network Elements That Incumbents Must Make Available Is Contrary to the Act's Language, Structure, and Policy.

Having allowed new entrants to use an incumbent's network elements in a way that Congress never intended, the FCC then compounded the problem by expanding the number of such elements that incumbents must provide. The Commission did so in several ways, none of which is consistent with the 1996 Act.

1. First, the FCC nullified the statutory directive that, in determining what elements an incumbent must make available, the FCC "shall consider, at a minimum," whether access to proprietary network elements is "necessary," and whether the failure to provide access to other network elements would "impair" the ability of the requesting carriers to provide service. 47 U.S.C. § 251(d)(2). That provision reflects Congress's recognition that access to an unbundled network element is economically justified only when a new entrant has a genuine need for such an element. As AT&T itself explained in its opening brief, the effect of these provisions was to "allow new entrants to obtain *essential facilities* that a LEC controls." AT&T Br. 2 (emphasis added).

The FCC disregarded Congress's direction. The Commission determined that the "necessary" and "impair" standards required no consideration of "whether a request-

ing carrier could obtain the desired elements from an alternative source"; the only proper inquiry, in the FCC's view, is whether the equivalent functionality can be obtained elsewhere in *the incumbent's own network*. *See* J.A. 547, 549 (¶¶ 283, 287). In other words, the only situation in which a new entrant is *not* entitled to an incumbent's network element is when *some other* element in the incumbent's network can perform the same function. *See id.*

That astonishing conclusion defies the plain meaning of the 1996 Act. Access to a proprietary element from an incumbent simply cannot be "necessary," and failure to provide an element cannot "impair" a new entrant's ability to provide service, if an equivalent element is readily available from a source other than the incumbent. Yet, under the blinkered inquiry required by the FCC's rules, a particular facility may be available from dozens of suppliers at competitive prices, but access may nevertheless be deemed "necessary" for an entrant to provide service.

That is an irrational result, and it is not the one Congress enacted into law. On the contrary, as noted above, by mandating an evaluation of the actual need for an element—under the necessity and impairment standards—Congress expressed its preference that new entrants rely on non-incumbent facilities where possible, in order to promote facilities-based competition and encourage innovation. After all, it is precisely where the new entrant can avail itself of facilities other than the incumbent's that the potential for true facilities-based competition is greatest. And, contrary to the Eighth Circuit's apparent belief, that does not mean that access to elements is not required whenever an "element[] could theoretically be duplicated eventually." Pet. App. 47a-48a. It simply means that *some* inquiry into actual market conditions should be made before the incumbent is conscripted into providing its competitors with access to its network equipment.

Indeed, it is hornbook antitrust law that "essential facilities" must be made available to competitors only if they are not *"available from another source or capable of being duplicated by the [competitor] or others."* 3A Areeda &

Hovenkamp, ¶ 773b, at 202 (1996) (emphasis added). The lower courts have repeatedly held that a prerequisite for access to an essential facility is a showing of the "competitor's inability practically or reasonably to duplicate" that facility. *MCI Communications Corp. v. AT&T*, 708 F.2d 1081, 1132-33 (7th Cir.), *cert. denied*, 464 U.S. 891 (1983).[41] The reason for that rule is straightforward, and it is fully applicable here. When the government "order[s] the [owner] to provide the facility and regulat[es] the price to competitive levels, then the [prospective entrant's] incentive to build an alternative facility is destroyed altogether." 3A Areeda & Hovenkamp, ¶ 771b, at 175. To protect against precisely that danger, Congress required an inquiry into "necessity" and "impairment" before the FCC could force incumbents to offer access to their network elements. By ignoring those statutory standards, the FCC created the very result—loss of any incentive to build facilities—that courts have scrupulously guarded against in antitrust cases.

The FCC's rule is particularly troublesome in the context of proprietary elements. Congress required the Commission to apply strict standards to the unbundling of such elements because it understood that no incumbent will invest in research and development if innovations must automatically be turned over to the incumbent's competitors. *See, e.g., Kewanee Oil Co. v. Bicron Corp.*, 416 U.S. 470, 480 (1974) (right of exclusivity provides "an incentive to inventors to risk the often enormous costs in terms of time, research, and development"). But, under the FCC's rules, an incumbent can be required, after investing millions of dollars in developing a new service or feature, to turn that service or feature over to its competitors at

---

[41] *Accord Twin Labs, Inc. v. Weider Health & Fitness*, 900 F.2d 566, 568 (2d Cir. 1990); *Ideal Dairy Farms, Inc. v. John Labatt, Ltd.*, 90 F.3d 737, 748 (3d Cir. 1996); *Laurel Sand & Gravel, Inc. v. CSX Trans., Inc.*, 924 F.2d 539, 544 (4th Cir. 1991); *City of Malden v. Union Elec. Co.*, 887 F.2d 157, 160 (8th Cir. 1989); *City of Anaheim v. Southern Calif. Edison Co.*, 955 F.2d 1373, 1379-80 (9th Cir. 1992).

forward-looking cost regardless of whether those competitors can obtain its equivalent elsewhere. That rule will quite obviously provide a significant disincentive to research and development by incumbents. Indeed, the FCC has admitted as much. See J.A. 546-47 (¶ 282) ("prohibiting incumbents from refusing access to proprietary elements could reduce their incentives to offer innovative services"). That result cannot be squared with the statutory text, and it should be reversed.

2. Having created a rule under which competitors are entitled to obtain just about anything deemed to be a "network element," the FCC then construed the term "network element" to encompass virtually every asset an incumbent owns. As a result, the FCC's unbundling rules require an incumbent to turn over to competitors essentially its entire business.

The Act defines a network element as a "*facility or equipment* used in the provision of a telecommunications service," as well as "features, functions, and capabilities that are provided *by means of such facility or equipment*, including subscriber numbers, databases, signaling systems, and information sufficient for billing and collection or used in the transmission, routing, or other provision of a telecommunications service." 47 U.S.C. § 153(29) (emphasis added). Thus, the concept of network elements under the Act is rooted in discrete *physical* facilities carriers use in providing local exchange service and "features" that may be made available "by means of" such facilities.

The Act's definition of a "network element" therefore reflects the basic purpose of the unbundling provisions—to give entrants access to those essential physical facilities they need to provide telecommunications service but could not reasonably duplicate, at least in the short term. At the same time, the term "network element" does not encompass aspects of an incumbent's business that Congress had no reason to believe could not be duplicated, such as back-office billing or other support functions that any new competitor could reasonably perform for itself.

The FCC, however, defined "network element" so broadly that it effectively permits competitors to make use of every part—both physical and non-physical—of an incumbent's business. Several such rulings are at issue here.

a. First, the FCC's order requires incumbent carriers to unbundle their operational support systems (or "OSS"). 47 C.F.R. § 51.319(f). These support systems consist of computer software that serves a number of functions relating to an incumbent's customer service operations, such as processing customer orders and routing customer requests to the right person in the company.

These systems are not "network elements" within the meaning of the statute. They are neither "a facility or equipment" used in the provision of "a telecommunications service"—that is, used in the "routing" or "transmission" of telephone calls—nor "features . . . provided *by means of* such facility or equipment." 47 U.S.C. § 153(29), (43), (46) (emphasis added). Rather, as their name suggests, they are *support* systems that an incumbent uses to run its business—to process orders, to dispatch repair personnel, to keep track of customer service requests. Requiring an incumbent to make these systems available to competitors has nothing to do with unbundling the pieces of the network actually used to deliver calls. As a result, the plain terms of the definition in the Act simply do not reach these software systems.

Indeed, the FCC does not even attempt to characterize these support systems as part of the equipment used to route or transmit a call. Rather, the FCC has made clear that its objective in unbundling support systems is to ensure that new entrants will be able to perform *business* functions such as "pre-ordering, ordering, . . . and billing" and "basic service functions [such] as scheduling customer appointments" in "substantially the same time and manner that an incumbent can for itself." J.A. 670-71 (¶ 518). But nothing in Congress's definition of network elements suggests that the incumbents' business skills, in contrast to portions of their physical networks, must be turned over to competitors. On the contrary, Congress specifically tied

the unbundling requirement to the physical "features and equipment" owned by the incumbent.

Nor can incumbents be required to provide these back-office support systems on the Eighth Circuit's theory that, since a "telecommunications service" is the "offering of telecommunications for a fee directly to the public" (47 U.S.C. § 153(46)), a facility is "used" in providing a "telecommunications service" any time it assists in the overall "commercial offering of telecommunications." Pet. App. 42a-43a. Under that principle, *any* asset that might be useful in running a telecommunications company—desks, repair trucks, office space—could be requisitioned by a competitor. But no one has seriously suggested that Congress intended any such result. And the statute's definition of "telecommunications"—which encompasses only the *physical* "transmission, between or among points specified by the user, of information of the user's choosing" (47 U.S.C. § 153(43))—is incompatible with the Eighth Circuit's expansive theory. Operational support systems—like desks, trucks, and office space—having nothing to do with the transmission of calls, and they therefore cannot qualify as "network elements" under any reasonable reading of the statutory terms.

b. The FCC also erred in deciding that *services* offered by incumbent LECs, such as operator services and directory assistance, should be treated as "elements" subject to unbundling. *See* J.A. 678-81 (¶¶ 534-540); 47 C.F.R. § 51.319(g). These services do not fall within the definition of "network elements": they are not a "facility or equipment" in the telephone transmission network; neither are they "features, functions, [or] capabilities . . . provided by means of" such facilities. 47 U.S.C. § 153(29). In fact, although the unbundling provision of the House bill originally applied to "*services*, elements, features, functions, and capabilities," the Conference Committee chose to eliminate the term "services" when it defined the scope of unbundling. H.R. 1555, § 242(a)(2) (emphasis added). The FCC improperly reversed Congress's decision in favor of its own policy preferences.

Straining to find a textual hook for its illegitimate stretching of the term "network element," the FCC asserted that operator services and directory assistance qualify as "*information* . . . used in the transmission, routing, or *other provision* of a telecommunications service." 47 U.S.C. § 153(29) (emphasis added). According to the Commission, the concluding phrase "other provision" expands the category of network elements to include any information related to the provision of telecommunications services. J.A. 537-38 (¶ 261).

Under established principles, however, that phrase must be understood in light of the company it keeps. When a general term such as "other provision" is tacked on at the end of a list, it is properly understood as limited by the more specific terms that precede it. *See, e.g., Hughey v. United States*, 495 U.S. 411, 419 (1990) ("general statutory term should be understood in light of the specific terms that surround it"); *Federal Maritime Comm'n v. Seatrain Lines, Inc.*, 411 U.S. 726, 734 (1973) ("catchall provision" is to be "read as bringing within a statute categories similar in type to those specifically enumerated"). Here, the other elements of the list—"transmission" and "routing"—are functions used in the physical delivery of calls, and nothing in the statute suggests that the reference to "other provision" should expand that definition so broadly that it includes essentially all assets owned by a company that provides telephone service.

The full absurdity of the Commission's theory is illustrated by its insistence that even such optional, discretionary services as Caller ID and Call Waiting must be treated as "network elements." All parties agree that these so-called "vertical services" are retail services that incumbents currently sell to their customers and that therefore must be made available at the statutory wholesale discount. But under the FCC's rules, new entrants may *also* obtain access to these same vertical services as network elements at cost-based rates—and may do so despite the incontestable fact that these services do not route, transmit, or oth-

erwise play a role in the physical delivery of a telephone call.

Congress had no reason to require incumbents to make the same service available at two different prices, and it did not do so. Indeed, adherence to the statutory resale rules is particularly important in the context of these services because, as with business services, State commissions typically set retail prices for vertical services at above-cost rates to support low prices for other services. Allowing competitors to obtain the same services at the cost-based rates reserved for true network elements would simply invite them to engage in yet another form of regulatory arbitrage. Congress intended no such result—indeed, as noted, it affirmatively decided to exclude "services" from the definition of network elements. And because an asset can qualify as a network element only if it is "*used* in the provision of a telecommunications service," it makes no sense at all to say that a telecommunications service is *itself* a network element.

III. THE FCC'S "PICK-AND-CHOOSE" RULE IS INCOMPATIBLE WITH THE ACT'S SCHEME OF PRIVATE NEGOTIATIONS AND BINDING AGREEMENTS.

The FCC's order precludes effective negotiation of binding agreements by allowing new entrants "to choose among individual provisions contained in publicly filed interconnection agreements" that the incumbent carriers have reached with other carriers. J.A. 1044-45 (¶ 1310). Competitors may poach "any individual interconnection, service, or network element arrangement contained in any agreement to which [the incumbent] is a party." 47 C.F.R. § 51.809(a) (emphasis added). Moreover, the competitor need not enter into renegotiations that would give the incumbent a chance to rebalance the relationship to take account of the terms imported from other agreements. Rather, the order lets the competitor bypass the statutory negotiations *entirely* and demand that a State regulator award it any term agreed to by others. J.A. 1048 (¶ 1321). In effect, the FCC transformed a negotiated agreement into a series of tariff provisions from which competitors

can pick and choose at will. The Eighth Circuit correctly set this rule aside as incompatible with the statutory structure.

Section 252(i), on which the FCC relies, requires nothing remotely like this bizarre rule. It provides only that an incumbent LEC "shall make available" in the negotiating process "any interconnection, service, or network element" that it provides under an approved agreement with any other carrier "*upon the same terms and conditions* as those provided in the agreement." 47 U.S.C. § 252(i) (emphasis added). This provision establishes a straightforward nondiscrimination principle that requires an incumbent LEC to put on the bargaining table for negotiation any item contained in another agreement, but *only* on the same terms and conditions—embodying all the same tradeoffs—that appear in that other agreement. This requirement ensures that a LEC cannot restrict a particular service to a specific carrier and that a second entrant can step into the shoes of an earlier one if it wishes to accept the deal that the earlier one has struck. It certainly does *not* mean that a second entrant can take what it likes from a prior agreement and leave behind what it doesn't like.[42]

Moreover, any agreements that *are* concluded under the FCC's "pick-and-choose" rule are not binding. A competitor may demand for itself a new term from another agreement at *any* time, even after it has already signed a contract with an incumbent agreeing to a full package of terms and conditions. *See* J.A. 1046-47 (¶ 1316). As this Court has recognized, a contract that gives one party unfettered discretion " 'to deny or change the effect of the promise[] is an absurdity.' " *United States Trust Co. v. New Jersey*, 431 U.S. 1, 25 n.23 (1977) (quoting *Murray v. Charleston*, 96 U.S. 432, 445 (1878)).

---

[42] The FCC's suggestion that this reading of the statute would encourage incumbents to lard an interconnection agreement with unrelated terms (FCC Br. 49-50) ignores the fact that any agreement must be approved by a State commission. 47 U.S.C. § 252(e). State commissions are amply equipped to reject any attempt to import such unrelated terms into an agreement.

The FCC's radical pick-and-choose regulation cannot be reconciled with a statutory scheme that relies on bilateral commercial negotiations to establish "binding agreement[s]." 47 U.S.C. § 252(a)(1). Bargaining is impossible where one party remains free to avoid its promises by selecting new contract terms at will, and where the other party cannot know the extent of its commitments because it cannot know who else in the future will demand the concessions it makes in a contract without agreeing to the same tradeoffs.

Pick-and-choose also distorts the *content* of interconnection arrangements. A complex commercial agreement is an integrated whole whose terms reflect the give and take of bargaining. Generally, each party makes concessions in some areas in exchange for benefits in others, reflecting the particular needs and priorities of the parties. A party might, for example, agree to a higher price for one service in exchange for a lower price for another. But pick-and-choose allows one side (the entrant) to demand the *quid* (the lower price on the first service) without having to take the *quo* (the higher price on the other) with which it was originally paired—regardless of differences in context or in the commercial assumptions on which each bilateral arrangement is based. Given this prospect, the incumbent simply cannot afford to make tradeoffs, and a negotiated agreement that would otherwise benefit the negotiating parties will not be reached.[43]

---

[43] AT&T suggests that the FCC rule does not permit a competitor to take the *quid* without the *quo* where the tradeoff is "legitimate" and "express[]." AT&T Br. 50. But the FCC has never defended its rule on this ground. Moreover, that interpretation ignores the reality that complex commercial agreements involving multiple services must be viewed as a whole—one party may accept a tradeoff that it believes to be somewhat disadvantageous because another tradeoff embodied in the agreement is particularly advantageous. And forcing an incumbent to disclose this type of detailed analysis during negotiations in order to be able to prove later that particular terms were "expressly" linked and that such a link is "legitimate" would have its own chilling effect on negotiations.

In short, the FCC's pick-and-choose rule conflicts with the terms and structure of the Act and impermissibly thwarts the statute's reliance on negotiated, binding agreements. This Court should affirm the Eighth Circuit's decision to vacate the rule as unlawful.

CONCLUSION

Both judgments of the court of appeals should be affirmed insofar as they vacate the rules and order paragraphs specified in the court's opinions. *See* Pet. App. 66a & n.39, 71a-72a, 91a. The judgment of the court of appeals in the lead case below should be reversed insofar as it upheld the FCC's rules (1) permitting competitors to lease all of an incumbent's network elements needed to replicate a service provided by the incumbent; (2) nullifying the statute's "necessary" and "impair" standards; and (3) impermissibly expanding the definition of "network elements" to include operations support systems, operator services, directory assistance, and "vertical services."

STATUTORY PROVISIONS

§ 152. Application of chapter

(a) Applicability to interstate and foreign communications or transmissions of energy originating in or received within the United States by wire or radio; Canal Zone exception; cable services

The provisions of this chapter shall apply to all interstate and foreign communication by wire or radio and all interstate and foreign transmission of energy by radio, which originates and/or is received within the United States, and to all persons engaged within the United States, in such communication or such transmission of energy by radio, and to the licensing and regulating of all radio stations as hereinafter provided; but it shall not apply to persons engaged in wire or radio communication or transmission in the Canal Zone, or to wire or radio communication or transmission wholly within the Canal Zone. The provisions of this chapter shall apply with respect to cable service, to all persons engaged within the United States in providing such service, and to the facilities of cable operators which relate to such service, as provided in subchapter V-A of this chapter.

(b) Exceptions to Federal Communications Commission jurisdiction

Except as provided in sections 223 through 227 of this title, inclusive, and section 332 of this title, and subject to the provisions of section 301 of this title and subchapter V-A of this chapter, nothing in this chapter shall be construed to apply or to give the Commission jurisdiction with respect to (1) charges, classifications, practices, services, facilities, or regulations for or in connection with intrastate communication service by wire or radio of any carrier, or (2) any carrier engaged in interstate or foreign communication solely through physical connection with the facilities of another carrier not directly

or indirectly controlling or controlled by, or under direct or indirect common control with such carrier, or (3) any carrier engaged in interstate or foreign communication solely through connection by radio, or by wire and radio, with facilities, located in an adjoining State or in Canada or Mexico (where they adjoin the State in which the carrier is doing business), of another carrier not directly or indirectly controlling or controlled by, or under direct or indirect common control with such carrier, or (4) any carrier to which clause (2) or clause (3) of this subsection would be applicable except for furnishing interstate mobile radio communication service or radio communication service to mobile stations on land vehicles in Canada or Mexico; except that sections 201 to 205 of this title shall, except as otherwise provided therein, apply to carriers described in clauses (2), (3), and (4) of this subsection.

§ 153. Definitions

* * * *

(29) Network element

The term "network element" means a facility or equipment used in the provision of a telecommunications service. Such term also includes features, functions, and capabilities that are provided by means of such facility or equipment, including subscriber numbers, databases, signaling systems, and information sufficient for billing and collection or used in the transmission, routing, or other provision of a telecommunications service.

* * * *

(43) Telecommunications

The term "telecommunications" means the transmission, between or among points specified by the user, of information of the user's choosing, without change in the form or content of the information as sent and received.

* * * *

(46) Telecommunications service

The term "telecommunications service" means the offering of telecommunications for a fee directly to the public, or to such classes of users as to be effectively available directly to the public, regardless of the facilities used.

(47) Telephone exchange service

The term "telephone exchange service" means (A) service within a telephone exchange, or within a connected system of telephone exchanges within the same exchange area operated to furnish to subscribers intercommunicating service of the character ordinarily furnished by a single exchange, and which is

covered by the exchange service charge, or (B) comparable service provided through a system of switches, transmission equipment, or other facilities (or combination thereof) by which a subscriber can originate and terminate a telecommunications service.

(48) Telephone toll service

The term "telephone toll service" means telephone service between stations in different exchange areas for which there is made a separate charge not included in contracts with subscribers for exchange service.

* * * *

(52) Wire communication

The term "wire communication" or "communication by wire" means the transmission of writing, signs, signals, pictures, and sounds of all kinds by aid of wire, cable, or other like connection between the points of origin and reception of such transmission, including all instrumentalities, facilities, apparatus, and services (among other things, the receipt, forwarding, and delivery of communications) incidental to such transmission.

* * * *

§ 220. Accounts, records, and memoranda

(a) Forms

(1) The Commission may, in its discretion, prescribe the forms of any and all accounts, records, and memoranda to be kept by carriers subject to this chapter, including the accounts, records, and memoranda of the movement of traffic, as well as of the receipts and expenditures of moneys.

(2) The Commission shall, by rule, prescribe a uniform system of accounts for use by telephone companies. Such uniform system shall require that each common carrier shall maintain a system of accounting methods, procedures, and techniques (including accounts and supporting records and memoranda) which shall ensure a proper allocation of all costs to and among telecommunications services, facilities, and products (and to and among classes of such services, facilities, and products) which are developed, manufactured, or offered by such common carrier.

(b) Depreciation charges

The Commission may prescribe, for such carriers as it determines to be appropriate, the classes of property for which depreciation charges may be properly included under operating expenses, and the percentages of depreciation which shall be charged with respect to each of such classes of property, classifying the carriers as it may deem proper for this purpose. The Commission may, when it deems necessary, modify the classes and percentages so prescribed. Such carriers shall not, after the Commission has prescribed the classes of property for which depreciation charges may be included, charge to operating expenses any depreciation charges on classes of property other than those prescribed by the Commission, or, after the Commission has prescribed percentages of depreciation, charge

with respect to any class of property a percentage of depreciation other than that prescribed therefor by the Commission. No such carrier shall in any case include in any form under its operating or other expenses any depreciation or other charge or expenditure included elsewhere as a depreciation charge or otherwise under its operating or other expenses.

(c) Access to information; burden of proof

The Commission shall at all times have access to and the right of inspection and examination of all accounts, records, and memoranda, including all documents, papers, and correspondence now or hereafter existing, and kept or required to be kept by such carriers, and the provisions of this section respecting the preservation and destruction of books, papers, and documents shall apply thereto. The burden of proof to justify every accounting entry questioned by the Commission shall be on the person making, authorizing, or requiring such entry and the Commission may suspend a charge or credit pending submission of proof by such person. Any provision of law prohibiting the disclosure of the contents of messages or communications shall not be deemed to prohibit the disclosure of any matter in accordance with the provisions of this section. The Commission may obtain the services of any person licensed to provide public accounting services under the law of any State to assist with, or conduct, audits under this section. While so employed or engaged in conducting an audit for the Commission under this section, any such person shall have the powers granted the Commission under this subsection and shall be subject to subsection (f) of this section in the same manner as if that person were an employee of the Commission.

(d) Penalty for failure to comply

In case of failure or refusal on the part of any such carrier to keep such accounts, records, and memoranda

on the books and in the manner prescribed by the Commission, or to submit such accounts, records, memoranda, documents, papers, and correspondence as are kept to the inspection of the Commission or any of its authorized agents, such carrier shall forfeit to the United States the sum of $6,000 for each day of the continuance of each such offense.

(e) False entry; destruction; penalty

Any person who shall willfully make any false entry in the accounts of any book of accounts or in any record or memoranda kept by any such carrier, or who shall willfully destroy, mutilate, alter, or by any other means or device falsify any such account, record, or memoranda, or who shall willfully neglect or fail to make full, true, and correct entries in such accounts, records, or memoranda of all facts and transactions appertaining to the business of the carrier, shall be deemed guilty of a misdemeanor, and shall be subject, upon conviction, to a fine of not less than $1,000 nor more than $5,000 or imprisonment for a term of not less than one year nor more than three years, or both such fine and imprisonment: *Provided*, That the Commission may in its discretion issue orders specifying such operating, accounting, or financial papers, records, books, blanks, or documents which may, after a reasonable time, be destroyed, and prescribing the length of time such books, papers, or documents shall be preserved.

(f) Confidentiality of information

No member, officer, or employee of the Commission shall divulge any fact or information which may come to his knowledge during the course of examination of books or other accounts, as hereinbefore provided, except insofar as he may be directed by the Commission or by a court.

(g) Use of other forms; alterations in prescribed forms

After the Commission has prescribed the forms and manner of keeping of accounts, records, and memoranda

to be kept by any person as herein provided, it shall be unlawful for such person to keep any other accounts, records, or memoranda than those so prescribed or such as may be approved by the Commission or to keep the accounts in any other manner than that prescribed or approved by the Commission. Notice of alterations by the Commission in the required manner or form of keeping accounts shall be given to such persons by the Commission at least six months before the same are to take effect.

(h) Exemption; regulation by State commission

The Commission may classify carriers subject to this chapter and prescribe different requirements under this section for different classes of carriers, and may, if it deems such action consistent with the public interest, except the carriers of any particular class or classes in any State from any of the requirements under this section in cases where such carriers are subject to State commission regulation with respect to matters to which this section relates.

(i) Consultation with State commissions

The Commission, before prescribing any requirements as to accounts, records, or memoranda, shall notify each State commission having jurisdiction with respect to any carrier involved, and shall give reasonable opportunity to each such commission to present its views, and shall receive and consider such views and recommendations.

(j) Report to Congress on need for further legislation

The Commission shall investigate and report to Congress as to the need for legislation to define further or harmonize the powers of the Commission and of State commissions with respect to matters to which this section relates.

* * * *

§ 225. Telecommunications services for hearing-impaired and speech-impaired individuals

(a) Definitions

As used in this section—

(1) Common carrier or carrier

The term "common carrier" or "carrier" includes any common carrier engaged in interstate communication by wire or radio as defined in section 153 of this title and any common carrier engaged in intrastate communication by wire or radio, notwithstanding sections 152(b) and 221(b) of this title.

(2) TDD

The term "TDD" means a Telecommunications Device for the Deaf, which is a machine that employs graphic communication in the transmission of coded signals through a wire or radio communication system.

(3) Telecomunications relay services

The term "telecommunications relay services" means telephone transmission services that provide the ability for an individual who has a hearing impairment or speech impairment to engage in communication by wire or radio with a hearing individual in a manner that is functionally equivalent to the ability of an individual who does not have a hearing impairment or speech impairment to communicate using voice communication services by wire or radio. Such term includes services that enable two-way communication between an individual who uses a TDD or other nonvoice terminal device and an individual who does not use such a device.

(b) Availability of telecommunications relay services

(1) In general

In order to carry out the purposes established under section 151 of this title, to make available to all individuals in the United States a rapid, efficient nationwide communication service, and to increase the utility of the telephone system of the Nation, the Commission shall ensure that interstate and intrastate telecommunications relay services are available, to the extent possible and in the most efficient manner, to hearing-impaired and speech-impaired individuals in the United States.

(2) Use of general authority and remedies

For the purposes of administering and enforcing the provisions of this section and the regulations prescribed thereunder, the Commission shall have the same authority, power, and functions with respect to common carriers engaged in intrastate communication as the Commission has in administering and enforcing the provisions of this title with respect to any common carrier engaged in interstate communication. Any violation of this section by any common carrier engaged in intrastate communication shall be subject to the same remedies, penalties, and procedures as are applicable to a violation of this chapter by a common carrier engaged in interstate communication.

(c) Provision of services

Each common carrier providing telephone voice transmission services shall, not later than 3 years after July 26, 1990, provide in compliance with the regulations prescribed under this section, throughout the area in which it offers service, telecommunications relay services, individually, through designees, through a competitively se-

lected vendor, or in concert with other carriers. A common carrier shall be considered to be in compliance with such regulations—

(1) with respect to intrastate telecommunications relay services in any State that does not have a certified program under subsection (f) of this section and with respect to interstate telecommunications relay services, if such common carrier (or other entity through which the carrier is providing such relay services) is in compliance with the Commission's regulations under subsection (d) of this section; or

(2) with respect to intrastate telecommunications relay services in any State that has a certified program under subsection (f) of this section for such State, if such common carrier (or other entity through which the carrier is providing such relay services) is in compliance with the program certified under subsection (f) of this section for such State.

(d) Regulations

(1) In general

The Commission shall, not later than 1 year after July 26, 1990, prescribe regulations to implement this section, including regulations that—

(A) establish functional requirements, guidelines, and operations procedures for telecommunications relay services;

(B) establish minimum standards that shall be met in carrying out subsection (c) of this section;

(C) require that telecommunications relay services operate every day for 24 hours per day;

(D) require that users of telcommunications relay services pay rates no greater than the rates

paid for functionally equivalent voice communication services with respect to such factors as the duration of the call, the time of day, and the distance from point of origination to point of termination;

(E) prohibit relay operators from failing to fulfill the obligations of common carriers by refusing calls or limiting the length of calls that use telecommunications relay services;

(F) prohibit relay operators from disclosing the content of any relayed conversation and from keeping records of the content of any such conversation beyond the duration of the call; and

(G) prohibit relay operators from intentionally altering a relayed conversation.

(2) Technology

The Commission shall ensure that regulations prescribed to implement this section encourage, consistent with section 157(a) of this title, the use of existing technology and do not discourage or impair the development of improved technology.

(3) Jurisdictional separation of costs

(A) In general

Consistent with the provisions of section 410 of this title, the Commission shall prescribe regulations governing the jurisdictional separation of costs for the services provided pursuant to this section.

(B) Recovering costs

Such regulations shall generally provide that costs caused by interstate telecommunications relay services shall be recovered from all subscribers for every interstate service and costs

caused by intrastate telecommunications relay services shall be recovered from the intrastate jurisdiction. In a State that has a certified program under subsection (f) of this section, a State commission shall permit a common carrier to recover the costs incurred in providing intrastate telecommunications relay services by a method consistent with the requirements of this section.

(e) Enforcement

(1) In general

Subject to subsections (f) and (g) of this section, the Commission shall enforce this section.

(2) Complaint

The Commission shall resolve, by final order, a complaint alleging a violation of this section within 180 days after the date such complaint is filed.

(f) Certification

(1) State documentation

Any State desiring to establish a State program under this section shall submit documentation to the Commission that describes the program of such State for implementing intrastate telecommunications relay services and the procedures and remedies available for enforcing any requirements imposed by the State program.

(2) Requirement for certification

After review of such documentation, the Commission shall certify the State program if the Commission determines that—

(A) the program makes available to hearing-impaired and speech-impaired individuals, either

directly, through designees, through a competitively selected vendor, or through regulation of intrastate common carriers, intrastate telecommunications relay services in such State in a manner that meets or exceeds the requirements of regulations prescribed by the Commission under subsection (d) of this section; and

(B) the program makes available adequate procedures and remedies for enforcing the requirements of the State program.

(3) Method of funding

Except as provided in subsection (d) of this section, the Commission shall not refuse to certify a State program based solely on the method such State will implement for funding intrastate telecommunication relay services.

(4) Suspension or revocation of certification

The Commission may suspend or revoke such cerification if, after notice and opportunity for hearing, the Commission determines that such certification is no longer warranted. In a State whose program has been suspended or revoked, the Commission shall take such steps as may be necessary, consistent with this section, to ensure continuity of telecommunications relay services.

(g) Complaint

(1) Referral of complaint

If a complaint to the Commission alleges a violation of this section with respect to intrastate telecommunications relay services within a State and certification of the program of such State under subsection (f) of this section is in effect, the Commission shall refer such complaint to such State.

(2) Jurisdiction of Commission

After referring a complaint to a State under paragraph (1), the Commission shall exercise jurisdiction over such complaint only if—

(A) final action under such State program has not been taken on such complaint by such State—

(i) within 180 days after the complaint is filed with such State; or

(ii) within a shorter period as prescribed by the regulations of such State; or

(B) the Commission determines that such State program is no longer qualified for certification under subsection (f) of this section.

* * * *

§ 251. Interconnection

(a) General duty of telecommunications carriers

Each telecommunications carrier has the duty—

(1) to interconnect directly or indirectly with the facilities and equipment of other telecommunications carriers; and

(2) not to install network features, functions, or capabilities that do not comply with the guidelines and standards established pursuant to section 255 or 256 of this title.

(b) Obligations of all local exchange carriers

Each local exchange carrier has the following duties:

(1) Resale

The duty not to prohibit, and not to impose unreasonable or discriminatory conditions or limitations on, the resale of its telecommunications services.

(2) Number portability

The duty to provide, to the extent technically feasible, number portability in accordance with requirements prescribed by the Commission.

(3) Dialing parity

The duty to provide dialing parity to competing providers of telephone exchange service and telephone toll service, and the duty to permit all such providers to have nondiscriminatory access to telephone numbers, operator services, directory assistance, and directory listing, with no unreasonable dialing delays.

(4) Access to rights-of-way

The duty to afford access to the poles, ducts, conduits, and rights-of-way of such carrier to competing providers

of telecommunications services on rates, terms, and conditions that are consistent with section 224 of this title.

(5) Reciprocal compensation

The duty to establish reciprocal compensation arrangements for the transport and termination of telecommunications.

(c) Additional obligations of incumbent local exchange carriers

In addition to the duties contained in subsection (b) of this section, each incumbent local exchange carrier has the following duties:

(1) Duty to negotiate

The duty to negotiate in good faith in accordance with section 252 of this title the particular terms and conditions of agreements to fulfill the duties described in paragraphs (1) through (5) of subsection (b) of this section and this subsection. The requesting telecommunications carrier also has the duty to negotiate in good faith the terms and conditions of such agreements.

(2) Interconnection

The duty to provide, for the facilities and equipment of any requesting telecommunications carrier, interconnection with the local exchange carrier's network—

(A) for the transmission and routing of telephone exchange service and exchange access;

(B) at any technically feasible point within the carrier's network;

(C) that is at least equal in quality to that provided by the local exchange carrier to itself or to any subsidiary, affiliate, or any other party to which the carrier provides interconnection; and

(D) on rates, terms, and conditions that are just, reasonable, and nondiscriminatory, in accordance with the terms and conditions of the agreement and the requirements of this section and section 252 of this title.

(3) Unbundled access

The duty to provide, to any requesting telecommunications carrier for the provision of a telecommunications service, nondiscriminatory access to network elements on an unbundled basis at any technically feasible point on rates, terms, and conditions that are just, reasonable, and nondiscriminatory, in accordance with the terms and conditions of the agreement and the requirements of this section and section 252 of this title. An incumbent local exchange carrier shall provide such unbundled network elements in a manner that allows requesting carriers to combine such elements in order to provide such telecommunications service.

(4) Resale

The duty—

(A) to offer for resale at wholesale rates any telecommunications service that the carrier provides at retail to subscribers who are not telecommunications carriers; and

(B) not to prohibit, and not to impose unreasonble or discriminatory conditions or limitations on, the resale of such telecommunications service, except that a State commission may, consistent with regulations prescribed by the Commission under this section, prohibit a reseller that obtains at wholesale rates a telecommunications service that is available at retail only to a category of subscribers from offering such service to a different category of subscribers.

(5) Notice of changes

The duty to provide reasonable public notice of changes in the information necessary for the transmission and rout-

ing of services using that local exchange carrier's facilities or networks, as well as of any other changes that would affect the interoperability of those facilities and networks.

(6) Collocation

The duty to provide, on rates, terms, and conditions that are just, reasonable, and nondiscriminatory, for physical collocation of equipment necessary for interconnection or access to unbundled network elements at the premises of the local exchange carrier, except that the carrier may provide for virtual collocation if the local exchange carrier demonstrates to the State commission that physical collocation is not practical for technical reasons or because of space limitations.

(d) Implementation

(1) In general

Within 6 months after February 8, 1996, the Commission shall complete all actions necessary to establish regulations to implement the requirements of this section.

(2) Access standards

In determining what network elements should be made available for purposes of subsection (c)(3), the Commission shall consider, at a minimum, whether—

(A) access to such network elements as are proprietary in nature is necessary; and

(B) the failure to provide access to such network elements would impair the ability of the telecommunications carrier seeking access to provide the services that it seeks to offer.

(3) Preservation of State access regulations

In prescribing and enforcing regulations to implement the requirements of this section, the Commission shall not preclude the enforcement of any regulation, order, or policy of a State commission that—

(A) establishes access and interconnection obligation of local exchange carriers;

(B) is consistent with the requirements of this section; and

(C) does not substantially prevent implementation of the requirements of this section and the purposes of this part.

(e) Numbering administration

(1) Commission authority and jurisdiction

The Commission shall create or designate one or more impartial entities to administer telecommunications numbering and to make such numbers available on an equitable basis. The Commission shall have exclusive jurisdiction over those portions of the North American Numbering Plan that pertain to the United States. Nothing in this paragraph shall preclude the Commission from delegating to State commissions or other entities all or any portion of such jurisdiction.

(2) Costs

The cost of establishing telecommunications numbering administration arrangements and number portability shall be borne by all telecommunications carriers on a competitively neutral basis as determined by the Commission.

(f) Exemptions, suspensions, and modifications

(1) Exemption for certain rural telephone companies

(A) Exemption

Subsection (c) of this section shall not apply to a rural telephone company until (i) such company has received a bona fide request for interconnection, services, or network elements, and (ii) the State commission determines (under subparagraph (B)) that such request is not unduly economically burdensome, is technically feasible, and is consistent with section 254 of this title (other than subsections (b)(7) and (c)(1)(D) thereof).

(B) State termination of exemption and implementation schedule

The party making a bona fide request of a rural telephone company for interconnection, services, or network elements shall submit a notice of its request to the State commission. The State commission shall conduct an inquiry for the purpose of determining whether to terminate the exemption under subparagraph (A). Within 120 days after the State commission receives notice of the request, the State commission shall terminate the exemption if the request is not unduly economically burdensome, is technically feasible, and is consistent with section 254 of this title (other than subsections (b)(7) and (c)(1)(D) thereof). Upon termination of the exemption, a State commission shall establish an implementation schedule for compliance with the request that is consistent in time and manner with Commission regulations.

(C) Limitation on exemption

The exemption provided by this paragraph shall not apply with respect to a request under subsection (c) of this section, from a cable operator providing video programming, and seeking to provide any telecommunications service, in the area in which the rural telephone company provides video programming. The limitation contained in this subparagraph shall not apply to a rural telephone company that is providing video programming on February 8, 1996.

(2) Suspensions and modifications for rural carriers

A local exchange carrier with fewer than 2 percent of the Nation's subscriber lines installed in the aggregate nationwide may petition a State commission for a suspension or modification of the application of a requirement or requirements of subsection (b) or (c) of this section to telephone exchange service facilities specified in such petition. The State commission shall grant such petition to the extent that, and for such duration as, the State commission determines that such suspension or modification—

(A) is necessary—

(i) to avoid a significant adverse economic impact on users of telecommunications services generally;

(ii) to avoid imposing a requirement that is unduly economically burdensome; or

(iii) to avoid imposing a requirement that is technically infeasible; and

(B) is consistent with the public interest, convenience, and necessity.

The State commission shall act upon any petition filed under this paragraph within 180 days after receiving such petition. Pending such action, the State commission may suspend enforcement of the requirement or requirements to which the petition applies with respect to the petitioning carrier or carriers.

(g) Continued enforcement of exchange access and interconnection requirements

On and after February 8, 1996, each local exchange carrier, to the extent that it provides wireline services, shall provide exchange access, information access, and exchange services for such access to interexchange carriers and information service providers in accordance with the same equal access and nondiscriminatory interconnection restrictions and obligations (including receipt of compensation) that apply to such carrier on the date immediately preceding February 8, 1996 under any court order, consent decree, or regulation, order, or policy of the Commission, until such restrictions and obligations are explicitly superseded by regulations prescribed by the Commission after February 8, 1996. During the period beginning on February 8, 1996 and until such restrictions and obligations are so superseded, such restrictions and obligations shall be enforceable in the same manner as regulations of the Commission.

(h) Definition of incumbent local exchange carrier

(1) Definition

For purposes of this section, the term "incumbent local exchange carrier" means, with respect to an area, the local exchange carrier that—

(A) on February 8, 1996, provided telephone exchange service in such area; and

(B) (i) on February 8, 1996, was deemed to be a member of the exchange carrier association pursuant to section 69.601(b) of the Commission's regulations (47 C.F.R. 69.601(b)); or

(ii) is a person or entity that, on or after February 8, 1996, became a successor or assign of a member described in clause (i).

(2) Treatment of comparable carriers as incumbents

The Commission may, by rule, provide for the treatment of a local exchange carrier (or class or category thereof) as an incumbent local exchange carrier for purposes of this section if—

(A) such carrier occupies a position in the market for telephone exchange service within an area that is comparable to the position occupied by a carrier described in paragraph (1);

(B) such carrier has substantially replaced an incumbent local exchange carrier described in paragraph (1); and

(C) such treatment is consistent with the public interest, convenience, and necessity and the purposes of this section.

(i) Savings provision

Nothing in this section shall be construed to limit or otherwise affect the Commission's authority under section 201 of this title.

§ 252. Procedures for negotiations, arbitration, and approval of agreements

(a) Agreements arrived at through negotiation

(1) Voluntary negotiations

Upon receiving a request for interconnection, services, or network elements pursuant to section 251, an incumbent local exchange carrier may negotiate and enter into a binding agreement with the requesting telecommunications carrier or carriers without regard to the standards set forth in subsections (b) and (c) of section 251 of this title. The agreement shall include a detailed schedule of itemized charges for interconnection and each service or network element included in the agreement. The agreement, including any interconnection agreement negotiated before February 8, 1996, shall be submitted to the State commission under subsection (e) of this section.

(2) Mediation

Any party negotiating an agreement under this section may, at any point in the negotiation, ask a State commission to participate in the negotiation and to mediate any differences arising in the course of the negotiation.

(b) Agreements arrived at through compulsory arbitration

(1) Arbitration

During the period from the 135th to the 160th day (inclusive) after the date on which an incumbent local exchange carrier receives a request for negotiation under this section, the carrier or any other party to the negotiation may petition a State commission to arbitrate any open issues.

(2) Duty of petitioner

(A) A party that petitions a State commission under paragraph (1) shall, at the same time as it submits

the petition, provide the State commission all relevant documentation concerning—

(i) the unresolved issues;

(ii) the position of each of the parties with respect to those issues; and

(iii) any other issue discussed and resolved by the parties.

(B) A party petitioning a State commission under paragraph (1) shall provide a copy of the petition and any documentation to the other party or parties not later than the day on which the State commission receives the petition.

(3) Opportunity to respond

A non-petitioning party to a negotiation under this section may respond to the other party's petition and provide such additional information as it wishes within 25 days after the State commission receives the petition.

(4) Action by State commission

(A) The State commission shall limit its consideration of any petition under paragraph (1) (and any response thereto) to the issues set forth in the petition and in the response, if any, filed under paragraph (3).

(B) The State commission may require the petitioning party and the responding party to provide such information as may be necessary for the State commission to reach a decision on the unresolved issues. If any party refuses or fails unreasonably to respond on a timely basis to any reasonable request from the State commission, then the State commission may proceed on the basis of the best information available to it from whatever source derived.

(C) The State commission shall resolve each issue set forth in the petition and the response, if any, by imposing appropriate conditions as required to implement

subsection (c) of this section upon the parties to the agreement, and shall conclude the resolution of any unresolved issues not later than 9 months after the date on which the local exchange carrier received the request under this section.

(5) Refusal to negotiate

The refusal of any other party to the negotiation to participate further in the negotiations, to cooperate with the State commission in carrying out its function as an arbitrator, or to continue to negotiate in good faith in the presence, or with the assistance, of the State commission shall be considered a failure to negotiate in good faith.

(c) Standards for arbitration

In resolving by arbitration under subsection (b) of this section any open issues and imposing conditions upon the parties to the agreement, a State commission shall—

(1) ensure that such resolution and conditions meet the requirements of section 251 of this title, including the regulations prescribed by the Commission pursuant to section 251 of this title;

(2) establish any rates for interconnection services, or network elements according to subsection (d) of this section; and

(3) provide a schedule for implementation of the terms and conditions by the parties to the agreement.

(d) Pricing standards

(1) Interconnection and network element charges

Determinations by a State commission of the just and reasonable rate for the interconnection of facilities and equipment for purposes of subsection (c)(2) of section 251 of this title, and the just and reasonable rate for network elements for purposes of subsection (c)(3) of such section—

(A) shall be—

(i) based on the cost (determined without reference to a rate-of-return or other rate-based proceeding) of providing the interconnection of network element (whichever is applicable), and

(ii) nondiscriminatory, and

(B) may include a reasonable profit.

(2) Charges for transport and termination of traffic

(A) In general

For the purposes of compliance by an incumbent local exchange carrier with section 251(b)(5) of this title, a State commission shall not consider the terms and conditions for reciprocal compensation to be just and reasonable unless—

(i) such terms and conditions provide for the mutual and reciprocal recovery by each carrier of costs associated with the transport and termination on each carrier's network facilities of calls that originate on the network facilities of the other carrier; and

(ii) such terms and conditions determine such costs on the basis of a reasonable approximation of the additional costs of terminating such calls.

(B) Rules of construction

This paragraph shall not be construed—

(i) to preclude arrangements that afford the mutual recovery of costs through the offsetting of reciprocal obligations, including arrangements that waive mutual recovery (such as bill-and-keep arrangements); or

(ii) to authorize the Commission or any State commission to engage in any rate regulation proceeding to establish with particularity the additional costs of transporting or terminating calls, or to require carriers to maintain records with respect to the additional costs of such calls.

(3) Wholesale prices for telecommunications services

For the purposes of section 251(c)(4) of this title, a State commission shall determine wholesale rates on the basis of retail rates charged to subscribers for the telecommunications service requested, excluding the portion thereof attributable to any marketing, billing, collection, and other costs that will be avoided by the local exchange carrier.

(e) Approval by State commission

(1) Approval required

Any interconnection agreement adopted by negotiation or arbitration shall be submitted for approval to the State commission. A State commission to which an agreement is submitted shall approve or reject the agreement, with written findings as to any deficiencies.

(2) Grounds for rejection

The State commission may only reject—

(A) an agreement (or any portion thereof) adopted by negotiation under subsection (a) of this section if it finds that—

(i) the agreement (or portion thereof) discriminates against a telecommunications carrier not a party to the agreement; or

(ii) the implementation of such agreement or portion is not consistent with the public interest, convenience, and necessity; or

(B) an agreement (or any portion thereof) adopted by arbitration under subsection (b) of this section if it finds that the agreement does not meet the requirements of section 251 of this title, including the regulations prescribed by the Commission pursuant to section 251 of this title, or the standards set forth in subsection (d) of this section.

(3) Preservation of authority

Notwithstanding paragraph (2), but subject to section 253 of this title nothing in this section shall prohibit a State commission from establishing or enforcing other requirements of State law in its review of an agreement, including requiring compliance with intrastate telecommunications service quality standards or requirements.

(4) Schedule for decision

If the State commission does not act to approve or reject the agreement within 90 days after submission by the parties of an agreement adopted by negotiation under subsection (a) of this section, or within 30 days after submission by the parties of an agreement adopted by arbitration under subsection (b) of this section, the agreement shall be deemed approved. No State court shall have jurisdiction to review the action of a State commission in approving or rejecting an agreement under this section.

(5) Commission to act if State will not act

If a State commission fails to act to carry out its responsibility under this section in any proceeding or other matter under this section, then the Commission shall issue an order preempting the State commission's jurisdiction of that proceeding or matter within 90 days after being notified (or taking notice) of such failure, and shall assume the responsibility of the State commission under this section with respect to the proceeding or matter and act for the State commission.

(6) Review of State commission actions

In a case in which a State fails to act as described in paragraph (5), the proceeding by the Commission under such paragraph and any judicial review of the Commission's actions shall be the exclusive remedies for a State commission's failure to act. In any case in which a State commission makes a determination under this section, any

party aggrieved by such determination may bring an action in an appropriate Federal district court to determine whether the agreement or statement meets the requirements of section 251 of this title and this section.

(f) Statements of generally available terms

(1) In general

A Bell operating company may prepare and file with a State commission a statement of the terms and conditions that such company generally offers within that State to comply with the requirements of section 251 of this title and the regulations thereunder and the standards applicable under this section.

(2) State commission review

A State commission may not approve such statement unless such statement complies with subsection (d) of this section and section 251 of this title and the regulations thereunder. Except as provided in section 253 of this title nothing in this section shall prohibit a State commission from establishing or enforcing other requirements of State law in its review of such statement, including requiring compliance with intrastate telecommiunications service quality standards or requirements.

(3) Schedule for review

The State commission to which a statement is submitted shall, not later than 60 days after the date of such submission—

(A) complete the review of such statement under paragraph (2) (including any reconsideration thereof), unless the submitting carrier agrees to an extension of the period for such review; or

(B) permit such statement to take effect.

(4) Authority to continue review

Paragraph (3) shall not preclude the State commission from continuing to review a statement that has been permitted to take effect under subparagraph (B) of such paragraph or from approving or disapproving such statement under paragraph (2).

(5) Duty to negotiate not affected

The submission or approval of a statement under this subsection shall not relieve a Bell operating company of its duty to negotiate the terms and conditions of an agreement under section 251 of this title.

(g) Consolidation of State proceedings

Where not inconsistent with the requirements of this chapter a State commission may, to the extent practical, consolidate proceedings under sections 214(e), 251(f), and 253, of this title, and this section in order to reduce administrative burdens on telecommunications carriers, other parties to the proceedings, and the State commission in carrying out its responsibilities under this chapter.

(h) Filing required

A State commission shall make a copy of each agreement approved under subsection (e) of this section and each statement approved under subsection (f) of this section available for public inspection and copying within 10 days after the agreement or statement is approved. The State commission may charge a reasonable and nondiscriminatory fee to the parties to the agreement or to the party filing the statement to cover the costs of approving and filing such agreement or statement.

(i) Availability to other telecommunications carriers

A local exchange carrier shall make available any interconnection, service, or network element provided under an

agreement approved under this section to which it is a party to any other requesting telecommunications carrier upon the same terms and conditions as those provided in the agreement.

(j) Definition of incumbent local exchange carrier

For purposes of this section, the term "incumbent local exchange carrier" has the meaning provided in section 251(h) of this title.

§ 253. Removal of barriers to entry

(a) In general

No State or local statute or regulation, or other State or local legal requirement, may prohibit or have the effect of prohibiting the ability of any entity to provide any interstate or intrastate telecommunications service.

(b) State regulatory authority

Nothing in this section shall affect the ability of a State to impose, on a competitively neutral basis and consistent with section 254 of this section, requirements necessary to preserve and advance universal service, protect the public safety and welfare, ensure the continued quality of telecommunications services, and safeguard the rights of consumers.

(c) State and local government authority

Nothing in this section affects the authority of a State or local government to manage the public rights-of-way or to require fair and reasonable compensation from telecommunications providers, on a competitively neutral and nondiscriminatory basis, for use of public rights-of-way on a nondiscriminatory basis, if the compensation required is publicly disclosed by such government.

(d) Preemption

If, after notice and an opportunity for public comment, the Commission determines that a State or local government has permitted or imposed any statute, regulation, or legal requirement that violates subsection (a) or (b) of this section, the Commission shall preempt the enforcement of such statute, regulation, or legal requirement to the extent necessary to correct such violation or inconsistency.

(e) Commercial mobile service providers

Nothing in this section shall affect the application of section 332(c)(3) of this title to commercial mobile service providers.

(f) Rural markets

It shall not be a violation of this section for a State to require a telecommunications carrier that seeks to provide telephone exchange service or exchange access in a service area served by a rural telephone company to meet the requirements in section 214(e)(1) of this title for designation as an eligible telecommunications carrier for that area before being permitted to provide such service. This subsection shall not apply—

(1) to a service area served by a rural telephone company that has obtained an exemption, suspension, or modification of section 251(c)(4) of this title that effectively prevents a competitor from meeting the requirements of section 214(e)(1) of this title; and

(2) to a provider of commercial mobile services.

§ 254. Universal service

(a) Procedures to review universal service requirements

(1) Federal-State Joint Board on universal service

Within one month after February 8, 1996, the Commission shall institute and refer to a Federal-State Joint Board under section 410(c) of this title a proceeding to recommend changes to any of its regulations in order to implement sections 214(e) of this title and this section, including the definition of the services that are supported by Federal universal service support mechanisms and a specific timetable for completion of such recommendations. In addition to the members of the Joint Board required under section 410(c) of the title, one member of such Joint Board shall be a State-appointed utility consumer advocate nominated by a national organization of State utility consumer advocates. The Joint Board shall, after notice and opportunity for public comment, make its recommendations to the Commission 9 months after February 8, 1996.

(2) Commission action

The Commission shall initiate a single proceeding to implement the recommendations from the Joint Board required by paragraph (1) and shall complete such proceeding within 15 months after February 8, 1996. The rules established by such proceeding shall include a definition of the services that are supported by Federal universal service support mechanisms and a specific timetable for implementation. Thereafter, the Commission shall complete any proceeding to implement subsequent recommendations from any Joint Board on universal service within one year after receiving such recommendations.

(b) Universal service principles

The Joint Board and the Commission shall base policies for the preservation and advancement of universal service on the following principles:

(1) Quality and rates

Quality services should be available at just, reasonable, and affordable rates.

(2) Access to advanced services

Access to advanced telecommunications and information services should be provided in all regions of the Nation.

(3) Access in rural and high cost areas

Consumers in all regions of the Nation, including low-income consumers and those in rural, insular, and high cost areas, should have access to telecommunications and information services, including interexchange services and advanced telecommunications and information services, that are reasonably comparable to those services provided in urban areas and that are available at rates that are reasonably comparable to rates charged for similar services in urban areas.

(4) Equitable and nondiscriminatory contribution

All providers of telecommunications services should make an equitable and nondiscriminatory contribution to the preservation and advancement of universal service.

(5) Specific and predictable support mechanisms

There should be specific, predictable and sufficient Federal and State mechanisms to preserve and advance universal service.

(6) Access to advanced telecommunications services for schools, health care, and libraries

Elementary and secondary schools and classrooms, health care providers, and libraries should have access to advanced telecommunications services as described in subsection (h) of this section.

(7) Additional principles

Such other principles as the Joint Board and the Commission determine are necessary and appropriate for the protection of the public interest, convenience, and necessity and are consistent with this chapter.

(c) Definition

(1) In general

Universal service is an evolving level of telecommunications services that the Commission shall establish periodically under this section, taking into account advances in telecommunications and information technologies and services. The Joint Board in recommending, and the Commission in establishing, the definition of the services that are supported by Federal universal service support mechanisms shall consider the extent to which such telecommunications services—

(A) are essential to education, public health, or public safety;

(B) have, through the operation of market choices by customers, been subscribed to by a substantial majority of residential customers;

(C) are being deployed in public telecommunications networks by telecommunications carriers; and

(D) are consistent with the public interest convenience, and necessity.

(2) Alterations and modifications

The Joint Board may, from time to time, recommend to the Commission modifications in the definition of the services that are supported by Federal universal service support mechanisms.

(3) Special services

In addition to the services included in the definition of universal service under paragraph (1), the Commission

may designate additional services for such support mechanisms for schools, libraries, and health care providers for the purposes of subsection (h) of this section.

(d) Telecommunications carrier contribution

Every telecommunications carrier that provides interstate telecommunications services shall contribute, on an equitable and nondiscriminatory basis, to the specific, predictable, and sufficient mechanisms established by the Commission to preserve and advance universal service. The Commission may exempt a carrier or class of carriers from this requirement if the carrier's telecommunications activities are limited to such an extent that the level of such carrier's contribution to the preservation and advancement of universal service would be de minimis. Any other provider of interstate telecommunications may be required to contribute to the preservation and advancement of universal service if the public interest so requires.

(e) Universal service support

After the date on which Commission regulations implementing this section take effect, only an eligible telecommunications carrier designated under section 214(e) of this title shall be eligible to receive specific Federal universal service support. A carrier that receives such support shall use that support only for the provision, maintenance, and upgrading of facilities and services for which the support is intended. Any such support should be explicit and sufficient to achieve the purposes of this section.

(f) State authority

A State may adopt regulations not inconsistent with the Commission's rules to preserve and advance universal service. Every telecommunications carrier that provides intrastate telecommunications services shall contribute, on an equitable and nondiscriminatory basis, in a manner determined by the State to the preservation and advance-

ment of universal service in that State. A State may adopt regulations to provide for additional definitions and standards to preserve and advance universal service within that State only to the extent that such regulations adopt additional specific, predictable, and sufficient mechanisms to support such definitions or standards that do not rely on or burden Federal universal service support mechanisms.

(g) Interexchange and interstate services

Within 6 months after February 8, 1996, the Commission shall adopt rules to require that the rates charged by providers of interexchange telecommunications services to subscribers in rural and high cost areas shall be no higher than the rates charged by each such provider to its subscribers in urban areas. Such rules shall also require that a provider of interstate interexchange telecommunications services shall provide such services to its subscribers in each State at rates no higher than the rates charged to its subscribers in any other State.

(h) Telecommunications services for certain providers

(1) In general

(A) Health care providers for rural areas

A telecommunications carrier shall, upon receiving a bona fide request, provide telecommunications services which are necessary for the provision of health care services in a State, including instruction relating to such services, to any public or nonprofit health care provider that serves persons who reside in rural areas in that State at rates that are reasonably comparable to rates charged for similar services in urban areas in that State. A telecommunications carrier providing service under this paragraph shall be entitled to have an amount equal to the difference, if any, between the rates for services provided

to health care providers for rural areas in a State and the rates for similar services provided to other customers in comparable rural areas in that State treated as a service obligation as a part of its obligation to participate in the mechanisms to preserve and advance universal service.

(B) Educational providers and libraries

All telecomunications carriers serving a geographic area shall, upon a bona fide request for any of its services that are within the definition of universal service under subsection (c)(3) of this section, provide such services to elementary schools, secondary schools, and libraries for educational purposes at rates less than the amounts charged for similar services to other parties. The discount shall be an amount that the Commission, with respect to interstate services, and the States, with respect to intrastate services, determine is appropriate and necessary to ensure affordable access to and use of such services by such entities. A telecommunications carrier providing service under this paragraph shall

(i) have an amount equal to the amount of the discount treated as an offset to its obligation to contribute to the mechanisms to preserve and advance universal service, or

(ii) notwithstanding the provisions of subsection (e) of this section, receive reimbursement utilizing the support mechanisms to preserve and advance universal service.

(2) Advanced services

The Commission shall establish competitively neutral rules—

(A) to enhance, to the extent technically feasible and economically reasonable, access to advanced telecommunications and information services for all public and nonprofit elementary and secondary school classrooms, health care providers, and libraries; and

(B) to define the circumstances under which a telecommunications carrier may be required to connect its network to such public institutional telecommunications users.

(3) Terms and conditions

Telecommunications services and network capacity provided to a public institutional telecommunications user under this subsection may not be sold, resold, or otherwise transferred by such user in consideration for money or any other thing of value.

(4) Eligibility of users

No entity listed in this subsection shall be entitled to preferential rates or treatment as required by this subsection, if such entity operates as a for-profit business, is a school described in paragraph (5)(A) with an endowment of more than $50,000,000, or is a library or library consortium not eligible for assistance from a State library administrative agency under the Library Services and Technology Act [20 U.S.C.A. § 9121 *et seq.*].

(5) Definitions

For purposes of this subsection:

(A) Elementary and secondary schools

The term "elementary and secondary schools" means elementary schools and secondary schools, as defined in paragraphs (14) and (25), respectively, of section 8801 of Title 20.

(B) Health care provider

The term "health care provider" means—

(i) post-secondary educational institutions offering health care instruction, teaching hospitals, and medical schools;

(ii) community health centers or health centers providing health care to migrants;

(iii) local health departments or agencies;

(iv) community mental health centers;

(v) not-for-profit hospitals;

(vi) rural health clinics; and

(vii) consortia of health care providers consisting of one or more entities described in clauses (i) through (vi).

(C) Public institutional telecommunications user

The term "public institutional telecommunications user" means an elementary or secondary school, a library, or a health care provider as those terms are defined in this paragraph.

(i) Consumer protection

The Commission and the States should ensure that universal service is available at rates that are just, reasonable, and affordable.

(j) Lifetime Assistance

Nothing in this section shall affect the collection, distribution, or administration of the Lifeline Assistance Program provided for by the Commission under regulations set forth in section 69.117 of title 47, Code of Federal Regulations, and other related sections of such title.

(k) Subsidy of competitive services prohibited

A telecommunications carrier may not use services that are not competitive to subsidize services that are subject to competition. The Commission, with respect to interstate services, and the States, with respect to intrastate services, shall establish any necessary cost allocation rules, accounting safeguards, and guidelines to ensure that services included in the definition of universal service bear no more than a reasonable share of the joint and common costs of facilities used to provide those services.

* * * *

§ 261. Effect on other requirements

(a) Commission regulations

Nothing in this part shall be construed to prohibit the Commission from enforcing regulations prescribed prior to February 8, 1996, in fulfilling the requirements of this part, to the extent that such regulations are not inconsistent with the provisions of this part.

(b) Existing State regulations

Nothing in this part shall be construed to prohibit any State commission from enforcing regulations prescribed prior to February 8, 1996, or from prescribing regulations after such date of enactment, in fulfilling the requirements of this part, if such regulations are not inconsistent with the provisions of this part.

(c) Additional State requirements

Nothing in this part precludes a State from imposing requirements on a telecommunications carrier for intrastate services that are necessary to further competition in the provision of telephone exchange service or exchange access, as long as the State's requirements are not inconsistent with this part or the Commission's regulations to implement this part.

* * * *

§ 271. Bell operating company entry into interLATA services

(a) General limitation

Neither a Bell operating company, nor any affiliate of a Bell operating company, may provide interLATA services except as provided in this section.

(b) InterLATA services to which this section applies

(1) In-region services

Bell operating company, or any affiliate of that Bell operating company, may provide interLATA services originating in any of its in-region States (as defined in subsection (i) of this section) if the Commission approves the application of such company for such State under subsection (d)(3) of this section.

(2) Out-of-region services

A Bell operating company, or any affiliate of that Bell operating company, may provide interLATA services originating outside its in-region States after February 8, 1996, subject to subsection (j) of this section.

(3) Incidental interLATA services

A Bell operating company, or any affiliate of a Bell operating company, may provide incidental interLATA services (as defined in subsection (g) of this section) originating in any State after February 8, 1996.

(4) Termination

Nothing in this section prohibits a Bell operating company or any of its affiliates from providing termi-

nation for interLATA services, subject to subsection (j) of this section.

(c) Requirements for providing certain in-region interLATA services

(1) Agreement or statement

A Bell operating company meets the requirements of this paragraph if it meets the requirements of subparagraph (A) or subparagraph (B) of this paragraph for each State for which the authorization is sought.

(A) Presence of a facilities-based competitor

A Bell operating company meets the requirements of this subparagraph if it has entered into one or more binding agreements that have been approved under section 252 of this title specifying the terms and conditions under which the Bell operating company is providing access and interconnection to its network facilities for the network facilities of one or more unaffiliated competing providers of telephone exchange service (as defined in section 153(47)(A) of this title, but excluding exchange access) to residential and business subscribers. For the purpose of this subparagraph, such telephone exchange service may be offered by such competing providers either exclusively over their own telephone exchange service facilities or predominantly over their own telephone exchange service facilities in combination with the resale of the telecommunications services of another carrier. For the purpose of this subparagraph, services provided pursuant to subpart K of part 22 of the Commission's regulations (47 C.F.R. 22.901 *et seq.*) shall not be considered to be telephone exchange services.

(B) Failure to request access

A Bell operating company meets the requirements of this subparagraph if, after 10 months after February 8, 1996, no such provider has requested the access and interconnection described in subparagraph (A) before the date which is 3 months before the date the company makes its application under subsection (d)(1) of this section, and a statement of the terms and conditions that the company generally offers to provide such access and interconnection has been approved or permitted to take effect by the State commission under section 252(f) of this title. For purposes of this subparagraph, a Bell operating company shall be considered not to have received any request for access and interconnection if the State commission of such State certifies that the only provider or providers making such a request have (i) failed to negotiate in good faith as required by section 252 of this title, or (ii) violated the terms of an agreement approved under section 252 of this title by the provider's failure to comply, within a reasonable period of time, with the implementation schedule contained in such agreement.

(2) Specific interconnection requirements

(A) Agreement required

A Bell operating company meets the requirements of this paragraph if, within the State for which the authorization is sought—

(i)(I) such company is providing access and interconnection pursuant to one or more agreements described in paragraph (1)(A), or

(II) such company is generally offering access and interconnection pursuant to a

statement described in paragraph (1)(B), and

(ii) such access and interconnection meets the requirements of subparagraph (B) of this paragraph.

(B) Competitive checklist

Access or interconnection provided or generally offered by a Bell operating company to other telecommunications carriers meets the requirements of this subparagraph if such access and interconnection includes each of the following:

(i) Interconnection in accordance with the requirements of sections 251(c)(2) and 252(d)(1) of this title.

(ii) Nondiscriminatory access to network elements in accordance with the requirements of sections 251(c)(3) and 252(d)(1) of this title.

(iii) Nondiscriminatory access to the poles, ducts, conduits, and rights-of-way owned or controlled by the Bell operating company at just and reasonable rates in accordance with the requirements of section 224 of this title.

(iv) Local loop transmission from the central office to the customer's premises, unbundled from local switching or other services.

(v) Local transport from the trunk side of a wireline local exchange carrier switch unbundled from switching or other services.

(vi) Local switching unbundled from transport, local loop transmission, or other services.

(vii) Nondiscriminatory access to—

(I) 911 and E911 services;

(II) directory assistance services to allow the other carrier's customers to obtain telephone numbers; and

(III) operator call completion services.

(viii) White pages directory listings for customers of the other carrier's telephone exchange service.

(ix) Until the date by which telecommunications numbering administration guidelines, plan, or rules are established, nondiscriminatory access to telephone numbers for assignment to the other carrier's telephone exchange service customers. After that date, compliance with such guidelines, plan, or rules.

(x) Nondiscriminatory access to databases and associated signaling necessary for call routing and completion.

(xi) Until the date by which the Commission issues regulations pursuant to section 251 of this title to require number portability, interim telecommunications number portability through remote call forwarding, direct inward dialing trunks, or other comparable arrangements, with as little impairment of functioning, quality, reliability, and convenience as possible. After that date, full compliance with such regulations.

(xii) Nondiscriminatory access to such services or information as are necessary to allow the requesting carrier to implement

local dialing parity in accordance with the requirements of section 251(b)(3) of this title.

(xiii) Reciprocal compensation arrangements in accordance with the requirements of section 252(d)(2) of this title.

(xiv) Telecommunications services are available for resale in accordance with the requirements of sections 251(c)(4) and 252(d)(3) of this title.

(d) Administrative provisions

(1) Application to commission

On and after February 8, 1996, a Bell operating company or its affiliate may apply to the Commission for authorization to provide interLATA services originating in any in-region State. The application shall identify each State for which the authorization is sought.

(2) Consultation

(A) Consultation with the Attorney General

The Commission shall notify the Attorney General promptly of any application under paragraph (1). Before making any determination under this subsection, the Commission shall consult with the Attorney General, and if the Attorney General submits any comments in writing, such comments shall be included in the record of the Commission's decision. In consulting with and submitting comments to the Commission under this paragraph, the Attorney General shall provide to the Commission an evaluation of the application using any standard the Attorney General considers appropriate. The Commission shall give substantial weight to the Attor-

ney General's evaluation, but such evaluation shall not have any preclusive effect on any Commission decision under paragraph (3).

(B) Consultation with State commissions

Before making any determination under this subsection, the Commission shall consult with the State commission of any State that is the subject of the application in order to verify the compliance of the Bell operating company with the requirements of subsection (c) of this section.

(3) Determination

Not later than 90 days after receiving an application under paragraph (1), the Commission shall issue a written determination approving or denying the authorization requested in the application for each State. The Commission shall not approve the authorization requested in an application submitted under paragraph (1) unless it finds that—

(A) the petitioning Bell operating company has met the requirements of subsection (c)(1) of this section and—

(i) with respect to access and interconnection provided pursuant to subsection (c)(1)(A) of this section, has fully implemented the competitive checklist in subsection (c)(2)(B) of this section; or

(ii) with respect to access and interconnection generally offered pursuant to a statement under subsection (c)(1)(B) of this section, such statement offers all of the items included in the competitive checklist in subsection (c)(2)(B) of this section;

(B) the requested authorization will be carried out in accordance with the requirements of section 272 of this title; and

(C) the requested authorization is consistent with the public interest, convenience, and necessity.

The Commission shall state the basis for its approval or denial of the application.

(4) Limitation on Commission

The Commission may not, by rule or otherwise, limit or extend the terms used in the competitive checklist set forth in subsection (c)(2)(B) of this section.

(5) Publication

Not later than 10 days after issuing a determination under paragraph (3), the Commission shall publish in the Federal Register a brief description of the determination.

(6) Enforcement of conditions

(A) Commission authority

If at any time after the approval of an application under paragraph (3), the Commission determines that a Bell operating company has ceased to meet any of the conditions required for such approval, the Commission may, after notice and opportunity for a hearing—

(i) issue an order to such company to correct the deficiency;

(ii) impose a penalty on such company pursuant to title V; or

(iii) suspend or revoke such approval.

(B) Receipt and review of complaints

The Commission shall establish procedures for the review of complaints concerning failures by Bell operating companies to meet conditions required for approval under paragraph (3). Unless the parties otherwise agree, the Commission shall act on such complaint within 90 days.

(e) Limitations

(1) Joint marketing of local and long distance services

Until a Bell operating company is authorized pursuant to subsection (d) of this section to provide interLATA services in an in-region State, or until 36 months have passed since February 8, 1996, whichever is earlier, a telecommunications carrier that serves greater than 5 percent of the Nation's presubscribed access lines may not jointly market in such State telephone exchange service obtained from such company pursuant to section 251(c)(4) of this title with interLATA services offered by that telecommunications carrier.

(2) IntraLATA toll dialing parity

(A) Provision required

A Bell operating company granted authority to provide interLATA services under subsection (d) of this section shall provide intraLATA toll dialing parity throughout that State coincident with its exercise of that authority.

(B) Limitation

Except for single-LATA States and States that have issued an order by December 19, 1995, requiring a Bell operating company to implement intraLATA toll dialing parity, a State may not require a Bell operating company to implement intraLATA toll dialing parity in that State

before a Bell operating company has been granted authority under this section to provide interLATA services originating in that State or before 3 years after February 8, 1996, whichever is earlier. Nothing in this subparagraph precludes a State from issuing an order requiring intraLATA toll dialing parity in that State prior to either such date so long as such order does not take effect until after the earlier of either such dates.

(f) Exception for previously authorized activities

Neither subsection (a) of this section nor section 273 of this title shall prohibit a Bell operating company or affiliate from engaging, at any time after February 8, 1996, in any activity to the extent authorized by, and subject to the terms and conditions contained in, an order entered by the United States District Court for the District of Columbia pursuant to section VII or VIII(C) of the AT&T Consent Decree if such order was entered on or before February 8, 1996, to the extent such order is not reversed or vacated on appeal. Nothing in this subsection shall be construed to limit, or to impose terms or conditions on, an activity in which a Bell operating company is otherwise authorized to engage under any other provision of this section.

(g) Definition of incidental interLATA services

For purposes of this section, the term "incidental interLATA services" means the interLATA provision by a Bell operating company or its affiliate—

(1)(A) of audio programming, video programming, or other programming services to subscribers to such services of such company or affiliate;

(B) of the capability for interaction by such subscribers to select or respond to such audio program-

ming, video programming, or other programming services;

(C) to distributors of audio programming or video programming that such company or affiliate owns or controls, or is licensed by the copyright owner of such programming (or by an assignee of such owner) to distribute; or

(D) of alarm monitoring services;

(2) of two-way interactive video services or Internet services over dedicated facilities to or for elementary and secondary schools as defined in section 254(h)(5) of this title;

(3) of commercial mobile services in accordance with section 332(c) of this title and with the regulations prescribed by the Commission pursuant to paragraph (8) of such section;

(4) of a service that permits a customer that is located in one LATA to retrieve stored information from, or file information for storage in, information storage facilities of such company that are located in another LATA;

(5) of signaling information used in connection with the provision of telephone exchange services or exchange access by a local exchange carrier; or

(6) of network control signaling information to, and receipt of such signaling information from, common carriers offering interLATA services at any location within the area in which such Bell operating company provides telephone exchange services or exchange access.

(h) Limitations

The provisions of subsection (g) of this section are intended to be narrowly constued. The interLATA services provided under subparagraph (A), (B), or (C) of sub-

section (g)(1) of this section are limited to those inter-LATA transmissions incidental to the provision by a Bell operating company or its affiliate of video, audio, and other programming services that the company or its affiliate is engaged in providing to the public. The Commission shall ensure that the provision of services authorized under subsection (g) of this section by a Bell operating company or its affiliate will not adversely affect telephone exchange service ratepayers or competition in any telecommunications market.

(i) Additional definitions

As used in this section—

(1) In-region State

The term "in-region State" means a State in which a Bell operating company or any of its affiliates was authorized to provide wireline telephone exchange service pursuant to the reorganization plan approved under the AT&T Consent Decree, as in effect on the day before February 8, 1996.

(2) Audio programming services

The term "audio programming services" means programming provided by, or generally considered to be comparable to programming provided by, a radio broadcast station.

(3) Video programming services; other programming services

The terms "video programming service" and "other programming services" have the same meanings as such terms have under section 522 of this title.

(j) Certain service applications treated as in-region service applications

For purposes of this section, a Bell operating company application to provide 800 service, private line service, or their equivalents that—

(1) terminate in an in-region State of that Bell operating company, and

(2) allow the called party to determine the interLATA carrier,

shall be considered an in-region service subject to the requirements of subsection (b)(1) of this section.

* * * *

§ 276. Provision of payphone service

(a) Nondiscrimination safeguards

After the effective date of the rules prescribed pursuant to subsection (b) of this section, any Bell operating company that provides payphone service—

(1) shall not subsidize its payphone service directly or indirectly from its telephone exchange service operations or its exchange access operations; and

(2) shall not prefer or discriminate in favor of its payphone service.

(b) Regulations

(1) Contents of regulations

In order to promote competition among payphone service providers and promote the widespread deployment of payphone services to the benefit of the general public, within 9 months after February 8, 1996, the Commission shall take all actions necessary (including any reconsideration) to prescribe regulations that—

(A) establish a per call compensation plan to ensure that all payphone service providers are fairly compensated for each and every completed intrastate and interstate call using their payphone, except that emergency calls and telecommunications relay service calls for hearing disabled individuals shall not be subject to such compensation;

(B) discontinue the intrastate and interstate carrier access charge payphone service elements and payments in effect on such date of enactment, and all intrastate and interstate payphone subsidies from basic exchange and exchange ac-

cess revenues, in favor of a compensation plan as specified in subparagraph (A);

(C) prescribe a set of nonstructural safeguards for Bell operating company payphone service to implement the provisions of paragraphs (1) and (2) of subsection (a) of this section, which safeguards shall, at a minimum, include the nonstructural safeguards equal to those adopted in the Computer Inquiry-III (CC Docket No. 90-623) proceeding;

(D) provide for Bell operating company payphone service providers to have the same right that independent payphone providers have to negotiate with the location provider on the location provider's selecting and contracting with, and, subject to the terms of any agreement with the location provider, to select and contract with, the carriers that carry interLATA calls from their payphones, unless the Commission determines in the rulemaking pursuant to this section that it is not in the public interest; and

(E) provide for all payphone service providers to have the right to negotiate with the location provider on the location provider's selecting and contracting with, and, subject to the terms of any agreement with the location provider, to select and contract with, the carriers that carry intraLATA calls from their payphones.

(2) Public interest telephones

In the rulemaking conducted pursuant to paragraph (1), the Commission shall determine whether public interest payphones, which are provided in the interest of public health, safety, and welfare, in locations where there would otherwise not be a payphone,

should be maintained, and if so, ensure that such public interest payphones are supported fairly and equitably.

(3) Existing contracts

Nothing in this section shall affect any existing contracts between location providers and payphone service providers or interLATA or intraLATA carriers that are in force and effect as of February 8, 1996.

(c) State preemption

To the extent that any State requirements are inconsistent with the Commission's regulations, the Commission's regulations on such matters shall preempt such State requirements.

(d) Definition

As used in this section, the term "payphone service" means the provision of public or semi-public pay telephones, the provision of inmate telephone service in correctional institutions, and any ancillary services.

§ 543. Regulation of rates

* * * *

(b) Establishment of basic service tier rate regulations

(1) Commission obligation to subscribers

The Commission shall, by regulation, ensure that the rates for the basic service tier are reasonable. Such regulations shall be designed to achieve the goal of protecting subscribers of any cable system that is not subject to effective competition from rates for the basic service tier that exceed the rates that would be charged for the basic service tier if such cable system were subject to effective competition.

(2) Commission regulations

Within 180 days after October 5, 1992, the Commission shall prescribe, and periodically thereafter revise, regulations to carry out its obligations under paragraph (1). In prescribing such regulations, the Commission—

(A) shall seek to reduce the administrative burdens on subscribers, cable operators, franchising authorities, and the Commission;

(B) may adopt formulas or other mechanisms and procedures in complying with the requirements of subparagraph (A); and

(C) shall take into account the following factors:

(i) the rates for cable systems, if any, that are subject to effective competition;

(ii) the direct costs (if any) of obtaining, transmitting, and otherwise providing signals carried on the basic service tier, including signals and services carried on the

basic service tier pursuant to paragraph (7)(B), and changes in such costs;

(iii) only such portion of the joint and common costs (if any) of obtaining, transmitting, and otherwise providing such signals as is determined, in accordance with regulations prescribed by the Commission, to be reasonably and properly allocable to the basic service tier, and changes in such costs;

(iv) the revenues (if any) received by a cable operator from advertising from programming that is carried as part of the basic service tier or from other consideration obtained in connection with the basic service tier;

(v) the reasonably and properly allocable portion of any amount assessed as a franchise fee, tax, or charge of any kind imposed by any State or local authority on the transactions between cable operators and cable subscribers or any other fee, tax, or assessment of general applicability imposed by a governmental entity applied against cable operators or cable subscribers;

(vi) any amount required, in accordance with paragraph (4), to satisfy franchise requirements to support public, educational, or governmental channels or the use of such channels or any other services required under the franchise; and

(vii) a reasonable profit, as defined by the Commission consistent with the Commission's obligations to subscribers under paragraph (1).

(3) Equipment

The regulations prescribed by the Commission under this subsection shall include standards to establish, on the basis of actual cost, the price or rate for—

(A) installation and lease of the equipment used by subscribers to receive the basic service tier, including a converter box and a remote control unit and, if requested by the subscriber, such addressable converter box or other equipment as is required to access programming described in paragraph (8); and

(B) installation and monthly use of connections for additional television receivers.

(4) Costs of franchise requirements

The regulations prescribed by the Commission under this subsection shall include standards to identify costs attributable to satisfying franchise requirements to support public, educational, and governmental channels or the use of such channels or any other services required under the franchise.

(5) Implementation and enforcement

The regulations prescribed by the Commission under this subsection shall include additional standards, guidelines, and procedures concerning the implementation and enforcement of such regulations, which shall include—

(A) procedures by which cable operators may implement and franchising authorities may enforce the regulations prescribed by the Commission under this subsection;

(B) procedures for the expeditious resolution of disputes between cable operators and franchising authorities concerning the administration of such regulations;

(C) standards and procedures to prevent unreasonable charges for changes in the subscriber's selection of services or equipment subject to regulation under this section, which standards shall require that charges for changing the service tier selected shall be based on the cost of such change and shall not exceed nominal amounts when the system's configuration permits changes in service tier selection to be effected solely by coded entry on a computer terminal or by other similarly simple method; and

(D) standards and procedures to assure that subscribers receive notice of the availability of the basic service tier required under this section.

(6) Notice

The procedures prescribed by the Commission pursuant to paragraph (5)(A) shall require a cable operator to provide 30 days' advance notice to a franchising authority of any increase proposed in the price to be charged for the basic service tier.

(7) Components of basic tier subject to rate regulation

(A) Minimum contents

Each cable operator of a cable system shall provide its subscribers a separately available basic service tier to which subscription is required for access to any other tier of service. Such basic service tier shall, at a minimum, consist of the following:

(i) All signals carried in fulfillment of the requirements of sections 534 and 535 of this title.

(ii) Any public, educational, and governmental access programming required by

the franchise of the cable system to be provided to subscribers.

(iii) Any signal of any television broadcast station that is provided by the cable operator to any subscriber, except a signal which is secondarily transmitted by a satellite carrier beyond the local service area of such station.

(B) Permitted additions to basic tier

A cable operator may add additional video programming signals or services to the basic service tier. Any such additional signals or services provided on the basic service tier shall be provided by subscribers at rates determined under the regulations prescribed by the Commission under this subsection.

(8) Buy-through of other tiers prohibited

(A) Prohibition

A cable operator may not require the subscription to any tier other than the basic service tier required by paragraph (7) as a condition of access to video programming offered on a per channel or per program basis. A cable operator may not discriminate between subscribers to the basic service tier and other subscribers with regard to the rates charged for video programming offered on a per channel or per program basis.

(B) Exception; limitation

The prohibition in subparagraph (A) shall not apply to a cable system that, by reason of the lack of addressable converter boxes or other technological limitations, does not permit the operator to offer programming on a per channel

or per program basis in the same manner required by subparagraph (A). This subparagraph shall not be available to any cable operator after—

(i) the technology utilized by the cable system is modified or improved in a way that eliminates such technological limitation; or

(ii) 10 years after October 5, 1992, subject to subparagraph (C).

(C) Waiver

If, in any proceeding initiated at the request of any cable operator, the Commission determines that compliance with the requirements of subparagraph (A) would require the cable operator to increase its rates, the Commission may, to the extent consistent with the public interest, grant such cable operator a waiver from such requirements for such specified period as the Commission determines reasonable and appropriate.

(c) Regulation of unreasonable rates

(1) Commission regulations

Within 180 days after October 5, 1992, the Commission shall, by regulation, establish the following:

(A) criteria prescribed in accordance with paragraph (2) for identifying, in individual cases, rates for cable programming services that are unreasonable;

(B) fair and expeditious procedures for the receipt, consideration, and resolution of complaints from any franchising authority (in accordance with paragraph (3)) alleging that a rate for

cable programming services charged by a cable operator violates the criteria prescribed under subparagraph (A), which procedures shall include the minimum showing that shall be required for a complaint to obtain Commission consideration and resolution of whether the rate in question is unreasonable; and

(C) the procedures to be used to reduce rates for cable programming services that are determined by the Commission to be unreasonable and to refund such portion of the rates or charges that were paid by subscribers after the filing of the first complaint filed with the franchising authority under paragraph (3) and that are determined to be unreasonable.

(2) Factors to be considered

In establishing the criteria for determining in individual cases whether rates for cable programming services are unreasonable under paragraph (1)(A), the Commission shall consider, among other factors—

(A) the rates for similarly situated cable systems offering comparable cable programming services, taking into account similarities in facilities, regulatory and governmental costs, the number of subscribers, and other relevant factors;

(B) the rates for cable systems, if any, that are subject to effective competition;

(C) the history of the rates for cable programming services of the system, including the relationship of such rates to changes in general consumer prices;

(D) the rates, as a whole, for all the cable programming, cable equipment, and cable services provided by the system, other than program-

ming provided on a per channel or per program basis;

(E) capital and operating costs of the cable system, including the quality and costs of the customer service provided by the cable system; and

(F) the revenues (if any) received by a cable operator from advertising from programming that is carried as part of the service for which a rate is being established, and changes in such revenues, or from other consideration obtained in connection with the cable programming services concerned.

(3) Review of rate changes

The Commission shall review any complaint submitted by a franchising authority after February 8, 1996, concerning an increase in rates for cable programming services and issue a final order within 90 days after it receives such a complaint, unless the parties agree to extend the period for such review. A franchising authority may not file a complaint under this paragraph unless, within 90 days after such increase becomes effective it receives subscriber complaints.

(4) Sunset of upper tier rate regulation

This subsection shall not apply to cable programming services provided after March 31, 1999.

QUESTIONS PRESENTED

1. Whether the FCC violated the Communications Act of 1934, as amended by the Telecommunications Act of 1996 ("Act"), by requiring incumbent telephone companies to sell network services and capabilities as unbundled network elements under section 251(c)(3), even where an incumbent's competitors have no need to obtain those services and capabilities from the incumbent because equivalents are readily available from sources other than the incumbent.

2. Whether the FCC violated the Act by concluding that the term "network elements" encompasses not only physical facilities used in the delivery of calls, but virtually every productive asset of an incumbent telephone company's business, including human operators, software used for business functions such as billing, and services.

3. Whether the FCC violated the Act, and in particular its express distinction between resale and unbundled network elements, by requiring incumbent telephone companies to sell as unbundled network elements under section 251(c)(3) finished retail services such as caller I.D. and call forwarding, when the same services must be made available for resale under section 251(c)(4).

4. Whether the FCC violated the Act by requiring incumbent telephone companies to sell to competitors who possess no facilities of their own access to *all* the network elements associated with a particular retail service, not at the statute's discounted rate for resale, but at the cost-based rate reserved for competitors who purchase access to individual network elements to combine with their own facilities.

5. Whether the FCC violated the Act's requirement that incumbents provide their competitors with unbundled

network elements "in a manner that allows *requesting carriers* to combine such elements," 47 U.S.C. § 251 (c)(3) (emphasis added), by mandating that incumbents do the work of combining elements purchased by requesting carriers.

6. Whether the FCC violated the Act by permitting new entrants to "pick and choose" individual terms from an incumbent's past and future interconnection agreements without accepting all of the contractual tradeoffs that originally accompanied those terms.

7. Whether the FCC violated the Act by asserting jurisdiction to regulate the rates and certain other terms of local interconnection arrangements despite the fact that Congress gave states authority to "establish" and "determin[e]" the rates for local interconnection arrangements (47 U.S.C. §§ 252(c), (d)) and provided that "nothing in this Act shall be construed . . . to give the [FCC] jurisdiction" with respect to intrastate matters (*id.* § 152(b)).

RULE 29.6 STATEMENT

Pursuant to Supreme Court Rule 29.6, U S WEST, Inc. advises the Court that it has no parent companies. U S WEST, Inc. has the following non-wholly owned subsidiaries having outstanding securities in the hands of the public: Financial Security Holding, Ltd. and TeleWest PLC.

SUMMARY OF ARGUMENT 23

ARGUMENT 27

I. THE FCC'S UNBUNDLING RULES COLLAPSE THE CAREFUL STRUCTURE OF THE ACT AND DEFEAT THE GOALS CONGRESS SOUGHT TO ACHIEVE 27

A. The FCC Unlawfully Nullified the Act's Standards for What Network Elements Must Be Unbundled 29

B. The FCC Unlawfully Expanded the Act's Definition of "Network Element" 36

C. The FCC's Expansion of Incumbents' Unbundling Obligations Undermines the Structure of the Act by Permitting Competitors To Rely Exclusively on Unbundled Elements To Provide Service and Thereby Evade the Statutory Restrictions on Resale 41

D. The Combination Rules Invalidated by the Court of Appeals Were Contrary to the Terms of the Act and Were the Final Step in Eliminating Any Distinction between Unbundled Network Elements and Resale 47

II. THE FCC'S "PICK-AND-CHOOSE" RULE FURTHER ERODES THE ACT'S RELIANCE ON BASIC MARKET PRINCIPLES IN FAVOR OF REGULATORY FIAT 53

OPENING BRIEF OF RESPONDENT/CROSS-PETITIONER U S WEST, INC.

STATUTORY PROVISIONS INVOLVED

Relevant portions of the Communications Act of 1934, as amended by the Telecommunications Act of 1996, appear at Pet. App. 93a-130a [1] and in the appendix to this brief.

---

[1] "Pet. App." refers to the appendix to the petition for a writ of certiorari in *AT&T Corp. v. Iowa Utils. Bd., cert. granted*, No. 97-826 (Jan. 26, 1998), which has been consolidated with this case.

STATEMENT OF THE CASE

Providing a functioning local telephone service to consumers requires the coordinated use of a variety of facilities, equipment, and personnel. Some aspects of the business—for example, taking orders and sending bills—use readily available inputs such as computers and programmers, and thus are within the easy grasp of anyone with sound business skills and the necessary capital. The business also requires a network of specialized equipment, such as the switches that route calls and the wires that actually transmit the calls from one point to another.

Until the 1990s, it was widely assumed that each local market would support only one such network and that it would be uneconomical to build alternative facilities. In adopting the Telecommunications Act of 1996, Pub. L. No. 104-104, 110 Stat. 56 ("Act" or "1996 Act"), Congress reversed that assumption: It determined that deploying alternative networks to provide local services was no longer infeasible and that facilities-based competition therefore should be permitted and encouraged.

Underlying Congress' decision was the belief that potential new providers are now, or soon will be, able to build or acquire most of the components needed to provide local telephone service. To the extent that some facilities cannot be reasonably duplicated, Congress required incumbent carriers to share them with new entrants until the newcomers are able to obtain such equipment in the marketplace. In this way, Congress aimed to open the market for local telephone service to full and vigorous competition more quickly than if each new entrant had to complete its own network before offering service.

This case requires the Court to consider whether the FCC in its First Report and Order[2] fundamentally distorted Congress' scheme by rejecting the view that the

deployment of alternative facilities-based networks by competing local telephone service providers is now feasible and desirable. Specifically, the FCC required established carriers to share with their competitors not only facilities that remain difficult to duplicate, but *all* of their facilities, up to and including the entire network, and even new facilities that the carrier constructs in the future. The FCC also required the sharing of business functions that are not physical parts of the telephone network at all. And the FCC required incumbent carriers to perform the work of assembling their facilities into finished services on behalf of new competitors. These requirements collapse two distinct provisions of the 1996 Act, create opportunities for regulatory arbitrage that Congress plainly did not intend, and transform a regime designed to share facilities that are economically necessary for competition into one that grants virtually unlimited access to an incumbent carrier's entire business. In these and other respects, the FCC's Order is inconsistent with the 1996 Act.

A. Pre-1996 Regulatory Background

Before the 1990s, local telephone service was widely understood to be a natural monopoly. As explained in a leading treatise, "[t]he high cost of fixed plant, the steadily declining average cost of service, and the need for all customers to interconnect with one another made it seem both sensible and inevitable to have a single monopoly provider." Michael K. Kellogg, John Thorne, and Peter W. Huber, *Federal Telecommunications Law* 1 (1992). Regulation of the industry was "premised on the belief that service could be provided at the lowest cost to the maximum number of consumers through a regulated monopoly network." Pet. App. 131a (Order ¶ 1). Most states therefore granted an exclusive franchise in each local telephone service area. *See id.*; H.R. Rep. No. 104-204, at 49-50 (1995). The exclusive franchisees were known as "local exchange carriers" or "LECs."

Because there were no alternatives to the network facilities operated by LECs, regulatory authorities treated the facilities as quasi-public assets. LECs were regulated as "common carriers," meaning that they had to provide service to all requesting customers on a nondiscriminatory basis. As telecommunications technology became a crucial component of computer and information services, the FCC took steps to ensure for all potential competitors "nondiscriminatory access to and use of common carrier transmission facilities" that were "essential to the competitive provision" of such services. *Computer and Bus. Equip. Mfrs. Ass'n*, Report and Order, 93 F.C.C. 2d 1226, 1236 ¶ 32 (1983).

Similarly, the breakup of AT&T in the early 1980s was designed to put an end to alleged anticompetitive practices made possible by AT&T's "control over the local exchange facilities" that "were and are needed for interconnection purposes by AT&T's competitors." *United States v. AT&T*, 552 F. Supp. 131, 162 (D.D.C. 1982).[3] The theory was that long distance service was potentially competitive, but that the ability to compete depended on access to noncompetitive local facilities controlled by AT&T. To prevent AT&T from discriminating against its long distance competitors, AT&T was required to spin off its local exchange facilities to independent Bell Operating Companies, which in turn were required to provide access to all long distance and information service providers on a nondiscriminatory basis. *See id.* at 196. In short, the monopoly local exchange network could be used by everyone, and LECs were required to provide their essential service in a manner that would not favor one user over another.

---

[3] *See also MCI Communications Corp. v. AT&T*, 708 F.2d 1081, 1133 (7th Cir.), *cert. denied*, 464 U.S. 891 (1983) (concluding that "AT&T had complete control over the local distribution facilities that . . . were essential for MCI to offer [competing long distance] service" and that "[t]he facilities in question met the criteria of 'essential facilities' in that . . . [i]t would not be economically feasible for MCI to duplicate [AT&T's] local distribution facilities").

In addition, states closely regulated the prices for local telephone service. State rate regulation established what was in essence a regulatory compact with each LEC. The LEC would effectuate state policies designed to promote "universal service"—that is, to make basic telephone service available to all customers at affordable rates. *See, e.g.*, H.R. Rep. No. 104-204, at 49-50 (1995). In return, state regulators would protect the LEC's opportunity to earn a reasonable rate of return on its investments. *See* Kellogg, et al., *supra*, at 429-31 (describing traditional "rate-of-return" regulation).

The result of this compact was a state-mandated rate structure in which prices for particular local telephone services were based more on policy considerations than on ordinary economic and market factors. Prices for some services—specifically, residential service and service in rural areas—were set artificially low, and prices for other services were set correspondingly high. For example, business customers generally paid substantially higher rates than residential customers, even though the costs of providing the two types of service are roughly the same. *See Federal-State Joint Board on Universal Service*, Report and Order, 12 F.C.C. Rcd 8776, 8784 ¶¶ 10-11 (1997). Because LECs were required to serve all customers and competing service providers were not permitted at all, there was no risk of a carrier disrupting this cross-subsidy pricing structure by serving only the most profitable customers. The system worked well, and residential customers received rates that were often substantially below cost.

The states conducted detailed periodic ratemaking proceedings designed to ensure that these rate structures continued to produce overall revenues sufficient to enable LECs to achieve reasonable rates of return. The opportunity to earn such a return, in addition to avoiding possible constitutional concerns, enabled the LECs to attract the capital needed to fund investments in their networks. *See Duquesne Light Co. v. Barasch*, 488 U.S. 299, 310

(1989) (utility must be permitted a rate that will allow it to " 'maintain its financial integrity, to attract capital, and to compensate its investors for the risk [they have] assumed' " (quoting *FPC v. Hope Natural Gas Co.*, 320 U.S. 591, 605 (1944))). Thus, the rate structures preserved the incentive and ability of LECs to invest in maintaining and improving their networks and services, which served the public interest in having a high quality and widely accessible telecommunications network.

B. The Telecommunications Act of 1996

In adopting the Telecommunications Act of 1996, Congress decided to end the monopoly in local telephone service and open up local markets to competition. Underlying this decision was Congress' rejection of the old assumption that local telephone service is a natural monopoly—that is, that it is inefficient to have more than one network to provide local service. Congress determined that, given the current state of technology, real competition among multiple providers of local telephone service with separate networks is possible and will benefit consumers. And Congress did not simply endorse the goal of competitive local service markets and leave to the FCC the task of managing the transition. Rather, the 1996 Act provides a detailed road map for reform.

The Act adopts specific measures designed to promote investment and innovation in telecommunications infrastructure by new entrants and incumbent LECs alike, resulting in vigorous facilities-based competition. But Congress also understood that developing alternatives to some network facilities controlled by incumbent LECs may be difficult, at least in the near term, and that as a result access to such facilities still may be essential to the effective provision of service by competitors. For that reason, Congress imposed a duty on incumbent LECs to share such facilities with other carriers so long as the facilities remain essential to the ability to compete and newcomers remain unable reasonably to build or acquire

them from alternative sources. Congress also permitted carriers that wished to compete without any facilities of their own to purchase the complete services of incumbent LECs and to resell them, but under a separate provision of the Act and subject to different pricing standards. Finally, to ensure that the onset of competition would neither undermine nor be undermined by universal service policies, Congress launched a process to reform the measures used to support universal service.

1. *The Act's Structure for Promoting Competition*

The Act opens the door to competition by expressly preempting state and local barriers to entry in all segments of the telecommunications services market, intrastate as well as interstate. 47 U.S.C. § 253. As a result, states may no longer grant exclusive franchises to provide local telephone service or otherwise arbitrarily limit participation in the market. Other carriers now have the legal right to build and operate local telephone networks in competition with incumbent LECs.

Because a customer is unlikely to subscribe to a new carrier's service unless he can call and be called by users of the incumbent LEC's network, the Act requires incumbent LECs to interconnect their networks with those of "any requesting telecommunications carrier." 47 U.S.C. § 251(c)(2). With interconnection, a carrier can build a network covering a small area—say, a single neighborhood—and rely on the incumbent to carry traffic to and from points outside that network. Thus, interconnection enables a new entrant to launch itself as a facilities-based competitor on a limited scale and then expand its operation over time. Incumbents may charge for providing interconnection, but their rates must be "based on the cost" of the service and "nondiscriminatory." 47 U.S.C. §252(d)(1)(A). The Act specifies that these cost-based rates "may include a reasonable profit." 47 U.S.C. § 252(d)(1)(B).

Congress wanted and expected that the removal of entry barriers and the right to interconnect with the incumbent's network at cost-based prices would generate effective facilities-based competition for local service. The Act's procompetitive framework was intended to "accelerate rapidly private sector deployment of advanced telecommunications and information technologies." H.R. Conf. Rep. No. 104-458, at 1 (1996) ("Conference Report"). That goal plainly envisions new carriers deploying their own advanced technology in competition with incumbent LECs. The Conference Report expressly endorsed the view that "meaningful facilities-based competition is possible." *Id.* at 148.[4] Thus, Congress' intention was to encourage robust competition among providers with separate networks, not competition in which all participants are dependent on a single network operated by a single carrier.

However, Congress also recognized that erecting a fully functional local exchange network is a substantial task. The Act therefore provides two distinct routes through which a carrier may begin to offer a competing local service without constructing a complete network of its own. One route is to obtain access to selected individual pieces of the incumbent LEC's network, called "unbundled network elements," which the new entrant may

---

[4] *See also Communications Law Reform: Hearings Before the Subcomm. on Telecommunications and Finance of the House Comm. on Commerce*, 104th Cong. 9 (1995) (statement of Rep. Schaefer) ("[The Act's approach to reform] rightly stresses a need for facilities-based competitors to lead the way in providing a true alternative to today's monopoly in the local exchange service. In fact, it is no exaggeration to say that the entire bill is premised on the existence of robust facilities-based competitors."); 141 Cong. Rec. H8465 (daily ed. Aug. 4, 1995) (statement of Rep. Goodlatte) ("[The telecommunications legislation] gives new entrants the incentive to build their own local facilities-based networks, rather than simply repackaging and reselling the local services of the local telephone company. This is important if the information superhighway is to be truly competitive.").

use to fill in gaps in its own unfinished network. 47 U.S.C. § 251(c)(3). The other is to purchase complete services from the incumbent LEC and resell them to end users, thus enabling the new entrant to compete without constructing any new network facilities at all. *Id.* § 251(c)(4).

a. The Unbundled Access Provisions of Section 251 (c)(3). Some of the specialized telephone equipment that was once expensive to duplicate is now, thanks to technological advances, not particularly difficult to build or acquire. (Switching increasingly falls in this category.) However, the provision of local exchange service also requires some facilities that the incumbent LEC has had in place for many years and that still may be difficult for competitors to duplicate in the short run. For example, developing widely available alternatives to the incumbents' "local loops," the wires running into each individual household, may be a gradual and expensive process. Congress recognized that, as a result, incumbent LECs may retain dominant control over some such bottleneck facilities for some time to come, at least in areas that are relatively costly to serve.[6]

Section 251(c)(3) seeks to address this issue and facilitate entry by new facilities-based competitors by enabling a competitor to lease selected "network elements" from the incumbent and to combine those elements with its own facilities in order to provide service. 47 U.S.C. § 251(c)(3).

---

[6] Alternatives are being developed even to the incumbent LECs' local loops. *See, e.g.*, "Section 706: An Opportunity for Broadband Competition Policy," Remarks of Gloria Tristani before the U S WEST Regional Oversight Committee (Apr. 27, 1998) (available at www.fcc.gov/commissioners/tristani/gtsspeech.html) ("Fixed wireless technology may someday provide a cost effective and reliable loop substitute. And cable lines are being upgraded to permit telecommunications and Internet access.") The difficulty of duplicating particular facilities has tended to decline over time as technology advances. The practicality of duplicating a facility also may vary with geographic location, depending on such factors as population density and terrain.

The statute requires an incumbent LEC to provide a requesting carrier with access to network elements "on an unbundled basis," "at any technically feasible point," and "in a manner that allows requesting carriers to combine such elements in order to provide . . . telecommunications service." *Id.* As the Conference Report explains, this provision means that new local carriers assembling their own networks, instead of needing a "fully redundant network in place when they initially offer local service," may begin to provide service using "[*s*]*ome* facilities and capabilities . . . obtained from the incumbent local exchange carrier as network elements." Conference Report at 148 (emphasis added). In other words, a competitor using unbundled network elements configures and operates its own network —it merely uses some parts obtained from the incumbent.

Not every network facility must be unbundled and provided to competing carriers under section 251(c)(3). The Act limits the scope of the unbundling requirement by charging the FCC with the task of "determining what network elements should be made available" under section 251(c)(3). 47 U.S.C. § 251(d)(2). Congress prescribed specific criteria for the FCC to use in making this determination: The FCC must consider at a minimum whether lack of access to the element in question would "impair the ability" of a competitor to provide telephone service or, in the case of a network element that is "proprietary in nature," whether access is "necessary" for the competitor to provide service. 47 U.S.C. §§ 251(d)(2)(A), (B). Thus, an incumbent LEC's unbundling duty is limited to those network facilities that, according to the FCC, need to be available *from the incumbent* to enable the requesting carrier to compete effectively.

In addition, the Act defines a network element, not broadly as *any asset* owned by an incumbent LEC, but more narrowly as a "facility or equipment used in the provision of a telecommunications service" or the "features, functions, and capabilities" provided by such a phys-

ical component of the network. 47 U.S.C. § 153(29). Thus, network elements are individual, physical *pieces* of the network that the incumbent LEC uses to route and deliver calls. A carrier using unbundled elements purchases these pieces individually and combines them with its own facilities to create its own network. *See* 47 U.S.C. § 251(c)(3) ("An incumbent local exchange carrier shall provide such unbundled network elements in a manner that allows requesting carriers to combine such elements in order to provide such telecommunications service.").

To ensure that an incumbent LEC's essential facilities would be available to new entrants on economically reasonable terms, Congress made network elements subject to the same cost-based pricing standard as interconnection: Prices for unbundled elements must be based on the cost to the incumbent LEC of providing them, must be nondiscriminatory, and may include a reasonable profit for the incumbent. 47 U.S.C. § 252(d)(1). The Act expressly requires that such cost-based prices be determined "without reference" to state ratemaking proceedings. 47 U.S.C. § 252(d)(1)(A)(i). The practical result has been that prices for unbundled elements, unlike state-mandated prices for complete services, have not reflected cross-subsidies designed to promote universal service.

b. The Resale Provisions of Section 251(c)(4). To enable a new local carrier to enter the market on a virtually immediate basis, the Act also provides carriers with a distinct entry strategy that permits them to begin competing without deploying *any* physical facilities of their own or taking any responsibility for configuring a network. Section 251(c)(4) allows a carrier to buy complete local exchange telecommunications services from an incumbent LEC at wholesale prices and then resell those services to customers in competition with the incumbent.

This resale option provides a quick and easy initial gambit for carriers seeking to enter the local telephone market. However, the scope of a reseller's competitive

activity is quite narrow. Since a carrier competing through resale buys entire finished services from the incumbent, *see* 47 U.S.C. § 251(c)(4)(A), its role is basically limited to marketing, billing, and collection. The work of actually carrying the customer's calls, as well as designing, investing in, and maintaining the network that will carry the calls, is handled exclusively by the incumbent LEC. In this regard, section 251(c)(4) provides a very different market entry strategy from section 251(c)(3).

Congress also subjected resale to an entirely different pricing standard than unbundled network elements—a "wholesale" standard that starts with the retail price and subtracts the marketing costs avoided by the incumbent LEC in selling at wholesale, thus maintaining intact any universal service cross-subsidies. *See* 47 U.S.C. § 252 (d)(3). By basing wholesale prices on retail prices, the Act ensures that the wholesale price for a service will reflect the same implicit contribution to support universal service (or receipt of such support) as the retail price for the service.[6] For example, if a state has set the retail price of a particular service two dollars above cost (including a reasonable profit) to help subsidize rates for other services, the wholesale price for that service will include the same two-dollar subsidy component. *See* H.R. Rep. No. 104-204, at 72 (1995) ("[I]n determining the resale rate, it is the Committee's intent that there be a recognition of pricing structures for telephone exchange service in the State. . . . The rate should reflect whether, and to what extent, the local dialtone service is subsidized by other services.").

---

[6] The subsidy component is "implicit" because state regulators generally do not specify the precise amount by which particular services cross-subsidize or receive cross-subsidies from other services.

2. *Implementation through Negotiations and State Arbitration*

Consistent with its view that relations between market participants should be governed as far as possible by market forces rather than regulatory mandates, *see, e.g.*, Conference Report at 113 (describing the Act as creating a "de-regulatory national policy framework"), Congress created a system in which private negotiations between incumbent LECs and their competitors are the preferred method for implementing the Act's local competition provisions. Section 251(c)(1) imposes on incumbent LECs and competing carriers "[t]he duty to negotiate in good faith in accordance with section 252 the particular terms and conditions of agreements to fulfill the duties" described in section 251. 47 U.S.C. § 251(c)(1). Therefore, where a carrier wants to purchase interconnection, unbundled elements, or wholesale services for resale from an incumbent LEC, the first step is to negotiate a "binding agreement" with the incumbent for the purchase. 47 U.S.C. § 252(a)(1). Congress expressly directed that this voluntary negotiation process take precedence over regulatory mandates: Section 252(a)(1) provides that an incumbent LEC may negotiate an agreement with a competing carrier "without regard" to any of the pricing, technical, and quality standards set out in the Act. *Id.* The backstop to these private negotiations is the possibility of action by state public utility commissions. Either party to a negotiation may ask the relevant state commission to mediate or arbitrate unresolved issues. *Id.* §§ 252(a)(2), (b)(1).

3. *Preservation and Reform of Universal Service*

While the Act embraces competition and market forces, it also makes clear that support for universal service must not be impaired. The Act requires that support continue to be provided at levels that are "sufficient" to "preserve and advance" universal service. 47 U.S.C. §§ 254(b)(5), (d), (e). Since full-fledged competition will make implicit

cross-subsidies through service prices unsustainable in the long run, the Act requires the FCC to establish new mechanisms to support universal service that are "explicit" and "nondiscriminatory." 47 U.S.C. §§ 254(b)(4), (e), (f). The FCC must meet specific deadlines in carrying out its responsibilities for universal service reform, but state action to reform local rate structures is not subject to any timetable. *See* 47 U.S.C. §§ 254(a), (f).

C. The FCC's First Report and Order

On August 8, 1996, the FCC released its First Report and Order purporting to implement the Act's local competition provisions. The Order adopted rules concerning the scope of incumbent LECs' unbundled access obligations and a "pick-and-choose" rule giving competing carriers a trump card in their negotiations and agreements with incumbent LECs. As discussed in other briefs in this case, the Order also displaced state authority over local prices for interconnection and unbundled elements with a complex and sweeping set of federal pricing rules.

1. *The FCC's Unbundled Access Rules*

The Order established a series of rules specifying the FCC's interpretation of an incumbent LEC's unbundled access obligations under section 251(c)(3) of the Act. The rules required the unbundling of practically every aspect of an incumbent's business. Their cumulative effect was to enable an incumbent LEC's competitors to obtain complete, end-to-end service supplied entirely by the incumbent at the cost-based prices reserved for network elements.

First, the FCC ruled that, in carrying out its responsibility under section 251(d)(2) to consider whether lack of access to a particular unbundled element would "impair" the ability of a competitor to offer service or whether access to such an element is "necessary," the agency will not even consider the availability of substitutes from

sources other than the incumbent LEC. *See* Joint Appendix ("J.A.") 51-52, 54-55 (Order ¶¶ 283, 287). The FCC stated that the availability of elements from other sources should be ignored "because, in theory, any new entrant could provide all of the elements in the incumbents' networks." *Id.* at 54-55 (Order ¶ 287). Apparently rejecting Congress' determination that facilities-based competition is possible and desirable, the FCC also asserted that limiting the scope of unbundling to elements not readily available from other sources would require competing carriers to "duplicate unnecessarily" parts of the incumbent's network and thus "generate delay and higher costs for new entrants." *Id.* at 51-52 (Order ¶ 283); *see also id.* at 54-55 (Order ¶ 287). The agency therefore extended the unbundling obligations to "*all* network elements [of an incumbent LEC] for which it is *technically feasible* to provide access," including elements that are readily available from other sources at reasonable prices. *Id.* at 49, 53-54 (Order ¶¶ 278, 286) (emphasis added). In short, the FCC held that the "impair" and "necessary" standards are satisfied by virtually *any* potentially useful incumbent LEC facility, regardless of how commonplace or easy to duplicate. It declined to require any real showing of need. *See id.* at 53-54 (Order ¶ 286) ("We conclude that the statute does not require us to interpret the 'impairment' standard in a way that would significantly diminish the obligation imposed by section 251(c)(3).").

The FCC further interpreted the term "network element" to include items that are neither discrete physical parts of the network nor functions of such discrete physical parts. The FCC determined that services provided via personnel and equipment entirely separate from the telephone network itself could nonetheless be network elements. In particular, the Order classified as network elements such nonnetwork items as back-office support systems (for example, systems used to take orders from retail customers) and operator services using human operators.

Id. at 116-17, 126-27 (Order ¶¶ 516, 536). The FCC further ruled that services such as caller I.D., call forwarding, and call waiting are included in the "local switching element" despite the fact that they constitute complete retail telecommunications services available to end user customers and to the incumbent LEC's competitors under the Act's resale provisions. *Id.* at 87-89 & n.917 (Order ¶¶ 413-14 & n.917).

The FCC not only made virtually every aspect of an incumbent LEC's business available to new entrants under section 251(c)(3), it also ruled that a new entrant may obtain from the incumbent LEC the *full set* of network elements necessary to provide a finished service. Pet. App. 242a-49a (¶¶ 328-41). The agency further mandated that the incumbent LEC provide the requested elements on a *combined* basis: The FCC's rules both required an incumbent LEC to combine elements on its competitors' behalf and forbade an incumbent to separate any elements that it has already combined in its own network. 47 C.F.R. §§ 51.315(b)-(f).[7] As a result, an incumbent's competitors could obtain a fully assembled combination of all the elements needed to provide service, the so-called "UNE platform." Access to this "platform" enables a competitor effectively to buy and resell the incumbent's finished local exchange services, without making any investment in network facilities of its own and without undertaking any of the tasks involved in configuring and operating a network. Such a competitor need not even determine which particular facilities will be used to carry its customers' traffic; it can force the incumbent to do that for it as well.

---

[7] The FCC's rules further obligated an incumbent LEC to combine network elements at the direction of a competitor to create even services not offered by the incumbent itself. *See* 47 C.F.R. § 51.315(c) (requiring an incumbent LEC to "perform the functions necessary to combine unbundled network elements in any manner, even if those elements are not ordinarily combined in the incumbent LEC's network").

In short, these rules together allowed a competitor of an incumbent LEC to purchase as unbundled network elements virtually any functions the incumbent performs as part of its business and order the incumbent to combine those elements and use them to provide service on behalf of the competitor. The competitor effectively could obtain, at the cost-based prices reserved for network elements, *any* service that the incumbent provides or is capable of providing, for the competitor to resell to customers under its own brand name—all without making the slightest investment in facilities or systems of its own.

Moreover, the FCC ordered that, except for a limited, temporary, and now-expired exemption, the cost-based prices for unbundled network elements may not include any part of the costs of supporting universal service (that is, the costs of subsidizing residential and rural service). *See* J.A. 153, 155-59 (Order ¶¶ 712, 715-20).[8] As a result, a competitor taking advantage of the FCC's rules to offer service entirely through unbundled network elements could avoid contributing to the universal service subsidies built into state-mandated rate systems. For services priced above cost—for example, business services—the carrier naturally would opt to buy the service as a collection of combined elements, and thus pay a cost-based rate, as opposed to buying it under the resale provision at the higher wholesale rate that includes support for universal service subsidies. In this way, the carrier could engage in regulatory arbitrage by taking advan-

---

[8] More generally, the FCC distorted the statute's requirement of cost-based rates by, among other things, ordering that rates be based not on the *actual* cost of providing service, but rather on the cost of providing service using a hypothetical, ideally efficient network. *See* 47 C.F.R. § 51.505(b)(1) (prices must be "based on the use of the most efficient telecommunications technology currently available and the lowest cost network configuration"). The substantive validity of this and other pricing rules is not before the Court because the court of appeals vacated them on jurisdictional grounds.

tage of the difference between state-mandated retail prices and unbundled element prices.

In addition to giving competitors cost-based, subsidy-free access to any combination of an incumbent LEC's existing business assets, the FCC required the incumbent LEC to make available network elements "superior in quality to that which the incumbent LEC provides to itself." 47 C.F.R. § 51.311(c). As a result, a competitor wanting something new, instead of investing itself in an improved facility, could require the incumbent LEC to make the necessary investment on its behalf.

The cumulative effect of the FCC's unbundling rules was to broaden greatly the opportunity and incentive of new competitors to rely on the incumbent LEC's network instead of investing in facilities of their own. Any new investment by the incumbent, no matter how easily available from other sources, had to be made available at cost-based rates and combined by the incumbent LEC at the behest of the competitor. In the FCC's view, this dramatic action was necessary to permit all competitors to share whatever competitive advantage the incumbent LEC might have—thus entirely depriving the incumbent of any such advantage irrespective of whether access to the facilities involved is truly necessary for the advancement of competition.

2. *The FCC's "Pick-and-Choose" Rule*

Section 252(i) of the Act requires an incumbent LEC to offer a competing carrier any "interconnection, service, or network element" that the incumbent has provided to another carrier under a prior interconnection agreement, on the "same terms and conditions" as in the prior agreement. 47 U.S.C. § 252(i). The FCC invoked this nondiscrimination requirement as the basis for a quite different rule that permits a competitor to pick and choose isolated provisions from previous interconnection agree-

ments and to take advantage of those provisions without any obligation to accept terms and conditions that may have been part of the quid pro quo for those provisions in the original agreements. Pet. App. 261a-64a (Order ¶¶ 1310, 1314-15). The FCC's rule further creates a unilateral right of competing carriers to change the terms of previously concluded, purportedly "binding" interconnection agreements. Specifically, the FCC decreed that a competing carrier may at any time reopen a final, validly negotiated or arbitrated interconnection agreement to incorporate any isolated term or condition found in a subsequent interconnection agreement between the incumbent LEC and another carrier. *Id.* at 264a-65a (Order ¶ 1316).

The FCC dismissed the concern that this "pick-and-choose" rule would undermine the Act's regime by rendering it irrational for incumbent LECs to make concessions in negotiated agreements. The FCC's response focused solely on whether the rule would benefit the incumbent LEC's competitors: "[W]e observe that new entrants, who stand to lose the most if negotiations are delayed, generally do not argue that concern over slow negotiations would outweigh the benefits they would derive from being able to choose among terms of publicly filed agreements." *Id.* at 263a (Order ¶ 1313).

3. *The FCC's Assertion of Jurisdiction over Pricing*

Despite Congress' decision to implement the requirements of section 251 primarily through private negotiations backed up by the possibility of state-level mediation or arbitration, the FCC promulgated a sweeping set of detailed nationwide pricing rules. The lawfulness of the FCC's assertion of jurisdiction over the pricing of interconnection and unbundled elements is a major focus of other briefs in this case, and this brief does not discuss it.

D. The Appeal to the Eighth Circuit

Incumbent LECs and state utility commissions sought judicial review of the FCC's First Report and Order, and the cases were consolidated in the U.S. Court of Appeals for the Eighth Circuit. The appeals focused on the FCC's rules concerning the scope of an incumbent LEC's duty to provide unbundled access to network elements; the "pick-and-choose" rule; and the FCC's assertion of jurisdiction over pricing. Many of the petitioners also requested a stay of the Order, in whole or in part, pending the outcome of the appeal. On October 15, 1996, the court of appeals stayed the FCC's pricing and "pick-and-choose" rules. J.A. 224-42. This Court declined to vacate the stay. *FCC v. Iowa Utils. Bd.*, 117 S. Ct. 429 (1996).

After consideration on the merits, the court of appeals issued a decision on July 18, 1997 invalidating a number of the pertinent FCC rules, but upholding others. Pet. App. 1a-67a. It upheld the FCC's conclusion that the "impair" and "necessary" standards in section 251(d)(2) do not require the agency to be selective in determining what elements must be unbundled. In particular, the court held that those standards "do not require an inquiry into whether a competing carrier could obtain the element from another source." *Id.* at 47a-48a. The court reasoned that requiring such an inquiry would severely narrow the scope of an incumbent's unbundling obligation because "many network elements could theoretically be duplicated eventually." *Id.* at 48a. The court also upheld the FCC's determination that nonnetwork items such as back-office support systems and end-user services such as caller I.D. can qualify as "network elements." *Id.* at 41a-45a.

However, the court of appeals rejected the FCC's extension of the unbundled access obligation to all elements for which unbundling is "technically feasible." The court held that section 251(c)(3) requires unbundled access

"at any technically feasible point" in order to establish *where* access may occur, not *which* elements must be unbundled. *Id.* at 45a. The court likewise rejected the FCC's rules requiring an incumbent LEC to provide unbundled elements and interconnection of superior quality to that which it provides to itself. *Id.* at 50a-52a.

The court also vacated the rules requiring incumbent LECs to combine elements on behalf of their competitors. The court explained that, "[w]hile the Act requires incumbent LECs to provide elements in a manner that enables the competing carriers to combine them, unlike the Commission, we do not believe that this language can be read to levy a duty on the incumbent LECs to do the actual combining of elements." *Id.* at 53a. "[T]he plain meaning of the Act," the court continued, "indicates that the requesting carriers will combine the unbundled elements themselves; the Act does not require the incumbent LECs to do *all* of the work." *Id.* However, the court did not address section 51.315(b) of the FCC's rules, the provision that prohibited incumbent LECs from separating elements that were already combined in their networks.

The court upheld the FCC's determination that carriers with no facilities of their own may provide local service entirely through unbundled elements, but also accepted the premise, critical for the preservation of universal service, that Congress did not intend unbundled access and resale to be interchangeable. The court upheld the rule precisely because it believed that "unbundled access has several disadvantages that preserve resale as a meaningful alternative." *Id.* at 56a. Specifically, the court stated that, in light of its ruling on the combination of elements, a competitor providing service entirely through unbundled elements is different from a reseller because it "expend[s] valuable time and resources recombining unbundled network elements." *Id.* at 56a-57a. The court also noted that the competitor using network elements bears "greater risks" in attempting to "match its supply with its demand."

Id. at 56a. In other words, such a competitor is subject to the ordinary expenses and business risks associated with configuring and operating a local telephone network.

The court reaffirmed its rejection in its stay decision of the FCC's "pick-and-choose" and pricing rules. The court explained that the "pick-and-choose" rule "would thwart the negotiation process" required by the Act, because, "[d]uring a negotiation, an incumbent LEC would be very reluctant to make a concession on one term in exchange for a benefit on another term when faced with the prospect that a subsequent competing carrier will be able to receive the concession without having to grant the incumbent the corresponding benefit." *Id.* at 26a. The court also observed that the "pick-and-choose" rule conflicts with the Act's requirement that negotiated agreements be binding, "because, according to the FCC, an entrant who is an original party to an agreement may unilaterally incorporate more advantageous provisions contained in subsequent agreements negotiated by other carriers." *Id.* With respect to the FCC's pricing rules, the court held that "the FCC exceeded its jurisdiction in promulgating the pricing rules regarding local telephone service." *Id.* at 8a.

Following the court of appeals' decision, a number of incumbent LECs filed petitions for rehearing urging the court to vacate 47 C.F.R. § 51.315(b), the rule that forbade incumbents from separating elements that are currently combined in their networks. The petitions noted that carriers such as AT&T and MCI had seized on the court's silence about rule 51.315(b) to argue to state commissions that those carriers were still entitled to get the fully combined "platform" of network elements where those elements are already combined in the incumbent's network.[9] On October 14, 1997, the court of appeals

---

[9] *See* Petition for Rehearing of GTE entities, SBC Communications, Inc., BellSouth Corporation, and U S WEST, Inc., *Iowa*

granted the rehearing petitions and amended its opinion to strike down rule 51.315(b) as contrary to the Act. Reinforcing its earlier decision regarding network element combinations, the court explained that "Section 251(c)(3) requires an incumbent LEC to provide access to the elements of its network only on an unbundled (as opposed to a combined) basis," and "does not permit a new entrant to purchase the incumbent LEC's assembled platform(s) of combined network elements (or any lesser existing combination of two or more elements)." Pet. App. 71a. The court stressed that "[t]o permit such an acquisition of already combined elements at cost based rates for unbundled access would obliterate the careful distinction Congress has drawn in subsections 251(c)(3) and (4)" between access to unbundled elements and the purchase of services for resale. *Id.*

E. Certiorari Proceedings

The FCC, MCI, AT&T, and other parties filed petitions for certiorari seeking review of the court of appeals' decision to vacate the FCC's pricing rules, the "pick-and-choose" rule, and rule 51.315(b). Incumbent LECs submitted conditional cross-petitions arguing that, if the Court decided to review the court of appeals' rejection of rule 51.315(b), it should consider the lower court's holdings on the other unbundled access issues as well. On January 26, 1998 the Court granted certiorari on all of the issues raised in the petitions and cross-petitions.

SUMMARY OF ARGUMENT

Through the unbundling and resale provisions in sections 251 and 252 of the Act, Congress devised a structure that would promote a number of different goals—increased competition, greater investment and innovation, the preser-

---

Utilities Board v. FCC (No. 96-3321 and consolidated cases, 8th Cir.) at 2.

vation of universal service, and ultimately enhanced consumer welfare. Congress sought to foster an environment in which new entrants have the incentive to build their own physical facilities to compete with the incumbents' networks because it understood that such independent facilities are vital to creating a vigorous competitive market in local telephony. At the same time, Congress recognized that not every potential competitor could immediately construct a complete alternative network. To encourage the eventual development of facilities-based competition, Congress granted newcomers the option to buy some unbundled physical inputs from the incumbents to combine with their own incomplete sets of facilities until they were able to assemble complete networks capable of providing finished services. Congress also permitted competitors that wished to enter without investing in any facilities to buy and resell incumbents' own finished services.

In structuring these alternative avenues of entry, Congress struck a balance designed to give new entrants access to incumbents' networks and services where necessary to enable them to begin to compete, while preserving newcomers' incentives to build their own facilities. That is, Congress sought to ensure that the use of incumbents' unbundled facilities would not become so economically attractive as to stifle any incentive for new entrants to engage in facilities-based competition. In accordance with this goal, the Act provides that incumbents can be required to unbundle only in cases where new entrants truly need such elements to enter the marketplace, much as antitrust law requires monopolists to provide access only to those facilities that are *essential* to competitors. This limitation is reinforced by the statute's definition of "network elements," which includes only those parts of an incumbent's network that might not be reasonably available to new entrants in the competitive marketplace —the physical elements and their associated features and functions.

Consistent with this concept of unbundling, the statute also requires that incumbents provide the discrete, physical facilities to new entrants "in a manner that allows requesting carriers to combine such elements" to provide service. 47 U.S.C. § 251(c)(3). The statute thus makes clear that the purchaser of elements is expected to design and create a network of its own by combining the unbundled, "essential" elements it obtains from an incumbent with its own facilities. For a new competitor that wants to rely solely on an incumbent's network and have no facilities of its own, the statute provides the alternative option of purchasing and reselling an incumbent's retail *services*. However, a competitor that engages in resale must buy services from the incumbent at prices based on retail rates, rather than the cost-based prices for unbundled network elements. By basing resale prices on retail rates, Congress ensured that incumbents would not be deprived of the universal service subsidies implicit in their rates.

In its Order, the FCC destroyed the statute's careful balance by focusing on helping new competitors without regard to the statutory language or to the overall effects of its actions on Congress' goals. Indeed, the FCC's decisions reflect a rejection of Congress' intent to promote facilities-based competition in favor of transforming the incumbent's network into a wholesale platform for competitors, at the expense of true competition, innovation and investment, universal service, and ultimately the welfare of consumers. The FCC unlawfully expanded the Act's unbundling duty in four distinct but related ways:

First, the FCC effectively nullified Congress' directive that the agency consider "at a minimum" whether denial of access to network elements would "impair" service or, in the case of proprietary elements, whether access was in fact "necessary." In particular, the FCC refused even to consider whether an entrant can procure a particular element from a source other than an incumbent, effectively guaranteeing that an incumbent must provide every "net-

work element" to its competitors, rather than merely those bottleneck local exchange facilities a competitor needs but cannot reasonably duplicate. *Second*, the FCC compounded this error by redefining "network element" to include not only physical facilities and their accompanying features and functions, but virtually every part of an incumbent's business, from its personnel to billing software, even though such assets are not part of an incumbent's network.

Through these two errors, the FCC transformed the unbundling requirement from a limited right to obtain "essential facilities" into a right to obtain virtually every part of the incumbent's business as a network element at a price dictated by the FCC. And, far from backtracking from this transformation, the FCC embraced it in two additional parts of its Order. In its *third* unlawful expansion of the unbundling obligation, the FCC determined that a competitor could buy *all* the network elements needed to provide service under the pretense of buying them as individual pieces, so that the competitor could rely exclusively on unbundled network elements from an incumbent to provide finished services without having any facilities of its own. *Finally*, the FCC completed its work by deciding that competitors were entitled to acquire all of these pieces from the incumbent in precombined form as a fully assembled network.

In addition to defeating Congress' purposes in the Act's unbundling and resale provisions, the FCC further undermined the statutory structure by taking the straightforward nondiscrimination requirement in section 252(i) of the Act—under which an entrant can take for itself a prior interconnection agreement if it is willing to accept all the terms of that agreement—and reconstructing it as an extraordinary right of an entrant to "pick and choose" any individual term from the incumbent's past and future agreements with other carriers, even *after* the entrant has signed an agreement with the incumbent. In other words,

the entrant may at any time have the full commercial benefit of any isolated provision in any other agreement, entirely uncoupled from the balance of that agreement. In requiring this, the FCC made a mockery of the commercial negotiations that are central to the implementation scheme of section 252 and contradicted the statute's directive that interconnection agreements are to be "binding."

Each of these decisions by the FCC is contrary to the language, structure, and purposes of the 1996 Act. More significantly, the combined effect of these decisions is to undermine entirely the balanced regime Congress created. The agency's rules defeat the goal of promoting facilities-based competition by collapsing the statutory distinction between unbundled network elements and resale and creating an economically irrational model in which competitors have no reason to invest in their own facilities, incumbents have no incentive to innovate, and traditional universal service support is undermined.

ARGUMENT [10]

I. THE FCC'S UNBUNDLING RULES COLLAPSE THE CAREFUL STRUCTURE OF THE ACT AND DEFEAT THE GOALS CONGRESS SOUGHT TO ACHIEVE.

In the Telecommunications Act of 1996, Congress did not simply declare that local communications markets should be opened to competition and leave to the FCC the question of how best to reach that goal. To the contrary, Congress mapped out in detail the ways in which new entrants could use incumbents' facilities and services in entering local exchange markets, a map that it expected

[10] U S WEST incorporates by reference the argument made in the brief for Bell Atlantic Corp., BellSouth Corp., and SBC Communications, Inc. concerning the court of appeals' ruling that the FCC exceeded its jurisdiction with respect to pricing. *See* Opening Brief of Respondents/Cross-Petitioners Bell Atlantic Corp., BellSouth Corp., and SBC Communications, Inc. (May 18, 1998).

the FCC to follow. This case is about the FCC's refusal to heed Congress' will.

Despite the FCC's attempts to cloak itself in the protective mantle of *Chevron*, its unbundling rules are contrary to the plain meaning of the 1996 Act, as evident from its language, structure, and legislative history. *See Chevron U.S.A. Inc. v. Natural Resources Defense Council, Inc.*, 467 U.S. 837, 842-43 & n.9 (1984) (if by "employing traditional tools of statutory construction" the Court finds Congress' intent to be clear, then "that is the end of the matter"). The FCC's attempt to have this Court review each of its individual decisions in isolation and to claim deference as to each of these discrete issues ignores this Court's oft-repeated admonition that, "in ascertaining the plain meaning of the statute, the court must look to the particular statutory language at issue, *as well as the language and design of the statute as a whole.*" *Sullivan v. Everhart*, 494 U.S. 83, 89 (1990) (emphasis added).

While each individual deviation from the Act is important by itself, the cumulative effect of the FCC's errors is utterly inconsistent with the design of the 1996 Act as a whole. The FCC disregarded Congress' intention that incumbents be required to provide only those network elements that their competitors truly need, extended the definition of network element to encompass virtually every part of an incumbent's business, and permitted entrants to procure all the elements needed to provide a service on a precombined basis. By these decisions, the FCC abrogated Congress' careful distinction between unbundled network elements and resale and undermined the development of facilities-based competition, discouraged innovation, and put at risk universal service support. The court below, while failing to correct all of these errors, mitigated their cumulative effect by vacating the FCC's rules requiring incumbents to provide network elements as precombined, assembled network platforms. Even so, the court below

did not go far enough. The FCC's " 'construction[] of [the] statute . . . [is] inconsistent with the statutory mandate [and] frustrate[s] the policy that Congress sought to implement' " and therefore must be rejected. *Securities Indus. Ass'n v. Board of Governors of the Fed. Reserve Sys.*, 468 U.S. 137, 143 (1984) (quoting *FEC v. Democratic Senatorial Campaign Comm.*, 454 U.S. 27, 32 (1981)).

A. The FCC Unlawfully Nullified the Act's Standards for What Network Elements Must Be Unbundled.

The Act draws clear limits around what "network elements" must be unbundled. Section 251(d)(2) charges the FCC with the task of "determining what network elements should be made available" under section 251(c)(3). 47 U.S.C. § 251(d)(2). Congress prescribed that the FCC "*shall* consider, at a minimum," whether the failure to provide access to particular network elements would "impair" the ability of the requesting carriers to provide service and whether access to proprietary network elements is "necessary." 47 U.S.C. § 251(d)(2) (emphasis added). These statutory commands reflect Congress' recognition that access to an unbundled element of the incumbent's network is economically justified only when a new entrant genuinely needs the element in order to compete and the element is not readily available in the marketplace. As AT&T explained in its opening brief, the goal of these provisions was to "allow new entrants to obtain *essential facilities* that a LEC controls." AT&T Br. at 2 (emphasis added). And determining whether an incumbent's facility is essential or needed by a competitor requires examining whether and how easily it can duplicate the equivalent facility itself.

By mandating an evaluation of need—under the "impair" and "necessary" standards—Congress sought to encourage new entrants to rely on nonincumbent facilities where possible, in order to promote facilities-based competition and encourage innovation. *See, e.g.*, H.R. Conf.

Rep. No. 104-458, at 1 (1996) (passage of the Act would "accelerate rapidly private sector deployment of advanced telecommunications and information technologies") ("Conference Report"); *In the Matter of Amendment of the Commission's Rules to Establish Competitive Service Safeguards for Local Exchange Carrier Provision of Commercial Mobile Radio Services*, Notice of Proposed Rulemaking, Order on Remand, and Waiver Order, 11 F.C.C.R. 16639, 16678-79 ¶ 80 (1996) ("The interconnection provisions of the Act, Section[s] 251 and 252, are designed to promote facilities-based local exchange competition.").[11]

After all, it is precisely where the new entrant can provide or acquire its own competitive facilities that the potential to increase the choices available to consumers is greatest: "[C]ompetition [is] increased by encouraging [firms] to [develop rival facilities], rather than taking the easier and less competitive course of obtaining access to another's facilities." 3A Philip E. Areeda & Herbert Hovenkamp, *Antitrust Law* ¶ 773b1 (1996). A competitor that depends on an incumbent's network cannot compete on the basis of operational efficiency or upgrade the network, and it has limited ability to create new services. A facilities-based competitor, on the other hand, is a rival to the incumbent at *every* level of operation and has incentives to invest in the creation of innovative technologies and services and to achieve operational economies.

---

[11] *See also Communications Law Reform: Hearings Before the Subcomm. on Telecommunications and Finance of the House Comm. on Commerce*, 104th Cong. 9 (1995) (the Act "rightly stresses a need for facilities-based competitors to lead the way in providing a true alternative to today's monopoly in the local exchange service. In fact, it is no exaggeration to say that the entire bill is premised on the existence of robust facilities-based competitors") (statement of Rep. Schaefer); 141 Cong. Rec. H8465 (Aug. 4, 1995) (the Act is intended to "give[] new entrants the incentive to build their own local facilities-based networks, rather than simply repackaging and reselling the local services of the local telephone company") (statement of Rep. Goodlatte).

In its zeal to aid competitors without regard to the effects on facilities-based competition, the FCC adopted rules that unlawfully thwarted Congress' intent. *See generally* Hon. Stephen G. Breyer, "Antitrust, Deregulation, and the Newly Liberated Marketplace," 75 Calif. L. Rev. 1005, 1018 (1987) ("A . . . special policy risk of deregulation is that government policymakers will protect [new] competitors instead of protecting competition."). As the court below explained, the FCC determined that the "impair" and "necessary" standards did "not require an evaluation of whether a requesting carrier could obtain the desired elements from an alternative source," but instead authorized the FCC to consider solely the other elements that the new entrant could obtain *from the incumbent LEC's own network*. Pet. App. 47a. Rather than constituting a meaningful evaluation of whether the facilities in question are truly needed by a competitor, the FCC's reading of the Act renders irrelevant even readily available alternatives outside the incumbent LEC's network that could enable the newcomer to provide service equal in quality and cost to what is achievable using the incumbent's facilities. Thus, the FCC guaranteed each competitor the ability to acquire from incumbents every network element it desires to provide service no matter how easily the competitor could obtain a substitute elsewhere.

That approach defies the plain meaning of the Act. Failure to obtain an element from an incumbent cannot "impair" a new entrant's ability to provide service, and access to a proprietary element from an incumbent cannot be "necessary," if an equivalent element is readily available from a source other than the incumbent. When Congress directed the FCC to consider the "impair" and "necessary" standards in deciding whether to require unbundling of a particular element, it obviously intended that there be some showing of need before the incumbent could be required to unbundle any particular element, not that a competitor could commandeer any of an incumbent's facili-

ties whenever convenient. Even the FCC concedes that the unbundling provisions authorize competitors to obtain access to "elements they need (and not elements they do not need)." FCC Br. at 5. Whatever the degree of need that must be shown, the competitor's need to obtain the element from the incumbent cannot be evaluated without at least considering what the competitor can procure elsewhere.[12]

The FCC's primary justification for ignoring all sources outside the incumbent's network was its assertion that any consideration of nonincumbent sources might require new entrants to "duplicate unnecessarily even a part of the incumbent's network." J.A. 51-52, 54-55 (Order ¶¶ 283, 287). But this justification merely illustrates the FCC's transformation of Congress' objective—facilities-based competition—into a pejorative. Facilities-based competition by definition involves duplication of facilities. The FCC disagrees with this goal, apparently preferring to perpetuate markets in which incumbent LECs own the only facilities used for telecommunications services and are forced to share those facilities with competitors under regulatory supervision. But the FCC is bound by Congress' contrary choice: "[R]apid[] private sector deployment of advanced telecommunications and information technologies," Conference Report at 1, requires building new facilities.

The FCC also sought to rationalize its decision to disregard what is available from sources other than the incumbent on the theory that "ultimately" every facility can be replicated and thus consideration of outside sources

---

[12] Indeed, by so severing the relationship between the incumbent's obligation to provide its facilities to a competitor and the competitor's true economic need for the facilities, the FCC threatens to run afoul of this Court's repeated statement that "one person's property may not be taken for the benefit of another private person without a justifying public purpose, even though compensation be paid." *Hawaii Housing Auth. v. Midkiff*, 467 U.S. 229, 240 (1984) (quoting *Thompson v. Consolidated Gas Corp.*, 300 U.S. 55, 80 (1937)).

would mean that none of the incumbent's facilities would be made available. J.A. 54-55 (Order ¶ 287). Or, as the court below put it, considering outside sources might limit the availability of unbundled network elements "because many network elements could theoretically be duplicated eventually." Pet. App. 48a. But the fact that availability is a matter of degree or that it may change over time merely means that the FCC must inquire into actual market conditions to determine where to draw a line as to the degree of availability that will warrant a finding of lack of "impairment" and that such a line might change over time. The FCC's reading of the statute simply bypasses these issues by making an alternative facility irrelevant even if it is readily available today at the same or lower price than the incumbent's.

The FCC's refusal even to consider the availability of facilities outside an incumbent's network is inconsistent with not only the terms of the statute but also basic economic principles. When the government "order[s] the [monopolist] to provide the facility and regulat[es] the price to competitive levels, then the [prospective entrant's] incentive to build an alternative facility is destroyed altogether. . . . [Loss of incentive to build] could be extremely serious . . . in the case where either the [entrant] or some other rival could enter the market by some alternative not requiring the sharing of the [monopolist's] facility." 3A Areeda & Hovenkamp, *supra*, ¶ 771b.

Not surprisingly then, in the closely analogous context of the "essential facilities" doctrine, under which monopolists are required to provide prospective competitors with access to their essential facilities to aid the development of competition, a facility must be turned over for use by competitors *only* if it is not "available from another source or capable of being duplicated by the [competitor] or others." *Id.* ¶ 773b.[13] The lower courts are unanimous in

---

[13] *See also* ABA Section of Antitrust Law, *Antitrust Law Developments* 280 (4th ed. 1997) ("It is insufficient, however, for a

holding that a prerequisite to requiring a monopolist to turn over an essential facility is "a competitor's inability practically or reasonably to duplicate" the facility. *MCI Communications Corp. v. American Tel. & Tel. Co.*, 708 F.2d 1081, 1132-33 (7th Cir.), *cert. denied*, 464 U.S. 891 (1983).[14] The FCC's refusal even to consider whether or how easily an element could be obtained from a source other than the incumbent cannot be reconciled with the statutory language or these underlying principles.[15]

---

plaintiff to allege that access to one facility is simply 'more economical' than other alternatives . . . ."); William Blumenthal, "Three Vexing Issues Under the Essential Facilities Doctrine: ATM Networks as Illustration," 58 Antitrust L.J. 855, 860 (1989) ("In light of the potentially perverse competitive incentives created by the opportunity for compulsory access, a plaintiff should not be granted access in an essential facilities case unless alternatives to the facility are extraordinarily difficult for anyone to put in place." (citations omitted)); Panel Discussion, "Exclusionary Conduct," 57 Antitrust L.J. 723, 742 (1989) ("There is a great danger in . . . the notion that it somehow is easy to let competitors have access without impairing the facility.") (comments by William Baxter).

[14] *See also Twin Labs. Inc. v. Weider Health & Fitness*, 900 F.2d 566, 568 (2d Cir. 1990); *Ideal Dairy Farms, Inc. v. John Labatt, Ltd.*, 90 F.3d 737, 748 (3d Cir. 1996); *Laurel Sand & Gravel, Inc. v. CSX Transp., Inc.*, 924 F.2d 539, 544 (4th Cir.), *cert. denied*, 502 U.S. 814 (1991); *City of Malden v. Union Elec. Co.*, 887 F.2d 157, 159 (8th Cir. 1989); *City of Anaheim v. Southern Calif. Edison Co.*, 955 F.2d 1373, 1380 (9th Cir. 1992); *McKenzie v. Mercy Hosp.*, 854 F.2d 365, 369 (10th Cir. 1988), *overruled on other grounds by SystemCare, Inc. v. Wang Labs. Corp.*, 117 F.3d 1137 (10th Cir. 1997).

[15] The FCC's seeming blindness to the relationship between network elements and the concept of "essential facilities" is particularly perplexing in light of its recognition elsewhere that Congress' focus in the 1996 Act was the control of essential facilities: "[T]he structural and nondiscrimination requirements [of section 272] taken together were intended by Congress to effectuate the goal of preventing anticompetitive abuses by BOCs that *control essential local facilities* and seek to enter competitive markets that require these facilities as an input." *Implementation of the Non-Accounting Safeguards of Sections 271 and 272 of the Communications Act of*

The FCC's evisceration of the statutory "impair" and "necessary" standards also means that a new entrant's entitlement to particular network elements will not change as the marketplace evolves. Even if lack of access to a particular element will impair service (or the element is necessary) at one point in time, the availability of a new technology or another change in the marketplace may over time eliminate the need to acquire that element from the incumbent. For example, even if lack of access to the local loop would impair an entrant's ability to provide service today, that effect might disappear once cable television, wireless, or other technologies offer equivalent access to the home in the future.[16] Similarly, as a competitor establishes itself in the marketplace, it may capture a sufficient number of customers to generate the economies of scale that would allow it to build particular facilities that were not feasible for it to build on initial entry. *See* AT&T Br. at 14 (Congress intended unbundled elements to allow "new entrants to share in whatever economies of scale inhere in particular LEC facilities"). Such developments clearly would affect whether lack of access to the incumbent's facility would "impair" the newcomer's ability to compete under any common sense meaning of the term—yet under the FCC's construction of the Act such developments are to be ignored entirely.

The FCC's rule makes even less sense in the context of proprietary elements—those in which an incumbent holds an intellectual property interest. Congress required the FCC to apply the even stricter "necessary" standard to the unbundling of such elements, because it no doubt understood that an incumbent LEC will not invest in research and development if its innovations must automatically be turned over to rivals. *See, e.g., Kewanee Oil Co. v. Bicron Corp.*, 416 U.S. 470, 480 (1974) (right of

---

1934, as Amended, Second Order on Reconsideration, 12 F.C.C.R. 8653, 8658 (1997) (emphasis added).

[16] *See, e.g., supra* note 5.

exclusivity provides "an incentive to inventors to risk the often enormous costs in terms of time, research, and development").[17] Nevertheless, the FCC decided that, where an incumbent invests in developing a new proprietary service or feature, the incumbent can be forced immediately to turn that service or feature over to its competitors at cost regardless of whether the competitors can obtain its equivalent elsewhere.

The only situation in which the FCC did not require an incumbent to turn over a proprietary element is if a nonproprietary element *in the incumbent's own network* can perform the same function equally well at the same or lower price. J.A. 51-52 (Order ¶ 283). Of course, the incumbent would have had no reason to develop the proprietary element in the first place if it already had other elements capable of performing the same function equally well. Congress wanted the Act to spur innovation, not retard it. However, the effect of the FCC's nullification of the necessary standard, as even the FCC admitted in its order, *id.* at 50-51 (Order ¶ 282), will be to reduce incumbents' incentives to innovate in direct contravention of Congress' intent.

B. The FCC Unlawfully Expanded the Act's Definition of "Network Element."

The FCC not only ignored the Act's express limitations on the availability of "network elements" to an incumbent's competitors. It compounded the anticompetitive effect of that decision by rejecting the statutory limitations in the definition of "network element" itself. The FCC expanded the definition to encompass not just certain physical elements of an incumbent's network, but essentially all of the incumbent's productive assets and services,

[17] *See also* Hon. Stephen G. Breyer, "Antitrust, Deregulation, and the Newly Liberated Marketplace," 75 Calif. L. Rev. 1005, 1034 (1987) (because "requiring an inventor . . . to give his secrets away to his competitors discourages innovation," courts have required bottleneck facilities to be turned over to competitors only in rare instances).

even those involving ordinary business skills and personnel that a competitor readily could provide for itself or hire from others.

The Act defines "network element" as a "facility or equipment," together with "features, functions, and capabilities that are provided *by means of such facility or equipment.*" 47 U.S.C. § 153(29) (emphasis added.) Thus, the concept of network elements under the Act is rooted in the discrete *physical* equipment that carriers use in providing local exchange service. Indeed, the very term "*network* element" reinforces this meaning. After all, an incumbent's "network" is made up of the wires and switches that carry telephone calls. Moreover, a facility can only be a "network element" if it is "used in the transmission, routing, or other provision of a telecommunications service." *Id.* Through its use of terms such as "transmission" and "routing," Congress made clear that "network elements" refer to those pieces of equipment that the carrier uses for call delivery.[18]

This straightforward definition of "network element" reinforces the effect of the "impair" and "necessary" limitations in section 251(d): to give new entrants access to those of the incumbent LECs' physical assets they need to provide telecommunications service but cannot reasonably duplicate (at least in short term). "Network element" does not encompass aspects of an incumbent's business that Congress had no reason to believe posed an entry barrier, such as backroom functions that any new competitor could reasonably perform for itself.

The FCC, however, construed "network element" so broadly that it effectively permits an incumbent's competitors to demand access on an unbundled basis to every part—both physical and nonphysical—of an incumbent's

[18] Congress' use of the term "other provision" in the definition does not, under the principle of *ejusdem generis*, expand network elements to include nonphysical aspects of an incumbent's business. *See infra* at 40.

business. Under the FCC's Order, "network element" includes not just facilities and equipment that are used to deliver calls, but also systems and functions that have no role in transmitting or routing a call over the network. For example, the Order requires incumbent LECs to unbundle their "operational support systems." 47 C.F.R. § 51.319(f). These are computers and software used in an incumbent's customer service operations, not facilities or features that are used to route or transmit telephone calls. As their name suggests, they are *support* systems that an incumbent uses to run its business: to process orders, dispatch repairmen, and keep track of customer service requests. Requiring an incumbent to make these support functions available to competitors has nothing to do with unbundling the pieces of the network that the incumbent uses to deliver calls. And it has nothing to do with essential facilities—an incumbent's competitor can write or buy computer software as easily as the incumbent can. As a result, neither the plain terms nor the purposes of the definition of "network element" in the Act reach these software systems.

Indeed, the FCC does not even attempt to characterize these support systems as part of the equipment used to carry a call. To the contrary, the FCC declares that its objective in requiring incumbents to provide these support systems to their competitors is to ensure that the competitors will be able to perform business functions such as "pre-ordering, ordering, . . . and billing," J.A. 118 (Order ¶ 518), and "basic service functions [such] as scheduling customer appointments," *id.* at 118-20 (Order ¶ 519), in "substantially the same time and manner that an incumbent can for itself," *id.* at 118 (Order ¶ 518). But nothing in Congress' definition of network elements suggests that the incumbents' *business skills*—especially those that are not at all unique to the telecommunications business—must be turned over to competitors.

The FCC again disregarded the text of the statute in deciding that *services* offered by incumbent LECs, such as operator services and directory assistance, should be treated as "elements" subject to unbundling. *See id.* at 125-29 (Order ¶¶ 534-40). The FCC requires incumbents to make available to competitors the resources that incumbents use in providing these services, including their own staffs (that is, the operators themselves). *See* 47 C.F.R. § 51.5 (defining the operator services subject to unbundling as including "live assistance" to customers and "operator-assisted directory assistance"). But such services (not to mention people) are not even remotely within the definition of "network element." They are not "facilities" or "equipment" in the network. Nor are they "features, functions or capabilities . . . provided by means of" such facilities. And incumbents are not uniquely able to assemble staffs of operators. In fact, although the unbundling provision of the House bill originally applied to "*services*, elements, features, functions, and capabilities," the Conference Committee chose to delete the term "services" when it defined the scope of unbundling. *Compare* H.R. 1555, 104th Cong., 1st Sess. § 242(a)(2) (1995) (emphasis added) *with* 47 U.S.C. § 251(c)(3). The FCC has simply reversed Congress' decision.

The defect in the FCC's interpretation is further highlighted by its conclusion that "vertical services" such as call forwarding and call waiting are network elements. Vertical services are complete telecommunications services —not facilities—that incumbents sell at retail and thus must allow their competitors to buy at *wholesale rates* and then resell under section 251(c)(4). But the FCC's rules entitle competitors to obtain access to these same vertical services as network elements *at cost-based rates.* Thus, the FCC requires incumbents to make identical services available to competitors at two different prices. Doing so collapses the Act's two distinct means of accelerated entry for competitors—resale of service purchased

at wholesale discounts and access to unbundled network elements obtained at the incumbent's cost—through the sleight of hand of labeling vertical services as network elements. This result is particularly irrational because states typically set retail prices for vertical services above cost to support universal service, and allowing competitors to purchase vertical services at cost-based rates invites them to engage in regulatory arbitrage that undermines universal service. Congress intended no such result—it expressly deleted "services" from the definition of network element and defined an element as a "facility or equipment . . . *used* in the transmission, routing, or other provision of telecommunications service," not as such a service itself.

The FCC claimed its expansive view of network elements was justified in part by the definition's statement that elements include "*information* . . . used in the transmission, routing, or *other provision* of a telecommunications service." 47 U.S.C. § 153(29) (emphasis added). The FCC asserted that the term "other provision" expands the category of network elements beyond the physical delivery of telephone calls to virtually any information used for any purpose. J.A. 40 (Order ¶ 261). However, the general term "other provision" is limited by the more specific terms that precede it in the list. *See, e.g., Hughey v. United States*, 495 U.S. 411, 418 (1990); *United States v. Salen*, 235 U.S. 237, 244 (1914) (principle of *ejusdem generis*). Here, the other items in the list—"transmission" and "routing"—are functions of equipment used in the delivery of calls, and nothing in the statute suggests that the reference to "other provision" expands the definition beyond that type of function to encompass every aspect of operating a telephone company. To the contrary, that reference simply acknowledges that other technical functions of an incumbent's network, such as switching, also are involved in delivering a phone call. Nor can the reference to "telecommunications serv-

ice"—the "offering of telecommunications for a fee directly to the public," 47 U.S.C. § 153(46)—somehow unmoor the definition of "network element" from the core textual requirement that an element be a facility or equipment (or features and functions provided by means of such facility or equipment). The FCC's expansion of the category of network elements thus finds no support in the text of the Act.

The FCC's expansion of the definition to include support systems, retail services, and other parts of an incumbent's business beyond facilities used in call delivery is equally contrary to the purposes of the unbundling requirements. Most resources or assets of this kind, such as operator staffs to provide directory assistance, can readily be developed or acquired from sources other than an incumbent and are therefore beyond the scope of what a competitor would need from an incumbent in order to compete. By nevertheless requiring incumbents to provide these nonessential facilities and services, the FCC has stripped away any incentive new entrants would have to invest in the personnel and the development of skills required to run a local telephone business. Congress never envisioned such a result when it gave new entrants the option of using some of an incumbent's network elements as substitutes for the limited facilities entrants might not readily obtain elsewhere.

C. The FCC's Expansion of Incumbents' Unbundling Obligations Undermines the Structure of the Act by Permitting Competitors To Rely Exclusively on Unbundled Elements To Provide Service and Thereby Evade the Statutory Restrictions on Resale.

Under the FCC's decision, virtually every part of an incumbent's business is a "network element" and virtually every "network element" must be turned over to an incumbent's competitors. The FCC has taken the limited right that Congress granted competitors—to obtain from

incumbents physical facilities that are essential to compete but are not reasonably available from other sources—and has transformed that right into an almost unqualified entitlement to use every productive asset of an incumbent's business. As a result, as even the FCC explicitly acknowledged, Pet. App. 242a-44a (Order ¶¶ 328-32), an incumbent's competitors can rely exclusively on unbundled network elements from an incumbent to recreate and then resell finished retail services—and be supported by the incumbent's personnel and support functions.

This opportunity to engage in "sham unbundling" cannot be reconciled with the structure of the Act. The statute expressly creates two distinct entry options short of full facilities-based competition. A competitor that wants to utilize an incumbent's entire network without any facilities of its own can compete on the basis of marketing ability by buying the incumbent's finished services at wholesale rates and reselling them, as permitted under section 251(c)(4). Alternatively, section 251(c)(3) gives the competitor the option of obtaining at cost-based rates the individual "elements" that are reasonably available only from the incumbent's network and then combining those elements with the competitor's own facilities. Unlike a reseller, which obtains use of the same configuration of network facilities that the incumbent uses, a competitor using network elements leased from the incumbent must still design and configure its own network and identify which particular facilities will carry its customers' traffic.

What Congress did not intend is that the FCC would read the Act's provisions on unbundled elements so broadly that a competitor can procure as network elements from an incumbent *all* the facilities and other aspects of a local exchange business required to provide finished services, thereby totally duplicating local exchange service at a price different from that specified in

section 251(c)(4). Rather, Congress expected competitors to use at least some of their own facilities in constructing their networks or to pay the wholesale price for resale of services. Indeed, for that very reason, Congress directed incumbents to provide "physical collocation of equipment necessary for . . . access to unbundled network elements at the premises of the local exchange carrier" so that competitors would have places at which to connect their facilities with the network elements they purchase from incumbents. 47 U.S.C. § 251(c)(6). Congress recognized that a competitor might not be expected to have a full network in place when it begins offering local service and therefore that "[*s*]*ome* facilities and capabilities (e.g., central office switching) will likely *need* to be obtained from the incumbent local exchange carrier as network elements pursuant to new section 251." Conference Report at 148 (emphasis added). Unbundled access was intended to ensure "the interoperability of *both carriers' networks.*" S. Rep. No. 104-23, at 20 (1995) (emphasis added). By contrast, if a competitor wants to use an incumbent's entire network to offer service, the Act provides the option of resale, which permits "*non-facilities-based carriers* to have an opportunity to compete." H.R. Rep. No. 104-204, at 72 (1995) ("House Rep.") (emphasis added). The FCC's unbundling rules, however, allow a non-facilities-based carrier to use unbundled network elements as a substitute for resale at the price reserved for network elements.

The chance to exploit such sham unbundling directly contravenes Congress' goal of encouraging facilities-based competition. Because the FCC's rules give competitors the right to use, at cost-based prices, all of an incumbent's equipment, personnel, and other business assets necessary to run a local telephone business, competitors have little incentive to build their own facilities. It is far easier and less risky for competitors to force the incumbent to build and maintain its network for them, particularly when the opportunity for regulatory arbitrage allows the competitors

to siphon away the incumbent's profitable customers with no risk or investment. Indeed, the ability of new competitors to engage in regulatory arbitrage and gain a free-ride hurts not only incumbents, but also other new entrants that have chosen to engage in actual facilities-based competition.

The FCC's Order also frustrates the purposes of the Act by creating an opportunity for regulatory arbitrage, enabling new entrants to provide the same services as incumbents at lower prices that are the result not of any efficiencies but simply the evasion of universal service support obligations. Congress provided different pricing structures for the alternative competitive strategies of unbundled network elements and resale because of universal service concerns. While incumbents must offer unbundled network elements to rivals at cost—which the FCC has ruled cannot include universal service subsidies, *see* J.A. 153, 155-59 (Order ¶¶ 712, 715-20)—incumbents offer services for resale at prices discounted from retail rates, which do include such implicit subsidies. Congress legislated this difference in order to minimize arbitrage that would simply exploit these regulatory price differentials. *See* House Rep. at 72 ("The [resale] rate should reflect whether, and to what extent, the local dialtone service is subsidized by other services."). Congress was well aware that the traditional means of support for universal service was for states to require incumbent LECs to charge well above cost for some services (such as business services) in order to support below-cost prices for others (such as basic residential service to rural users). As Congress recognized, if resellers could purchase the former services at cost rather than at prices pegged to retail rates, they could lure away the incumbent's high-margin customers by charging less than the incumbent must charge to recoup the cost of serving subsidized customers.

The FCC's rules enable competitors to engage in precisely such arbitrage by allowing them to acquire at cost-

based prices all the network elements required to provide a service, thereby collapsing the distinction between unbundled network elements and resale. By obtaining an incumbent's finished service entirely through the incumbent's network elements at cost-based rates, competitors can undercut above-cost prices and deprive the incumbent of the subsidies that undergird universal service, while avoiding their own obligation to support universal service. At the same time, because competitors can obtain subsidized services at a discount from the below-cost rates incumbents must charge, competitors can resell them at comparably below-cost prices without needing to find subsidies to make up the difference between the actual cost and the price, as the incumbent would.

By creating a regime in which competitors will have every opportunity and incentive to undercut the above-cost prices on which incumbents must rely to support universal service, the FCC has assured through government regulation that incumbents will not, in the aggregate, be able to charge rates that recover their costs. Incumbents will continue to be forced by regulatory mandate to charge below-cost prices for some services. At the same time, because of the FCC's evisceration of the distinction between unbundling and resale, incumbents will not be compensated for providing these below-cost services—as they were previously—by having the ability to charge above-cost rates for other services. Such a reading of the Act threatens confiscation of incumbents' property and turns on its head the usual rule of statutory interpretation that statutes must be construed to minimize their potential constitutional infirmities. *See Edward J. DeBartolo Corp. v. Florida Gulf Coast Trades Council*, 485 U.S. 568, 575 (1988) ("[W]here an otherwise acceptable construction of a statute would raise serious constitutional problems, the Court will construe the statute to avoid such problems unless such construction is plainly contrary to the intent of Congress.").

MCI dismisses this opportunity for new entrants such as itself to engage in arbitrage because the existing implicit subsidies might someday end. MCI Br. at 25. But Congress clearly intended to prevent such arbitrage, no matter how long the opportunity for arbitrage might last —that is precisely why it provided two different pricing standards for unbundled network elements and resale. If Congress believed, as MCI asserts, that arbitrage was not a problem because retail "prices are set by market forces," MCI Br. at 25, then Congress would not have specified that wholesale prices were to be discounted from retail rates rather than based on cost as it required for network elements, interconnection, transport, and termination. Congress specifically chose to rely on discounted retail rates because such rates would "reflect whether, and to what extent, the local dialtone service is subsidized by other services." House Rep. at 72. Moreover, the Act sets no timetable for states to eliminate implicit subsidies, and, more than two years after passage of the Act, no state has abandoned such subsidies or even begun a proceeding to do so.[19]

---

[19] The FCC's elimination of the unbundling/resale distinction also subverts the statutory scheme by permitting competitors to evade the Act's express restriction on the joint marketing of resold local services. Congress sought to create a competitive balance by preventing large long distance carriers from jointly marketing their services with local service acquired from an incumbent Bell operating company under the statutory resale provision *until* that incumbent is authorized to provide long distance service in its home region. *See* 47 U.S.C. § 271(e)(1). This section is intended "to provide parity between the Bell operating companies and other telecommunications carriers in their ability to offer 'one stop shopping' for telecommunications services." S. Rep. No. 104-23, at 43 (1995). But, as even the FCC concedes, an entity providing service through the use of unbundled network elements will not be subject to the joint marketing restriction (presumably because Congress expected such an entity to be engaging in a degree of facilities-based competition rather than simply reselling by another name). Pet. App. 246a (Order ¶ 335). In this respect as well, the FCC's elimination of the limitations on unbundled network elements undermines the statutory structure Congress created.

D. The Combination Rules Invalidated by the Court of Appeals Were Contrary to the Terms of the Act and Were the Final Step in Eliminating Any Distinction between Unbundled Network Elements and Resale.

Even after the FCC had expanded the scope of network elements and rejected any consideration of whether a competitor truly needed to obtain such elements from the incumbent, one difference between the use of unbundled network elements and resale should have remained: With resale, a competitor acquires use of an incumbent's network as a single, assembled service, whereas with unbundling competitors are entitled only to individual elements and must assemble those elements into a functioning network and business themselves. But the FCC did away with this distinction as well. Consistent with its unswerving determination to favor competitors over incumbents in every manner, the agency decreed that incumbents must provide "unbundled" network elements in a prepackaged, combined form whenever a competitor requests. 47 C.F.R. §§ 51.315(b)-(f). Coupled with the FCC's removal of any limits on what pieces of an incumbent's business must be provided as network elements, these combination rules would permit competitors to buy use of an incumbent's *entire* network as a preassembled and preconfigured "UNE platform," under the cloak of unbundled network elements.

The court of appeals rejected this result. As it explained, "[t]o permit [the] acquisition of already combined elements at cost based rates for unbundled access would obliterate the careful distinctions Congress has drawn in subsections 251(c)(3) and (4) between access to unbundled network elements on the one hand and the purchase at wholesale rates of an incumbent's telecommunications retail services for resale on the other." Pet. App. 71a. Under the FCC's rules, new entrants could provide exactly the same services through either unbundled network elements or resale, depending on which price would be most advantageous to them.

The lower court's ruling was compelled by the plain text of section 251, which requires incumbents to provide "*unbundled* network elements in a manner that allows *requesting carriers to combine* such elements in order to provide a telecommunications service." 47 U.S.C. § 251 (c)(3) (emphasis added). This statutory language is entirely consistent with the role that Congress expected unbundled network elements to play. Because Congress intended that incumbents be required to unbundle only the limited number of bottleneck facilities that competitors themselves could not reasonably duplicate, it fully expected that competitors would have to take those individual elements and "combine" them with their own facilities in order to design and construct their own networks. The FCC, having already removed other limits on the nature and use of network elements, disregarded this statutory directive as well and required incumbents to provide network elements to competitors on a precombined basis.

The court of appeals' invalidation of the FCC's combination rule provides a bulwark against the total elimination of Congress' distinction between unbundled elements and resale. Requiring competitors to combine elements, as the statute commands, helps to preserve resale as a distinct option despite its often less advantageous pricing: By choosing resale, a competing carrier can avoid spending the resources and taking the risks that inhere in designing and constructing a network through the combination of individual facilities. Allowing competitors effectively to obtain an incumbent's entire, already-combined network in the guise of unbundled network elements would absolve competitors of the risks associated with selecting and paying in advance for particular facilities and designating the "points" on the incumbent's network where they require access.

Petitioners try to sidestep the clear statutory language of section 251(c)(3) by contending that "unbundled"

means merely offered at separate prices. *See, e.g.*, FCC Br. at 44-45; AT&T Br. at 38-42; MCI Br. at 18-20. And they claim the statutory language assigning an incumbent's competitors the responsibility to "combine" elements simply requires that incumbents not restrict competitors from combining elements obtained from incumbents with other elements. *See, e.g.*, MCI Br. at 22. Thus, Petitioners effectively assert that Congress meant sham unbundling to be a lower-priced version of resale and intended no meaningful distinction between sections 251(c)(3) and (c)(4) of the Act.

Even taken on its own terms, this argument fails to make sense of the FCC's rules. Normally, the sum of the prices for individual pieces of a package is at least equal to (if not greater than, because of lost efficiencies) the price for the package as a whole. Indeed, if that were not the case, a purchaser would never have any reason to buy the package. But the FCC has given new entrants not only the right to obtain pieces of an incumbent's network at separate prices, but the right to obtain *all* the pieces of the network at a total price that will often be far *less* than the price that Congress designated for the whole. Congress dictated that the price for use of the entire network must be based on retail rates, which includes support for universal service subsidies. Under the FCC's vision of unbundling, competitors can obtain use of the same network—on a preassembled basis—at a price equal to the sum of the cost-based rates for each element, which do not include any universal service subsidies. That is obviously not what Congress intended.

Indeed, even under their own definition, petitioners truly seek to turn the concept of "unbundling" on its head. Requiring incumbents "to offer [unbundled] elements for *individual* leasing at *individual* prices," FCC Br. at 44 (emphasis added), protects new entrants by preventing an incumbent from forcing an entrant to take the whole

network or a package of elements, rather than only the individual pieces the entrant needs. Petitioners utterly pervert this justification by insisting that the "unbundling" provisions give them the right to obtain an incumbent's *entire* network as a preassembled whole.

In any event, taking petitioners' argument on its own terms is too generous, because it cannot be squared with the language that Congress used. Although "unbundled" can mean in part "separately priced," the language and structure of the statute as a whole demonstrate that Congress intended "unbundled" also to mean "physically separated." Petitioners improperly ask the Court to consider the term "unbundled" in isolation from the remainder of the statute. *See Bailey v. United States*, 516 U.S. 137, 145 (1995) (a court must "consider not only the bare meaning of the word but also its placement and purpose in the statutory scheme"). In particular, petitioners ignore or deny any connection between the term "unbundled" and the use of the word "combine" in the same sentence of the same subsection. *See, e.g.*, FCC Br. at 44-45; AT&T Br. at 38-42; MCI Br. at 21-22. But section 251(c)(3) requires that an incumbent *"shall provide* such unbundled network elements *in a manner* that allows requesting carriers *to combine"* the elements. That statement necessarily presupposes that the provided elements are not already combined. It would make no sense to say that the incumbent's duty is to provide network elements in a manner that allows entrants to combine them unless Congress intended the entrants to have the responsibility to do the combining. Congress expressly understood "unbundled" to require not only separate prices, but physical disconnection.

Indeed, until it resorted in its brief to this post hoc rationalization that is "entitled to little deference," the FCC itself had always understood that unbundling has a physical component. *See Securities Indus. Ass'n v. Board of Governors of the Fed. Reserve Sys.*, 468 U.S. 137, 143 (1982). In its Order, the FCC explained that " 'access' to network elements 'on an unbundled basis' means that incumbent LECs must provide the facility or functionality of a particular element to requesting carriers, *separate from the facility or functionality of other elements, for a separate fee*." Pet. App. 226a (Order ¶ 268) (emphasis added). In other words, unbundling involves not simply a "separate fee," but separation from "the facility . . . of other elements." Similarly, in discussing the feasibility of unbundling loops that were delivered in an aggregated form by an integrated digital loop carrier ("IDLC"), the FCC stated that "[*o*]*ne way to unbundle* an individual loop from an IDLC is to use a demultiplexer *to separate the unbundled loop(s)* prior to connecting the remaining loops to the switch. Commenters identify a number of other methods for separating out individual loops from IDLC facilities . . . ." J.A. 73 (Order ¶ 384) (emphasis added); *see also id.* at 247-48 (Third Order on Reconsideration ¶ 44) ("Although we conclude that shared transport is *physically severable* from switching, incumbent LECs may not unbundle switching and transport facilities that are already combined, except upon request by a requesting carrier." (emphasis added)).

Petitioners' own comments on the proposal that led to the FCC's Order reflected the same understanding. The Department of Justice, for example, noted that, "[i]n jurisdictions which have begun to open up local markets by requiring the *unbundling* of the local network into the loop, . . . local switching, and interoffice transport elements, a variety of problems have developed in *separating* a customer's loop . . . from the local switch." Reply Comments of the Department of Justice, CC Docket No. 96-98, at 28 n.33 (May 30, 1996) (emphasis added); *see also* Comments of MCI Corp., CC Docket No. 96-98, at 13 (May 16, 1996) ("To the extent an ILEC itself has the ability to separate its network into elements and sub-

elements . . . this demonstrates the technical feasibility of providing those unbundled elements or subelements.").

Petitioners' remaining arguments as to why the Court should ignore Congress' clear directive that "requesting carriers [are] to combine" unbundled network elements are equally unavailing. Petitioners contend that incumbents must provide competitors with network elements in a combined form when those elements are already combined in an incumbent's network in order to ensure "nondiscriminatory access." *See, e.g.*, FCC Br. at 46; AT&T Br. at 35-36; MCI Br. at 20-21. But this argument treats incumbents as though they merely stumbled on their networks already constructed and combined. Of course, it was the incumbent that did the work and spent the money to design a network and combine the individual elements that comprise it. Accordingly, requiring incumbents to hand those preassembled networks over to their competitors is the rule that violates the standard of nondiscrimination. Such a rule discriminates in favor of the competitors by relieving them of the need to combine elements in a network of their own design—the very tasks that the incumbents had to complete before they could provide service.

Finally, Petitioners engage in word games by suggesting that the court below somehow transformed the incumbents' "duty" to provide access to unbundled network elements into a "right . . . to disconnect those elements." *See, e.g.*, FCC Br. at 45-46. The court of appeals' interpretation simply defines the scope of the incumbents' duty: They must provide access to individual, disconnected network elements. The FCC is simply wrong in suggesting that the "grammatical implication of the Eighth Circuit's construction . . . is that incumbent LECs *must* provide access to network elements . . . *only* on a *disconnected* basis." *Id.* at 46 (emphasis in original). Although incumbents' duty is limited to providing access to

individual, unbundled elements, they obviously may go beyond their duty and provide combinations of elements if they so choose.

* * * *

Taken together, the FCC's unbundling rules create a regime entirely foreign to the statutory language, structure, and purposes. In its eagerness to help competitors instead of promoting meaningful competition, the agency rejected Congress' vision of unbundling as a limited option to obtain physical network elements that new entrants need to compete and cannot reasonably build or acquire elsewhere. In its place, the FCC substituted a broad right of cost-based access to virtually every part of an incumbent's business on a precombined basis. The FCC's regime discourages the development of facilities-based competition by eliminating any incentive for a new entrant to invest in rival facilities. It also undermines the foundation of universal service support by encouraging new entrants to engage in regulatory arbitrage and depriving incumbents of the revenues needed to support below-cost prices that they still are required to offer for some services. Petitioners' reliance on *Chevron* thus rings hollow. In determining whether an agency is entitled to deference, courts must "look to the provisions of the whole law, and to its object and policy." *John Hancock Mut. Life Ins. Co. v. Harris Trust and Sav. Bank*, 510 U.S. 86, 94-95 (1993). By that measure, the FCC's unbundling regime cannot stand.

II. THE FCC'S "PICK-AND-CHOOSE" RULE FURTHER ERODES THE ACT'S RELIANCE ON BASIC MARKET PRINCIPLES IN FAVOR OF REGULATORY FIAT.

As the court of appeals recognized, the FCC's "pick-and-choose" rule—under which a competitor can pick for itself at any time (even after it signs an agreement with the incumbent) any term from any of an incumbent's prior or subsequent interconnection agreements—further undermines the statutory structure Congress created. The

rule again exemplifies the FCC's determination to aid new entrants even if the results are contrary to the structure of the Act.

Section 252 is designed to encourage carrers to set the terms and conditions of interconnection and the purchase of network elements and wholesale services through private commercial negotiations. On receiving a request under the provisions of section 251, "an incumbent local exchange carrier may negotiate and enter into a *binding agreement* with the requesting telecommunications carrier" that governs the rates, terms, and conditions of the requesting carrier's purchase. 47 U.S.C. § 252(a)(1) (emphasis added). Both an incumbent LEC and an interconnecting competitor have an explicit duty to negotiate in good faith. 47 U.S.C. § 251(c)(1). They may bargain "without regard" to the Act's pricing, technical, and quality requirements, and a state must approve a negotiated agreement even if it departs from those requirements as long as the agreement is nondiscriminatory and consistent with the public interest. 47 U.S.C. §§ 252 (a)(1), 252(e)(2)(A).

The broad freedom of incumbents and competitors alike to settle voluntarily on the terms and conditions of their interconnection is "[c]onsistent with [Congress'] intent that carriers be encouraged to negotiate and resolve interconnection issues" and reflects Congress' recognition that, in order to reach commercially acceptable agreements, parties must have the flexibility to make tradeoffs and tailor agreements to their particular circumstances. S. Rep. No. 104-23, at 20 (1995). The statutory scheme is "intend[ed] to encourage private negotiation of interconnection agreements." *Id.* at 19. Bilateral negotiations can take into account the economic and other conditions that differ widely from place to place and between pairs of parties, enabling interconnecting carriers to reach arrangements that serve them most efficiently and, under competitive conditions, serve the public interest as well.

The FCC's Order effectively wipes out this statutory scheme. It precludes meaningful negotiation of binding agreements by allowing new entrants "to choose among individual provisions contained in publicly filed interconnection agreements" that incumbent LECs have reached with other carriers. Pet. App. 254a (Order ¶ 1298). Competitors may poach "any individual interconnection, service, or network element arrangement contained in any agreement to which [the incumbent] is a party." 47 C.F.R. § 51.809(a). What is more, a competitor may demand any such term for itself at *any* time, even after it has already signed a contract with an incumbent agreeing to a full package of terms and conditions. *See* Pet. App. 264a-65a (Order ¶ 1316). The competitor need not enter into renegotiations that would give the incumbent a chance to rebalance the relationship to take account of the terms imported from other agreements. Rather, the Order lets the competitor bypass the statutory negotiations *entirely* and demand that a state regulator award it any term agreed to by others. *Id.* at 267a (Order ¶ 1321).

This "pick-and-choose" regulation cannot be reconciled with a statutory scheme that relies on bilateral commercial negotiations to establish "binding agreement[s]," 47 U.S.C. § 252(a)(1), and emphasizes reliance on private negotiations. Bargaining is impossible if one party remains free to avoid its promises by selecting new contract terms at will, and the other party cannot know the extent of its commitments because it cannot know to whom else it will be forced to extend each isolated concession that it makes. And any agreements that are concluded under the "pick-and-choose" rule are not binding. A contract that gives one party unfettered discretion "to deny or change the effect of the promise, is an absurdity." *United States Trust Co. v. New Jersey*, 431 U.S. 1, 25 n.23 (1977).

"Pick and choose" distorts the content of interconnection arrangements as well. A complex commercial agreement is an integrated whole whose terms reflect the give

and take of bargaining. Generally, each party makes concessions in some areas in exchange for benefits in others, reflecting the particular needs and priorities of the parties. A party might, for example, agree to a higher price for one service in exchange for a lower price for another. But "pick and choose" allows one side (the new entrant) to demand the *quid* (the lower price on the first service) without having to take the *quo* with which it was originally paired (the higher price on the other)—regardless of differences in context or in the commercial assumptions on which each bilateral arrangement is based.[20] Given this prospect, an incumbent simply cannot afford to make tradeoffs, and a negotiated agreement that would benefit the negotiating parties will not be reached. The individualized, negotiated agreements Congress envisioned are replaced by "one size fits all" agreements similar to the tariffs that have long pervaded telecommunications regulation.

This preclusion of meaningful negotiations is exacerbated because competitors may pick and choose even from agreements negotiated before the 1996 Act was passed—which most frequently were agreements of convenience between neighboring incumbent LECs under which they handed off calls to each other at the borders of their contiguous territories, often at no charge. *See* Pet. App. 267a-68a (Order ¶ 1322); J.A. 23-24 (Order ¶ 162). By creating a regime in which one party at the bargaining

[20] The FCC did provide incumbents with the option of grouping terms it could "prove" were "legitimately related to the purchase of the individual element being sought." Pet. App. 264a (Order ¶ 1315). But such compartmentalization ignores the reality that a complex commercial agreement involving multiple elements and services must be viewed as a whole—one party may accept a tradeoff that it believes to be somewhat disadvantageous on one element because a tradeoff for another element that is a subject of the same agreement is particularly advantageous. And forcing an incumbent to disclose this type of detailed analysis during negotiations in order to be able to prove later that such a link is "legitimate" or that particular terms were "expressly" linked, AT&T Br. at 50, would have its own chilling effect on negotiations.

table can force the other to comply with terms designed for entirely different circumstances, including even no-charge terms from previous agreements of convenience, the FCC has corrupted Congress' design and ignored its decision to rely on and give maximum effect to private commercial negotiations among carriers.

The FCC tries to ground the "pick-and-choose" rule on section 252(i) of the Act, which provides that a "local exchange carrier shall make available any interconnection, service, or network element provided under an agreement . . . to which it is a party to any other requesting telecommunications carrier *upon the same terms and conditions* as those provided in the agreement." 47 U.S.C. § 252(i) (emphasis added). But the "terms and conditions" of an interconnection contract include all the terms and tradeoffs in the agreement, not separate subsets of terms. Section 252(i) means only that prior interconnection agreements must be made available *as integrated wholes*, so that a second entrant can step entirely into the shoes of an earlier one.[21] The FCC's contrary reading would negate the negotiation scheme established in the remainder of the statute and is therefore not entitled to *Chevron* deference.[22] *See Chevron*, 467 U.S. at 843 n.9;

---

[21] The FCC's suggestion that such a rule would encourage incumbents to lard an interconnection agreement with unrelated terms, FCC Br. at 49-50, ignores the fact that any agreement must be approved by a state commission under a broad public interest standard. 47 U.S.C. § 252(e). Accordingly, any attempt to include unrelated terms in an interconnection agreement would subject it to rejection by the state commission.

[22] The FCC's construction of section 252(i) is also a reversal from how it has previously interpreted similar nondiscrimination obligations, which provides further reason to accord it little deference. *See, e.g., INS v. Cardoza-Fonseca*, 480 U.S. 421, 446 n.30 (1987). For example, the FCC has long required AT&T to serve any requesting customer under a filed interstate tariff, so that AT&T cannot discriminate among customers. In the 1980s, when AT&T sought to offer certain large customers individually tailored packages of interstate services, the FCC allowed AT&T to file a special tariff

NationsBank v. Variable Annuity Life Ins. Co., 513 U.S. 251, 256 (1995) (agency interpretation must be "reasonable in light of the legislature's revealed design").

CONCLUSION

For these reasons, the FCC's unbundling rules and its "pick-and-choose" rule should be vacated in their entirety.

listing each tailored package as a separate tariff option. The FCC required AT&T to allow other customers to buy its services under this tariff, but only if the customer would purchase the entire integrated bundle of services offered under the option; the customer could not just pick and choose individual terms. The FCC ruled at that time—in direct contrast to what it concluded here—that integrated packages of services necessarily involve tradeoffs and cannot be pulled apart, and that making these bundles available to all comers *as integrated wholes* is the proper way to satisfy the Communications Act's nondiscrimination requirements. *See AT&T Communications Revisions to Tariff F.C.C. No. 12*, 7 F.C.C.R. 7039, 7040-42, 7044, 7048-49 (Nov. 22, 1991), *aff'd*, *Competitive Telecom. Ass'n v. FCC*, 998 F.2d 1058, 1062-64 (D.C. Cir. 1993); 47 U.S.C. § 202(a).

APPENDIX

47 U.S.C. § 153. Definitions

* * * *

(29) Network element—The term "network element" means a facility or equipment used in the provision of a telecommunications service. Such term also includes features, functions, and capabilities that are provided by means of such facility or equipment, including subscriber numbers, databases, signaling systems, and information sufficient for billing and collection or used in the transmission, routing, or other provision of a telecommunications service.

* * * *

(43) Telecommunications—The term "telecommunications" means the transmission, between or among points specified by the user, of information of the user's choosing, without change in the form or content of the information as sent and received.

* * * *

(46) Telecommunications service—The term "telecommunications service" means the offering of telecommunications for a fee directly to the public, or to such classes of users as to be effectively available directly to the public, regardless of the facilities used.

47 U.S.C. § 271. Bell Operating Company Entry into InterLATA Services

* * * *

(e) Limitations—

(1) Joint marketing of local and long distance services—Until a Bell operating company is authorized pursuant to subsection (d) of this section to provide interLATA services in an in-region State, or until 36 months have passed since February 8, 1996, whichever is earlier, a telecommunications carrier that

serves greater than 5 percent of the Nation's presubscribed access lines may not jointly market in such State telephone exchange service obtained from such company pursuant to section 251(c)(4) of this title with interLATA services offered by that telecommunications carrier.

QUESTIONS PRESENTED

1. Whether the Federal Communications Commission ("FCC") correctly concluded that in enacting the Telecommunications Act of 1996, Congress intended to grant the FCC exclusive jurisdiction to dictate to the States a prescribed methodology for determining the intrastate component of the prices that an incumbent local exchange carrier ("LEC") may charge competing LECs for access to the incumbent LEC's network, as well as other terms and conditions for the provision of such access.

2. Whether the FCC correctly concluded that in enacting the Telecommunications Act of 1996, Congress intended to grant the FCC exclusive jurisdiction to dictate to the States prescribed rules governing the provision of intraLATA dialing parity, a matter which is almost entirely intrastate in nature.

Joint Explanatory Statement of the Committee of Conference 41, 48

Statistics of Communications Common Carriers (FCC 1996) 5

STATEMENT OF CALIFORNIA

The People of the State of California and the Public Utilities Commission of the State of California (hereinafter collectively "California" or "CPUC") are the sole State parties that challenged both the FCC's *First Report and Order*[1] and its *Second Report and Order*[2] and hence are the sole State respondents who prevailed in both cases below. California, which initiated its transition to local telephone competition in 1993, has an immense interest in bringing fair and effective local competition to its 32 million citizens as soon as possible. With the support of the other participating States and the National Association of Regulatory Utility Commissioners, California files this separate brief on the merits in both cases because of its unique interest and perspective.

STATEMENT OF THE CASE

I. Background

A. The Communications Act of 1934 and the Dual Jurisdictional Scheme

Even before the enactment of the Communications Act of 1934, 47 U.S.C. § 151, *et seq.*, it was well established that the States had exclusive jurisdiction over intrastate telecommunications. In *Smith v. Illinois Bell Telephone Co.*, 282 U.S. 133. 148-149 (1930), for example, this Court made clear that the provision of telephone service is a matter having both intrastate and interstate components and that the intrastate component, a matter of primarily local concern, was subject to

---

[1] 11 FCC Rcd 15499 (1996); J.A. 403-1160.

[2] 11 FCC Rcd 19392 (1996); J.A. 1161-1357.

exclusive State regulation. This had long been the rule with respect to matters subject in part to interstate regulation under the Interstate Commerce Act. *See, e.g., Minnesota Rate Cases*, 230 U.S. 352, 420, 423 (1912).

Thereafter, in 1934, when Congress enacted the Communications Act and transferred telephone regulation from the Interstate Commerce Commission to the newly created Federal Communications Commission, it was careful to ensure that the dual jurisdictional principle of *Smith v. Illinois* applied. Congress created a system of dual regulation through § 2 of the Act, 47 U.S.C. § 152, which granted the FCC jurisdiction over interstate communications, *see* § 2(a) of the Act, 47 U.S.C. § 152(a),[3] while leaving the States exclusive jurisdiction over intrastate matters, *see* § 2(b) of the Act, 47 U.S.C. § 152(b), App. A1.[4]

Section 2(b) provides in relevant part: "[N]othing in this chapter shall be construed to apply or to give the [FCC] jurisdiction with respect to charges, classifications, practices, services, facilities, or regulations for or in connection with intrastate communication service by wire or radio of any carrier." By § 2(b)'s express terms, neither the FCC's general jurisdiction over interstate communications, 47 U.S.C.

---

[3] The FCC's jurisdiction over "interstate" matters did not extend to communications crossing State lines if the communications were "between points . . . in the same State" and "regulated by a State commission." 47 U.S.C. § 153(22), App. A2. Nor did the FCC's jurisdiction extend to *local* calls crossing State lines if regulated "by a State commission." 47 U.S.C. § 221(b), App. A3.

[4] As herein used "J.A." refers to the deferred joint appendix, "Pet. App." refers to the petitioners' appendix, and "App." refers to the appendix to this brief.

§ 152(a), nor its general responsibility for ensuring an efficient national communications system, 47 U.S.C. § 151, may be used to override the jurisdiction over intrastate communications reserved to the States by Congress. *See Louisiana Pub. Serv. Comm'n v. FCC*, 476 U.S. 355, 369-70 (1986).

In addition, to facilitate the FCC's compliance with § 2(b), the 1934 Act authorized (and, under the *Smith* doctrine, *required*) the FCC to engage in the jurisdictional separation of the interstate and intrastate components of the cost of wire telephone toll service by enacting 47 U.S.C. § 221(c), App. A4.[5] Ch. 652, Title II, § 221, 48 Stat. 1080 (June 19, 1934). Thereafter, in 1971, Congress amended the 1934 Act by adding 47 U.S.C. § 410(c), App. A13, Pub. L. 92-131, § 2, 85 Stat. 363 (Sept. 30, 1971), establishing a Federal-State Joint Board procedure to further facilitate the jurisdictional separation of common carrier property and expenses between interstate and intrastate operations in order to facilitate interstate and intrastate ratemaking. The dual jurisdictional scheme and the separations process facilitating it have continuously remained in effect to the present day. *See, e.g., Louisiana*, 476 U.S. at 375-376; *Crockett Telephone Co. v. FCC*, 963 F.2d 1564, 1566-67, 1571 (D.C. Cir. 1992); *NARUC v. FCC*, 737 F.2d 1095, 1103-05 (D.C. Cir. 1984).

B. The AT&T Divestiture

By the early 1970s, regulatory policy in the field of telecommunications had begun to shift, in large part because

---

[5] As noted, jurisdiction over *local* service, whether intrastate or interstate, was assigned exclusively to the States under § 221(b), App. A3-A4.

regulators recognized that evolving technologies had created opportunities to harness the benefits of competition for consumers. In 1982, the United States Department of Justice and AT&T entered into a consent decree under which AT&T was required to divest itself of the 22 then-existent Bell Operating Companies ("BOCs"). *United States v. AT&T*, 552 F.Supp. 131 (D.D.C. 1982), *aff'd mem.*, 460 U.S. 1001 (1983); *see also* 47 U.S.C. §§ 153(3), 153(4). Under the decree, which was known as the "Modification of Final Judgment" or "MFJ," seven regional holding companies, known as the "RBOCs," were formed.

The MFJ created a new geographic unit for the provision of local telephone service, the "Local Access and Transport Area" or "LATA." *See generally* 47 U.S.C. § 153(25), App. A2; *United States v. Western Electric Co.*, 569 F.Supp. 990 (D.D.C. 1983). Under the MFJ, a BOC was allowed to transport calls between telephones within a single LATA – which was called "intraLATA" service – but not between telephones in two different LATAs – which was called "interLATA" service. 47 U.S.C. § 153(21), App. A2. Only an interexchange carrier – and not a BOC – was permitted to carry calls across LATA boundaries. There are now 163 LATAs nationally, and the vast majority of them are situated within the boundaries of a single State.

Virtually all intraLATA calls originating in California and in the United States are intrastate calls and hence subject to exclusive State jurisdiction. The percentage of intraLATA calls originating in California that cross State lines is "miniscule and so small as not to be statistically significant." *California v. FCC*, Eighth Cir. No. 96-3519, California Brief, at 6 n. 2. Nationally, the percentage of intraLATA calls that are interstate is similarly miniscule: "a small fraction of one per

cent" and "so inconsequential as to be *de minimis*." *Id.*, at 7 n. 3; *California v. FCC*, Eighth Cir. No. 96-3519, California Reply Brief, at 3 n. 5. Petitioners have never disputed these statements. *Id.* Nor have they disputed California's representations at oral argument before the Eighth Circuit and in its Brief in Opposition in this Court that only two out of every thousand (.002) intraLATA calls made in the United States are interstate calls. *See, e.g.*, California Brief in Opp., at 3 n. 7. Furthermore, to the extent there *are* intraLATA, interstate telephone calls made in this country, most of *those* calls fall within the jurisdiction of the originating State in any event under 47 U.S.C. § 221(b), App. A3-A4.

Because the percentage of intraLATA calls that are interstate is so small, the FCC does not bother to break down its statistics for intraLATA calls into intrastate and interstate components, although it does so for interLATA calls. *See Statistics of Communications Common Carriers*, Table 2.6, p. 24 (FCC, 1996). Moreover, the FCC has acknowledged as recently as 1994 that most intraLATA calls "are intrastate and not within our purview." *Notice of Proposed Rulemaking* ("*NPRM*"), *Administration of the North American Numbering Plan*, 9 FCC Rcd 2068, 2077 n. 93 (1994).[6]

It is also notable that in other contexts, the FCC has ruled under its jurisdictional separations procedures, 47 U.S.C.

---

[6] It is also notable that some 92 per cent of *all* telephone calls originating in California are intrastate in nature. *Statistics of Communications Common Carriers* (FCC, 1996), at 24. Remarkably, in 1995 there were significantly more intrastate telephone calls made in California (70+ billion) than there were interstate telephone calls made in the entire United States (50+ billion)! *Id.* Thus the FCC's usurping State authority over intrastate telecommunications leaves a very thin interstate tail wagging a very substantial intrastate dog.

§§ 221(c) and 410(c), App. A4, A13, that the federal interest in regulating service which involves less than 10 per cent interstate traffic is *de minimis* and not subject to FCC authority. *See Decision and Order, In the Matter of MTS and WATS Market Structure*, 4 FCC Rcd 5660 (1989), *adopting Recommended Decision and Order*, 4 FCC Rcd 1352 (1989).

IntraLATA telephone calls can be either "local" calls or "toll" calls. IntraLATA calls that remain within the caller's local calling area – the area in which local exchange calls are made without additional charge beyond the flat monthly rate – are "local" calls. IntraLATA calls that are completed outside the caller's local calling area, and for which a premium charge is assessed, are "toll" calls. 47 U.S.C. § 153(48), App. A3. However, neither the AT&T divestiture nor the creation of LATAs under the MFJ in any way affected the dual jurisdictional scheme established by Congress. Indeed, the MFJ court repeatedly acknowledged that under the decree, the States retained authority over both intraLATA and intrastate service. *United States v. Western Electric Co., supra*, 569 F.Supp. at 1005; *see also United States v. Western Electric Co.*, 569 F.Supp. 1057, 1109 (D.D.C.), *aff'd mem. sub nom. California v. United States*, 464 U.S. 1013 (1983). Since the AT&T divestiture, the States have continued to regulate intrastate service – whether the *intrastate* calls involved are intraLATA local calls, intraLATA toll calls or interLATA toll calls – while the FCC has continued to regulate interstate interLATA (long distance) service, as well as the miniscule realm of interstate intraLATA toll service. 47 U.S.C. §§ 152, 153(22), 221(b), App. A1, A2, A3-A4.

Following the AT&T divestiture, most States granted an exclusive monopoly franchise to a single carrier in each local

exchange area for the provision of local and intrastate intra-LATA toll service. These companies are called local exchange carriers or "LECs." 47 U.S.C. § 153(26), App. A3. While not required to do so, a number of States have in recent years chosen to introduce competition into the provision of intrastate telephone service. California is among those States. *See, e.g., Decision 94-09-065, Re Alternative Regulatory Frameworks for Local Exchange Carriers*, 56 Cal.P.U.C.2d 117, 141 (1994).

C. The Telecommunications Act of 1996

In 1996, Congress enacted the Telecommunications Act of 1996[7] to open all telecommunications markets, including local markets, to competition. The Act established a set of duties with which incumbent LECs were required to comply and identified the functions, features and services that incumbent LECs were required to make available to competing LECs, as well as the mutual duties of carriers to each other. 47 U.S.C. § 251, App. A4-A9.[8] The duties imposed upon the incumbent LECs included the duties to interconnect with competitors (47 U.S.C. § 251(c)(2), App. A6) and to provide access to unbundled network elements (47 U.S.C. § 251(c)(3), App. A6) at "just and reasonable" rates "based on . . . cost" as determined by a State commission (47 U.S.C. § 252(d)(1), App. A10), and the duty to resell telecommunications services

---

[7] Pub. L. No. 104-104, 110 Stat. 56 (Feb. 8, 1996), *codified in part at and amending* the Communications Act of 1934, 47 U.S.C. §§ 151, *et seq.*

[8] Unless otherwise specified, statutory references are to the 1934 Act, as amended by the 1996 Act.

(47 U.S.C. § 251(c)(4), App. A7) at wholesale rates as determined by a State commission (47 U.S.C. § 252(d)(3), App. A11).

The Act authorized carriers to negotiate agreements relating to the terms and conditions upon which interconnection, the purchase of unbundled network elements and resale would occur in order to allow a competing carrier access to the incumbent's network. 47 U.S.C. § 252. To the extent that such negotiations were unsuccessful, it authorized State commissions to arbitrate and resolve disputes, and it permitted aggrieved carriers to appeal State commission determinations to Federal district courts. *Id.* Only if a State commission failed to carry out its responsibility under § 252 was the FCC empowered to "assume the responsibility of the State commission. . . . " 47 U.S.C. § 252(e)(5).

The duties imposed on incumbent LECs also included the duty "to provide dialing parity to competing providers of telephone exchange service and telephone toll service." 47 U.S.C. § 251(b)(3), App. A5. The term "dialing parity" means that a competitor of a LEC can provide telecommunications services in a way that allows the caller to route the call automatically, without dialing extra digits, to the designated carrier of the caller's choice from among 2 or more carriers (including the LEC). *See* 47 U.S.C. § 153(15), App. A1.

By its terms, § 251(b)(3) addresses the duty of carriers to provide *intraLATA* dialing parity, not *interLATA* dialing parity. The provision of interLATA, or long distance, dialing parity was accomplished pursuant to rules established and enforced more than a decade ago following the AT&T divestiture by the MFJ court, the FCC and the States. In 1984, the MFJ required dialing parity for interLATA calls by requiring

that customers of the BOCs be permitted to preselect a competing interexchange carrier to carry their interLATA calls and to route calls to that carrier's network simply by dialing "1" plus the called party's telephone number. *United States v. AT&T*, *supra*, 552 F.Supp. at 233. GTE, a large LEC that was not one of the BOCs, was subject to a similar dialing parity or "equal access" requirement imposed by consent decree. *United States v. GTE Corp.*, 603 F.Supp. 730 (D.D.C. 1984). And other LECs have generally been required to follow this dialing parity model for interLATA calls by the States and the FCC. *See, e.g., NPRM, Administration of the North American Numbering Plan*, *supra*, 9 FCC Rcd at 2077, ¶ 55. Since dialing parity issues related to interLATA calls were long ago resolved under the so-called "1 plus" framework, the dialing parity issue in this case is whether the FCC's establishment of dialing parity standards and related requirements for intraLATA calls in the *Second Report and Order* impermissibly intrudes on legitimate State authority over intrastate telecommunications. As above noted, virtually all intraLATA calls made in California and across the nation are intrastate calls. Moreover, dialing parity only involves the *origination* of telephone calls, not the receipt or termination of calls, and hence as a practical matter only implicates the regulatory regime applicable in the originating State.

A few narrow provisions of the Act expressly gave the FCC authority over matters having intrastate aspects (*see, e.g.*, 47 U.S.C. § 251(b)(2), App. A5, granting the FCC jurisdiction over number portability and numbering administration), while other provisions arguably gave the States jurisdiction over matters having interstate aspects (*see, e.g.*, 47 U.S.C. § 251(b)(4), App. A5, granting the States jurisdiction over access to poles, ducts, conduits and rights-of-way). By

and large, however, the 1996 Act did not fundamentally alter the dual State/Federal jurisdictional scheme established by Section 2(b) of the 1934 Act, 47 U.S.C. § 152(b), App. A1. By leaving § 2(b) intact when it passed the 1996 Act (with narrow and limited exceptions), Congress preserved the FCC's broad authority over "interstate" matters but also continued to fence off from FCC reach and regulation "intrastate" matters which fall within the exclusive authority of the States. Indeed, early versions of the Act would have excepted the local competition portions of the Act from the reach of § 2(b), but the final version of the Act omitted the exception. As the Court has noted: "Where Congress includes limiting language in an earlier version of a bill but deletes it prior to enactment, it may be presumed that the limitation was not intended." *Russello v. United States*, 464 U.S. 16, 23-24 (1983).

Moreover, Congress further reinforced § 2(b) and the dual jurisdictional scheme by enacting the savings provision of § 601(c)(1) of the 1996 Act, App. A14, Pub. L. 104-104, Title VI, § 601(c)(1), 110 Stat. 143 (Feb. 8, 1996) (enacted but not codified), which clarified that neither § 2(b) nor any provision of State law was altered by the Act unless the Act did so *expressly*. Section 601(c)(1) states:

> (c) Federal, State and Local Law. –
>
> (1) No implied effect. – This Act and the amendments made by this Act shall not be construed to modify, impair, or supersede Federal, State, or local law unless expressly so provided in such Act or amendments.

II. The Decisions Below

A. The First Report and Order and Pricing

With the enactment of the new law, the FCC saw opportunity. It issued its epic *First Report and Order* and implementing regulations which tore asunder the dual jurisdictional scheme wrought by Congress by asserting FCC jurisdiction over intrastate matters which Congress reserved to the States, dictated a single methodology for the intrastate pricing of local competition services nationally which it required the States to employ,[9] deputized the States to carry out its policies, and appointed itself the court of review of all State actions.[10]

The FCC took these actions despite provisions in the 1996 Act which plainly gave authority over pricing determinations to the States. For example, § 252(d), entitled "Pricing standards," provides that "[d]eterminations *by a State commission* of the just and reasonable rate" for interconnection and for network elements shall be based on cost (emphasis added). App. A10-A11. Similarly, § 252(c)(2) provides: "In resolving by arbitration . . . any open issues and imposing conditions upon the parties to the agreement, *a State commission* shall . . . establish any rates for interconnection, services, or network elements . . . " (emphasis added). App. A10. And § 252(d)(3) provides that "*a State commission* shall determine wholesale rates on the basis of retail rates . . . "

---

[9] It did so despite significant differences in evolving local markets and network investment, and in derogation of proceedings in numerous States, including California, which had begun the process of transitioning to local telephone competition years before the 1996 Act was conceived.

[10] *First Report and Order*, ¶¶ 126-128; J.A. 468-469.

(emphasis added). App. A11. These provisions manifestly confer pricing authority on the States, not the FCC, subject only to the standards set forth in the Act.

The FCC's exercise of jurisdiction over intrastate matters was also taken in derogation of § 2(b) and the dual jurisdictional scheme, *see Louisiana*, *supra*, 476 U.S. at 370, even though the FCC candidly acknowledged in its order that the pricing provisions of §§ 251 and 252 "do not contain an explicit grant of intrastate authority to the Commission" – the necessary predicate to override § 2(b). *First Report and Order*, ¶ 84; J.A. 448.

B. The Second Report and Order and Dialing Parity

On the same day it issued the *First Report and Order*, the FCC issued its similarly lengthy *Second Report and Order* which arrogated to itself the power to dictate to the States the rules and standards for intraLATA dialing parity, even though almost every telephone call in the United States which is subject to those rules and standards is intrastate in nature.[11] In the *Second Report and Order*, the FCC asserted jurisdiction over policies and regulations relating to the provision by LECs of intrastate dialing parity. In making that jurisdictional

---

[11] The rules for interLATA or long distance dialing parity were established more than a decade ago following the AT&T divestiture, leaving the sole question the appropriate dialing parity rules for intraLATA calls (both local and toll). It was undisputed below that *no* measurable percentage of intraLATA calls (local and toll) associated with California LATAs is interstate in nature, and that nationally .002, or approximately 2 out of every 1000 intraLATA calls (local and toll), are interstate in nature. Moreover, a scant two per cent of intraLATA *toll* calls are interstate in nature.

determination and adopting regulations to implement intrastate dialing parity under 47 U.S.C. § 251(b)(3), App. A5, the FCC merely *assumed* it possessed such authority and failed to address § 2(b) and the several provisions of the 1996 Act which confirm that the States retain jurisdiction over intrastate dialing parity.

More specifically, the FCC purported to "delegate" a modicum of authority to the States over intrastate dialing parity for the time being. Nevertheless, it dictated a "minimum" presubscription standard for intraLATA or intrastate toll dialing parity – the so-called "full 2-PIC method"[12] – which according to the *Second Report and Order* is the *only* permissible method of presubscription that is currently technically feasible. *Second Report and Order*, ¶¶ 5, 37, 49, J.A. 1169, 1183, 1188; 47 C.F.R. § 51.209, Pet. App. 348a. The FCC therefore effectively dictated that States adopt the "full 2-PIC method" *only*, even though the so-called "modified 2-PIC method," which they prohibit, satisfies the definition of "dialing parity" contained in the 1996 Act. 47 U.S.C. § 153(15), App. A1.

The FCC also prohibited a State from establishing an interim default mechanism by which a LEC could assign itself as the intraLATA toll service provider of a new LEC customer who does not affirmatively choose an intraLATA toll service provider, thus requiring the customer to dial a carrier access code for each intraLATA toll call or intrastate toll call until

---

[12] The "full 2-PIC method" requires that a customer be allowed to select two presubscribed carriers (in addition to its LEC), one for intraLATA toll calls and another for interLATA calls. A "modified 2-PIC method" would permit the customer to choose an intraLATA toll service provider from among the LEC and the interLATA service provider.

the customer makes a permanent, affirmative selection. *Second Report and Order*, ¶ 78, J.A. 1203; 47 C.F.R. § 51.209(c), Pet. App. 349a. It required carriers to develop and submit detailed implementation plans and imposed on States and carriers an implementation schedule, the violation of which would purportedly result in the FCC's taking control from the States of the entire intrastate and intraLATA dialing parity implementation process. *Second Report and Order*, ¶¶ 38, 59, J.A. 1183-1184, 1193; 47 C.F.R. §§ 51.211, 51.213, Pet. App. 349a-353a.

While the FCC considered implementing local dialing parity requirements and methodologies, *see Second Report and Order*, ¶¶ 64-75, J.A. 1196-1202, it concluded that "local dialing parity will be achieved upon implementation of the number portability and interconnection requirements of section 251" and therefore "decline[d] to prescribe now any additional guidelines addressing the methods that LECs may use to accomplish local dialing parity." *Id.* at ¶ 71, J.A. 1199. However, its discussion of local dialing parity did not preclude it from imposing local dialing parity requirements at some future date nor did it address the fact that the Act leaves local calls, whether intrastate or interstate, subject to exclusive State jurisdiction. 47 U.S.C. § 221(b), App. A3-A4. Finally, the FCC established "national" rules for a LEC's recovering the costs incurred in implementing the dialing parity requirements. *Second Report and Order*, ¶¶ 92-95, J.A. 1209-1211; 47 C.F.R. § 51.215, Pet. App. 353a.

In exercising jurisdiction over intraLATA and intrastate dialing parity, the FCC nevertheless expressly acknowledged that the regulation of dialing parity is separable into intraLATA and interLATA components or, alternatively, into intrastate and interstate components. *Second Report and Order*,

¶ 37, J.A. 1183. The FCC also acknowledged that § 251(g), App. A9, which preserves the equal access obligations of the BOCs under the MFJ, has nothing to do with the FCC's dialing parity requirements imposed under § 251(b)(3), App. A3-A4. The FCC said: "That section [251(g)] contains no reference or cross reference to dialing parity or to section 251(b)(3). Section 251(g) preserves the equal access obligations already imposed on the BOCs and GTE, but does not exempt them from the toll dialing parity requirements." *Second Report and Order*, ¶ 29, J.A. 1178-1179. And, as above noted, the equal access obligations of the BOCs under the MFJ do not include intraLATA dialing parity. *United States v. Western Electric Co.*, *supra*, 569 F.Supp. at 1005; *United States v. Western Electric Co.*, *supra*, 569 F.Supp. at 1109.

C. The Eighth Circuit's Decisions

The FCC's actions spawned a flurry of petitions for review from State commissions and carriers. All told, thirty-three States,[13] along with many other parties, challenged the FCC's opportunistic seizure of pricing authority in the United States Court of Appeals for the Eighth Circuit. Some sought a partial stay of the FCC's pricing rules pending decision on the merits, and the Eighth Circuit granted the stay. *Iowa Utils. Bd. v. FCC*, 109 F.3d 418 (8th Cir. 1996), J.A. 224-242. On motions to vacate the stay filed by the petitioners herein, this Court unanimously declined to disturb the ruling, rejecting petitioners' claims that there was a "reasonable probability"

---

[13] This number includes State parties who participated in the motion to enforce the Eighth Circuit's mandate following its *Iowa Utils. Bd.* decision.

that four members of the Court would vote to grant certiorari, a "significant possibility" of reversal of the Eighth Circuit's decision and "a likelihood" of irreparable harm arising from the decision. *See FCC v. Iowa Utils. Bd.*, 117 S. Ct. 378 (No. A-299 Oct. 31, 1996) (Thomas, J., in chambers), 117 S. Ct. 429 (No. A-299 Nov. 12, 1996) (per curiam). In addition, California and several carriers, along with a host of supporting intervenors, challenged the FCC's opportunistic seizure of intraLATA dialing parity jurisdiction.

After full briefing and argument, the Eighth Circuit rendered its final decision in the pricing case, fully consistent with its earlier stay ruling, vacating the pricing regulations contained in the *First Report and Order* and associated FCC regulations. *Iowa Utils. Bd. v. FCC*, 120 F.3d 753 (8th Cir. 1997), Pet. App. 1a-67a. The Eighth Circuit also rendered its final decision in the dialing parity jurisdiction case, vacating the dialing parity regulations contained in the *Second Report and Order* and associated FCC regulations. *California v. FCC*, 124 F.3d 934 (8th Cir. 1997), Pet. App. 73a-91a.

These proceedings on writs of certiorari follow.

SUMMARY OF ARGUMENT

In enacting the Telecommunications Act of 1996, Congress did not grant the FCC exclusive jurisdiction to dictate to the States a prescribed methodology for determining the prices that an incumbent LEC may charge competing LECs for access to the incumbent LEC's network. Nor did it grant the FCC exclusive jurisdiction to dictate other terms and conditions for the provision of such access. Instead, Congress straightforwardly and unambiguously assigned to the States exclusive authority, subject only to the standards contained in

the Act itself, to determine the prices and pricing methodologies, and the other terms and conditions, under which an incumbent LEC must provide a competing LEC with access to the incumbent LEC's local network. *See* 47 U.S.C. §§ 252(c)(2), 252(d) and 252(d)(3), App. A10-A11. Section 251(d)(1) of the Act, the primary provision relied on by the FCC, is merely a procedural statute and does not constitute a straightforward and unambiguous grant of authority to the FCC to implement the matters addressed in § 251. Nor does the FCC derive support for its position from §§ 154(i), 201(b), 251(d)(2), 251(d)(3) or 303(r), none of which unambiguously grants the FCC the authority it seeks.

In addition, § 2(b) of the Act, 47 U.S.C. § 152(b), App. A1, fences off from FCC reach and regulation intrastate matters. *Louisiana*, *supra*, 476 U.S. at 370. Since Congress expressed no clear intent to grant the FCC authority over pricing and the other terms and conditions under which a LEC provides competitors with access to its local network – a fact the FCC concedes – the dual jurisdictional scheme remains intact with respect to such matters. Moreover, both the legislative history of the 1996 Act and the savings clause of § 601(c)(1) of the Act, App. A14, make manifest that Congress intended § 2(b) to apply to pricing and related matters. Accordingly, the States, not the FCC, have jurisdiction over the intrastate aspects of those matters.

The principle of *Chevron* deference (*Chevron U.S.A. Inc. v. NRDC*, 467 U.S. 837 (1984)), is inapplicable to this case. If the 1996 Act *expressly* grants either the States or the FCC exclusive jurisdiction over pricing and related matters, the principle of *Chevron* deference is inapplicable because "the intent of Congress is clear." *Chevron*, 467 U.S. at 842. If, however, the 1996 Act does not *expressly* grant exclusive

jurisdiction over pricing and related matters either to the States or to the FCC, *Chevron* is still inapplicable because the two mandatory rules of statutory construction contained in §§ 2(b) and 601(c)(1) of the Act, App. A1, A14, supersede the judge-made principle of *Chevron* in the circumstances presented.

Those provisions also preclude the construction of the statute advocated by the FCC. The FCC concedes as much when it acknowledges that §§ 251 and 252 "do not contain an explicit grant of intrastate authority to the Commission." *First Report and Order*, ¶ 84; J.A. 448. This Court has held that under § 2(b), the absence of such an explicit grant of authority precludes Federal preemption. *Louisiana*, *supra*, 476 U.S. at 368-69, 377. Moreover, in addition to §§ 2(b) and 601(c)(1), Congress left intact the jurisdictional separations requirements of 47 U.S.C. §§ 221(c) and 410(c), App. A4, A13, thereby further demonstrating its intent that the dual jurisdictional scheme be applicable to the amended statute. *Id.* at 375-376.

The FCC's argument that § 2(b) "cannot logically be construed to mean that [it] limits the scope of the Commission's authority *more* than it limits the substantive reach of federal telecommunications law" is similarly without merit. *See* FCC Brief, at 34. That argument is contrary to the plain language of § 2(b) and the purpose of § 2(b) as articulated by this Court – to "fence off from FCC reach or regulation intrastate matters – indeed, including matters 'in connection with' intrastate service." *Louisiana*, *supra*, 476 U.S. at 370. The argument is also inconsistent with the canons of construction that statutory terms connected by a disjunctive be given separate meanings and that a statute not be construed to render a portion of its text mere surplusage.

The FCC's argument that "[s]ection 2(b) . . . [was] intended to bar the Commission from exercising its 'ancillary' jurisdiction . . . over intrastate matters . . . to which the Act itself does not clearly extend" is unpersuasive. FCC Brief, at 34, *citing Louisiana* and *Houston, E. & W. Texas Ry. v. United States*, 234 U.S. 342 (1914) (*Shreveport Rate Case*). *Louisiana* nowhere refers to the FCC's ancillary jurisdiction and broadly refutes the argument that § 2(b) is subject to a narrowing construction because one of Congress' purposes in enacting § 2(b) was to legislatively overrule *Shreveport*. 476 U.S. at 370, 372-373. Congress' affirmative retention of § 2(b) and the broad construction of that section in *Louisiana*, of which Congress must be presumed to have been aware, strongly suggests the contrary. Finally, the FCC's construction would create a slippery slope, leaving the States without any role at all in the transition to local competition.

The FCC's reliance on the so-called "impossibility" exception to § 2(b), *see Louisiana*, 476 U.S. at 375-376 n. 4, is also misplaced. Not only was that doctrine *not* a stated basis for the FCC's decisions below, *see SEC v. Chenery Corp.*, 332 U.S. 194, 196 (1943), but it is flatly refuted by the other FCC and court decisions which have found that the dual jurisdictional scheme applies to the prices or rates charged by LECs for "access," "unbundled access" and "interconnection" to the local network. *MTS & WATS Market Structure: Third Report and Order*, 93 F.C.C.2d 241, 260-265 (1983), *aff'd, NARUC v. FCC, supra*, 737 F.2d 1095, 1114, 1115 (LEC intrastate access charges to interexchange carriers subject to dual jurisdictional scheme); *ONA Reconsideration Order*, 5 FCC Rcd 3084, 3088-3090, 3100 n. 111 (1990), *reversed on other grounds, California v. FCC*, 4 F.3d 1505 (9th Cir. 1993) (LEC unbundled basic service element charges to enhanced

service providers subject to dual jurisdictional scheme); *In the Matter of the Need to Promote Competition and Efficient Use of Spectrum for Radio Common Carrier Services*, 2 FCC Rcd 2910 (1987) (LEC interconnection charges to cellular carriers subject to dual jurisdictional scheme). In addition, the FCC cannot implicate the exception by simply abdicating its statutory responsibility and refusing to engage in the jurisdictional separations process. *Smith v. Illinois*, *supra*, 282 U.S. at 148-149; *Crockett Telephone Co. v. FCC*, *supra*, 963 F.2d at 1571.

The FCC's argument that jurisdiction must be found to repose in the FCC in order to expedite appellate review and hence the finality of agency determinations (FCC Brief, at 40) must be rejected because it asks the Court to *legislate*. Congress chose to give the States responsibility to make the initial determination of pricing and related matters, with appellate review through the Federal court system, in order to accord at least some degree of respect to local and regional differences in markets and competitive conditions and the ability of State regulators to address those differences. As in *Louisiana*, it is not for the FCC or this Court to effectuate a legislative approach which Congress consciously rejected.

Nor does the Act permit the FCC to dictate to the States nationwide policies and rules governing a LEC's provision of intraLATA dialing parity to competing service providers.[14] This brief addresses intraLATA dialing parity, rather than

---

[14] If the Court concludes that the Act grants the States *express* authority over pricing and related matters, as found by the Eighth Circuit, then dialing parity, with its unique factual setting, will be the *only* jurisdictional issue which requires the Court to address a § 2(b) analysis.

intrastate dialing parity, for three reasons: (1) the establishment of dialing parity requirements for the *interLATA*, or *long distance*, market occurred more than a decade ago with the imposition of the "1 plus" presubscription methodology under the supervision of the MFJ court, the FCC and the States, and is therefore irrelevant to the issue before the Court, (2) since virtually all intraLATA calls are intrastate calls which, under § 2(b), fall within exclusive State jurisdiction, § 2(b) leaves the matter of intraLATA dialing parity to the States, and (3) the § 251(b)(3) duty of LECs "to provide dialing parity to competing providers of telephone exchange service and telephone toll service" appears to address only intraLATA dialing parity, in part because the BOCs, which provide the overwhelming majority of LEC service nationally, are not yet permitted to compete in the interLATA, or long distance, market.

In enacting the 1996 Act, Congress expressed no clear intent to preclude § 2(b)'s applicability to the dialing parity duty placed on carriers by § 251(b)(3). Indeed, as noted, the FCC has conceded that § 251 does not contain "an explicit grant of intrastate authority to the Commission." *First Report and Order*, ¶ 84, J.A. 448. Hence the dual jurisdictional scheme remains intact with respect to § 251(b)(3). Moreover, both the legislative history of the 1996 Act and the savings clause of § 601(c)(1) make manifest that Congress intended § 2(b) to apply to dialing parity and related matters. Accordingly, the States, not the FCC, have jurisdiction over intraLATA dialing parity.

Other provisions of the 1996 Act also demonstrate that the FCC exceeded its authority in purporting to adopt standards and rules governing intrastate and intraLATA dialing parity. Several subdivisions of § 251 – §§ 251(b)(2) and

251(e)(1), App. A5, A8-A9 – expressly grant the FCC *authority* over number portability and numbering administration, but § 251(b)(3), App. A5, which involves dialing parity, contains no such affirmative grant of jurisdiction. Moreover, § 251(e)(2), App. A9, grants the FCC authority over cost recovery relating to number portability and numbering administration, but contains no such affirmative grant of jurisdiction with respect to dialing parity cost recovery.

In addition, Congress directly addressed "intraLATA toll dialing parity" in § 271(e)(2)(B), App. A12-A13, twice referring to *State* authority to implement such dialing parity. And in the "competitive checklist" for BOCs seeking to provide interLATA service, Congress characterized number portability, but not dialing parity, as a matter on which the FCC "issues regulations pursuant to section 251." 47 U.S.C. §§ 271(c)(2)(B)(xi), 271(c)(2)(B)(xii), App. A12. Finally, the FCC's heavy reliance on § 251(g), App. A9, is apparently abandoned in this Court. By the FCC's own admission, § 251(g) is inapplicable to the dialing parity requirements imposed by § 251(b)(3). *Second Report and Order*, ¶ 29, J.A. 1178.

ARGUMENT

I. THE FIRST REPORT AND ORDER MUST BE VACATED BECAUSE THE 1996 ACT EXPRESSLY GRANTS THE STATES' EXCLUSIVE AUTHORITY OVER THE PRICING OF ACCESS TO AN INCUMBENT LOCAL EXCHANGE CARRIER'S NETWORK

The Eighth Circuit correctly determined that Congress straightforwardly and unambiguously assigned to the States exclusive authority, subject only to the standards contained in

the Act itself, to determine the prices and pricing methodologies, and the other terms and conditions, under which an incumbent LEC must provide a competing LEC with access to the incumbent LEC's local network. For example, § 252(d), entitled "Pricing standards," provides that "[d]eterminations *by a State commission* of the just and reasonable rate for the interconnection of facilities and . . . for network elements . . . shall be . . . based on the cost . . . of providing the interconnection or network element . . . " 47 U.S.C. § 252(d)(1), App. A10 (emphasis added). Similarly, § 252(c)(2) provides: "In resolving by arbitration . . . any open issues . . . , *a State commission* shall . . . establish any rates for interconnection, services, or network elements . . . " (emphasis added). And § 252(d)(3), App. A11, provides that "*a State commission* shall determine wholesale rates on the basis of retail rates . . . " (emphasis added). These provisions manifestly confer exclusive pricing authority on the States, not the FCC.

The FCC nevertheless argues that Congress gave it the authority to prescribe pricing methodologies, and other terms and conditions of local competition, to the States by providing in § 251(d)(1) that "[w]ithin 6 months after February 8, 1996, the Commission shall complete all actions necessary to establish regulations to implement the requirements of this section." App. A10. The flawed assumption upon which this argument rests is that Congress' requiring the FCC to "establish regulations to implement the requirements of this section" is an unambiguous grant of jurisdiction to the FCC over all matters comprehended in § 251. To the contrary, in view of the numerous matters addressed in § 251 but expressly assigned to the States by § 252 and other provisions of the Act, § 251(d)(1) is properly read as merely requiring the FCC

to assure that there are no gaps in the procedural rules for implementation of the Act, not to dictate substantive methodologies which render a State's statutorily-assigned pricing determinations largely ministerial. The reading suggested by the FCC would allow it to usurp the States' clear authority to determine whether rates are "based on . . . cost," "just and reasonable" and based on "retail rates." 47 U.S.C. §§ 252(d)(1), 252(d)(3), App. A10, A11. Contrary to the FCC's argument, § 251(d)(1) does not authorize the FCC to override the substantive determinations which the Act otherwise expressly assigns to the States.

Nor do §§ 251(d)(2) and 251(d)(3), App. A8, aid the FCC. Section 251(d)(2) merely clarifies that the FCC has authority to determine, at least in part, "what network elements should be made available" pursuant to § 251(c)(3) – a matter no one has disputed. And § 251(d)(3), by its terms, is intended to *preserve* State access regulations, not preempt them. While the language of § 251(d)(3)(C), App. A8, may suggest some narrow FCC authority to preclude enforcement of a particular State commission regulation which "substantially prevent[s] implementation of the requirements of this section *and* the purposes of this part," it hardly authorizes the FCC to override substantive determinations which the Act expressly assigns to State commissions. Moreover, § 251(d)(3)(B), App. A8, suggests that State determinations under 251 are to be "consistent with the requirements of this section," not the pronouncements of the FCC.[15]

---

[15] Nor do the other provisions on which the FCC relies for a grant of intrastate jurisdiction – 47 U.S.C. §§ 154(i), 201(b) and 303(r) – support its argument. Reliance on these provisions is largely undermined by the FCC's acknowledgments that §§ 251 and 252 "do not contain an explicit grant of

As the 1996 Act gives the States unambiguous authority to establish the "just and reasonable" prices "based on . . . cost" and "wholesale rates" based on "retail rates" under which an incumbent LEC provides a competing LEC with access to its network, subject only to the pricing standards articulated in the Act itself, the FCC's pricing regulations are *ultra vires* and were properly vacated by the Eighth Circuit.

II. THE FIRST REPORT AND ORDER MUST BE VACATED BECAUSE THE 1996 ACT PRESERVED THE DUAL JURISDICTIONAL SCHEME

The Court, however, need not reach the foregoing argument to resolve these cases in favor of the States. Under the familiar dual jurisdictional framework established by § 2(b) of the Act, and reaffirmed by the Court in *Louisiana*, the FCC's attempt to regulate the intrastate component of pricing and related matters is plainly beyond its statutory authority.

---

intrastate authority" and that "sections 251 and 252 do not alter the jurisdictional division of authority with respect to matters falling outside the scope of these provisions." *First Report and Order*, 70, 84; J.A. 440, 448; footnote omitted. Beyond this, § 154(i) merely authorizes FCC actions "not inconsistent with this chapter." Section 201(b) relates back to § 201(a) which by its terms is limited to "interstate or foreign communication by wire or radio." And § 303(r) authorizes rulemaking "not inconsistent with law, as may be necessary to carry out the provisions of this chapter." None of these provisions provides the "unambiguous" and "straightforward" grant of authority over intrastate matters required by *Louisiana*, 476 U.S. at 377, and each of them is subject to the limitation on FCC jurisdiction over intrastate matters engendered in § 2(b), 47 U.S.C. § 152(b). *Id.*

A. The Principle of Chevron Deference is Inapplicable to this Case

Contrary to the assertions in the FCC's brief (at pp. 17, 42), the principle of *Chevron* deference[16] is inapplicable to this case. If the States are correct that the 1996 Act *expressly* grants them exclusive jurisdiction over pricing and related matters, *see* Argument I, *supra*, or if the FCC is correct that the Act *expressly* grants *it* exclusive jurisdiction over such matters, then the principle of *Chevron* deference is inapplicable because "the intent of Congress is clear." *Chevron*, 467 U.S. at 842.

If, however, the Court concludes that the 1996 Act does not *expressly* grant exclusive jurisdiction over pricing and related matters either to the States or to the FCC, *Chevron* is still inapplicable. That is so because Congress included in the Act two mandatory rules of statutory construction, both applicable to the jurisdictional questions here, which supersede the judge-made principle of *Chevron* in the circumstances presented. First, in § 2(b) of the 1934 Act, as amended, 47 U.S.C. § 152(b), Congress stated that "*nothing* in this chapter *shall be construed* to apply or to give the Commission jurisdiction with respect to . . . charges, classifications, practices, services, facilities, or regulations for or in connection with intrastate communication service by wire or radio of any carrier." Emphasis added. Under § 2(b), no statutory provision cited by the FCC can be found to give the FCC jurisdiction over intrastate matters unless that provision contains an *express* grant of authority over intrastate matters to the FCC. *Louisiana*, *supra*, 476 U.S. at 377.

---

[16] *Chevron U.S.A. Inc. v. NRDC*, 467 U.S. 837 (1984).

Congress intentionally retained § 2(b) in the 1996 Act and made it applicable to §§ 251 and 252. Early drafts of the Act expressly excepted Title II (including §§ 251 and 252) from the coverage of § 2(b) but the final version of the Act omitted the exception. *First Report and Order*, ¶¶ 80, 94, J.A. 446, 452. As this Court stated in *Russello*, *supra*, 464 U.S. at 23-24: "Where Congress includes limiting language in an earlier version of a bill but deletes it prior to enactment, it may be presumed that the limitation was not intended." Section 2(b) is a legislatively prescribed rule of statutory construction which displaces the judge-made rule of deference articulated in *Chevron*. *See Louisiana*, *supra*, 476 U.S. at 377.

Congress further reinforced § 2(b) and the dual jurisdictional scheme by enacting the rule of statutory construction contained in the savings provision of § 601(c)(1) of the 1996 Act, Pub. L. 104-104, Title VI, § 601(c)(1), 110 Stat. 143 (Feb. 8, 1996) (enacted but not codified), App. A14. Section 601(c)(1) commands that "[t]his Act and the amendments made by this Act shall not be construed to modify, impair, or supersede Federal, State, or local law unless expressly so provided in such Act or amendments." This provision, which clarifies that neither § 2(b) nor any provision of State law is altered by the Act unless the Act does so *expressly*, constitutes another legislatively prescribed rule of statutory construction which displaces the rule of *Chevron*.

Otherwise stated, the Act itself precludes as "impermissible" under *Chevron* any construction of its text which is inconsistent with the mandatory rules of statutory construction it contains. Because the Act requires that a grant of authority to the FCC over intrastate matters be made "expressly," any claim of authority which fails to meet the "express" standard must be rejected. That was precisely the

situation in *Louisiana*, 476 U.S. at 374-375, where *Chevron* deference was *not* accorded to the FCC.

Beyond this, where a dual jurisdictional scheme is involved, *Chevron* deference is inappropriate because the agency receiving the deference may use it to upset the statutory balance established by Congress. *See, e.g., Northwest Central Pipeline Corp. v. Kansas Corp. Comm'n*, 489 U.S. 493, 512, 515-516 n. 12 (1989); *Altamont Gas Transmission Co. v. FERC*, 92 F.3d 1239, 1246-1248 (D.C. Cir. 1996), *cert. denied sub nom. Indicated Expansion Shippers v. FERC*, 117 S. Ct. 1568 (1997); *Clark v. Alexander*, 85 F.3d 146, 152 (4th Cir. 1996); *but see Mississippi Power & Light Co. v. Mississippi ex rel. Moore*, 487 U.S. 354, 380-381 (1988) (Scalia, J., concurring in the judgment) (suggesting that *Chevron* deference should extend to an agency's determination of the scope of its own authority). Stated another way, by retaining § 2(b) in the Act, Congress legislatively determined that *Chevron* deference should not be accorded to an FCC determination expanding the agency's authority into the intrastate realm which Congress reserved to the States.

B. Section 2(b) Prohibits the FCC From Adopting Standards and Rules Governing Intrastate Pricing and Related Matters

The plain language of § 2(b) and the principles of *Louisiana* compel the conclusion that the FCC's regulation of matters pertaining to the intrastate component of interconnection, unbundled element and resale pricing is beyond its statutory authority. Section 2(b) provides that "nothing in this Act shall be construed to apply or to give the [FCC] jurisdiction with

respect to charges, classifications, practices, services, facilities, or regulations for or in connection with intrastate communication service by wire or radio of any carrier." In characterizing § 2(b), the Court has said: "By its terms, this provision fences off from FCC reach or regulation intrastate matters – indeed, including matters 'in connection with' intrastate service. Moreover, the language with which it does so is certainly as sweeping as the wording of the provision declaring the purposes of the Act and the role of the FCC." *Louisiana, supra*, 476 U.S. at 370. In addition, the rule of construction established by § 2(b) makes clear that every other provision of the Act which is susceptible of construction, including the provisions added by the 1996 Act, must be construed to find State authority over intrastate matters. *Louisiana, supra*, 476 U.S. at 373.

The FCC properly concedes that § 2(b) remains effective as to all matters falling outside §§ 251 and 252 of the 1996 Act. *First Report and Order*, ¶ 70, J.A. 440. The FCC nonetheless concludes that "section 251 authorizes the FCC to establish regulations regarding both interstate and intrastate aspects of interconnection, services, and access to unbundled elements" and that "the regulations the Commission establishes pursuant to section 251 are binding upon states and carriers and section 2(b) does not limit the Commission's authority to establish regulations governing intrastate matters pursuant to section 251." *Id.*, ¶ 84, J.A. 448.

However, the FCC's arrogating to itself the authority to dictate standards, methodologies and rules for intrastate pricing is refuted by the Act itself. The FCC concedes as much when it acknowledges that §§ 251 and 252 "do not contain an explicit grant of intrastate authority to the Commission." *First Report and Order*, ¶ 84, J.A. 448. The absence of such an

explicit grant of authority is fatal to its claim, for if *Louisiana* means anything, it means that Congress' intent to preempt state regulation of intrastate matters must be clear. *Louisiana*, *supra*, 476 U.S. at 368-69, 377; *see also Jones v. Rath Packing Co.*, 430 U.S. 519, 525 (1977), and many cases there cited. As no such clear expression appears here, the FCC's determinations with respect to intrastate pricing must be vacated.

In *Louisiana*, the FCC had concluded that State regulation of depreciation charges for local ratemaking purposes was thwarting Federal objectives and thus imperiling the economic well-being of the telecommunications industry. The FCC claimed that deference to the States was inappropriate where an important Federal policy, that of nurturing competition, was at stake. The FCC therefore established its own depreciation rules and declared that the States were required to follow those rules in setting intrastate depreciation rates. The Court, in the introduction to its decision rejecting the FCC's claim, stated: "[W]e do not assess the wisdom of the asserted federal policy of encouraging competition within the telecommunications industry. Nor do [w]e consider whether the FCC should have the authority to enforce, as it sees fit, practices which it believes would best effectuate this purpose. Important as these issues may be, our task is simply to determine where Congress *has* placed the responsibility. . . ." 476 U.S. at 359 (emphasis in original). The same inquiry is applicable here.

The Court in *Louisiana* went on to reject the FCC's unduly narrow construction of § 2(b). The Court stated: "[G]iven the breadth of the language of section 152(b), and the fact that it contains not only a substantive jurisdiction limitation of the FCC's power, but also a rule of statutory

construction . . . , we decline to accept the narrow view urged by respondents, and hold instead that it denied the FCC the power to preempt state regulation of depreciation for intrastate ratemaking purposes." *Id.* at 372-373. Here, as in *Louisiana*, the FCC has overridden an express Congressional limitation on its power.[17]

The legislative history of the 1996 Act also supports this view. Early drafts of the 1996 Act would have expressly excepted Part II of Title II and thus §§ 251 and 252 from the applicability of § 2(b), but the final version of the 1996 Act omitted that express exception to § 2(b). *First Report and Order*, ¶¶ 80, 94, J.A. 446, 452. The only reasonable inference to be drawn is that, apart from the narrow areas where it expressly provided to the contrary, Congress consciously chose to leave §§ 251 and 252 subject to § 2(b). As explained by the Court in *Russello*, *supra*, 464 U.S. at 23-24: "Where Congress includes limiting language in an earlier version of a bill but deletes it prior to enactment, it may be presumed that the limitation was not intended."

Mead Corp. v. Tilley, 490 U.S. 714, 723 (1989), relied on by the FCC, is not to the contrary. There the Court chose not to "attach decisive significance to the unexplained disappearance of one word from an unenacted bill because 'mute

---

[17] In cases following *Louisiana*, the FCC and the courts have reached the same conclusion. Thus in *California v. FCC*, 905 F.2d 1217, 1239 (9th Cir. 1990), "[t]he FCC concede[d] that § 2(b)(1) reserves to the States the sole authority to regulate intrastate basic telephone service." Similarly, in *NARUC v. FCC*, 880 F.2d 422, 429 (D.C. Cir. 1989), the court of appeals stated that "the *only* limit that this Court has recognized on a state's authority over intrastate telephone service occurs when the state's exercise of that authority negates the exercise by the FCC of its own lawful authority over interstate communication" (emphasis in original).

intermediate legislative maneuvers' are not reliable indicators of congressional intent." *First Report and Order*, ¶ 95 n. 155, J.A. 452. Here, however, the Joint Conference affirmatively removed from the legislation a significant exception to a broad, repeatedly litigated and universally understood reservation of State authority that has existed under the statute for more than 60 years and under federal common law for nearly a century. Under these circumstances, it is nonsensical to suppose that the omission of the exception was unintentional.

Moreover, in addition to § 2(b), Congress left intact the jurisdictional separations requirements and procedures of 47 U.S.C. §§ 221(c) and 410(c), App. A3-A4, A13, to permit dual ratemaking, thereby further demonstrating its intent that the dual jurisdictional scheme for regulating "charges, classifications, practices, services, facilities, or regulations" be applicable to the amended statute. *See Louisiana*, *supra*, 476 U.S. at 375-376. There can be little doubt that the statutory phrase "charges, classifications, practices, services, facilities, or regulations" includes the pricing and pricing methodologies for access, unbundled network elements, resale and the like. In *Louisiana*, the FCC's narrowing construction of the phrase was emphatically rejected by the Court. 476 U.S. at 372-73.[18] Indeed, the Court in *Louisiana* made clear that the broad statutory language could not be read to simply "forb[id] the FCC to establish specific rates for certain intrastate services." *Id.* at 373. "[H]ad this been the intention, it would hardly have been necessary to deny the FCC the

---

[18] Indeed, the FCC's dissection of pricing into methodology (over which the FCC has authority) and rates and charges between carriers (over which the States have authority) finds no textual support in the Act and the FCC points to none.

jurisdiction over 'charges, classifications, practices, services, facilities, or regulations for or in connection with intrastate communication service. . . . ' " *Id.*

Finally, § 601(c)(1) of the 1996 Act, App. A14, clarifies that neither § 2(b) nor any provision of State law is altered or overridden by the Act unless the Act does so *expressly.* In sum, § 2(b) of the 1934 Act, as amended, precludes the FCC's assertion and exercise of authority over intrastate pricing and related matters without an *express* grant of jurisdiction over such matters.

In this connection, the FCC criticizes the court of appeals' determination of Congressional intent because the court of appeals considered, among other things, whether particular provisions of the 1996 Act make "mention" of the FCC. FCC Brief, at 12, 13, 15, 18, 38. Contrary to the FCC's argument, however, the court of appeals, having been charged with the duty of ascertaining whether FCC authority over intrastate matters was *express*, was perfectly justified in giving significance to the fact that certain provisions of the Act did not reference the FCC when other provisions of the Act clearly did so. Express reference to the FCC in a statutory provision is a legitimate factor to be taken into consideration in determining whether Congress expressly granted jurisdiction to the FCC.

The FCC also presses a strained and implausible construction of § 2(b) itself. It cites the portion of the statute which creates two separate limitations – separated by the disjunctive word "or" – on the manner in which the Act may be construed: " 'nothing in this [chapter] shall be construed to apply *or* to give the Commission jurisdiction with respect to' intrastate matters." FCC Brief, at 34; emphasis in original. It

then argues that the section "cannot logically be construed to mean that [it] limits the scope of the Commission's authority *more* than it limits the substantive reach of federal telecommunications law." *Id.*

This argument is patently without merit for at least three reasons. First, it is contrary to the plain language of § 2(b), which compels the conclusion that these two distinct limitations on the manner in which the statute may be construed should be treated separately. That is particularly so when the construction advocated by the FCC is flatly inconsistent with the purpose of § 2(b) as articulated by this Court – to "fence off from FCC reach or regulation intrastate matters – indeed, including matters 'in connection with' intrastate service." *Louisiana*, *supra*, 476 U.S. at 370.

Second, in addressing the use of the disjunctive in statutory drafting, the Court has often invoked the rule that "[c]anons of construction ordinarily suggest that terms connected by a disjunctive be given separate meanings, unless the context dictates otherwise." *Brooke Group Ltd. v. Brown & Williamson Tobacco Corp.*, 509 U.S. 209, 229 (1993), *quoting Reiter v. Sonotone Corp.*, 442 U.S. 330, 339 (1979). Third, the FCC's suggestion that the scope of the Act and the scope of FCC jurisdiction must be treated as equivalent terms runs afoul of the well established canon that a statute should not be construed to render a portion of its text mere surplusage. *Babbitt v. Sweet Home Chapter of Communities for a Great Oregon*, 515 U.S. 687, 698 (1995); *Colautti v. Franklin*, 439 U.S. 379, 392 (1979); *United States v. Menasche*, 348 U.S. 528, 538-539 (1955).

The FCC nevertheless argues that "[s]ection 2(b) refers to the Commission's authority as well as to the applicability

of federal law . . . because Congress intended to bar the Commission from exercising its 'ancillary' jurisdiction . . . over intrastate matters . . . to which the Act itself does not clearly extend." FCC Brief, at 34, *citing Louisiana* and *Houston, E. & W. Texas Ry. v. United States*, 234 U.S. 342 (1914) (*Shreveport Rate Case*). This revisionist theory of the meaning of *Louisiana* is at best implausible. *Louisiana* nowhere refers to ancillary jurisdiction in broadly concluding that the purpose of § 2(b) was to "fence off from FCC reach or regulation intrastate matters." 476 U.S. at 370. Indeed, in *Louisiana* the Court pointed out that "the language with which it does so is certainly as sweeping as the wording of the provision declaring the purpose of the Act and the role of the FCC." *Id.* Moreover, it rejects the applicability of the *Shreveport Rate Case*, concluding that the breadth of the language in § 2(b) refutes the argument that the section is subject to a narrowing construction because one Congressional purpose in enacting § 2(b) was to legislatively overrule *Shreveport*. *Id.* at 372-373.

Furthermore, the FCC cites no persuasive authority suggesting that in affirmatively choosing to eliminate the statutory language excepting Title II from § 2(b), Congress effectively performed an idle act because § 2(b) had no applicability to Title II in any event. The gravamen of the FCC's argument is that it is only intrastate matters *not covered by the Act* that § 2(b) precludes the FCC from regulating. However, there is simply no evidence at all that Congress had that view when it enacted the 1996 Act. Indeed, Congress' retention of § 2(b) and the broad construction of that section in *Louisiana*, of which Congress must be presumed to have been aware, are strong indicators to the contrary. Finally, the FCC's argument would create a slippery slope: if there is

nothing addressed by the 1996 Act that is not subject to the FCC's exclusive superintendence, then the States would be left without any role whatsoever in the transition to local competition. Clearly, this was not Congress' intention.

The FCC also argues that the so-called "impossibility" exception to § 2(b), *see Louisiana*, 476 U.S. at 375-376 n. 4, precludes the applicability of § 2(b) to the local competition provisions of the Act. This argument is similarly without merit. Not only was it *not* a stated basis for the FCC's decisions below, *see SEC v. Chenery Corp.*, 332 U.S. 194, 196 (1943); *Burlington Truck Lines v. United States*, 371 U.S. 156, 168-169 (1962), but it is flatly refuted by the FCC's *ONA Reconsideration Order*, 5 FCC Rcd 3084 (1990), *reversed on other grounds sub nom. California v. FCC*, 4 F.3d 1505 (9th Cir. 1993), in which the FCC required, and the Ninth Circuit upheld, dual Federal/State tariffing of basic network elements, the very sort of unbundled network elements at issue in this case. 4 F.3d at 1513, 1515. Indeed, as noted by the court of appeals below, ratemaking is inherently severable. Pet. App. 20a. This Court has of course agreed. *Louisiana*, 476 U.S. at 375.

Finally, the FCC's impossibility claim ignores that the exception to § 2(b) is "a limited one." *California v. FCC*, 905 F.2d 1217, 1243 (9th Cir. 1990). Where such a claim is properly asserted, the FCC bears the burden, plainly not satisfied here, "of justifying its *entire* preemption order by demonstrating that the order is narrowly tailored to preempt *only* such state regulations as would negate valid FCC regulatory goals." *Id.* (emphasis in original); *accord, California v. FCC*, 75 F.3d 1350, 1359 (9th Cir.), *cert. denied*, 116 S. Ct. 1841 (1996) (FCC bears burden of demonstrating negation); *NARUC v. FCC*, 880 F.2d 422, 430 (D.C. Cir. 1989) ("The

FCC has the burden . . . of showing with some specificity that [State regulation] . . . would negate the federal policy. . . . "). Finally, the FCC cannot implicate the exception by simply abdicating its statutory responsibility and refusing to engage in the jurisdictional separations process. *Smith v. Illinois*, *supra*, 282 U.S. at 148-149 (some form of jurisdictional separations mandatory); *Crockett Telephone Co. v. FCC*, *supra*, 963 F.2d at 1571 (same).

Indeed, in a number of similar contexts, the FCC has held that the dual jurisdictional scheme applies to the prices or rates charged by LECs for "access," "unbundled access" and "interconnection" to the local network. For example, in the Access Charge case, *MTS & WATS Market Structure: Third Report and Order*, 93 F.C.C.2d 241, 260-265 (1983), *affirmed on other grounds, NARUC v. FCC, supra*, 737 F.2d 1095, the FCC acknowledged the long-standing practice of imposing state-approved access charges upon competing long distance carriers for use of the LEC's intrastate network. Moreover, on appeal, the court of appeals, while affirming the FCC's setting interstate access charges for use of local plant applicable to interstate service, endorsed the imposition by States of intrastate access charges for the use of local plant applicable to intrastate service. *See* 737 F.2d at 1114, 1115. Notably, such intrastate access charges are imposed upon competing long distance carriers, not on end use customers.

Similarly, in the *ONA Reconsideration Order*, *supra*, 5 FCC Rcd at 3088-3090, 3100 n. 111, the FCC required that LECs file tariffs with the FCC offering unbundled basic service elements ("BSEs") for access to the *interstate* network and that they similarly file tariffs with the relevant State commission offering unbundled BSEs for access to the *intrastate* network. On appeal, in concluding that the FCC's

approach was fully consistent with the statutory scheme, the court of appeals said: "The ONA orders clearly establish a dual federal and state tariffing structure for BSEs, and the states will retain authority to set rates for those BSEs which are used for intrastate service. This system complies with the Supreme Court's decision in *Louisiana* that the Communications Act is designed to establish a dual regulatory scheme." *California v. FCC*, *supra*, 4 F.3d at 1515. Once tariffed, BSEs were then offered to competitive enhanced service providers – not end users – who in turn provided enhanced services utilizing the BSEs to end use customers. If the intrastate component of these charges for providing unbundled network elements to competitive service providers was properly subject to State jurisdiction, as the FCC conceded in the ONA Tariffing case, then the intrastate component of the interconnection, access and unbundled network element charges imposed upon competitive local telephone service providers here is similarly subject to State jurisdiction.

The same is true with respect to "interconnection" charges. In *In the Matter of the Need to Promote Competition and Efficient Use of Spectrum for Radio Common Carrier Services*, 2 FCC Rcd 2910 (1987), which involved the terms and conditions under which cellular service providers would be permitted to interconnect with the local network, the FCC stated that "[t]he charges for interconnection . . . are severable between the jurisdictions because the underlying costs of interconnection are segregable. Charges for switching of interconnected calls are also subject to dual jurisdiction." *Id.* at 2911, ¶ 12.

The FCC nevertheless argues that Congress could not have intended to accord State commissions jurisdiction over

pricing and other aspects of local competition because without FCC jurisdiction, final resolution of issues under the Act would not occur for many years, "after the various pricing and other issues have wound their way through 50 state commissions, numerous federal district courts, various courts of appeal, and ultimately this Court, all without comprehensive direction from the federal agency with the expertise to interpret federal communications law." FCC Brief, at 40. The short answer to this exaggerated policy argument is that it asks the Court to *legislate*.

Contrary to the FCC's argument, Congress knew how to establish a system of appellate review which would maximize and expedite uniformity, certainty and finality if that was its predominant goal. *See, e.g.*, 15 U.S.C. § 29(b) (providing for direct appeal from a district court to this Court under certain circumstances). Instead, Congress chose the States to make the initial determination of pricing and related matters, with appellate review of State commission system in the Federal courts, in order to accord at least some degree of respect, deference and comity to local and regional differences in markets and competitive conditions and the ability of State regulators to address those differences.

It is beyond the role of the FCC and of this Court to effectuate a legislative approach which Congress consciously rejected. As in *Louisiana*, the Court should not "grant the agency power to override Congress." 476 U.S. at 374-375.

III. THE SECOND REPORT AND ORDER MUST BE VACATED BECAUSE THE 1996 ACT GRANTS THE STATES EXCLUSIVE AUTHORITY OVER INTRA-LATA DIALING PARITY

A. Section 2(b) Prohibits the FCC From Adopting Standards and Rules Governing Intrastate and Intra-LATA Dialing Parity and Related Cost Recovery

Under § 2(b), the States possess exclusive jurisdiction over intrastate dialing parity.[19] California's brief addresses *intraLATA*, rather than *intrastate*, dialing parity for three reasons. First, dialing parity requirements for the *interLATA*, or *long distance*, market occurred more than a decade ago with the imposition of the "1 plus" presubscription methodology under the supervision of the MFJ court, the FCC and the States.[20] Dialing parity to facilitate interLATA competition is thus irrelevant to the issue before the Court.

Second, virtually all intraLATA telephone calls initiated in the United States are intrastate in nature. Thus virtually all intraLATA calls fall on the State side of the jurisdictional fence erected by § 2(b). Since this case is about intraLATA

---

[19] In making its § 2(b) argument regarding dialing parity, California relies on all points raised in Argument II, *supra*, and, to minimize repetition, primarily addresses in Argument III the factual and analytical differences between the pricing and dialing parity arguments predicated on § 2(b). If the Court concludes that the 1996 Act grants the States express authority over pricing, as did the Eighth Circuit, then dialing parity with its unique factual setting, will perhaps be the *only* jurisdictional issue which requires the Court to address the § 2(b) analysis set forth in Arguments II and III.

[20] At the time, dialing parity requirements for intrastate long distance service were placed in intrastate access tariffs under the supervision and authority of the State commissions, while dialing parity requirements for interstate long distance service were placed in interstate access tariffs under the supervision and authority of the FCC.

dialing parity (interLATA dialing parity having been addressed long ago), and since virtually all intraLATA calls are intrastate calls which, under § 2(b), fall within exclusive State jurisdiction, it is obvious that § 2(b) leaves the matter of intraLATA dialing parity to the States.

Third, the duty of LECs "to provide dialing parity to competing providers of telephone exchange service and telephone toll service" under § 251(b)(3), App. A5, appears to address only intraLATA dialing parity. The BOCs, which provide the overwhelming majority of LEC service nationally, are not yet permitted to compete in the interLATA, or long distance, market. *See* § 271 of the Act, 47 U.S.C. § 271. Moreover, § 251(b)(3) places a duty on LECs to provide dialing parity to *their own* competitors – competitors in the intraLATA market – not to the interexchange carriers that compete with AT&T and others in the interLATA market.

This construction of § 251(b)(3) is supported by the section's legislative history. The Joint Explanatory Statement of the Committee of Conference notes at p. 5 that in the Senate bill, "[n]umber portability and *local* dialing parity are included in the minimum standards of subsection 251(b)" (emphasis added). Similarly, the House amendment provision set out "the specific requirements . . . that apply to LECs *as competitors enter the local market*," *id.*, at 7 (emphasis added). Finally, the conference agreement established § 251(b)(3) as ultimately signed into law, with the conferees noting that "the duties imposed under section new 251(b) make sense only in the context of a specific request from another telecommunications carrier or any other person *who actually seeks to connect with or provide services using the LEC's network*," *id.*, at 8 (emphasis added).

It is therefore entirely reasonable to conclude that Congress intended that the dialing parity requirement of § 251(b)(3) be fashioned and implemented by the States, subject only to the express requirements of the Act. Section 2(b), which after much Congressional debate was intentionally left intact by the 1996 Act, mandates that "*nothing* in this chapter" – including § 251(b)(3) – "shall be construed to apply or to give the [FCC] jurisdiction with respect to charges, classifications, practices, services, facilities, or regulations for or in connection with intrastate communication service by wire or radio of any carrier" (emphasis added). The broad statutory phrase, "charges, classifications, practices, services, facilities, or regulations," plainly includes the provision of dialing parity. *Louisiana*, 476 U.S. at 372-373.

The FCC nevertheless concluded in the *Second Report and Order* that it possessed statutory authority to adopt nationwide standards governing intraLATA dialing parity. It said: "We conclude that the purpose of the statutory dialing parity requirements – to facilitate the introduction of competition in the local and toll markets – is best served by the adoption of broad guidelines and minimum federal standards that build upon the states' experiences. . . . [S]uch minimum nationwide standards will facilitate competition to the extent the new entrants seeking to offer regional or national services will not be subjected to an array of differing state standards or timetables. . . . [U]niform standards – in some cases minimum, uniform standards – will speed competitive entry by more promptly opening the local and toll markets to competition." *Second Report and Order*, ¶ 25, J.A. 1176; footnotes omitted.

The FCC's arrogating to itself the authority to dictate standards, policies and rules for intraLATA dialing parity is

refuted by FCC's concession that §§ 251 and 252 "do not contain an explicit grant of intrastate authority to the Commission." *First Report and Order*, ¶ 84, J.A. 448. As above noted, *Louisiana* and the cases following it teach that the absence of such an explicit grant of authority precludes preemption. *Louisiana*, *supra*, 476 U.S. at 368-69, 377. *See also NPRM, Administration of the North American Numbering Plan*, *supra*, 9 FCC Rcd at 2077 n. 93 (in which the FCC stated in connection with dialing parity that most intraLATA toll calls "are intrastate and not within our purview"). As no such clear expression appears here, the principle of *Louisiana* controls and the jurisdictional conclusions in the *Second Report and Order* with respect to intrastate dialing parity must be vacated.

The legislative history of the 1996 Act also supports this view. Congress' choosing to omit from the statute the provision that would have expressly excepted Part II of Title II and thus §§ 251 and 252 from the applicability of § 2(b) strongly supports the conclusion that Congress consciously chose to leave § 251(b)(3) subject to § 2(b).

There can be little doubt that the statutory phrase "charges, classifications, practices, services, facilities, or regulations" includes dialing parity. In *Louisiana*, the FCC's narrow construction of the phrase was emphatically rejected by the Court. 476 U.S. at 372-73. Indeed, the Court in *Louisiana* made clear that the broad statutory language could not be read to simply "forb[id] the FCC to establish specific rates for certain intrastate services." *Id.* at 373. "[H]ad this been the intention, it would hardly have been necessary to deny the FCC the jurisdiction over 'charges, classifications, practices, services, facilities, or regulations for or in connection with intrastate communication service. . . . ' " *Id.* The FCC's

similarly narrow construction of these words here, so as to exclude "practices" and "regulations" seeking to ensure a customer's ability to complete intrastate and intraLATA toll calls through a chosen competitive service provider without having to dial extra digits, must also be rejected.

Nor is there an "impossibility" or "inseverability" issue with respect to dialing parity requirements, even though dialing parity does not involve rates. Again, the FCC did not rely on the impossibility exception in the *Second Report and Order*. Moreover, the *Second Report and Order*, at ¶ 37, J.A. 1183, itself acknowledges that dialing parity rules can be separated into interLATA and intraLATA components, or interstate and intrastate components, at the discretion of the relevant State commission. It states: "[W]e have also concluded that each state should have the opportunity to determine whether customers should be able to presubscribe to carriers for intrastate toll service and for interstate toll service in lieu of the intraLATA and interLATA toll presubscription dichotomy that we have established. . . . We thus conclude that states . . . should have the flexibility to require that toll dialing parity implementation be based on state boundaries where they determine that implementing toll dialing parity on the basis of state boundaries would be pro-competitive and otherwise in the public interest." *Id.*

In addition, the FCC's interest in imposing dialing parity rules which would apply to intraLATA calls which are 99.8 per cent intrastate in nature (100 per cent in California) is obviously *de minimis*. In other contexts, the FCC has held that the Federal interest in regulating service which involves less than ten per cent interstate traffic is *de minimis*. *Decision and Order, In the Matter of MTS and WATS Market Structure*, 4

FCC Rcd 5660 (1989), at ¶ 2, *adopting Recommended Decision and Order, In the Matter of MTS and WATS Market Structure*, 4 FCC Rcd 1352 (1989).

In sum, § 2(b) precludes the FCC's assertion and exercise of authority over intraLATA dialing parity.

B. Other Provisions of the 1996 Act Support the Conclusion That the FCC Has Exceeded Its Statutory Authority in Adopting Standards and Rules Governing Intrastate and IntraLATA Dialing Parity and Related Cost Recovery

Other provisions of the 1996 Act support California's argument. Several subdivisions of § 251 *do* grant the FCC authority over limited substantive areas addressed by the section, while § 251(b)(3), App. A5, addressing dialing parity, does not. For example, in § 251 Congress gave the FCC authority to prescribe requirements for "number portability" (§ 251(b)(2), App. A5) as well as "exclusive jurisdiction" over the portions of the North American Numbering Plan applicable to the United States (§ 251(e)(1), App. A8). However, the dialing parity provisions of § 251(b)(3) include no such grant of authority to the FCC. "Where Congress includes particular language in one section of a statute but omits it in another section of the same Act, it is generally presumed that Congress acts intentionally and purposely in the deliberate inclusion or exclusion." *Russello, supra*, 464 U.S. at 23.

This conclusion is reinforced by the fact that Congress gave the FCC no express authority over dialing parity cost recovery. Having expressly given the FCC jurisdiction over number portability and numbering administration in §§ 251(b)(2) and 251(e)(1), App. A5, A8, Congress carefully

clarified in § 251(e)(2), App. A9, that the FCC had *additional* jurisdiction to determine cost recovery issues relating to number portability and numbering administration. It stated: "The cost of establishing telecommunications numbering administration arrangements and number portability shall be borne by all telecommunications carriers on a competitively neutral basis *as determined by the Commission*." 47 U.S.C. § 251(e)(2), App. A9; emphasis added. However, no such explicit grant of authority to the FCC was made with respect to cost recovery for dialing parity.[21]

In addition, Congress directly addressed "intraLATA toll dialing parity" in § 271(e)(2)(B) of the 1996 Act, App. A12-A13, twice referring to narrow requirements affecting the timing of an exercise of *state* authority to implement intra-LATA toll dialing parity. It said:

> Except for single-LATA States and States that have issued an order by December 19, 1995, requiring a [BOC] to implement intraLATA toll dialing parity, *a State may not require* a [BOC] to implement intra-LATA toll dialing parity in that State before a [BOC] has been granted authority . . . to provide interLATA services originating in that State or before 3 years after the date of enactment of the

---

[21] The FCC rests its determination that it has authority to regulate dialing parity cost recovery on the implementation timetable of § 251(d)(1) and the catch-all provision of § 4(i) of the 1934 Act, 47 U.S.C. § 154(i), which authorizes it "to take any action [it] consider[s] 'necessary and proper' to further the public interest." *Second Report and Order*, ¶ 92; J.A. 1209. However, neither of these provisions constitutes a substantive grant of jurisdiction to take action not otherwise authorized by the Act. *E.g., California v. FCC*, 905 F.2d 1217, 1240-41 n. 35 (9th Cir. 1990). Moreover, those provisions are themselves subject to the limitation and rule of statutory construction of § 2(b). *Id.*

> Telecommunications Act of 1996, whichever is earlier. Nothing in this paragraph precludes *a State from issuing an order* requiring intraLATA toll dialing parity in that State prior to either such date so long as such order does not take effect until after the earlier of either such dates.

47 U.S.C. § 271(e)(2)(B), App. A12-A13; emphasis added.

Similarly, in the "competitive checklist" for BOCs seeking to provide interLATA service contained in § 271(c)(2)(B), App. A12, Congress referred to number portability, but not dialing parity, as a matter upon which the FCC "issues regulations pursuant to section 251." It set a standard for number portability applicable "[u]ntil the date by which *the Commission issues regulations pursuant to section 251 to require number portability* . . . " (*see* § 271(c)(2)(B)(xi), App. A12) but made no such reference with respect to the checklist requirement for dialing parity (*see* § 271(c)(2)(B)(xii), App. A12). The obvious inference is that Congress did not intend the FCC to issue regulations pursuant to § 251 governing dialing parity.

Finally, petitioners appear to have abandoned their heavy reliance on § 251(g) of the 1996 Act, 47 U.S.C. § 251(g), App. A9, in this Court. If they have done so, the abandonment is justified. Section 251(g) does not grant the FCC authority to regulate intraLATA dialing parity. In the first place, the FCC itself in the *Second Report and Order* correctly determined that § 251(g) has nothing to do with the intraLATA dialing parity duty of § 251(b)(3). The *Second Report and Order* states: "That section [251(g)] contains no reference or cross reference to dialing parity or to section 251(b)(3). Section 251(g) preserves the equal access obligations already imposed on the BOCs and GTE, but does not exempt them

from the toll dialing parity requirements." *Second Report and Order*, ¶ 29, J.A. 1178-1179. Thus the FCC's argument to the effect that § 251(g) grants it the authority to interpret and enforce the § 251(b)(3) dialing parity duty is nothing but an impermissible post hoc rationalization of counsel. *SEC v. Chenery Corp., supra*, 332 U.S. at 196.

Moreover, § 251(g) addresses only the obligations of the BOCs and GTE under their respective consent decrees, while § 251(b)(3) addresses the obligations of all LECs. Further, § 251(g), by its terms, involves only the provision of equal access to interexchange carriers and information services providers – parties with whom the BOCs were at one time precluded from competing by MFJ restrictions. It does not address the LECs' provision of intraLATA dialing parity to facilitate competition between the LECs and those seeking to compete with them directly in the provision of intraLATA service. That latter subject is addressed by § 251(b)(3). As all parties appear to concede, the MFJ court left to the States the question of whether there would be intraLATA competition at all, as well as the subsidiary question of the appropriate dialing parity requirements, should there be such competition. *United States v. Western Electric Co., supra*, 569 F.Supp. 990, at 1005; *United States v. Western Electric Co., supra*, 569 F.Supp. 1057, at 1109.[22]

Both § 2(b) and other provisions of the 1996 Act compel the conclusion that the Act does not authorize the FCC to regulate intraLATA dialing parity.

---

[22] The legislative history of § 251(g) supports this view. *See* Joint Explanatory Statement of the Committee of Conference, at p. 9.

CONCLUSION

In the final analysis, this case is fundamentally the same as *Louisiana*. There, the FCC argued that "federal displacement of state regulation is justified under the Act when necessary 'to avoid frustration of validly adopted federal policies.' " 476 U.S. at 362, 363. In the face of this argument, the Court observed that "it goes without saying that we do not assess the wisdom of the asserted federal policy of encouraging competition within the telecommunications industry. Nor do we consider whether the FCC should have authority to enforce, as it sees fit, practices which it believes would best effectuate this purpose." *Id.* at 359. The Court then rejected the FCC's argument, stating: "As we so often admonish, only Congress can rewrite this statute." *Id.* at 376. The Court should take the same course here.

Respectfully submitted,

APPENDIX OF STATUTES

47 U.S.C. § 152(b)(1)

(b) Exceptions to Federal Communications Commission jurisdiction

Except as provided in sections 223 and 227 of this title, inclusive, and section 332 of this title, and subject to the provisions of section 301 of this title and subchapter V-A of this chapter, nothing in this chapter shall be construed to apply or to give the Commission jurisdiction with respect to (1) charges, classifications, practices, services, facilities, or regulations for or in connection with intrastate communication service by wire or radio of any carrier.

---

47 U.S.C. § 153(15), (16), (21), (22), (25), (26), (47), (48)

§ 153. Definitions

For the purposes of this chapter, unless the context otherwise requires –

(15) Dialing parity

The term "dialing parity" means that a person that is not an affiliate of a local exchange carrier is able to provide telecommunications services in such a manner that customers have the ability to route automatically, without the use of any access code, their telecommunications to the telecommunications services provider of the customer's designation from among 2 or more telecommunications services providers (including such local exchange carrier).

(16) Exchange access

The term "exchange access" means the offering of access to telephone exchange services or facilities for the purpose of the origination or termination of telephone toll services.

(21) InterLATA service

The term "interLATA service" means telecommunications between a point located in a local access and transport area and a point located outside such area.

(22) Interstate communication

The term "interstate communication" or "interstate transmission" means communication or transmission (A) from any State, Territory, or possession of the United States (other than the Canal Zone), or the District of Columbia, to any other State, Territory, or possession of the United States (other than the Canal Zone), or the District of Columbia, (B) from or to the United States to or from the Canal Zone, insofar as such communication or transmission takes place within the United States, or (C) between points within the United States but through a foreign country; but shall not, with respect to the provisions of subchapter II of this chapter (other than section 223 of this title), include wire or radio communication between points in the same State, Territory, or possession of the United States, or the District of Columbia, through any place outside thereof, if such communication is regulated by a State commission.

(25) Local access and transport area

The term "local access and transport area" or "LATA" means a contiguous geographic area –

(A) established before February 8, 1996, by a Bell operating company such that no exchange area includes points within more than 1 metropolitan statistical area, consolidated metropolitan statistical area, or State, except as expressly permitted under the AT&T Consent Decree; or

(B) established or modified by a Bell operating company after February 8, 1996, and approved by the Commission.

(26) Local exchange carrier

The term "local exchange carrier" means any person that is engaged in the provision of telephone exchange service or exchange access. Such term does not include a person insofar as such person is engaged in the provision of a commercial mobile service under section 332(c) of this title, except to the extent that the Commission finds that such service should be included in the definition of such term.

(47) Telephone exchange service

The term "telephone exchange service" means (A) service within a telephone exchange, or within a connected system of telephone exchanges within the same exchange area operated to furnish to subscribers intercommunicating service of the character ordinarily furnished by a single exchange, and which is covered by the exchange service charge, or (B) comparable service provided through a system of switches, transmission equipment, or other facilities (or combination thereof) by which subscriber can originate and terminate a telecommunications service.

(48) Telephone toll service

The term "telephone toll service" means telephone service between stations in different exchange areas for which there is made a separate charge not included in contracts with subscribers for exchange service.

---

47 U.S.C. § 221(b), (c)

(b) State jurisdiction over services

Subject to the provisions of sections 225 and 301 of this title, nothing in this chapter shall be construed to apply, or to give the Commission jurisdiction, with respect to charges, classifications, practices, services, facilities, or regulations for or in connection with wire, mobile, or point-to-point radio telephone exchange service, or any combination thereof, even

though a portion of such exchange service constitutes interstate or foreign communication, in any case where such matters are subject to regulation by a State commission or by local governmental authority.

(c) Determination of property used in interstate toll service

For the purpose of administering this chapter as to carriers engaged in wire telephone communication, the Commission may classify the property of any such carrier used for wire telephone communications, and determine what property of said carrier shall be considered as used in interstate or foreign telephone toll service. Such classification shall be made after hearing, upon notice to the carrier, the State commission (or the Governor, if the State has no State commission) of any State in which the property of said carrier is located, and such other persons as the Commission may prescribe.

---

47 U.S.C. § 251(a)-(e), (g)

§ 251. Interconnection

(a) General duty of telecommunications carriers

Each telecommunications carrier has the duty –

(1) to interconnect directly or indirectly with the facilities and equipment of other telecommunications carriers; and

(2) not to install network features, functions, or capabilities that do not comply with the guidelines and standards established pursuant to section 255 or 256 of this title.

(b) Obligations of all local exchange carriers

Each local exchange carrier has the following duties:

(1) Resale

The duty not to prohibit, and not to impose unreasonable or discriminatory conditions or limitations on, the resale of its telecommunications services.

(2) Number portability

The duty to provide, to the extent technically feasible, number portability in accordance with requirements prescribed by the Commission.

(3) Dialing parity

The duty to provide dialing parity to competing providers of telephone exchange service and telephone toll service, and the duty to permit all such providers to have nondiscriminatory access to telephone numbers, operator services, directory assistance, and directory listing, with no unreasonable dialing delays.

(4) Access to rights-of-way

The duty to afford access to the poles, ducts, conduits, and rights-of-way of such carrier to competing providers of telecommunications services on rates, terms, and conditions that are consistent with section 224 of this title.

(5) Reciprocal compensation

The duty to establish reciprocal compensation arrangements for the transport and termination of telecommunications.

(c) Additional obligations of incumbent local exchange carriers

In addition to the duties contained in subsection (b) of this section, each incumbent local exchange carrier has the following duties:

(1) Duty to negotiate

The duty to negotiate in good faith in accordance with section 252 of this title the particular terms and

conditions of agreements to fulfill the duties described in paragraphs (1) through (5) of subsection (b) of this section and this subsection. The requesting telecommunications carrier also has the duty to negotiate in good faith the terms and conditions of such agreements.

(2) Interconnection

The duty to provide, for the facilities and equipment of any requesting telecommunications carrier, interconnection with the local exchange carrier's network –

(A) for the transmission and routing of telephone exchange service and exchange access;

(B) at any technically feasible point within the carrier's network;

(C) that is at least equal in quality to that provided by the local exchange carrier to itself or to any subsidiary, affiliate, or any other party to which the carrier provides interconnection; and

(D) on rates, terms, and conditions that are just, reasonable, and nondiscriminatory, in accordance with the terms and conditions of the agreement and the requirements of this section and section 252 of this title.

(3) Unbundled access

The duty to provide, to any requesting telecommunications carrier for the provision of a telecommunications service, nondiscriminatory access to network elements on an unbundled basis at any technically feasible point on rates, terms, and conditions that are just, reasonable, and nondiscriminatory in accordance with the terms and conditions of the agreement and the requirements of this section and section 252 of this title. An incumbent local exchange carrier shall provide such unbundled network elements in a manner that allows requesting carriers to combine such elements in order to provide such telecommunications service.

(4) Resale

The duty –

(A) to offer for resale at wholesale rates any telecommunications service that the carrier provides at retail to subscribers who are not telecommunications carriers; and

(B) not to prohibit, and not to impose unreasonable or discriminatory conditions or limitations on, the resale of such telecommunications service, except that a State commission may, consistent with regulations prescribed by the Commission under this section, prohibit a reseller that obtains at wholesale rates a telecommunications service that is available at retail only to a category of subscribers from offering such service to a different category of subscribers.

(5) Notice of changes

The duty to provide reasonable public notice of changes in the information necessary for the transmission and routing of services using that local exchange carrier's facilities or networks, as well as of any other changes that would affect the interoperability of those facilities and networks.

(6) Collocation

The duty to provide, on rates, terms, and conditions that are just, reasonable, and nondiscriminatory, for physical collocation of equipment necessary for interconnection or access to unbundled network elements at the premises of the local exchange carrier, except that the carrier may provide for virtual collocation if the local exchange carrier demonstrates to the State commission that physical collocation is not practical for technical reasons or because of space limitations.

(d) Implementation

(1) In general

Within 6 months after February 8, 1996, the Commission shall complete all actions necessary to establish regulations to implement the requirements of this section.

(2) Access standards

In determining what network elements should be made available for purposes of subsection (c)(3) of this section, the Commission shall consider, at a minimum, whether –

(A) access to such network elements as are proprietary in nature is necessary; and

(B) the failure to provide access to such network elements would impair the ability of the telecommunications carrier seeking access to provide the services that it seeks to offer.

(3) Preservation of State access regulations

In prescribing and enforcing regulations to implement the requirements of this section, the Commission shall not preclude the enforcement of any regulation, order, or policy of a State commission that –

(A) establishes access and interconnection obligations of local exchange carriers;

(B) is consistent with the requirements of this section; and

(C) does not substantially prevent implementation of the requirements of this section and the purposes of this part.

(e) Numbering administration

(1) Commission authority and jurisdiction

The Commission shall create or designate one or more impartial entities to administer telecommunications

numbering and to make such numbers available on an equitable basis. The Commission shall have exclusive jurisdiction over those portions of the North American Numbering Plan that pertain to the United States. Nothing in this paragraph shall preclude the Commission from delegating to State commissions or other entities all or any portion of such jurisdiction.

(2) Costs

The cost of establishing telecommunications numbering administration arrangements and number portability shall be borne by all telecommunications carriers on a competively neutral basis as determined by the Commission.

(g) Continued enforcement of exchange access and interconnection requirements

On and after February 8, 1996, each local exchange carrier, to the extent that it provides wireline services, shall provide exchange access, information access, and exchange services for such access to interexchange carriers and information service providers in accordance with the same equal access and nondiscriminatory interconnection restrictions and obligations (including receipt of compensation) that apply to such carrier on the date immediately preceding February 8, 1996 under any court order, consent decree, or regulation, order, or policy of the Commission, until such restrictions and obligations are explicitly superseded by regulations prescribed by the Commission after February 8, 1996. During the period beginning on February 8, 1996 and until such restrictions and obligations are so superseded, such restrictions and obligations shall be enforceable in the same manner as regulations of the Commission.

---

47 U.S.C. § 252(c), (d)

(c) Standards for arbitration

In resolving by arbitration under subsection (b) of this section any open issues and imposing conditions upon the parties to the agreement, a State commission shall –

(1) ensure that such resolution and conditions meet the requirements of section 251 of this title, including the regulations prescribed by the Commission pursuant to section 251 of this title;

(2) establish any rates for interconnection, services, or network elements according to subsection (d) of this section; and

(3) provide a schedule for implementation of the terms and conditions by the parties to the agreement.

(d) Pricing standards

(1) Interconnection and network element charges

Determinations by a State commission of the just and reasonable rate for the interconnection of facilities and equipment for purposes of subsection (c)(2) of section 251 of this title, and the just and reasonable rate for network elements for purposes of subsection (c)(3) of such section –

(A) shall be –

(i) based on the cost (determined without reference to a rate-of-return or other rate-based proceeding) of providing the interconnection or network element (whichever is applicable), and

(ii) nondiscriminatory, and

(B) may include a reasonable profit.

(2) Charges for transport and termination of traffic

(A) In general

For the purposes of compliance by an incumbent local exchange carrier with section 251(b)(5) of this

title, a State commission shall not consider the terms and conditions for reciprocal compensation to be just and reasonable unless –

(i) such terms and conditions provide for the mutual and reciprocal recovery by each carrier of costs associated with the transport and termination on each carrier's network facilities of calls that originate on the network facilities of the other carrier; and

(ii) such terms and conditions determine such costs on the basis of a reasonable approximation of the additional costs of terminating such calls.

(B) Rules of construction

This paragraph shall not be construed –

(i) to preclude arrangements that afford the mutual recovery of costs through the offsetting of reciprocal obligations, including arrangements that waive mutual recovery (such as bill-and-keep arrangements); or

(ii) to authorize the Commission or any State commission to engage in any rate regulation proceeding to establish with particularity the additional costs of transporting or terminating calls, or to require carriers to maintain records with respect to the additional costs of such calls.

(3) Wholesale prices for telecommunications services

For the purposes of section 251(c)(4) of this title, a State commission shall determine wholesale rates on the basis of retail rates charges to subscribers for the telecommunications service requested, excluding the portion thereof attributable to any marketing, billing, collection, and other costs that will be avoided by the local exchange carrier.

---

47 U.S.C. § 271(c)(2)(B)(xi), (xii)

(B) Competitive checklist

Access or interconnection provided or generally offered by a Bell operating company to other telecommunications carriers meets the requirements of this subparagraph if such access and interconnection includes each of the following:

(xi) Until the date by which the Commission issues regulations pursuant to section 251 of this title to require number portability, interim telecommunications number portability through remote call forwarding, direct inward dialing trunks, or other comparable arrangements, with as little impairment of functioning, quality, reliability, and convenience as possible. After that date, full compliance with such regulations.

(xii) Nondiscriminatory access to such services or information as are necessary to allow the requesting carrier to implement local dialing parity in accordance with the requirements of section 251(b)(3) of this title.

---

47 U.S.C. § 271(e)(2)

(2) IntraLATA toll dialing parity

(A) Provision required

A Bell operating company granted authority to provide interLATA services under subsection (d) of this section shall provide intraLATA toll dialing parity throughout that State coincident with its exercise of that authority.

(B) Limitation

Except for single-LATA States and States that have issued an order by December 19, 1995, requiring a Bell operating company to implement intraLATA toll dialing parity, a State may not require a Bell operating company to implement intraLATA toll dialing parity in that State before a Bell operating company has been granted

authority under this section to provide interLATA services originating in that State or before 3 years after February 8, 1996, whichever is earlier. Nothing in this subparagraph precludes a State from issuing an order requiring intraLATA toll dialing parity in that State prior to either such date so long as such order does not take effect until after the earlier of either such dates.

---

47 U.S.C. § 410(c)

The Commission shall refer any proceeding regarding the jurisdictional separation of common carrier property and expenses between interstate and intrastate operations, which it institutes pursuant to a notice of proposed rulemaking and, except as provided in section 409 of this title, may refer any other matter, relating to common carrier communications of joint Federal-State concern, to a Federal-State Joint Board. The Joint Board shall possess the same jurisdiction, powers, duties, and obligations as a joint board established under subsection (a) of this section, and shall prepare a recommended decision for prompt review and action by the Commission. In addition, the State members of the Joint Board shall sit with the Commission en banc at any oral argument that may be scheduled in the proceeding. The Commission shall also afford the State members of the Joint Board an opportunity to participate in its deliberations, but not vote, when it has under consideration the recommended decision of the Joint Board or any further decisional action that may be required in the proceeding. The Joint Board shall be composed of three Commissioners of the Commission and of four State commissioners nominated by the national organization of the State commissions and approved by the Commission. The Chairman of the Commission, or another Commissioner designated by the Commission, shall serve as Chairman of the Joint Board.

REPLY BRIEF FOR CROSS-PETITIONER AMERITECH CORPORATION

Petitioners' agenda in defending *both* the "all elements" rule *and* Rule 315(b) is clear: they seek to overturn the Eighth Circuit's ruling that incumbent local exchange carriers ("incumbent LECs") may not be required to provide new entrants with the so-called "unbundled network element platform" or UNE platform. The UNE platform is a preassembled combination of network components that consists of *precisely* the same facilities, in *exactly* the same configuration, as the network designed and used by the incumbent to provide its own retail services to customers and resale services to new entrants. However, large new entrants like AT&T and MCI seek to obtain the platform *not* at the statutory wholesale discount mandated by Congress for the resale of retail services, but rather at the lower cost-based rates reserved for unbundled network elements.

Our opening brief (at 15-20, 24-31) demonstrated that the UNE platform would obliterate the distinction between the unbundled network element and resale entry options established in sections 251(c)(3) and (c)(4) of the Telecommunications Act of 1996 ("1996 Act"). See also Bell Atl. Br. 46-65; GTE Br. 62-71. Significantly, the Association for Local Telecommunications Services ("ALTS"), an association of smaller facilities-based new entrants that compete with incumbent LECs in local service markets, concurs. As ALTS correctly observes, "[h]ad Congress intended that resold services be made available at 'cost' pursuant to section 251(c)(3), it [would] not have created a separate statutory mechanism" for resale. ALTS Opposing Br. 8.

Petitioners do not dispute the central proposition underlying our and ALTS's position: that the 1996 Act prohibits new entrants from obtaining the incumbent's resale services at the lower cost-based rates reserved for unbundled network elements. Rather, petitioners argue — contradicting what

they have said in other forums — that the UNE platform is somehow different from the incumbent's resale services. As explained below, their argument has no merit. Indeed, former FCC Chairman Reed Hundt, who presided over the agency's promulgation of the "all elements" rule and Rule 315(b), acknowledged just three days ago that "[t]he UNE platform is a version of resale."[1] The only difference between the platform and resale services is price, which is *precisely* what creates the arbitrage opportunities that unravel the 1996 Act's distinction between the unbundled network element and resale entry options.

Our opening brief (at 34-37) also demonstrated that the UNE platform is not a combination of "unbundled" network elements within the meaning of section 251(c)(3). Petitioners argue that two physically connected network elements are "unbundled" if a new entrant has the option to acquire one of the elements but not the other. We explained that even if that were true, the UNE platform still would not be a combination of "unbundled" network elements because entrants acquiring the platform do not have the option of obtaining the platform's interoffice transmission component without also taking the local switching component. Petitioners respond with silence, effectively conceding that the platform cannot be classified as a combination of "unbundled" network elements under section 251(c)(3).

Finally, our opening brief (at 32-33) demonstrated that the UNE platform violates the plain language of section 251(c)(3) because it does not give new entrants "access" to network elements "on an unbundled basis at any technically feasible point." 47 U.S.C. § 251(c)(3). The FCC's principal response — that section 251(c)(3) does not *require* that new entrants gain "access" to network elements at a "technically feasible point," but only gives them the *option* of doing so —

---

[1] *In the Matter of: Telecommunications Policy Open Meeting*, Tr. 235 (Ill. Comm. Comm'n July 14, 1998) (statement of Reed Hundt).

rests upon a patently absurd reading of the statute. And petitioners' argument that new entrants would gain "access * * * at any technically feasible point" to the UNE platform through the incumbent's operations support systems ("OSS") is equally unsound. The argument simply proves too much: new entrants purchasing the incumbent's resale services under section 251(c)(4), which does *not* give the new entrant "access * * * at a technically feasible point" to the incumbent's facilities, *also* use the incumbent's OSS — indeed, in precisely the same manner as an entrant acquiring the platform.

For these reasons, the UNE platform is incompatible with the 1996 Act. Pet. App. 71a. And while this Court should reverse the Eighth Circuit's approval of the FCC's "all elements" rule — and affirm the Eighth Circuit's vacatur of Rule 315(b) — at the very least the Court should hold that both rules are invalid insofar as they require incumbents to provide the UNE platform at the cost-based rates reserved for unbundled elements.

ARGUMENT

I. The UNE Platform Violates Section 251(c)(3) Because It Does Not Provide New Entrants With "Access To Network Elements On An Unbundled Basis At Any Technically Feasible Point."

Petitioners' defense of the UNE platform fails to come to grips with the plain text of section 251(c)(3). As we have explained, the UNE platform, while a preassembled combination of the incumbent carrier's *facilities*, is not a combination of *unbundled network elements* within the meaning of section 251(c)(3). Ameritech Br. 32-37. Thus, irrespective of the fate of the "all elements" rule, section 251(c)(3) prohibits new entrants from obtaining the UNE platform at cost-based rates. The FCC, AT&T and MCI offer nothing to refute this conclusion.

A. The Components Of The UNE Platform Are Not "Unbundled" Network Elements Within The Meaning of Section 251(c)(3).

Section 251(c)(3) establishes the ground rules for the unbundled network element entry option, and requires incumbent LECs to provide "access" to network elements "on an unbundled basis." 47 U.S.C. § 251(c)(3). Because the term "unbundled" means physically separated, the UNE platform — which consists of all elements in the incumbent's entire bundled network — obviously could not be a combination of "unbundled" network elements. Petitioners assert, however, that the Eighth Circuit was wrong in holding that the term "unbundled" means physically separated. Rather, they maintain, two physically connected network elements are "unbundled" so long as a new entrant has the option to acquire one of the elements but not the other. See Ameritech Br. 35.[2]

Even if petitioners were right on that score,[3] the UNE platform *still* would not be a combination of "unbundled" network elements. It is undisputed that the UNE platform consists of a combination of numerous incumbent LEC facilities, including "shared transport" and "switching."[4] The

---

[2] See also Ex Parte Letter of AT&T's Albert M. Lewis, Director and Senior Attorney for Federal Government Affairs, to William F. Caton, Acting Secretary of the Federal Communications Commission, CC Docket No. 96-98, at 5 (Aug. 8, 1997) ("when Congress used the term 'unbundled' in § 251(c)(3)," it meant to require incumbent LECs "simply to state a separate *price* for the element and give consumers the *option* of declining to purchase the element from that carrier and obtaining it from a different source") (AT&T's emphasis).

[3] They are, in fact, wrong. See Bell Atl. Br. 53-57; GTE Br. 65-71; U S WEST Br. 47-53.

[4] AT&T witnesses have testified in other forums that "[t]he platform is a combination of unbundled network elements," including "the unbundled switch, shared transport, * * * and tandem switching." *In the Matter of Application by Ameritech Michigan for Authorization Under Section 271*

FCC has defined "shared transport" and "switching" to be separate network elements. See 47 C.F.R. §§ 51.319(c), (d) (Pet. App. 296a-298a). And the FCC has expressly acknowledged that a new entrant does not have the option of taking the transport component of the UNE platform without *also* taking the switching component. See *Third Reconsideration Order*, ¶ 47 (new entrant acquiring "shared transport" from the incumbent LEC "must also take local switching") (J.A. 248).[5]

As explained in our opening brief (at 35-37), these admissions are fatal to the UNE platform. Because a new entrant *must* take the transport and switching components of the platform together as an integrated whole, and thus does *not* have the option of taking the former without the latter, the platform is not a combination of "unbundled" network elements under section 251(c)(3) — *even* under petitioners' unduly restrictive definition of the term "unbundled." Indeed, petitioners' definition would invalidate *any* preassembled combination of two or more network elements where the entrant does not have the option of taking one constituent element without taking another. Those elements could not be "unbundled" elements because, as AT&T puts it (AT&T Br. 38-39), the entrant would not have "the option of declining to purchase [each element] as part of a package."

---

of the Communications Act to Provide In-Region InterLATA Services in the State of Michigan, CC Docket No. 97-137, Affidavit of Robert V. Falcone and Maureen E. Gerson on Behalf of AT&T Corp., ¶ 13 (filed June 10, 1997).

[5] *In re Implementation of the Local Competition Provisions in the Telecommunications Act of 1996* (CC Docket No. 96-98), Third Order on Reconsideration and Further Notice of Proposed Rulemaking, FCC 97-295, 12 F.C.C.R. 12460 (1997) ("*Third Reconsideration Order*") (J.A. 1359-1402), petitions for review pending, *Southwestern Bell Tel. Co. v. FCC*, Nos. 97-3389 et al. (8th Cir.).

The FCC, AT&T and MCI remain silent on this matter, apparently hoping that our point will get lost amid the welter of arguments advanced in this case. But petitioners' ostrich-like tactics cannot obscure the fact that, even using their own definition of "unbundled,"[6] the UNE platform is not a combination of "unbundled" network elements.

In sum, the text of section 251(c)(3) prohibits new entrants from acquiring the UNE platform at the cost-based rates reserved by section 252(d)(1) for unbundled network elements. For that reason, even if this Court were to uphold the facial validity of the "all elements" rule and Rule 315(b), it should still hold that section 251(c) invalidates the UNE platform.

B. The UNE Platform Does Not Give A New Entrant "Access" To Network Elements "At A "Technically Feasible Point," As Required By Section 251(c)(3).

The UNE platform irreconcilably clashes with the text of section 251(c) in another way. The statute requires incumbent

---

[6] Apparently recognizing that their interpretation would invalidate the UNE platform and many other preassembled network element combinations, the FCC and MCI hastily retreat. In its opening brief, the FCC vigorously argued that "the term 'unbundled' * * * denote[s] giving someone a *choice* of elements at separate prices." FCC Br. 44 (emphasis added). The FCC shifts gears in its response brief, even going so far as to mischaracterize what it said in its opening brief. FCC Reply 25 ("[a]s we observe in our opening brief (at 44-45), however, the prevailing definition of 'unbundled' * * * was 'offered at separate prices'"). MCI takes the same turn. In its opening brief, MCI argued that the "normal meaning" of "unbundled" is "'*separately available* at a separate price.'" MCI Br. 19 (emphasis added) (citation omitted). In its response brief, MCI suggests that a network element can be "unbundled" even if it cannot be made "separately available" from adjacent elements. MCI Reply 8 n.2 ("[e]lements that can be unbundled for use by a lessor at a separate price typically — though not inevitably — can be made available as physically separate items").

LECs to provide "*access* to network elements on an unbundled basis *at any technically feasible point*." 47 U.S.C. § 251(c)(3) (emphasis added). As explained in our opening brief (at 32 & n.16), the words "access to network elements * * * at any technically feasible point" undeniably has a physical dimension. Because the platform allows new entrants to use the incumbent's network as a bundled, amalgamated whole, the platform does not give entrants physical "access" to network elements at *any* point, let alone at a "technically feasible point." The platform, then, is flatly inconsistent with the text of section 251(c)(3). See Ameritech Br. 32-33; Bell Atl. Br. 57-60; GTE Br. 66.

Petitioners offer two wholly unpersuasive responses. The first is that section 251(c)(3) allows, but does not require, new entrants obtaining access to unbundled network elements to do so at a "technically feasible point." The second assumes that section 251(c)(3) requires new entrants to obtain access to network elements at a "technically feasible point," but holds that entrants acquiring the UNE platform would obtain such access through the incumbent's operations support systems ("OSS").

1. The FCC claims that section 251(c)(3) does not require a new entrant using unbundled network elements to obtain "access" to such elements at a "technically feasible point." Rather, the FCC asserts, section 251(c)(3) gives network element purchasers the choice of whether or not to obtain such "access." FCC Reply 28.

This reading of section 251(c)(3), which AT&T and MCI do not adopt,[7] is preposterous. The FCC maintains that

---

[7] AT&T advances a less radical, but equally unpersuasive, variant of the FCC's argument. According to AT&T, "§ 251(c)(3)'s requirement that LECs provide access to 'network *elements*' (in the plural) at any 'technically feasible *point*' (in the singular) clearly establishes that new entrants can obtain access to network elements in combination." AT&T Reply 34 (AT&T's emphasis). This argument reflects a fundamental

the "access * * * at any technically feasible point" language in the statute is optional for new entrants.[8] If that were correct, then the "on an unbundled basis" language of section 251(c)(3) would have to be optional as well, and new entrants would be entitled to acquire network elements on something *other* than on an "unbundled basis." Indeed, if the FCC were right, a new entrant could acquire use of all of the incumbent LEC's combined network elements without obtaining "access" at a "technically feasible point" to *any* of them. That, of course, would destroy the distinction between unbundled network elements and resale services: If a new entrant could acquire under section 251(c)(3) all of the incumbent's network elements without obtaining "access" thereto, the entrant would acquire precisely what a reseller acquires under section 251(c)(4).

The FCC's statutory theory, in sum, would make a mockery of the statutory language. Section 251(c)(3) establishes the scope of the incumbent LECs' duty to provide, and a new entrant's right to acquire, network elements. Just as a

---

misunderstanding of how unbundled access actually works. For example, a new entrant acquiring unbundled local switching from an incumbent LEC, and combining that switching with the entrant's local loops and interoffice transport facilities, must obtain "access" to local switching at *two* technically feasible points: the line (loop) side of the switch and the trunk (transport) side of the switch. See 47 C.F.R. § 51.319(c)(1)(i)(A)-(B) (Pet. App. 296a). (As a technical matter, the entrant would obtain such access via cross-connect wires terminating in its collocation space.) The fact that a new entrant can obtain access to a single network element at two technically feasible points shows that AT&T incorrectly attributes significance to the statute's use of "network elements" in the plural and "technically feasible point" in the singular.

[8] Contra *In re Implementation of the Local Competition Provisions in the Telecommunications Act of 1996* (CC Docket No. 96-98), First Report and Order, ¶ 269, FCC 96-325, 11 F.C.C.R. 15499, 15636 (1996) (J.A. 541) ("[w]e further conclude that * * * section 251(c)(3) *requires* 'access * * * at any technically feasible point'") (emphasis added).

new entrant must take network elements "on an unbundled basis," so, too, must the entrant obtain "access" to network elements at a "technically feasible point." The FCC's contrary interpretation would read the words "access * * * at any technically feasible point" out of the statute, in violation of the "cardinal principle of statutory construction" that courts must "give effect, if possible, to every clause and word of a statute." *Bennett* v. *Spear*, 117 S. Ct. 1154, 1166 (1997) (internal quotation marks omitted); see also *Bailey* v. *United States*, 516 U.S. 137, 145-46 (1995).

2. Petitioners next argue that new entrants acquiring the UNE platform would, in fact, obtain access to the incumbent LEC's network elements at a "technically feasible point." That access, they argue, is obtained at the incumbent's operations support systems ("OSS"). See FCC Reply 29; AT&T Reply 39-40; MCI Reply 12.

Even if OSS were an unbundled network element,[9] petitioners' argument would have no merit. OSS consists of the backoffice databases and information that support the incumbent's pre-ordering, ordering, provisioning, maintenance and repair, and billing functions. See 47 C.F.R. § 51.319(f)(1) (Pet. App. 301a). Although it is true that new entrants must use the incumbent's OSS when acquiring *unbundled network elements*, the same holds when an entrant acquires the incumbent's *resale services*.[10]

---

[9] It is not. See Bell. Atl. Br. 69-70; GTE Br. 58-59; U S WEST Br. 37-41. Accordingly, access to OSS does not qualify as the "access to network elements * * * at any technically feasible point" required by section 251(c)(3).

[10] This is undisputed. See *In re Application of Ameritech Michigan Pursuant to Section 271 of the Communications Act, as amended, To Provide In-Region, InterLATA Services in Michigan* (CC Docket No. 97-137), Memorandum Opinion and Order, FCC 97-298, ¶ 133 (rel. Aug. 19, 1998) ("*Ameritech Michigan 271 Order*") (access to OSS "supports each of the three modes of competitive entry strategies established by the

That fact defeats petitioners' argument. If use of the incumbent's OSS qualified as "access" to the incumbent's facilities at a "technically feasible point," then it necessarily would follow that resellers obtain such access. But the text of section 251(c)(4) makes clear that an entrant purchasing the incumbent LEC's resale services does *not* obtain access to the incumbent's network at a "technically feasible point." Compare 47 U.S.C. § 251(c)(3) (requiring entrant to obtain "access" to network elements "at any technical feasible point") with *id.* § 251(c)(4) (no such requirement for entrants acquiring resale services). Because a reseller uses the incumbent's OSS when purchasing resale services, use of OSS cannot possibly qualify as the "access * * * at any technically feasible point" required by section 251(c)(3). Indeed, a new entrant acquiring resale services uses OSS in the same manner as an entrant purchasing the UNE platform — with the touch of the entrant's keypad. It follows that a UNE platform purchaser's use of the incumbent's OSS cannot possibly distinguish the platform from resale; indeed, it simply confirms their equivalence.

In sum, new entrants acquiring the UNE platform, like new entrants engaged in the resale of the incumbent's retail services, do not obtain "access" to the incumbent's network elements at a "technically feasible point." Therefore, the UNE platform is not a combination of unbundled network elements within the meaning of section 251(c)(3).

Act: interconnection, unbundled network elements, and services offered for resale"); AT&T Reply 46 ("nondiscriminatory access to [OSS] is necessary to the statutory requirement that LECs provide nondiscriminatory access to * * * services for resale").

II. The UNE Platform Undermines The Structure Of Section 251(c) By Obliterating The Statutory Distinction Between Access To Unbundled Network Elements And Resale.

The foregoing textual arguments are sufficient, in and of themselves, to find that the UNE platform violates section 251(c). But the platform is invalid for an additional reason: it obliterates the distinction between the unbundled network element and resale entry options established by Congress in sections 251(c)(3) and 251(c)(4), and thus undermines the structure of section 251(c). See Ameritech Br. 24-31.

Unlike competitors that combine unbundled network elements into a competing network, new entrants acquiring the UNE platform would not design and establish their own alternative network; would not determine the amount of network elements necessary to carry their customers' traffic; would not make an up-front investment in all of the necessary elements; and would not make any effort even to identify the particular network elements they need. Rather, the platform would allow new entrants to use the incumbent's entire preassembled network — identical to what an entrant acquires when purchasing resale services under section 251(c)(4). Yet the platform would be priced *not* at the retail-minus-avoided-cost rate mandated by section 252(d)(3) for the resale of retail services, but rather at the cost-based rates reserved in section 252(d)(1) for unbundled network elements.

Petitioners do not and could not challenge our central proposition: that the 1996 Act prohibits new entrants from obtaining resale services at the cost-based rates reserved for unbundled network elements. Compare 47 U.S.C. § 252(d)(1) with *id.* § 252(d)(3). See also H.R. Rep. 104-204, at 71-72 (1995) (while rate for "unbundling" is based on "cost," the "resale rates" for resale services "should * * * take into account the rate at which local service is tariffed in a particular State"); Ameritech Br. 25, 27-30. Nor do peti-

tioners seriously challenge our argument that entrants using unbundled network elements must design and establish their own alternative, competing network. See Ameritech Br. 26-27.

These are significant concessions. If the UNE platform is equivalent to resale services for all material purposes, *or* if the platform permits new entrants to compete without designing and establishing an alternative network, then there can be no dispute that the platform violates the 1996 Act. Thus, petitioners have no choice but to argue that the UNE platform is somehow distinct from resale. Their arguments are far-fetched and meritless.

1. a. Petitioners spill much ink attempting to show that the UNE platform and resale services are distinct telecommunications products. But nowhere do they challenge, let alone disprove, the fact that both consist of the same preexisting, bundled network through which the incumbent carrier provides retail service to its own customers. Accordingly, petitioners do not, and could not, explain why Congress would have established a separate resale entry option (§ 251(c)(4)), with its own wholesale rate structure (§ 252(d)(3)), if it wished to permit entrants to obtain the same product through the network element entry option (§ 251(c)(3)) at cost-based rates (§ 252(d)(1)).

AT&T simply denies that Congress intended to "preserv[e] a separate role for the resale authorized by § 251(c)(4)," arguing that preservation of the resale option is a "non-textual objective[] of Congress" dreamed up by cross-petitioners. AT&T Reply 19. That is absurd. Because Congress established three entry options, with different rules governing each, it must have expected that each would play a separate role in the development of local competition. Congress could not have intended, and the 1996 Act does not allow, new entrants to get the benefit of the cost-based unbundled network element rate structure when acquiring an incumbent LEC's resale services. The UNE platform would

have precisely that effect. Thus, far from being a "non-textual objective[ ]," the distinction between the resale and unbundled network element entry options is firmly established in the statutory text. See *Bennett*, 117 S. Ct. at 1166 (citing cases). The fact that the FCC has different policy objectives than those reflected in the statute does not entitle the agency to disregard this statutory command.

b. Petitioners next attempt to show that the UNE platform is different from the incumbent LEC's resale services. Yet their arguments contradict what they have said outside of this litigation. In other forums, AT&T and MCI have not hesitated to admit — indeed, boast — that the UNE platform gives new entrants access to the same thing as resale, but at cost-based rates. For example, in a meeting with investment analysts, AT&T's president touted the UNE platform as "another way to resell" the incumbent's retail services, but at an effective discount twice as deep as the wholesale discount applicable to resale services under sections 251(c)(4) and 252(d)(3).[11]

Along the same lines, AT&T and MCI have argued to State commissions across the country that they should be permitted to obtain what has been dubbed "as is" migration to the UNE platform.[12] With "as is" migration, an incumbent LEC retail customer switches carriers and becomes, instantaneously and with the press of a button, an AT&T or MCI UNE platform customer. As AT&T argued less than three months ago — elsewhere, of course — "as is" migra-

---

[11] Transcript, Investment Community Meeting (Mar. 3, 1997) (comments of John Zeglis) ("Zeglis Statement") (J.A. 255-256).

[12] See, *e.g.*, Comments of AT&T Communications of Ohio Regarding the Effect of the Eighth Circuit Order, Case No. 96-922-TP-UNC (Pub. Util. Comm'n of Ohio), at 6-9 (filed Aug. 19, 1997); Comments of MCI Telecommunications on the Impact of the Decision of the Eighth Circuit, Case No. 96-922-TP-UNC (Pub. Util. Comm'n of Ohio), at 6-9 (filed Aug. 19, 1997).

tion to the UNE platform is appropriate "for Ameritech retail customers who want to keep *the same type of service using the same equipment* but simply want to switch local service providers from Ameritech to AT&T." In those circumstances, AT&T noted, "no physical changes are necessary and no interconnection charge will be assessed."[13] That is, of course, exactly what happens when an Ameritech retail customer switches and becomes an AT&T *resale* customer. AT&T's candid admissions confirm that even AT&T believes that, putting aside price, the platform is indistinguishable from resale services.

Notably, petitioners remain silent on these matters, which figured prominently in our opening brief (at 16-17). Instead, they offer platitudes concerning how the UNE platform will allow AT&T and MCI to offer "different services" than those offered by the incumbent LEC for resale. See FCC Reply 38-40; AT&T Reply 20-21; MCI Reply 15. That argument, even if it were true, begs the question. Regardless of which new services a new entrant can *provide* with the UNE platform, an entrant ordering the platform *receives* the same thing from the incumbent LEC as an entrant ordering a resale service — the preexisting, bundled network that the incumbent uses to provide retail service to its own customers — but at the cost-based rates applicable to unbundled network elements. Again, Congress would not have established a separate resale entry option, with a separate rate structure, if it wanted to allow new entrants to obtain the same product via the unbundled network element option.

In any event, petitioners give few examples of the "different services" the UNE platform supposedly will allow new entrants to offer, and those examples belie any such distinction. For instance, AT&T suggests that the platform

---

[13] AT&T's Memorandum Contra to Ameritech Ohio's Application for Rehearing and Request for Stay, Case No. 96-922-TP-UNC (Pub. Util. Comm'n of Ohio), at 25-26 (filed May 4, 1998) (emphasis added).

would permit it to "use its own operator service facilities in combination with LEC network elements." AT&T Reply 41. That hardly distinguishes the platform from resale services, because AT&T's interconnection agreements with Ameritech allow AT&T to use its own operator service facilities in conjunction with resale services acquired from Ameritech.[14]

Perhaps most significantly, petitioners do not challenge the proposition that new entrants using the network element entry option, unlike resellers, must design and establish their own alternative, competing network. See Ameritech Br. 26-27. Establishing an alternative network requires, at a minimum, that the new entrant designate and combine the particular network facilities that will carry its customers' traffic. Yet the UNE platform *relieves* entrants of these obligations by permitting them to use the incumbent LEC's entire bundled, preassembled network. Like resellers, then, entrants acquiring the platform do not establish their own competing network, but simply use the incumbent's existing network.

In the end, the FCC is reduced to the *ipse dixit* that the UNE platform and resale are different because an entrant purchasing the platform "does not resell anything; it leases an incumbent's underlying elements." FCC Reply 38. But if AT&T were to obtain the UNE platform on an "as is" basis, it would do the same thing that a reseller does: provide local service to its own customers by acquiring the same preexisting, bundled network used by the incumbent to serve the incumbent's customers. Thus, although AT&T *nominally*

---

[14] See, *e.g.*, Interconnection Agreement Under Sections 251 and 252 of the Telecommunications Act of 1996 by and between Ameritech Information Industry Services and AT&T Communications of Illinois, Inc., § 10.10.2 (approved by the Ill. Commerce Comm'n Jan. 8, 1997) (when AT&T acquires a resale service from Ameritech, "Ameritech shall make available to AT&T, upon AT&T's request, the ability to route * * * Local Operator Services calls (0+, 0-) dialed by AT&T Customers directly to the AT&T Local Operator Services platform * * * to the extent such routing is technically feasible").

would be leasing the incumbent LEC's network elements, in substance it would receive from the incumbent precisely what a reseller acquires — but at cost-based rates.

c. The FCC understandably is loathe to acknowledge our point that the UNE platform is indistinguishable from resale. In addition to insisting that the "UNE platform" label transforms the incumbent's preassembled network into a different product, the FCC also asserts that the platform will be a boon to facilities-based competition. See FCC Reply 33-41. However, the FCC's former Chairman — under whose direction the agency promulgated the rules designed to give new entrants access to the UNE platform — recently repudiated the central premises of the FCC's position at a hearing before the Illinois Commerce Commission. Addressing the UNE platform, Mr Hundt stated:

> I think it has to be stipulated that real competition, competition that brings investment and innovation, * * * has to be essentially facilities based. I think all versions of resale are transitional techniques. The UNE platform is a version of resale.[15]

Thus, as both AT&T's president and the former FCC Chairman have acknowledged, there is no difference between the UNE platform and resale. The platform therefore is antithetical to the separate unbundled network element entry provisions enacted by Congress.

2. Petitioners also do not come to grips with our second proposition: that the UNE platform, priced at the cost-based rates reserved for unbundled network elements (§ 252(d)(1)) rather than the retail-less-avoided-cost rate established for resale (§ 252(d)(3)), creates arbitrage opportunities that obliterate the distinction between the network element and resale entry options. See Ameritech Br. 27-30.

---

[15] *In the Matter of: Telecommunications Policy Open Meeting*, Tr. 235 (Ill. Comm. Comm'n July 14, 1998) (statement of Reed Hundt).

a. *First*, petitioners argue that the UNE platform will not nullify the resale entry provisions because new entrants will acquire the incumbent LEC's resale services under section 251(c)(4), rather than the platform under section 251(c)(3), when it is less expensive to do so. See FCC Reply 40 n.27; AT&T Reply 23; MCI Reply 13. But that only confirms our point. It is a prescription for arbitrage to allow a new entrant, when obtaining use of an incumbent LEC's entire bundled network, to invoke the label "resale" when the resale rate is lower than the UNE platform rate, and the label "UNE platform" when the UNE platform rate is lower than the resale rate. Regardless of which rate is lower, there is only one legal rate for use of the incumbent's entire bundled network on an "as is" basis: the retail-minus-avoided-cost rate established in section 252(d)(3) for resale services. Allowing new entrants to obtain cost-based rates simply by using a different label would corrupt the 1996 Act.

Requiring new entrants to abide by the 1996 Act's resale provisions does not, as petitioners claim, improperly "disadvantage" or "limit" the network element entry option in favor of the resale entry option. See AT&T Reply 23; MCI Reply 20; FCC Reply 37. It simply enforces Congress' explicit command that the wholesale rate structure apply to resale services. See 47 U.S.C. §§ 251(c)(4), 252(d)(3). Likewise, it reserves the cost-based network element rate for those entrants that actually use unbundled elements to establish a competing, alternative network. See *id.* §§ 251(c)(3), 252(d)(1).

b. *Second*, petitioners maintain that the UNE platform imposes pricing risks not assumed by resellers. See FCC Reply 39; AT&T Reply 24-25; MCI Reply 15-16. AT&T argues that "in contrast to resellers of [incumbent] LECs' retail services, a network element purchaser can *never* avoid the fact that its profit or loss depends on customer usage volumes and usage patterns." AT&T Reply 25 (emphasis added). AT&T's claim rests upon the premise that a new

entrant must charge its UNE platform customers a flat monthly rate for local service. That premise is false: AT&T can simply establish a rate consisting of a low monthly flat fee, plus additional charges based upon the customer's usage — just as incumbent LECs establish similar usage sensitive rates for their own retail customers. That would guarantee that an entrant using the UNE platform would recover the costs incurred by its customer's high usage volumes.

c. *Third*, petitioners argue that new entrants acquiring the UNE platform, unlike resellers, will have to incur costs establishing systems to bill and collect for exchange access services. See FCC Reply 39-40; AT&T Reply 24-25. This argument fails on a number of grounds. Most obviously, as ALTS points out, "almost all new entrants" — including, presumably, giants like AT&T and MCI — already "have the back office systems and financial resources" necessary to bill and collect when using the UNE platform. ALTS Opposing Br. 17-18.

Moreover, the FCC and AT&T grossly exaggerate the efforts a new entrant must undertake to bill for and collect exchange access revenues when using the UNE platform. In opposing Ameritech Michigan's application for authority to provide long distance services, AT&T argued that *Ameritech* was obligated to provide the "billing detail" necessary for AT&T to collect exchange access revenues.[16] In its order denying Ameritech's application, the FCC agreed that Ameritech has an "*obligation* to provide usage information to competing LECs * * * in a manner that permits competing LECs to collect access revenues." *Ameritech Michigan 271*

---

[16] *In the Matter of Application by Ameritech Michigan for Authorization Under Section 271 of the Communications Act to Provide In-Region InterLATA Services in the State of Michigan*, CC Docket No. 97-137, Affidavit of Robert V. Falcone and Robert A. Sherry on Behalf of AT&T Corp., ¶¶ 78-81 (filed June 10, 1997); *id.*, Affidavit of Robert V. Falcone and Maureen E. Gerson, ¶¶ 32-33 (filed June 10, 1997).

Order, ¶ 330 (emphasis added). This puts the lie to the FCC's and AT&T's argument in *this* litigation about the alleged burdens of establishing systems to bill for and collect exchange access revenues.

Indeed, a UNE platform purchaser's ability to collect exchange access revenues can hardly be termed a "responsibility" or a "task" (FCC Reply 38) at all. Rather, it is an additional *benefit* that exacerbates the arbitrage opportunities created by the platform. When a new entrant's resale customer makes or receives a long distance call, the incumbent LEC collects "access" charges from the long distance company as compensation for originating or terminating the call. However, if the entrant serves its customer via the UNE platform, the entrant would collect the access revenues — even though it would do nothing more than a reseller does to originate or terminate the call. A new entrant acquiring the UNE platform, then, not only would pay the cost-based rates reserved for unbundled network elements, but *also* would collect access charges from long distance companies. Thus, petitioners' argument that the new entrant's ability to "compete in the highly profitable market for exchange access" (MCI Reply 14; see also AT&T Reply 21-22; FCC Reply 38-39) distinguishes the UNE platform from resale is correct — and supports *our* position on the platform.

d. As explained in our opening brief (at 29-30, 38-40), the real reason why AT&T and MCI want to affix the "UNE platform" label rather than "resale" to use of the incumbent's entire bundled network is because those carriers are dissatisfied with the retail-less-avoided-cost rate structure established by Congress in section 252(d)(3). It therefore is ironic that petitioners repeatedly accuse us of relying upon "policy" arguments in opposing their efforts to obtain the UNE platform at the cost-based rates reserved by section 252(d)(1) for unbundled network elements. See FCC Reply 38-39; AT&T Reply 19; MCI Reply 18. For the reasons set forth above, it is the statutory text and structure that supports —

indeed, compels — the conclusion that the UNE platform would obliterate the distinction between the unbundled network element and resale provisions of the 1996 Act.

3. Finally, petitioners do not even address our argument that the UNE platform would allow the large long distance carriers to evade the joint marketing restrictions of section 271(e)(1). See Ameritech Br. 30-31. Petitioners' only possible defense would be that the UNE platform is somehow distinct from resale services. Such a claim, however, lacks merit for the reasons set forth above.

* * *

As ALTS correctly observes, the UNE platform is a tool of "the long distance companies" like AT&T and MCI that "have not invested to the same degree in local competitive facilities" as ALTS members, but that nonetheless want to enter local service markets by acquiring resale services on the cheap. ALTS Opposing Br. 7. The fact that ALTS — whose members compete by combining their facilities with the incumbent's unbundled network elements — opposes the UNE platform puts the lie to petitioners' refrain that opponents of the platform simply wish to "cripple" (AT&T Reply 33) the network element entry option. Indeed, by seeking to allow new entrants to acquire the incumbent's resale services under the label "UNE platform," it is petitioners that seek to eliminate one of the entry options explicitly created by Congress.

CONCLUSION

The judgment of the court of appeals should be reversed insofar as it upholds the "all elements" rule. If this Court determines that the "all elements" rule and Rule 315(b) are valid on their face, the Court should hold that the rules are invalid to the extent they require incumbent LECs to provide the UNE platform at the cost-based rates reserved for unbundled network elements.

Respectfully submitted.

Telecommunications Policy Open Meeting Transcript (Ill. Comm. Comm'n, July 14, 1998) 8

INTRODUCTION[1]

GTE's opening brief demonstrated that the FCC's quadruple-barreled expansion of the duty to provide unbundled network elements ignores the terms of the Act and upsets the balance Congress achieved between competing objectives. In response, the FCC and its allies focus primarily on two tactics.

First, the FCC attempts to mischaracterize challenges to its unbundling rules as a "variety of policy contentions" unrelated to the text. FCC Reply 21. That is an obvious strawman. GTE's arguments are grounded firmly in the terms of the Act.

Specifically, with respect to the FCC's attempt to expand the definition of "network elements" to all aspects of an incumbent's business, the text limits network elements to "facilit[ies] and equipment" (including their "features") "used" in providing telecommunications service. 47 U.S.C. § 153(29). It is hardly a "policy contention" to point out that this language limits network elements to physical pieces of equipment in an incumbent's call-delivery network.

Similarly, with respect to *which* network elements should be unbundled, it is not a policy contention to show that the FCC misinterpreted the phrase in § 251(c)(3) governing *where* network elements must be available for interconnection ("at any technically feasible point") to create an erroneous presumption concerning *which* elements must be unbundled — namely, any element that it is technically feasible to unbundle. Nor is it a policy argument to demonstrate that, to conform the rest of the statute to its misreading of § 251(c)(3), the FCC eviscerated the standards of § 251(d)(2) that govern what network elements should be made available.

Likewise, the argument that the FCC erred in allowing entrants to engage in "sham unbundling" — purchasing all the elements needed to provide completed service in lieu of

---

[1] In lieu of filing their own reply brief on the subjects addressed here, the Mid-Sized Local Exchange Carriers, Cross-Petitioners in No. 97-1141, have authorized GTE to state that they adopt the arguments in this brief.

purchasing service according to the statutory resale method — is again rooted in the text. Section 251(c)(3) provides new entrants "access" to "unbundled" "elements" of the network at any "technically feasible point." Those terms describe leasing *pieces* of the network; they do not reasonably extend to purchasing *complete* service — especially at prices different from the prices set by the Act for the same service.[2] The FCC's approach undermines the structure of the Act by creating a second, extra-statutory route for resale that evades the restrictions on resold services. The result of these distortions of the text, as we have explained, is a rampant opportunity for arbitrage that will undermine universal service.

More generally, reading the Act as a whole (rather than parsing individual terms in isolation), and evaluating the cumulative effect of the FCC's expansions of the unbundling duty, does not involve an appeal to free-floating policy. Even under the first step of *Chevron* analysis, considering the overall structure of an act of Congress to ensure that the construction of different sections will create a functioning whole (and to ensure that a misreading of an individual term will not undermine complementary parts of the statutory plan) is an integral part of a *textual* approach to statutory interpretation.[3]

---

[2] This reply brief is limited to the issues raised in our cross-petition in No. 97-1087 and thus does not revisit specific arguments relating to the FCC's fourth step in expanding the unbundling duty — namely the requirement in Rule 315(b) that incumbents provide pre-assembled combinations of network elements. For the reasons stated in our opening brief, that rule, which is an integral part of the conversion of elements into "another way to resell," also violates the Act. *See* GTE Br. 65-71.

[3] *See, e.g.*, *Sullivan v. Everhart*, 494 U.S. 83, 89 (1990) (on first step of *Chevron* analysis, court must determine meaning of statute by examining both "the particular statutory language at issue, as well as the language and design of the statute as a whole"); *Dole v. United Steelworkers*, 494 U.S. 26, 36 (1990) (evaluating agency rule in light of "consideration of the object and structure of the Act as a whole").

Second, unable to deny the plain effect of its four-part expansion of the unbundling duty, the FCC attempts to relabel bad as good. The FCC nowhere denies that its rules will promote precisely the arbitrage we have described. By allowing entrants to buy *all* the elements needed to provide finished service (indeed, by allowing entrants to purchase them as a pre-assembled platform at no extra charge), the FCC has converted network elements, as AT&T's president has explained, into "[a]nother way to resell." J.A. 255. This extra-statutory avenue for reselling service, however, evades the restrictions Congress imposed on resale. *See* §§ 251(c)(4), 252(d)(3). In particular, while Congress specified that an entrant reselling a service would pay a wholesale rate based on the incumbent's own retail rate, *see* § 252(d)(3) — a rate that would thus reflect universal service subsidies in retail rates — an entrant exploiting the FCC's unbundling rules can purchase finished service at a price that excludes universal service costs. The entrant is thus guaranteed that, while doing nothing but reselling an incumbent's service, it will be able to undercut retail rates for business customers whose rates have been set above cost to support universal service.

Unable to deny these results, the FCC resorts to Orwellian relabeling, claiming that the regulatory arbitrage promoted by its rules "is [merely] another name for . . . rational, cost-based competition." FCC Br. 21. But what the FCC's rules set in motion is, by definition, arbitrage: the FCC allows entrants to game two regulatory systems to buy service at one price, add nothing whatsoever, and turn around and sell at a higher price while undercutting state-regulated rates.

It is not "*real* competition," MCI Reply 5 (emphasis in original), moreover, to allow a competitor to purchase every last element of the incumbent's business at the prices that supposedly would prevail for a hypothetical, most-efficient network in a perfectly competitive market. Declaring by bureaucratic edict that the incumbent must sell its services to

its competitors at the price a government regulator believes would be established by perfect competition is not allowing competition to work (which is what Congress required); rather it is *bypassing* competition by attempting to set *in advance* the prices that a perfectly competitive (and perfectly nonexistent) market would produce.

By requiring an incumbent to sell its service at those prices to *competitors*, moreover, the FCC merely allows competitors to pocket most of the difference between current retail rates and its hypothetical, most-efficient price — thus depriving customers of the benefits of the process of competition. Worse still, since current retail rates reflect the costs of subsidizing universal service, the impact of the FCC's approach is to allow entrants such as AT&T and MCI to pocket the amounts that currently support affordable rates. Nothing about this system of arbitrage can remotely be equated with "real competition."

ARGUMENT

I. THE FCC ERRED BY RULING THAT ENTRANTS COULD PROVIDE SERVICE USING *SOLELY* NETWORK ELEMENTS.

Section 251(c)(3) provides potential entrants a method for purchasing discrete pieces or "elements" of the incumbent's network and for obtaining access to them "at any technically feasible point." The terms of the section make plain that Congress contemplated an incumbent offering entrants discrete pieces of its network and allowing an entrant to interconnect its facilities with these pieces at any of various points. The section thus provides a method of entry for carriers that have some facilities of their own.

For entrants who wanted to rely solely on the incumbent's network, Congress established a distinct method of purchasing finished service at wholesale rates for resale, *see* § 251(c)(4), and specified that the wholesale rate would be pegged to the incumbent's own (state-regulated) retail rate. *See* § 252(d)(3).

By allowing an entrant to purchase *all* of the parts of the network needed to provide service so that elements could be used — as AT&T's president put it — to "create local service," J.A. 256, the FCC impermissibly converted unbundled elements into another method for obtaining finished service and provided entrants a means for evading the limitations Congress imposed on resale.

The primary defense of the FCC's approach seems to be that Congress failed to explain in detail in § 251(c)(3) that converting the statutory method for buying discrete "elements" into an avenue for obtaining everything needed to resell local service — thus transforming it into "another way to resell" — would disrupt the separate system for resale that Congress explicitly created in § 251(c)(4). But there was no need for such an extraordinary caution. The ordinary presumption is that "[w]hen a statute limits a thing to be done in a particular mode, it includes the negative of any other mode." *Botany Worsted Mills v. United States*, 278 U.S. 282, 289 (1929). Section 251(c)(4) provides the method for obtaining finished service, and there can be no basis for twisting § 251(c)(3) into a redundant means of obtaining the same thing.[4]

The FCC and its allies do not advance analysis by repeating the mantra that there should be no restraint on network elements because Congress created several entry vehicles to give entrants a "range of opportunities." AT&T Reply 23. The very question is what sort of opportunity each distinct entry vehicle was intended to provide. Contrary to the

---

[4] The FCC also strains to find support in the fact that § 251(c)(2), addressing interconnection, expressly refers to the entrant's "facilities and equipment," while § 251(c)(3) lacks a similar reference. *See* FCC Reply 27. That is hardly a basis for distorting the import of § 251(c)(3). Section 251(c)(2) also provides for "interconnection," and while § 251(c)(3) nowhere repeats that express requirement, the FCC found no difficulty in concluding that the section included an obligation to "provide a connection to a network element" independent of § 251(c)(2). J.A. 541 (¶ 269).

FCC's efforts at distortion, our arguments have nothing to do with imposing "artificial" limits on the use of unbundling to limit its utility as a means of entry, but rather with ensuring that each mode of promoting entry is used only as Congress specified in the Act.

Underlying the refrain about "multiple routes of entry" is the implicit assumption that Congress created multiple routes for obtaining effectively the same thing and established different pricing standards for these routes. That is utterly illogical. Congress explicitly addressed the method by which entrants could obtain service for resale in § 251(c)(4) and established a wholesale pricing standard to apply to such service. *See* § 252(d)(3). The FCC's efforts to expand a *different* provision of the Act dealing with access to pieces of the network into "another way to resell" — and at a different price to boot — turns statutory construction on its head.

Nor can the FCC defend its refusal to enforce the distinction between resale and purchasing discrete pieces of the network by claiming that it would be too hard to administer any requirement that purchasers of elements have at least some facilities of their own. FCC Reply 27-28. Such a rule no doubt would require the FCC to exercise discretion in drawing lines to preserve the structure of the Act Congress intended, but that is an agency's role. Where the FCC has wanted to extend its regulatory power, moreover — such as in the realm of setting prices — it has never balked at the difficulty of the task at hand.

Indeed, the FCC's confidence in its price-setting ability is particularly ironic here. The FCC claims that enforcing any facilities-ownership requirement will require the agency to force the use of alternative facilities, and thus that it would interfere with pure "market forces" guiding decisions about deploying facilities. *See* FCC Reply 22, 33. But by dictating the prices for network elements, government regulators are controlling incentives for deploying facilities just as surely as

they would be by requiring purchasers of elements to have some facilities of their own. As the FCC occasionally acknowledges, *see id.* 34, 35, it can pretend that its rules leave decisions up to the "market" only by assuming that prices for elements have been set perfectly at market levels, and that regulated rates will continue to mimic perfectly the prices that would be set in a dynamic market — a far-fetched proposition at best.[5] Enforcing a reasonable ownership rule thus would not fundamentally alter the agency's role at all. In short, regulation already controls incentives for deploying facilities, and an agency with such unbounded confidence in its ability to set rates perfectly could surely devise a reasonable rule to ensure that purchasing elements does not become an end-run around the Act's resale provisions.

Moving beyond the basic textual difficulties it encounters in transforming access to elements into an extra-statutory method for obtaining finished service, the FCC prefers to defend its rules at a higher level of generality. Thus, it makes a series of arguments intended to minimize the arbitrage that its rules promote. None of these efforts can reconcile the FCC's approach to unbundling with the terms of the Act.

1. The Arbitrage Fostered by the FCC's Unbundling Rules Is Not "Real Competition."

The FCC's boldest maneuver is its effort to claim that the arbitrage promoted by its rules is not arbitrage at all, but rather the "rational, cost-based competition" that Congress intended to promote. FCC Reply 21. That is nonsense. Under the FCC's rules, an entrant can buy all the elements needed to "create local service" at rates that exclude any of the costs of supporting universal service. Then, without adding any facilities of its own or providing any inputs, it can secure a

---

[5] One of the guiding assumptions of a de-regulatory statute like the Act, after all, is that regulation cannot perfectly mimic the market and thus that consumers will benefit from the actual process of competition.

guaranteed profit by turning around and reselling the incumbent's own service at rates below the above-cost rates state regulators have set (primarily for businesses) to support universal service.

To suggest that this quick-turnaround, buy-and-sell approach to repackaging the incumbent's own service is the "*real* competition," MCI Reply 5 (emphasis in original), that is the goal of the Act is absurd. An entrant exploiting the price differential between network element rates and the above-cost retail rates that support universal service does not produce any efficiencies or provide the benefits of innovation that Congress sought to foster through competition. *Cf.* H.R. Conf. Rep. No. 104-458, at 113 (1996) (Act seeks to "accelerate rapidly private sector deployment of advanced telecommunications and information technologies and services").

Indeed, to the extent that such an arbitrageur might bring some consumers even the short-term benefit of lower prices, that results not from any added efficiency, but simply from the fact that the FCC allows the entrant to play two different regulatory systems off one another so as to buy an incumbent's service at one regulated price and to sell it by undercutting higher, regulated retail rates. The lower price comes from the entrant's ability to avoid the real costs of universal service built disproportionately into some customers' retail rates. This is not an "efficiency-inducing process," FCC Reply 30; it is the essence of arbitrage.[6]

---

[6] Even the former Chairman of the FCC who presided over the creation of the First Report and Order has rejected the idea that the sham-unbundling approach fosters real competition. *See* Telecommunications Policy Open Meeting, transcript at 235 (Ill. Comm. Comm'n, July 14, 1998) (testimony of Reed Hundt) ("[R]eal competition, competition that brings investment and innovation, that ultimately permits deregulation, that has to be essentially facility based. I think all versions of resale are transitional techniques. The UNE platform is a version of resale.").

The FCC's effort to pass off this regulatory gamesmanship as genuine "competition," moreover, speaks volumes about the vision driving the FCC's approach to the Act. The FCC has made the classic error of conflating the proliferation of the number of "competitors" in the market with the advancement of competition. By providing an easy route for entrants to use the incumbent's own network to provide service at rates that are guaranteed to undercut current retail prices, the agency may succeed in subsidizing entry by a number of firms piggy-backing on the incumbent's network. But by stifling incentives for entrants to deploy new technologies of their own, it will inhibit the competitive process the Act was designed to foster.[7]

More fundamentally, the FCC and its allies demonstrate that their approach to expanding the unbundling duty is rooted in the belief that facilities-based competition is not a realistic possibility. AT&T makes this premise clearest as it asserts that the Act in no way rejects the assumption that local networks are a natural monopoly. *See* AT&T Reply 28 & n.11. Such an assumption necessarily leads to a very different view of the type of competition that can be fostered under the Act. Under AT&T's view, it would be irrational for competitors to develop rival networks. And not surprisingly, the FCC's approach to unbundling tracks this assumption perfectly. It is custom-tailored to produce a system in which there is only *one* network, effectively nationalized and sold off to so-called "competitors" at regulated rates so that they can provide carbon-copy services over the same facilities. That is plainly not the vision of robust competition that Congress had in mind.

---

[7] *Cf.* Hon. Stephen G. Breyer, *Antitrust, Deregulation, and the Newly Liberated Marketplace*, 75 Calif. L. Rev. 1005, 1018 (1987) (explaining the risk that regulators "will protect competitors instead of protecting competition" and that the "consequence of misdirect[ed] protection is to threaten to deprive the consumer of the very benefits deregulation seeks").

2. The FCC's Extra-Statutory Creation of "Another Way to Resell" Promotes Arbitrage and Undermines the Restrictions Congress Established to Govern Resold Service.

The FCC and its allies next resort to a series of quibbles purportedly intended to downplay the arbitrage the FCC has opened up or to show that it will not systematically favor network elements in all scenarios. These claims are either misleading or irrelevant, and they provide no basis for reconciling the FCC's approach with the text of the Act.

To start, the FCC acts as if it can score a decisive point by explaining that a purchaser of elements does not receive the *exact* equivalent of service for resale. FCC Reply 38 (element purchaser can use the incumbent's facilities to provide services in different packages, for example, and can offer exchange access). But the basic end-run the FCC has created around the Act's resale provisions in no way depends on the capabilities offered to a purchaser of elements being limited in every detail to match those secured by a statutory reseller. Rather, the problem arises because the FCC has converted an avenue for buying "elements" into a method for "creat[ing] local service," J.A. 256, and thus has offered, in all functional respects, "[a]nother way to resell," J.A. 255.

In any event, the differences the FCC highlights serve only to show that an entrant exploiting the FCC's unbundling rules to "create local service" actually receives *more* than under the statutory resale route. But these facts only exacerbate the magnitude of the arbitrage opportunity by showing that a purchaser of elements gets a souped-up version of finished service — and still gets it all for a *lower price*. The FCC cannot logically *defend* its rules by pointing out that it has found a way to provide an even *more* outrageous arbitrage option than it would have provided by recreating an exact equivalent to wholesale service.

Next, the FCC and its allies proclaim that the FCC's reading must be permissible because it will not cause resale to fall *wholly* into disuse. This point, too, is irrelevant. What MCI would like to paint as the "key premise" of our argument — namely that "resale will *always* be more expensive than relying exclusively on network elements," MCI Reply 14 (emphasis added) — is not a premise of our argument at all. It is trivially true that for some customers — those who currently enjoy below-cost, subsidized rates — resale will remain the preferred method of entry. The entire point of the arbitrage problem is that there are different sets of customers who enjoy very different retail rates. The focus of arbitrage will be on customers at the *other* end of the spectrum — business customers whose retail rates have been set high to support universal service. Thus, the mere fact that the FCC's rules will not make resale *entirely* a dead letter in no way rescues the FCC's approach. If anything, by highlighting that the FCC has relegated statutory resale to the role of serving only one limited set of customers, this point again re-emphasizes that the FCC has devised an end-run around resale for the highest-profit segments of the market.

Next, the FCC and its allies claim that purchasers of network elements will not really be guaranteed easy profits because they face different risks from statutory resellers — in particular, the risk that they might not be able to cover the fixed cost of elements. *See, e.g.*, FCC Reply 39. Again, such claims incorporate a number of misleading assumptions. To start, the only elements that an entrant must purchase at a flat rate are the loop, network interface device (NID), and the port. Other elements have been priced on a usage-sensitive basis, and thus an entrant has no risk of an excess, up-front investment. And as for these flat-rated elements, comparisons to *residential* rates again distort the picture. *See* FCC Reply 39 n.25; MCI Reply 14 & n.5. Retail *business* rates typically exceed the basic cost of elements by a wide margin. For example, in North Carolina's Research Triangle Park, the cost

of an unbundled loop, NID, and port from GTE is $20.41; far below the retail rate of $39.95.[8] A purchaser of elements thus starts out with a hefty guaranteed profit.

As a result, there is nothing to the claims that entrants face a risk that they will not "stimulat[e]" sufficient demand for *new* services to cover costs. AT&T Reply 24. The purchaser of elements is not starting off with a loss to make up and does not need to "stimulate" demand to make a profit. Such complaints, moreover, create the impression that entrants like AT&T and MCI are gambling that they will not end up with high-cost customers that make little use of their telephones. That is misleading at best. Unlike incumbents, entrants are not required by state law to serve all customers in a given area; rather, they can target selected customers. And it is well known that the name of the game is high-volume, urban business customers — that is, customers who generate high revenues and low costs. Entrants have already established a pattern of targeting such customers,[9] and as AT&T's president has explained, their declared strategy is "to go into a high density, low [UNE] price zone," J.A. 257. Established interexchange carriers such as AT&T and MCI, moreover, already know which large business customers have high long

---

[8] *See* North Carolina General Customer Tariff, GTE South Incorporated, 23d revised page 3 (filed Feb. 2, 1998) (retail rate); Recommended Arb. Order, *Petition of AT&T Communications of the Southern States, Inc. for Arbitration of Interconnection with GTE South, Inc.*, Docket No. P-140, Sub. 51, at 53, 60 (N.C.U.C. Feb. 4, 1997) (element rates).

[9] *See, e.g.*, M. Mills, *Bells Are Ringing on Wall St. for Local Phone Start-Ups*, Wash. Post, Oct. 1, 1997, at D-10 (entrants are "not after a mass market: Their target is business customers . . . ."); S. Berkelman, *Unleashed, AT&T Goes After Bells*, Newsday, Feb. 9, 1996 ("It's logical that bees follow honey and banks are robbed because that's where the money is, and our focus will be on concentrated markets in major cities with concentrations of business customers.") (quoting Robert Allen, Chairman of AT&T).

distance bills, and they can target those customers specifically.[10]

Any suggestion, moreover, that purchasers of elements face large up-front costs in developing new billing systems, *see, e.g.*, FCC Reply 40; MCI Reply 16, is baseless. One of the very arguments in this Court is an effort to protect current FCC rules that entrants believe will give them access to all the OSS necessary to handle billing and to "convert the recorded customer usage information into bills." AT&T Reply 44.

Finally, the FCC's supporters cannot immunize the FCC's rules by arguing that they are based on "findings" and "predictive judgments" showing that the agency's reading of the unbundling duty will not undermine the resale provisions. *See, e.g.*, MCI Reply 12-13; AT&T Reply 20. These supposed "findings" are just the quibbles about pricing and incentives dealt with above. At bottom, moreover, these assertions are nothing but a transparent effort to wrap up in the terminology of a factual "finding" a *legal* conclusion that the undisputed arbitrage promoted by the FCC does not evade the terms of the Act. But that question of law is for the Court to decide.

3. By Creating "Another Way To Resell" That Will Undermine Universal Service Funding, the FCC Violated the Terms of the Act.

The FCC and its allies cannot dispute that the arbitrage outlined above will undermine universal service funding. Indeed, they nowhere deny that, at least until an entirely new funding mechanism is in place under § 254, entrants taking

---

[10] If by no other means, an entrant could ensure that its customers would meet a target volume of calls by selling local service in a package with a set number of minutes of long distance pre-paid. Unlike a statutory reseller, the purchaser of elements would not be prohibited from jointly marketing its long distance service with local service effectively resold from a local Bell company. *See* § 271(e). The FCC's version of unbundled elements provides an end-run around that restriction of the Act as well.

advantage of the FCC's approach to unbundling would be able to evade any contribution at all to universal service. Instead, they attempt, in part, to belittle this result as a mere "policy" concern. But that ignores the text of the Act. Congress specifically pegged the wholesale price for an incumbent's service to the retail rate — and thus ensured that it would reflect the costs of universal service subsidies. *See* § 252(d)(3). By creating another way to "create local service" through network elements sold at rates that (under the prevailing interpretation) *do not* reflect such subsidies, the FCC's rules evade the explicit protection built into the wholesale pricing term. As explained above, moreover, examining the FCC's approach to unbundling in light of the text and structure of the Act's resale provisions, and more generally in light of terms showing Congress's concern for preserving (rather than undermining) universal service, is not a foray into policy — it is part and parcel of proper construction of the Act.

Next, the FCC and its allies try to brush aside the free ride on universal service that the FCC is offering entrants by claiming that these are "interim concerns" properly resolved by the reforms required by § 254, including a new, explicit funding system. But the "interim" period these parties would like the Court to overlook is the critical transition period that will give entrants like AT&T and MCI a chance to cash in on a unique exemption from universal service burdens to cream-skim billions of dollars worth of incumbents' highest-value customers. AT&T's explanations of how entrants *will* contribute to universal service *once* § 254 has been implemented, AT&T Reply 29, are irrelevant. That system does not yet exist. Rather, the FCC has determined that there will be no explicit funding to reform universal service until at least 1999. In re Federal State Joint Board on Universal Service, CC Docket No. 96-45, ¶ 26 (May 8, 1997).

Indeed, for that reason it is supremely ironic that the FCC would now claim that the "proper way" to deal with the threat

that its unbundling rules undeniably pose to universal service is to "ensure timely implementation of the universal service reforms ordered in Section 254." FCC Reply 31. Ignoring the fifteen-month timetable set by Congress, *see* § 254(a), the FCC has postponed explicit funding under § 254 until 1999 and is now fighting before the Fifth Circuit to protect its delays, insisting that the "explicit and sufficient" funding system demanded by the Act is not an "immediate requirement" at all, but rather is merely an "eventual goal." *See* Brief for the FCC 49, *in Texas Office of Pub. Utility Counsel v. FCC*, Nos. 97-60421, *et al.* (5th Cir.).[11] Even on its face, therefore, the suggestion that unbundling arbitrage will be taken care of by swift action on § 254 cannot be taken seriously.

In any event, efforts to reduce the arbitrage here to an interim quibble about the timing of universal service reform are misplaced. First, as explained above, the root problem in the FCC's approach to converting access to "elements" into "another way to resell" is that it defies a basic limitation in the text of the Act linking the price for wholesale service to retail rates. *See* § 252(d)(3). That limitation applies at all times, regardless of the state of universal service reform. Creating a second method for purchasing service that will avoid that pricing standard flatly distorts the Act.

Second, at a more practical level, the suggestion that § 254 will remove any opportunity to game the system is simply incorrect. To be sure, the discrepancy between the wholesale rate set by the Act and the price for service recreated through "unbundled" elements is starkest when one focuses on implicit subsidies in retail rates. But even if implicit subsidies are removed, the FCC's rules will still offer entrants two routes for obtaining finished service at prices determined under

---

[11] In fact, the FCC is now considering proposals to postpone explicit funding even further. *See* In re En Banc Hearing, tr. at 26 (FCC June 8, 1998) (available at http://www.fcc.gov/enbanc/060898/eb060898.html).

different statutory sections. There is no guarantee that the bottom-up approach of setting cost-based rates for elements will result in the same price as the top-down approach of applying a discount to retail rates — the method that Congress demanded in § 252(d)(3) for wholesale service. To the contrary, the prevailing approach under § 252(d)(1)'s cost-based standard (using long-run incremental costs of hypothetical networks) systematically excludes a variety of actual costs included in incumbents' retail rates; thus, it would necessarily yield a different price from the wholesale rate. The FCC's extra-textual method for using elements as "another way to resell" thus will always provide entrants some opportunity for gaming the system to receive a substitute for wholesale service at a price different from the one specified by the Act.

II. THE FCC IMPROPERLY EXPANDED THE DEFINITION OF NETWORK ELEMENTS.

Remarkably, the FCC does not spend a single sentence in its brief defending the construction of the statutory definition of network elements that is at the heart of this part of the case. Below, the FCC insisted that by referring to a "facility or equipment" used in providing "telecommunications *service*," § 153(29) (emphasis added), Congress radically expanded "network elements" far beyond the network itself to include any asset that an incumbent uses in "offering" telecommunications to the public. Indeed, the agency convinced the Eighth Circuit to adopt this reading, making the breadth of the "overall commercial offering of telecommunications" the key factor in determining the scope of network elements. Pet. App. 42a-43a. *See also id.* (OSS are network elements because they "constitute features, functions, and capabilities that are provided through the use of software and hardware that is used *in the commercial offering of telecommunication services to the public*") (emphasis added).

As we explained before, that extravagant gloss removes any textual constraint on what is deemed a "network element."

Everything that a LEC owns is used in some way to "offer" service. No doubt recognizing the indefensible overbreadth of that rationale, the FCC now abandons it, relegating it to a parenthetical in a footnote, *see* FCC Reply 47 n.31, and leaves any further defense of that theory to its allies. *See* AT&T Reply 47. As a result, the FCC nowhere provides any limiting principle to constrain the approach to defining network elements that the decision below has enshrined as law.[12]

An illustration readily shows the limitless nature of the FCC's distorted definition. If an incumbent used telemarketers to offer subscribers new services, such as Caller ID, an entrant could demand the right to "unbundle" and rent four or five telemarketers to perform the same functions on its behalf. The telemarketers are, after all, plainly used in "offering" telecommunications service to the public. Under the FCC's definition, there could be no logical reason for refusing to treat them, like operators, *see infra* pp. 19-20, as network elements.

Nor do the FCC's allies provide any principle to limit what might be deemed a network element. Instead, in response to the charge that the FCC would require incumbents to offer entrants effectively every back-office system so that entrants can manage their businesses "just as efficiently as incumbents," they confirm that this is "precisely" what they want. MCI Reply 24. But by mandating access to the "facilit[ies] or equipment" of the network, Congress in no way required incumbents to turn over additional systems entirely outside the network that they use to run their businesses. *See infra* pp. 20-

---

[12] Nor does the FCC attempt to reconcile its countertextual gloss on the term "facilities" with the opposite approach the agency itself took in another section of the same Act. As noted before, *see* GTE Br. 56 n.22, under § 214(e), the FCC has determined that "facilities" used to "offer" telecommunications services are limited to "physical components of the telecommunications network that are used in the transmission or routing" of calls. In re Federal-State Joint Board on Universal Service, CC Docket No. 96-45, ¶ 151 (May 8, 1997).

22. Requiring incumbents to surrender such expertise eliminates incentives for entrants to develop systems of their own and short-circuits the innovation the Act was designed to foster.

Even a cursory examination of the text shows that the FCC's approach to defining elements has nothing to do with the definition set by Congress. By limiting a "network element" to a "facility or equipment" (including its "features, functions, and capabilities") "used in the provision of a telecommunications service," § 153(29), Congress rooted "network elements" in the physical facilities of the local exchange. Indeed, Congress made clear that the equipment it was designating consisted of components of the call-routing network as it went on to explain that the "features" of such equipment that should also be made available are those "used in the transmission, routing, or other provision of a telecommunications service." *id.* Despite the FCC's protests, there is no logical or textual basis for reading this reference to "other provision" of service as an engine for expanding "network elements" beyond the physical network. That general term rounds out a list of specific steps in the delivery of a call and should be read to refer to similar call-delivery functions.

Parsing the text thus confirms the result demanded by common sense. Congress did not transform the term "network element" into obscure jargon designating a limitless array of capacities an incumbent uses to run its business. Rather, the term means physical "elements" or pieces of the network — along with features and functions embedded in those facilities.

By concocting a concept of network elements that has no bounds, the FCC abandoned the task of determining what facilities actually fit the definition enacted by Congress. In particular, the agency erred by requiring unbundling of operator services and directory assistance and by treating all operational support systems (OSS) as network elements.

1. The FCC Erred By Treating Discrete Services As Network Elements.

Virtually the entire defense that the FCC and its allies can muster for the rules treating operator services and directory assistance as network elements is the repeated assertion that operator functions are "increasingly automated," FCC Reply 49, and thus that the FCC's rules will not *always* require the bizarre task of "unbundling" and renting out to competitors live operators. *See also* MCI Reply 25; AT&T Reply 49. But this half-hearted effort to blunt the jarring results of the FCC's rules simply papers over the basic conflict between unbundling operators and the terms of the Act. The Act limits network elements to a "facility or equipment" (or its "features") and cannot be stretched to include people (or the complex of tasks they perform). Whether operator services or directory assistance may in *some* instances be entirely automated is irrelevant. The FCC's approach to defining network elements treats an incumbent's personnel as the "elements" to be leased to an entrant and thus is flatly at odds with the text.

Similarly, the FCC cannot defend its rules with the facile claim that all network elements are controlled at some level by people and thus that "human involvement" cannot take operator services out of the ambit of network elements. FCC Reply 49. Providing "unbundled" operator services demands far more than the "human involvement" that may be needed to ensure, for example, that an unbundled loop is still up and functioning when an entrant orders it. The very "element" that the entrant is ordering, after all, is not a piece of equipment, but the service provided by the operators themselves. Indeed, in all relevant respects, leasing operators is indistinguishable from leasing the telemarketers described above. Neither can be reconciled with the text of the Act.

Finally, the FCC offers no plausible justification for treating distinct services (such as operator services) as network elements. As we noted before, Congress addressed "services"

and "network elements" in separate sections of the Act and even deleted any references to "services" from the definitions of network elements that had appeared in earlier drafts of the statute. *See* GTE Br. 57-58. The FCC's bald assertion that distinct services nevertheless should be treated as network elements ignores standard principles of construction. Where Congress has established distinct, defined terms such as finished "services" and "network elements" the use of one term necessarily implies the exclusion of the other. *See, e.g., O'Melveny & Meyers v. FDIC*, 512 U.S. 79, 86 (1994). Nor can the FCC salvage its approach to conflating services with network elements with the specter of incumbents evading unbundling by artificially labeling pieces of the network as separate services. *See* FCC Reply 48. The agency could easily prevent such patent evasions.

2. The FCC Erred By Indiscriminately Treating OSS as Network Elements.

As explained in our opening brief, the broad category of OSS includes a number of different systems used by an incumbent LEC in running its business. The FCC naturally tries to portray OSS as systems needed to "manipulat[e] network elements to provide services." FCC Reply 45. It is indisputable, however, that not every system included under the generalized heading of OSS performs such a function; rather, many such systems control entirely independent business functions such as managing billing or even scheduling the visits of repairmen. Indeed, even AT&T tacitly acknowledges that not all OSS play a role in operating the network. Instead, the most that AT&T can assert is that "[m]any of these systems" — not all — are "connected electronically to the facilities that route calls within the network." AT&T Reply 44-45. The rest of the systems grouped into the class of OSS are thus entirely *outside* the network.

By indiscriminately treating *all* OSS as network elements, the FCC failed even to undertake any inquiry to determine whether each system it was making available to entrants could actually fit within the definition of a network element — that is, a "facility or equipment" (or a feature of such a piece of equipment) that is used in the LEC's call-routing network.

In part, the FCC defends this broad-brush approach to OSS unbundling by focusing on half-truths. Thus, the FCC asserts that the second sentence of the statutory definition includes items such as "databases" and "information sufficient for billing and collection," § 153(29), that are examples of OSS. *See* FCC Reply 47; *see also* MCI Reply 24. The mere fact that Congress specifically designated *some* items that might be called OSS as network elements, however, does not remotely justify the FCC's decision to treat *every* system in the loose category of OSS as a network element.

Moreover, contrary to the FCC's assertions, *see* FCC Reply 47, by proposing that network elements should be limited — as the Act requires — to "facilit[ies] or equipment" in the call-routing network (including their "features, functions, and capabilities"), GTE has not offered a definition that would exclude any items actually enumerated in § 153(29). The "databases" and "information" mentioned in the section are plainly recorded and stored in computers that are part of the physical pieces of the call-routing network — not entirely separate systems that the LEC uses in administrative functions. Indeed, the Act lists such databases and information not as free-floating categories of network elements in their own right, but solely as examples of the "features, functions, and capabilities that are provided *by means of [a] facility or equipment*." § 153(29) (emphasis added).

Having established the trivial proposition that *some* OSS are included in the definition of network elements, the FCC and its supporters would like to gloss over the critical distinction between systems that are part of the network — such as the

databases in § 153(29) — and every separate software system used by a LEC in conducting other functions — for example, software used to transform information from network databases into bills. As AT&T candidly acknowledges, what it wants through access to OSS is not simply access to the "databases" or "information *sufficient* for billing and collection" that Congress included in the definition of network elements, § 153(29) (emphasis added). Rather, it wants the entire software system used "to *convert* the recorded customer usage information into bills." AT&T Reply 44 (emphasis added). By mandating access to data "sufficient" to create bills, however, Congress did not remotely require the broad access to software systems that AT&T would like.[13] By indiscriminately lumping into "network elements" anything that might be called a support system, however, the FCC never considered whether the terms of the Act were sufficient to grant access to the various systems it was providing to entrants.

Finally, the FCC and its allies assert that the FCC found that access to OSS should be required to ensure nondiscriminatory access to other network elements. *See, e.g.*, FCC Reply 46. But that is the purest makeweight. The FCC would render the specific terms of the definition limiting network elements utterly meaningless if it could grant access to every aspect of an incumbent's business on the theory that it was necessary for nondiscriminatory access to elements.

III. THE FCC REFUSED EVEN TO CONSIDER THE STANDARD CONGRESS SET FOR DETERMINING WHAT ELEMENTS MUST BE UNBUNDLED.

The FCC does not even respond to the errors the cross-petitions have identified in its approach to the "necessary" and

---

[13] Indeed, under the FCC's approach, it is hard to see what would stop AT&T from ordering the entire function of "billing" to be performed for it by the incumbent's personnel as yet another so-called "network element."

"impair" standards of § 251(d)(2). The section directs that, in determining which network elements should be made available, the FCC "shall consider" whether access to proprietary elements is "necessary" and whether failure to provide access to non-proprietary elements would "impair" an entrant's ability to provide service. § 251(d)(2). As we have explained, the FCC distorted those tests in two steps.

First, the agency misconstrued § 251(c)(3)'s command concerning *where* an incumbent must provide access to elements ("at any technically feasible point") as a command defining *what* had to be unbundled. The FCC thus created an extra-statutory presumption (since vacated, *see* Pet. App. 46a-47a) requiring unbundling of every element that could technically be unbundled. Next, when the FCC turned to the standards in § 251(d)(2) *limiting* access to elements, it perceived a tension between the section and its own blanket presumption favoring unbundling. Giving primacy to its own erroneous presumption, the FCC read § 251(d)(2) so as not to "significantly diminish the obligation imposed by section 251(c)(3)." J.A. 54. As a result, the FCC watered down the "necessary" and "impair" standards by refusing even to look at existing alternative facilities outside the incumbent's own network. The FCC thus distorted the standards enacted by Congress and evaluated entirely different tests.

Rather than addressing these undeniable errors, the FCC resorts to diversions, claiming that its dictionary definitions for "necessary" and "impair" were reasonable and stressing that Congress did not make those standards dispositive tests. *See, e.g.*, FCC Reply 42-44. Similarly, its supporters repeat that there was no need to consider the *theoretical* possibility of future alternative facilities. *See* MCI Reply 29-30.

GTE's challenge has nothing to do with these red herrings, and in particular does not turn on whether Congress made the § 251(d)(2) standards dispositive. The question is whether the FCC *considered* the standards Congress specified *at all*, or

whether, by refusing to consider alternatives outside the network, it fundamentally distorted the statutory criteria. When Congress limits an agency's discretion by defining a standard to be considered — even if it is not a dispositive test — the agency must at least evaluate the standard enacted into law, not a modified test of its own creation. *See Marsh v. Oregon Natural Resources Council*, 490 U.S. 360, 378 (1989) (agency must consider "the relevant factors"); *United States v. Markgraf*, 736 F.2d 1179, 1183 (7th Cir. 1984) ("Where Congress has provided express standards to guide an agency in its exercise of discretion, we will presume that Congress did not intend the agency to substitute its own standards for discretion."), *cert. dismissed*, 469 U.S. 1199 (1985).

On this point the FCC offers no defense. The statutory command is so straightforward — and the FCC's disregard for it so stark — that there is no justification for its approach. It defies plain English for the FCC to pretend that access to a particular element is "necessary" (or that its absence would "impair" ability to provide service) when an entrant can obtain comparable equipment from another source.

Despite AT&T's assertions, moreover, *see* AT&T Reply 43-44 & n.17, alternative facilities are not mere fantasies. As the Conference Report pointed out, the infrastructure that cable companies have already deployed provides a realistic basis for facilities-based competition. *See* H.R. Rep. 104-458, at 148. Indeed, AT&T itself is banking on the use of such facilities "to begin providing digital telephony and data services to consumers"[14] — that is the very basis for its recent proposed merger with TCI. By refusing even to consider when such facilities (or others) would provide an alternative to the incumbent's network, the FCC removed any restraint on access to elements that would encourage entrants to use alternatives in providing local service.

---

[14] AT&T and TCI Joint Press Release, June 24, 1998.

Nor can the FCC be rescued with the claim that considering alternatives outside the network would be pointless because entrants would voluntarily choose alternatives if they were more efficient. *See* MCI Reply 30; AT&T Reply 43. If Congress had intended to leave it entirely up to entrants to determine when they would use elements from an incumbent's network and when they would use alternatives, Congress would not have enacted § 251(d)(2). Section 251(d)(2) contemplates that the FCC will exercise discretion in determining whether particular elements should be made available to entrants, and that it will do so after evaluating a standard set by Congress. By mandating this independent evaluation of *need*, Congress clearly intended to restrain access to elements to preserve incentives for entrants to use alternative facilities where possible. Only where entrants use alternative facilities (or deploy their own) will they begin to generate efficiencies and provide the genuine benefits of competition. Some restraint on access to elements was essential, for as has long been recognized in the antitrust context, when the government forces a company to "provide [a] facility and regulat[es] the price to competitive levels, then the [entrant's] incentive to build an alternative facility is destroyed altogether." 3A P. Areeda & H. Hovenkamp, *Antitrust Law* ¶ 771b, at 175 (1996).

By effectively leaving the choice between an incumbent's network and using comparable alternative facilities wholly in the hands of new entrants, the FCC abdicated the role Congress assigned it and defeated the purpose of § 251(d)(2).

CONCLUSION

For the foregoing reasons, the Eighth Circuit's judgment upholding the FCC's rules (i) allowing entrants to provide service using *solely* network elements; (ii) expanding the definition of network elements; and (iii) refusing to consider alternative facilities outside an incumbent's network under the standards specified by § 251(d)(2) should be reversed.

AMENDED RULE 29.6 STATEMENT

U S WEST, Inc. advises the Court of an amendment to the company's Rule 29.6 statement to reflect a transaction and restructuring that occurred after the filing of its opening brief. U S WEST, Inc. still has no parent companies and has no non-wholly owned subsidiaries. U S WEST, Inc. has filed separately with the Court an explanation of the underlying transaction resulting in these changes.

REPLY BRIEF OF CROSS-PETITIONER U S WEST, INC.

INTRODUCTION

In their responses to U S WEST's opening brief, the FCC and its supporters repeatedly characterize the agency's far-reaching unbundling mandates—laid out in hundreds of pages of regulations and explanations—as procompetitive rules that somehow minimize government intrusion and maximize market-based decisionmaking. Despite the FCC's apparent hope that repetition might make this claim

come true, the reality is that, while the FCC's regime undoubtedly benefits the particular *competitors* who defend it so vociferously, the agency's unbundling rules do nothing to encourage the development of *competition*. Instead, key elements of those rules impose on incumbent telephone companies regulatory obligations that will stifle investment and innovation by new entrants and incumbents alike and undermine universal service.

As the FCC admits, its rules give competitors the right to obtain and use virtually every productive asset in an incumbent's business, preassembled into a combined "platform" of network elements—and at a price set by regulators—even when an element could be readily obtained from a source other than the incumbent. Such a rule maximizes regulatory interference with the marketplace and suppresses competition by discouraging investment in rival facilities. The FCC also embraces the fact that the "platform" enables a rival to obtain the incumbent's finished services for resale at the cost-based prices that apply to unbundled network elements rather than the wholesale prices specified by section 252(d)(3). The agency does not deny that this result, by enabling new entrants to obtain the same service for resale at two different prices, allows entrants to undercut an incumbent's prices, not by providing a service more efficiently, but by engaging in regulatory arbitrage. Such arbitrage undermines universal service subsidies in direct contravention of the Act.

The FCC and its supporters defend this regime by isolating each individual aspect of the agency's decision, claiming deference for the FCC's interpretation of individual statutory phrases, and eschewing analysis of the structure and goals of the statute as "mere policy arguments." However, what the FCC dismisses as "policy" is part and parcel of the "language and design of the statute as a whole." *Sullivan v. Everhart*, 494 U.S. 83, 89 (1990). And the end result of the FCC's rules cannot be reconciled with the entirety of the statute, as reflected in its language, structure, and purposes.

Crucial to the FCC's distortion of the Act was its decision to nullify the "impair" and "necessary" standards of section 251(d)(2) for determining what network elements must be unbundled. The agency did this by refusing even to consider whether and how easily a competitor can obtain a particular element from sources other than the incumbent. The FCC and its supporters never squarely address this failing in their briefs, preferring instead to set up and attack straw men.

The FCC's failure to confront the issue is unsurprising, for its decision cannot be reconciled with the language of the Act. The FCC simply cannot, as Congress commanded, "consider" whether failure to provide access to an incumbent's element would "impair" a competitor's ability to provide service (or whether access to an incumbent's proprietary element is "necessary") without evaluating the competitor's need to obtain the element from the incumbent. And, as in the closely analogous context of the "essential facilities" doctrine, such an evaluation requires appraising the competitor's ability reasonably to obtain the same or an equivalent element from sources other than the incumbent. Such an appraisal would promote the development of vigorous competition by ensuring that new entrants are able to access facilities they truly need in order to enter the market but that are available only from the incumbent. At the same time it would leave intact the incentives for new entrants to build or obtain their own facilities when doing so is feasible, instead of relying entirely on the incumbent.

The FCC's nullification of section 251(d)(2), coupled with its unlawful expansion of the definition of "network element" and its requirement that incumbents provide network elements in a combined form, collapses the distinction drawn in the Act between network elements and resale. The agency's rules enable new entrants to obtain at cost-based rates an incumbent's finished services for resale by employing the sham of ordering all the network elements needed to provide the service on an "unbundled"

basis but precombined into a platform that provides the service.[1] The FCC and its supporters do not dispute that this device enables competitors to choose between two different prices when they purchase the same finished service for resale. Nor can they deny that the only meaningful effect of this scheme is to open the way to massive arbitrage that Congress deliberately sought to prevent and that undermines the subsidies on which state universal service programs will rely for the foreseeable future.

Instead, the FCC and its supporters point to irrelevant differences between the FCC's conceptions of unbundling and resale. None of their arguments confronts the fact that the availability of the network element platform eliminates resale under section 251(c)(4) as a distinct competitive option. In particular, contrary to the FCC's assertion, a competitor that buys the complete platform makes no commitment to specific facilities and therefore does not bear the risks that the FCC itself has identified as central to the use of network elements.

The FCC asserts that it must allow access to the complete platform because it cannot practically limit the availability of network elements. But that is an attempt to hide behind a problem of the FCC's own making. Properly implemented, section 251(d)(2) limits the unbundling requirement to those network elements that a new entrant

---

[1] The expansion of the definition of "network element" to encompass vertical services and business assets that are not parts of the network was discussed in detail in U S WEST's opening brief. *See* Opening Brief of Respondent/Cross-Petitioner U S WEST, Inc. at 36-41 (May 18, 1998) ("U S WEST Br."). U S WEST incorporates by reference the discussions in the reply briefs for Bell Atlantic Corp., BellSouth Corp., and SBC Communications, Inc. and for GTE responding to the FCC's arguments concerning this issue. *See* Reply Brief for Cross-Petitioners Bell Atlantic Corp., BellSouth Corp., and SBC Communications, Inc. (July 17, 1998); Reply Brief for Cross-Petitioner GTE Midwest, Inc. (July 17, 1998). Because U S WEST and other cross-petitioners prevailed on the combination issue in the court below, it is not within the scope of this reply brief to address the FCC's most recent arguments on that issue.

cannot reasonably obtain from a source other than the incumbent. That limiting principle is both prescribed by the Act and the most sensible way to encourage the development of competition.

ARGUMENT

I. THE FCC OFFERS NO DEFENSE FOR ITS REFUSAL TO CONSIDER A COMPETITOR'S ACTUAL NEED TO OBTAIN PARTICULAR UNBUNDLED ELEMENTS FROM THE INCUMBENT.

Rather than defending the FCC's failure to consider the availability of network elements outside an incumbent's network, the agency and its supporters devote much of their discussion of the "impair" and "necessary" standards to defending against attacks that no cross-petitioner makes. The FCC asserts that its interpretation of "impair" and "necessary" is consistent with dictionary definitions, but no one has challenged the agency's definitions of these terms. FCC Reply Br. at 42-43; *see also* MCI Reply Br. at 29; AT&T Reply Br. at 43. Nor does the FCC make any headway by claiming that the statute requires it merely to "consider" the "impair" and "necessary" standards. FCC Reply Br. at 42-44; *see also* MCI Reply Br. at 28-29. Again, no one claims that these standards must always receive dispositive weight.

What U S WEST does contend is that the FCC may not evaluate the need for an element in a vacuum. The FCC may have discretion in judging the degree of need required to satisfy the "impair" and "necessary" standards and how much weight is given to this factor. But, even under the FCC's own definitions, the agency cannot "consider" whether lack of access to an element will "impair" service or whether access to a proprietary element is "necessary" without taking into account whether and how easily a competitor could procure the element from sources other than the incumbent. The FCC's refusal to undertake this analysis contravenes Congress's explicit directive.

In defense of the FCC's decision, its supporters fall back on the rationale articulated in the agency's Order—that "eventually" or "in theory" new entrants could duplicate any facility, and that therefore giving real consideration to the impair and necessary standards would eviscerate the unbundling requirements. MCI Reply Br. at 29-30. But here again, the FCC's supporters erect and knock down a straw man. U S WEST does not contend that an element may be unbundled only if it is impossible, now and forever, to obtain that element from a source other than an incumbent. Rather, our point is that the FCC cannot reasonably do what Congress required—"consider" the "impair" and "necessary" standards—without evaluating at all whether a given element can practically be duplicated from sources other than the incumbent and, to the extent that it can, whether that availability means that the incumbent should not be required to provide that element to its competitors. "Theory" has nothing to do with the issue; the focus should be on what is available *in practice* given current, actual market and technological conditions.

Moreover, an element that is available only "in theory" today may become available as a practical matter in the future as a result of technological or marketplace changes. For example, lack of access to an incumbent's local loops generally may impair a competitor's ability to provide local service today. But AT&T and TCI have promoted their recently announced plan to merge on the "theory" that it promises an alternative route for AT&T to reach consumers' homes to provide local telephone service.[2] If

---

[2] *See AT&T, TCI to merge, create new AT&T consumer services unit*, Press release, June 24, 1998, *available at* <http://www.att.com/press/0698/980624.cha.html> (visited July 13, 1998); Leslie Cauley, *AT&T To Acquire TCI for $37.3 Billion—Agreement Paves the Way for Long-Distance Firm To Pursue Local Market*, Wall St. J., June 25, 1998, at A3; Hearing on the Convergence of Technologies and Consolidation in the Telecommunications Industry Before the Antitrust, Business Rights and Competition Subcommittee of the Senate Judiciary Committee (July 7, 1998) (testimony of C.

this claim is borne out in practice, the merger may mean that, in the not too distant future, lack of access to incumbents' local loops will not impair AT&T's ability to provide service. The FCC's refusal to consider alternative sources precludes it from even analyzing the effect this change might have.

Unable to defend its interpretation of the statute, the FCC asserts that its error makes no real difference because new entrants will not voluntarily depend on the incumbent and instead will use other sources if they are efficient. FCC Reply Br. at 45; *see also* AT&T Reply Br. at 43-44. Even if that were true, of course, the FCC's action still would be contrary to the statute. But the FCC's assertion is also incorrect. New entrants will have a substantial incentive to use incumbent facilities at regulatorily mandated cost-based prices even if they can reasonably duplicate or procure those same facilities elsewhere. The ability to obtain incumbent facilities at cost-based prices enables competitors to avoid the investment and risk of creating or obtaining facilities of their own. A competitor that builds its own facility takes the risk that the underlying investment may never be recovered if demand for the competitor's service is insufficient. A competitor that procures the same facility from an incumbent largely avoids that risk, since it can always abandon the facility by terminating the contract with the incumbent.[3]

Michael Armstrong, Chairman and CEO, AT&T Corp.), *available in* 1998 WL 1276107; Stephanie N. Mehta, *AT&T's Bold Projections for Earnings Unveiled in Effort To Placate Investors*, Wall St. J., June 29, 1998, at B5.

[3] Moreover, in many cases the new entrant can obtain network elements on a usage-sensitive basis, which eliminates all risk of stranded investments. *See infra* at 14-15.

The entrant's incentive to rely on the incumbent's facilities instead of building its own is further increased by the FCC's interpretation of the "necessary" standard, which permits competitors

The flaw in the FCC's analysis is confirmed by consideration of the closely analogous essential facilities doctrine under antitrust law. In that context, courts and commentators have recognized that a competitor should have access to a monopoly's facility only if that facility cannot be duplicated by the competitor and is not reasonably available elsewhere. *See* U S WEST Br. at 33 & n.13. This limitation would be entirely unnecessary if, as the FCC suggests, a competitor always would exploit a source other than the incumbent where such an alternative is reasonably available. The FCC fails to recognize the effect of mandated sharing on incentives: When the government "order[s] the [monopolist] to provide the facility and regulat[es] the price to competitive levels, then the [prospective entrant's] incentive to build an alternative facility is destroyed altogether." 3A Philip E. Areeda & Herbert Hovenkamp, *Antitrust Law* ¶ 771b (1996). Even if the impair and necessary standards of section 251(d)(2) do not incorporate all the particular requirements of the essential facilities doctrine, they share its basic thrust—whether a competitor should be entitled to an incumbent's facility must depend, at least in part, on whether the competitor can reasonably obtain the facility elsewhere or build the facility itself.

In the height of irony, the FCC and its supporters finally suggest that the agency's refusal to consider alternative sources is appropriate because the free market should determine what facilities are duplicated. FCC Reply Br. at 22, 33-35; MCI Reply Br. at 30-31. But reliance on market forces is precisely what the FCC has prevented by issuing regulatory mandates that let competitors obtain

---

to obtain all of the incumbent's proprietary elements unless the incumbent also offers equivalent, nonproprietary alternatives. That ruling enables a competitor that uses network elements to avoid any expenditures for research without taking a risk that the incumbent may obtain a competitive advantage through innovation —a risk that would exist if the competitor were to construct and utilize its own facilities.

incumbents' network elements with little or no risk, thereby squelching competitors' incentives to invest in productive assets of their own. Market forces may be insufficient, and regulation may be appropriate, where an incumbent has essential facilities that are unavailable to competitors from any other source. But where competitors can obtain needed facilities from other sources, the incumbent lacks the power to exclude them. The competitors may rely on the market and select among the multiple choices it provides (including, of course, the possibility of arriving at a mutually satisfactory arrangement with the incumbent). The FCC has supplanted this market-driven selection process by forcing incumbents to provide all facilities at prices set by regulators.

II. ALLOWING COMPETITORS TO USE NETWORK ELEMENTS TO ENGAGE IN *DE FACTO* RESALE AT COST-BASED PRICES IS CONTRARY TO THE ACT.

The cumulative effect of the FCC's rules interpreting section 251(c)(3) is to allow new entrants to buy a complete network element "platform" that, when used to provide local exchange services, is functionally equivalent to resale under section 251(c)(4). The FCC and its supporters trot out some differences between sections 251 (c)(3) and (c)(4), but all they succeed in showing is that unbundled elements can be used for additional purposes than those available through resale. What they cannot refute is that, under the FCC's rules, unbundled elements can be used to obtain the equivalent of resale at a different—and often much lower—price. As a result, section 251(c)(4) becomes simply a different pricing option for something a new entrant already can obtain under section 251(c)(3), and new entrants are free to engage in arbitrage by exploiting state-mandated price structures that reflect universal service policies. Congress did not intend any such result: It made resale a distinct competitive option under section 251(c), and deliberately prescribed a

price standard for that option that would limit easy arbitrage opportunities. A narrower reading of the Act's unbundled access provisions than that adopted by the FCC—one that does not provide access to the full "platform"—is necessary to effectuate Congress's intent.

A. The FCC and Its Supporters Do Not Refute That the Platform Eliminates Resale as a Distinct Competitive Option.

Building on its nullification of the Act's "impair" and "necessary" standards for determining what network elements should be unbundled, the FCC expanded the definition of "network element" to include nonnetwork business assets and ruled that a new entrant has the right to obtain all network elements on a precombined basis. *See generally* U S WEST Br. at 15-16. Nobody disputes that the cumulative effect of these rules is to allow new entrants to buy, at cost-based prices, the complete unbundled network element "platform"—the full, prepackaged set of "all of the network elements necessary to provide service," already "combined together" into a functional whole. MCI Reply Br. at 10, 14. In the name of "*unbundled* access," a new entrant gets a fully *bundled* final product.

The FCC and its supporters try without avail to refute the Eighth Circuit's conclusion that access to the full, precombined platform would "obliterate the careful distinctions Congress has drawn in subsections 251(c)(3) and (4) between access to unbundled network elements on the one hand and the purchase at wholesale rates of an incumbent's telecommunications retail services for resale on the other." *Iowa Utilities Board*, Order on Petitions for Rehearing, Pet. App. 71a. Their arguments never focus on the effect of access to the platform. Instead, they try to divert attention by stressing differences that exist in general between resale and the use of unbundled network elements. Nobody denies that such differences may exist; the point is that none of these differences prevents the

"platform" from being a perfect, differently priced substitute for statutory resale of local telephone service. The platform provides *everything* that the competitor can obtain through resale of an incumbent's finished service. Only the price differs.

The FCC argues that leasing unbundled network elements offers new entrants greater flexibility than resale, including the ability to design and provide services that the incumbent does not itself provide to customers. FCC Reply Br. at 38; *see also* AT&T Reply Br. at 22; MCI Reply Br. at 15. But even if selecting and combining *individual* network elements offers such flexibility, the flexibility enjoyed by a new entrant that provides service through the *complete, preassembled platform* of elements is limited at best—the new entrant using the platform by definition does not add or rearrange any facilities and hence is limited to the services that can be provided by the incumbent's existing network configuration.

Moreover, the fact that unbundled elements can be used for a broader array of services (including exchange access) than resale is beside the point: For the provision of basic local exchange service (and any other service subject to section 251(c)(4)), the platform offers a functionally equivalent alternative to resale. Under the FCC's unbundling regime, a new entrant has two options if it wishes to provide local telephone service to a particular customer without investing in any of its own facilities or taking any responsibility for configuring a network. The entrant can purchase finished local exchange service from the incumbent and resell it to the customer pursuant to section 251(c)(4). Alternatively, it can purchase the full set of network elements needed to provide local exchange service, already selected, configured, and combined by the incumbent into a functioning service—the "platform." Either way, the new entrant simply markets and sells to the end user a local exchange service that, functionally, is supplied entirely by the incumbent over the incumbent's

existing network. The only difference is that, in the first instance, the new entrant acknowledges that it is engaging in resale, while in the second it embraces the fiction that it has somehow purchased individual network components and assembled them into a finished service.[4]

In short, the FCC has made section 251(c)(4) functionally redundant; the provision does not offer new entrants any capabilities that they could not already obtain under section 251(c)(3). The fact that section 251 (c)(4) offers *fewer* services and *less* flexibility than unbundling under section 251(c)(3), *see* U S WEST Br. at 42-43; Bell Atlantic Br. at 51-52; FCC Reply Br. at 38, simply reinforces the extent to which the FCC has rendered the Act's resale provisions a dead letter (with the sole exception of an arbitrage-related purpose barred by the Act and discussed *infra* at 16-19). The FCC's broad unbundling rules permit the same type of entry strategy as resale, but with additional advantages.

The FCC argues, however, that differences in the way unbundled elements and resale services are ordered and paid for make resale less risky than unbundling and hence preserve it as a distinct competitive option. In particular, the agency argues, citing its claims in the First Report and Order, that a purchaser of unbundled elements pays a flat fee for some elements and takes the risk that it will not sell enough services to cover those costs. FCC Reply

---

[4] Indeed, Reed Hundt, the Chairman of the FCC at the time the First Report and Order was adopted, recently recognized that use of the platform is effectively equivalent to resale:

> I think it has to be stipulated that real competition, competition that brings investment and innovation, that ultimately permits deregulation, that has to be essentially facility based. I think all versions of resale are transitional techniques. The [unbundled network element] platform is a version of resale.

Telecommunications Policy, Open Meeting (Ill. Commerce Comm'n, July 14, 1998) at 235 (statement of Mr. Hundt in response to question by Ms. Swanson-Hull).

Br. at 39 (citing Pet. App. 245a (Order ¶ 334)); *see also* AT&T Reply Br. at 24; MCI Reply Br. at 15-16. A reseller pays only for what it sells and thus bears no comparable risk.[5]

That *should* be a key difference between unbundled elements and resale. But the difference exists only if a new entrant, in order to compete using unbundled elements, must make a commitment to specific facilities—a commitment that cannot easily be reversed if customer demand for services using those facilities is lower than expected. Otherwise, there is no real risk in using unbundled network elements. As the FCC correctly recognized in the First Report and Order, Pet. App. 245a (Order ¶ 334), competition through unbundled elements should entail such a commitment. A new entrant that configures a network using some assets of its own and some leased from the incumbent is committed to those leased assets; it has connected its own facilities to them and has integrated them into its network, so it cannot easily reverse its choices. If the network it has configured turns out to be poorly matched to the demand for its services, the new entrant may find itself saddled with leased elements whose use is too low to justify their cost.

Where a new entrant buys the complete platform, however, it makes no such commitment and hence takes no such risk. The FCC argues that such risk exists because the new entrant must lease the local loop on a flat-rated

---

[5] AT&T also suggests that a purchaser of unbundled elements bears the risk that its customers will use a particularly *high* volume of local services (for on-line or Internet services, for example), resulting in high charges for elements that are priced on a traffic-sensitive basis. AT&T Reply Br. at 25. But extra charges for high volumes are a problem only if they are not offset by extra revenues. Therefore, the risk AT&T describes would be the result of a new entrant's *self-imposed* decision to rely exclusively on flat-rate pricing to consumers; the risk easily could be avoided by combining some flat-rate fee with traffic-sensitive prices for use above specified levels.

basis. FCC Reply Br. at 39. But each customer is served by a single, dedicated local loop, and thus a new entrant leasing a particular customer's loop is assured of all that customer's business. The new entrant, in other words, knows that it will receive all revenues from that customer's local telephone use. Indeed, if the new entrant charges any type of fixed monthly fee to the customer, it will be assured of a predictable revenue stream even if the customer never uses the telephone. And because each loop corresponds to a single customer, the new entrant can cancel the loop and avoid all costs as soon as the customer changes carriers.

Nor is there substantial risk in any of the other components of the platform. Under the FCC's rules, the loop is the only significant flat-rated element that a purchaser of the platform must specify.[6] Switching (the function of routing calls) and transport (the function of carrying calls between switches in the incumbent's network) generally are priced on a usage-sensitive basis, so the new entrant pays only for what it needs.[7] And the FCC has held that a new entrant may order switching and transport as generic functions, leaving to the incumbent the task of determin-

---

[6] AT&T mentions the network interface device (AT&T Reply Br. at 24) and MCI the port (MCI Reply Br. at 16) as other flat-rated elements that a new entrant must buy in order to provide service. But these elements are nothing more than the equipment that connects one end of the loop to the telephone wiring in the customer's home and the other end to the carrier's switching facilities. A new entrant purchases them together with the loop when it wins a customer and cancels them when it loses the customer. And just as in the case of the loop, the flat-rated costs of these elements easily can be recovered through a flat-rated monthly fee to the customer. In short, the reasons why the loop entails no substantial risk apply to the network interface device and the port as well.

[7] *See* J.A. 243 (Third Order on Reconsideration ¶ 30, *petitions for review pending, Southwestern Bell Telephone Co. v. FCC* (No. 97-3389 and consolidated cases) (8th Cir.)).

ing what particular facilities to use.[8] Thus, unlike a competitor that actually configures a network, a competitor that simply buys the full platform bears no risk of being committed to specific facilities that may turn out to be underutilized by consumers.

The FCC also points out that users of unbundled elements bear the cost of developing systems to bill long distance carriers for exchange access service. FCC Reply Br. at 39-40; *see also* AT&T Reply Br. at 21-22; MCI Reply Br. at 16. But a new entrant needs to develop a billing system for whatever local services it provides, regardless of whether it uses resale or unbundled elements, and the incremental cost of expanding or adapting that system to handle exchange access billing as well is not likely to be significant. Indeed, as ALTS has noted, "almost all new entrants have the back office systems and financial resources" needed to pursue a competitive strategy based on the use of unbundled network elements. ALTS Opp. Br. at 17. In any event, the minimal incremental cost of billing for access services will be more than offset by the additional revenues from those services, which are widely recognized to be priced above cost.[9] Be-

---

[8] *See generally* J.A. 1359-1402 (Third Order on Reconsideration) (defining a "shared transport" element consisting of the right to use an incumbent's entire interoffice transport network without specifying particular facilities). Consistent with its apparent desire to expand the scope of the Act's unbundled access provisions wherever possible, the FCC rejected the "contention that a network element must be identifiable as a limited or pre-identified portion of the network." J.A. 246 (Third Order on Reconsideration ¶ 43). Moreover, the FCC expressly acknowledged that its intent was to shield purchasers of unbundled network elements from risk, on the theory that a new entrant attempting to select individual facilities "would almost inevitably miscalculate the capacity or routing patterns" necessary to serve its customers. *Id.* (Third Order on Reconsideration ¶ 35).

[9] *See, e.g., Access Charge Reform*, First Report and Order, CC Docket No. 96-262, FCC 97-158 (rel. May 16, 1997) ¶¶ 11, 28,

cause a carrier engaging in resale pursuant to section 251(c)(4) does not have the opportunity to collect revenues from access services, the ability of users of unbundled elements to provide those services, far from helping to preserve resale as a meaningful competitive option, simply provides an additional reason for new entrants to use the unbundled network element platform instead.

The FCC's supporters further argue that the agency's rules do not eliminate resale as a separate and viable competitive option because the wholesale price applicable to resale may, for services to some customers, be lower than the cost-based price applicable to network elements. AT&T Reply Br. at 23; MCI Reply Br. at 14. This argument simply misses the point. The flaw in the FCC's rules is not that no carrier would ever choose to label its activity as "resale." Rather, it is that the rules eliminate resale as a distinct competitive option with its own set of *real* (non-price) advantages and disadvantages. A new entrant buying the full platform of network elements pursuant to section 251(c)(3) gets everything it would get if it bought the equivalent finished service for resale; only the price is different. Thus, where cost-based prices are lower than wholesale prices—as often will be the case—a new entrant has no reason to engage in resale under section 251(c)(4). Resale is a potentially viable option *only* for services that, thanks to state universal service policies, are required to be sold to consumers at below-cost prices. In other words, the FCC's rules make resale nothing more than a vehicle to enable new entrants to exploit state pricing structures. It has no genuine competitive role.[10]

---

petitions for review pending, Southwestern Bell Telephone Co. v. FCC (No. 97-2618 and consolidated cases) (8th Cir.). The FCC has begun a process to restructure access charges but estimates that it may take "several years" to complete the task. *Id.* ¶ 45.

[10] The FCC also claims that resale provides a "more immediate" entry strategy. FCC Reply Br. at 40. But since the platform comes precombined and consists of the incumbent's preexisting network

Congress did not intend such a result. The structure of Congress's scheme for promoting local competition makes sense only if the finished services a new entrant can obtain under section 251(c)(4) are *substantively* different from what it can obtain under section 251(c)(3)—not just differently priced. Congress would not have included section 251(c)(4) in the Act merely to give new entrants a second pricing option for something already available to them under section 251(c)(3). If Congress had intended simply to create a pricing alternative, it could have said so expressly in section 252(d), the section establishing "pricing standards," rather than creating an additional and independent duty under section 251(c). Similarly, Congress could not have intended, when it provided that new entrants reselling an incumbent's services would pay "wholesale rates," *see* 47 U.S.C. §§ 251(c)(4)(A), 252(d)(3), that resellers could in practice choose to pay cost-based rates instead if they merely relabeled their activity as "unbundling." For all nonsubsidized services, the FCC's rules effectively read the wholesale pricing standard of section 252(d)(3) out of the Act.

Moreover, Congress plainly did not intend to permit the arbitrage opportunities that result from allowing section 251(c)(3) to serve as a functional equivalent for resale under section 251(c)(4). *See* U S WEST Br. at 44-46. The FCC defends such arbitrage as the "market-oriented, efficiency inducing process . . . called 'competition.'" FCC Reply Br. at 30. But Congress's view, reflected in the Act, is that any benefits associated with such arbitrage are heavily outweighed by countervailing considerations. If Congress had wanted "competition" that is nothing more than the exploitation of state-mandated pricing structures by new entrants using only the

---

configuration, there is no reason to think that a new entrant could not obtain and begin offering services with it just as quickly as with resale.

incumbent's facilities, it would have expressly mandated cost-based rates for resale. Instead, in prescribing prices for resale—the easiest competitive option—Congress abandoned the cost-based standard it used for interconnection and unbundled elements. It adopted a special "wholesale" standard that is based on retail prices that states set to effectuate their own pricing policies. *See* 47 U.S.C. § 252(d)(3); H.R. Rep. No. 104-204, at 72 (1995) ("The [resale] rate should reflect whether, and to what extent, the local dialtone service is subsidized by other services."). The FCC and its supporters do not and cannot offer an explanation for this decision; under their theory of the Act, the adoption of a wholesale pricing standard simply makes no sense.

In fact, the wholesale pricing standard of section 252 (d)(3) has only one possible explanation: Congress recognized that the growth of competition would put pressure over time on state pricing structures, but it did not wish to allow the quick option of resale to force a flash-cut to cost-based pricing because of the destructive effect that would have on universal service. In other words, prevention of arbitrage built around universal service subsidies, far from being merely the "policy preference" of the incumbent LECs, MCI Reply Br. at 1, 2, is the policy Congress adopted in enacting section 252(d)(3). That the FCC now embraces such arbitrage with open arms is a further indication of how far the agency has strayed from Congress's vision.

The FCC also argues that universal service arbitrage, if it is a problem at all, is only temporary and hence unworthy of Congress's attention. FCC Reply Br. at 21, 32. But, as noted above, Congress *did* choose to address the issue. Nor was this an unreasonable choice; the arbitrage problem is far less "temporary" than the FCC suggests. The Act sets no timetable for state action to reform local rate structures, and, more than two years after passage of the Act, not a single state has even begun to elim-

inate implicit subsidies from local rates. And the FCC itself has argued before the Fifth Circuit that the replacement of current universal service subsidies with a new, explicit support system is "an eventual goal," not "an immediate requirement." Brief for the FCC at 49, *Texas Office of Pub. Util. Counsel v. FCC* (5th Cir.) (No. 97-60421 and consolidated cases). Congress correctly anticipated that the transition to a reformed universal service system might be slow and took action to prevent quick, resale-based arbitrage in the interim.

B. Declining To Make the Full Platform Available Would Be Neither Impractical Nor Contrary to the Goals of the Act.

The FCC and its supporters do their best to disparage any interpretation of the unbundled access provisions that would limit section 251(c)(3) to its intended scope. They repeatedly observe, for example, that the text of section 251(c)(3) contains no express restrictions on unbundling. *E.g.*, FCC Reply Br. at 20; AT&T Reply Br. at 19; MCI Reply Br. at 10. But, as discussed above, there is ample textual evidence in sections 251(d)(2) and 251(c)(4) that Congress did not intend the unbundled access obligation to be boundless and, in particular, to eclipse resale. Congress did not spell out further express restrictions because it never imagined that the FCC would try to make *everything* available as an unbundled element. Congress's vision was straightforward: New entrants may need access to certain of the incumbent's elements in order to compete, and allowing them to lease *those needed elements* at regulated prices will enable them to start competing. Congress's failure expressly to list and prohibit the various possible distortions of its statutory scheme does not leave the FCC free to take an entirely different tack. The FCC's order created a regime fundamentally different from the one Congress intended; no express prohibition is necessary to make such a course unlawful.

The FCC also suggests that there is no principled way to determine which or how many facilities a new entrant should be required to obtain on its own before turning to unbundled elements under section 251(c)(3). FCC Reply Br. at 27-28; *see also* AT&T Reply Br. at 40. If a token facility were all that was required, the limitation plainly would have little practical effect. But this problem is a red herring, created entirely by the FCC's unlawful decision to make virtually every part of an incumbent LEC's business subject to section 251(c)(3) in the first place. If the scope of section 251(c)(3) were properly limited to those facilities that a new entrant truly needs to obtain from the incumbent because they are not reasonably available from other sources, then a new entrant would not be able to provide service entirely through unbundled elements. Instead, it would have to provide some facilities on its own—namely, those facilities that are not within the bottleneck control of the incumbent. The particular facilities that are "nonessential" in this respect might vary from case to case or over time, but there is no question that the notion of "essential facilities" provides a reasonable principle for determining what facilities a new entrant must provide on its own.

Such a principle would not, contrary to the FCC's contention, "confin[e] new entrants to one option (resale)." FCC Reply Br. at 37. Unbundling would remain a viable option for many carriers, a useful and time-saving halfway house on the road to facilities-based competition. Nor would this narrower interpretation of the Act's unbundling provisions constitute an "artificial limitation." *Id.* Rather, it would simply recognize that one section of the Act may not be read so broadly as to engulf another. In short, the narrower interpretation, unlike that adopted by the FCC, would make sense of the Act's structure and effectuate Congress's purposes.

CONCLUSION

For these reasons, as well as those stated in U S WEST's opening brief, the Court should vacate the FCC's unbundling rules in their entirety.

Testimony of E. Beard for Bell Atlantic-Maryland, Inc., MD PSC Case No. 8731-II, (Jan. 10, 1997) 9

INTRODUCTION AND SUMMARY OF ARGUMENT

Respondents and cross-petitioners impermissibly ask this Court to recreate national telecommunications policy *de novo*. Avoiding any serious analysis of the statutory text and ignoring the compelling factual and policy findings of the Federal Communications Commission ("FCC"), the incumbent local carriers (joined by the state commissions only on the jurisdictional issue) demand a series of judicially imposed restrictions that appear nowhere in the Telecommunications Act of 1996 (the "1996 Act" or "Act"), and serve only to protect their entrenched interests. It is hardly surprising that the incumbent carriers would seek to derail efforts to end their longstanding monopolies, or that state utility commissions would be unhappy about Congress' decision to limit their prior authority to prescribe the substantive law governing competition in intrastate markets. But this case is not about whether Congress or the FCC made the best policy choices. The issue here is whether Congress foreclosed the FCC from implementing the 1996 Act in the way that the FCC has. *See Regions Hosp. v. Shalala*, 118 S. Ct. 909, 915-16 (1998). On that question, respondents and cross-petitioners are virtually silent.

The incumbent carriers' attempt to replace the statutory text and the FCC's expert policy judgments with their own policy preferences is most transparent in their attacks on the FCC rules implementing § 251(c)(3), the provision requiring incumbents to lease unbundled elements of the local network. Those attacks rest on the premise that entry into local markets through the use of unbundled elements should be discouraged because such entry would threaten the existing scheme of implicit universal service subsidies and create disincentives to pure facilities-based competition. For these reasons, the incumbents demand four specific restrictions: (i) no leasing of existing combinations of network elements; (ii) no leasing of *any* network elements unless a new entrant already has facilities of its own; (iii) no leasing of critical features, functions and capabilities of the network; and

(iv) no leasing of network elements that are theoretically "available" from a source other than the incumbent.

The Act, however, does not suggest, much less impose, the restrictions the incumbents demand. Had Congress wanted to impose them, it could easily have done so in plain English. There is no reason to think that Congress wanted to preserve the status quo of monopoly service and implicit subsidies until some distant future time when (or if) competing ubiquitous physical networks have been built. To the contrary, Congress wanted to ignite competition as "quickly as possible," [1] and (as even the incumbents' own lawyers have acknowledged) legislated an end to the insupportable scheme of hidden subsidies that was the sole remaining justification for shielding the incumbent carriers from competition. *See* P. Huber, M. Kellogg & J. Thorne, *The Telecommunications Act of 1996*, at 55 (1996) (praising the Act's "long overdue" reform of "the universal service guarantee [that] has evolved into a rat's nest of implicit subsidies and accounting sleight-of-hands utterly unsuited to a competitive marketplace"). Nor did Congress view the prospect of the immediate reduction of implicit subsidies as a threat requiring remedial statutory impediments. Instead, in § 254 of the Act, Congress mandated explicit, competitively neutral regulatory mechanisms that would fund universal service in ways that did not impede the rapid emergence of competition. Thus, there is simply no basis for concluding that Congress foreclosed the FCC from implementing the 1996 Act's unbundling requirements in a manner that would jumpstart local competition.

Respondents' efforts to deny the FCC any authority to implement the Act's pricing requirements are likewise an attempt to rewrite the statutory text in the service of policy preferences that Congress nowhere articulated. The statutory text unambiguously gives the FCC authority to implement all requirements of the 1996 Act. Section

---

[1] H.R. Rep. No. 104-204 at 89 (1995) ("H. Rep.").

251(d)(1) of the 1996 Act authorizes the FCC to implement the requirements of § 251, including the substantive requirement that rates be "just, reasonable, and nondiscriminatory." Section 201(b) of the Communications Act grants the FCC authority to implement all provisions of the Act—including §§ 251 and 252. Thus, the FCC would lack authority to issue pricing regulations only if other statutory language clearly restricted these plenary grants of authority. None does.

Respondents' arguments ultimately rest on the incorrect theory that the 1996 Congress wanted to maintain the division of regulatory authority previously established by the 1934 Communications Act. That argument ignores reality. The 1996 Act dramatically changed the prior regulatory regime in which federal law governed interstate matters and state law governed intrastate matters. Congress expressly preempted state laws that restricted competitive entry into local markets (§ 253), and supplanted state laws governing intrastate carrier-to-carrier relations with federal requirements designed to foster local competition (§§ 251(c) and 252(d))—including, specifically, requirements governing the prices incumbents could charge new entrants for use of the existing network. Congress made clear that the FCC, in "implementing and enforcing" these new substantive requirements, could preempt state laws that were inconsistent with them or that hindered achievement of their purposes. § 251(d)(3). Congress also denied state courts any power to review state commission decisions under § 252 of the Act, and mandated federal court review of those decisions. § 252(e)(4), (6). Thus, it is simply not plausible to argue that the FCC was guilty of "breaching a 60-year old statutory barrier that Congress had purposely left in place" when it passed the 1996 Act. Brief of Bell Atlantic Corporation, et al. (hereinafter "BA") at 2. Congress—not the FCC—breached that barrier.

Respondents' reliance on § 2(b) of the 1934 Act does not advance their case. The issue here is quite different than the one they pose; it involves the respective roles of

the FCC and state utility commissions in implementing *federal* law. In particular, the issue is whether as a result of § 2(b), after Congress has already prescribed law governing intrastate matters and granted the FCC general implementing authority, Congress must go further and specify expressly that the FCC's rulemaking authority extends to all of the particular intrastate matters indisputably governed by federal substantive law. Section 2(b) does not impose such a requirement. Instead, the requirements of § 2(b) are met when Congress indicates its intent in a "straightforward" and "unambiguous" manner. *Louisiana Pub. Serv. Comm'n v. FCC*, 476 U.S. 355, 377 (1986). There is no basis for respondents' attempts to read § 2(b) as imposing an additional rule that Congress make its intent "express." Just as Congress made clear (though not express) that the local competition provisions *apply* to intrastate matters, Congress plainly intended the FCC to have jurisdiction to implement those provisions. Moreover, in *Louisiana*, the Court relied on § 2(b) to deny the FCC the authority to exercise *ancillary* jurisdiction to regulate beyond where Congress had legislated. The case does not hold that even where Congress has enacted federal requirements to govern intrastate matters, the FCC lacks authority to implement those federal requirements absent an additional, and express, grant of specific authority to regulate.

ARGUMENT

I. THE INCUMBENTS' CHALLENGES TO THE FCC'S "UNBUNDLING" REGULATIONS ARE WITHOUT MERIT.

The incumbents devote most of their briefs to arguments designed to disable § 251(c)(3). The gist of their case is that the statutory language Congress employed in § 251(c)(3) (which sets forth the leasing obligation) and § 153(29) (which defines "network elements"), if given its ordinary meaning, would make it too easy for new entrants immediately to begin offering competitive service—and compete away monopoly profits—by leasing unbundled elements. They argue that Congress instead

intended to establish only two avenues to enter the local market—either undertaking the staggeringly expensive task of building a duplicative local network (which might bring about real competition in the distant future), or following the far easier route of reselling the incumbents' existing services (which does not threaten incumbents in any serious way). The right to lease unbundled elements was, in their view, merely a means by which new entrants could temporarily obtain discrete pieces to fill in gaps as they struggled through the long, slow process of building their own networks. The FCC's decision to give the text of § 251(c)(3) its ordinary meaning, thereby making leasing unbundled elements a robust entry strategy, the incumbents argue, was a grave error because it allowed for *real* competition—which would drive retail rates to cost—in the short term. According to the incumbents, the 1996 Act contemplates a much slower transition to competition, thus preserving for the indefinite future the current system of rate averages and implicit subsidies. Until new entrants have their own networks, the incumbents contend that they should be able to compete only by using the Act's resale option, which does not threaten the existing rate structure.

This central theme animates each of the incumbents' challenges to the FCC rules implementing § 251(c)(3). First, the incumbents defend the Eighth Circuit's invalidation of Rule 315(b) on the ground that new entrants must be made to bear the senseless and discriminatory cost of reconnecting the elements needlessly ripped apart by the incumbents, because otherwise leasing network elements might become an economically feasible means of competing away the incumbents' supracompetitive profits. Second, the incumbents attack the Eighth Circuit's affirmance of the FCC's decision that new entrants may lease network elements even if they do not yet have any of their own facilities, again arguing that new entrants will be able to erode too quickly the incumbents' monopoly profits. Third, the incumbents argue that the FCC made too much of the network avaliable for lease.

Finally, the incumbents assert that the FCC made it too easy for new entrants by allowing them to lease particular unbundled elements of the existing network even when those elements might be available (at a higher price) from another source. These particular complaints form the substance of incumbents' rhetorical claims that the FCC has authorized "sham unbundling" and read resale out of the Act.

Although the incumbents colorfully describe the FCC's rules as a "wrecking ball" demolishing carefully crafted statutory restrictions on the Act's leasing provisions, the truth is that the statutory text contains no such restrictions. That is critical, for (though the incumbents never mention it) the FCC's interpretation of § 251(c)(3) and § 153(29) is subject to judicial invalidation only if (i) Congress has spoken to " 'the precise question at issue' " and foreclosed the agency's interpretation, or (ii) that interpretation is arbitrary and capricious or otherwise unreasonable. *Regions Hosp.*, 118 S. Ct. at 915 (quoting *Chevron U.S.A. Inc. v. Natural Resources Defense Council, Inc.*, 467 U.S. 837, 842 (1984)). In evaluating the FCC's unbundling rules, judicial deference is particularly warranted, both because Congress directly delegated to the FCC the task of implementing the Act's unbundling requirements, *see United States v. O'Hagan*, 117 S. Ct. 2199, 2217 (1997), and because these issues involve a "complex and highly technical regulatory program" and "necessarily require significant expertise and entail the exercise of judgment grounded in policy concerns." *Thomas Jefferson Univ. v. Shalala*, 512 U.S. 504, 512 (1994) (quotation omitted). Indeed, deference should be at its zenith because (as will be shown) the incumbents' unbundling arguments ultimately rest on disagreements with the FCC's findings and predictive judgment about how market participants will behave. *See FCC v. National Citizens Comm. for Broad.*, 436 U.S. 775, 813 (1978) (deference especially appropriate for findings "of a judgmental or predictive nature").

With respect to each of the incumbents' challenges to the FCC's unbundling rules, there is no plausible argument that the statutory text unambiguously forecloses the FCC's interpretation. Nor have the incumbents shown that the FCC's rules are arbitrary or capricious, or otherwise unreasonable. In the rulemaking process, the incumbents vigorously pressed their demands for delaying local competition, preserving implicit subsidies, and creating artificial incentives for competitors to construct competing networks by burdening other possible entry strategies. But the FCC chose to implement the Act's unbundling requirements so as to jumpstart local competition. The FCC did so only after making appropriately detailed findings that its rules would not "read resale out of the Act" or otherwise threaten the legitimate interests of the incumbents. The FCC was not insensitive to the incumbents' policy pleas. But it made clear that the preservation of universal service would be accomplished as Congress intended—through the explicit, competitively neutral mechanisms mandated by § 254 of the Act—and not by subverting the goal of immediate competition in local markets. The 1996 Act did not deny the FCC that policy choice, and reviewing courts are not in a position to second-guess it.

A. The Incumbents Have Not Demonstrated That the Text of § 251(c)(3) Unambiguously Forecloses the FCC's Decision to Impose Rule 315(b), Or That the Rule Is Arbitrary And Capricious Or Otherwise Unreasonable.

The incumbents make only a half-hearted effort to defend the Eighth Circuit's invalidation of Rule 315(b). They do not take issue with most of what was said in petitioners' opening briefs. They do not even mention (much less try to satisfy) the governing legal standard set forth in *Chevron*. Nor do they even acknowledge the FCC's detailed findings made in support of Rule 315(b).

The best the incumbents can do by way of textual analysis is to argue that the FCC's interpretation of § 251(c)(3) is not the only possible reading. More

specifically, they assert that the statutory term "unbundle" in the first sentence of § 251(c)(3) can mean "physically separated," and that "separately priced" is therefore not "the only reasonable" interpretation of the term. BA 54. That hardly suffices. Under *Chevron*, an agency has the discretion to adopt *any* reasonable interpretation of a term, and past agency usage and multiple dictionary definitions are powerful indications that the agency's construction is reasonable.[2]

To buttress their argument that "physically separated" is the better reading, the incumbents argue that the requirement in the second sentence of § 251(c)(3) that incumbents "shall provide such unbundled network elements in a manner that allows requesting carriers to combine such elements," must be read as authorizing the lease of individual elements *only* in a physically separated form. But that is not what the statute says. The incumbents read into § 251(c)(3) the qualifier "only," a word that does not appear in the text.[3] The FCC reasonably read the second sentence of § 251(c)(3) to mean that *when* a competitor wishes to combine elements on its own in order to reconfigure the elements, the incumbent must allow the competitor to do so. It does not follow that elements which are already combined must be ripped apart for no valid economic reason. The incumbents' different construction of § 251(c)(3) "is not an inevitable one," *Regions Hosp.*, 118 S. Ct. at

---

[2] Elements that can be unbundled for use by a lessor at a separate price typically—though not inevitably—*can* be made available as physically separate items. It is therefore hardly surprising that the FCC on occasion has discussed the mechanics of separating elements that are to be unbundled.

[3] *See* BA 53 ("the 1996 Act says in no uncertain terms that incumbents need *only* provide 'access to network elements on an unbundled basis' and *only* in a 'manner that allows requesting cariers to combine such elements' ") (emphasis added); GTE 66 (section 251(c)(3) "concludes by specifying that incumbents are required to provide elements *only* 'in a manner that allows requesting carriers to combine such elements' ") (emphasis added).

916-17, and does not provide a basis for invalidating Rule 315(b).

Nor have the incumbents dealt with the conflict between their definition of "unbundled" and the nondiscrimination requirement of § 251(c)(3). The incumbents contend that it is not discriminatory to force new entrants to bear the cost of reconnecting elements the incumbent has ripped apart, because the incumbents did not "stumble[] on their networks already constructed and combined." U S West 52; *see also* BA 56. In other words, they argue that by being forced to put the network back together, a competitor is doing no more than what the incumbent had to do when it initially constructed the network. But that is to ignore the economies of scale that alone made it possible for the incumbents to construct their extensive networks—economies that the leasing provisions allow new entrants to share. In any event, as the incumbents know, when a competitor leases a network element, the cost of connecting that element to the rest of the telephone network has already been built into the lease price of that element.[4] As a result, when a competitor is forced to reconnect network elements the incumbent has ripped apart, it is paying twice, while the incumbent has paid only once (and has already been fully reimbursed for the competitor's share of that cost). Moreover, competitors' customers suffer a loss of service during the reconnection process, while the identically situated Bell Atlantic customer does not. That is the very definition of discrimination, prohibited by the plain terms of § 251(c)(3).

Because the text does not help them, the incumbents resort to the argument that the Court of Appeals' deci-

---

[4] For example, as Bell Atlantic testified in Maryland at the proceeding through which element prices were set, included as part of the element price of the wire loop that connects the residence to the switch is a "central office termination cost," which represents the cost of connecting the loop to the switch at the central office. Testimony of E. Beard for Bell Atlantic-Maryland, Inc., MD PSC Case No. 8731-II at 5 (Jan. 10, 1997).

sion was appropriate because it "provides a bulwark against the total elimination of Congress' distinction between unbundled elements and resale." U S West 48; *see also* GTE 50. As we demonstrate below, however, there simply is no basis for the incumbents' predictions that the FCC's rules will eliminate the distinction between unbundled elements and resale. *See infra* pp. 14-16. In any event, that concern cannot possibly justify the Eighth Circuit's hopelessly overbroad "bulwark." Rule 315(b) applies to a competitor's request to lease *any* two elements in combination, not only to a request by a competitor with no facilities of its own to lease all of the network elements necessary to provide service, the so-called "platform" of elements the incumbents wrongly assert is the functional equivalent of resale. The invalidation of Rule 315(b) is thus a grossly overbroad response to the policy concern the incumbents have raised. Knocking out every existing combination of network elements merely to prevent new entrants from relying *entirely* on leased elements has enormously harmful marketplace consequences. MCI, for example, has invested nearly two billion dollars in local facilities, and had intended to offer its own new services through its own facilities and facilities leased in combination from the incumbents. The Eighth Circuit's invalidation of Rule 315(b) has dramatically inflated the cost of MCI's entry strategy, even though by no stretch of the imagination could that strategy be described as the functional equivalent of resale. In sum, it was hardly unreasonable for the FCC to reject the incumbents' policy-based arguments against Rule 315(b).

B. The Act Does Not Make Ownership of Facilities a Prerequisite to Leasing Unbundled Elements.

The incumbents' attack on the FCC's refusal to read a facilities-ownership requirement into § 251(c)(3) suffers from the same flaws as their arguments against Rule 315(b): the statutory text does not unambiguously foreclose the FCC's reading, and it was reasonable for the FCC to reject the incumbents' policy arguments. Indeed, incumbents' pejorative assault on what they call

"sham unbundling," and their arguments that the FCC's rule will "read resale out of the Act"—and thereby threaten their cherished subsidies—amount to nothing more than a disagreement with the predictive judgments of the expert agency. But the FCC made detailed findings supporting its approach, and the incumbents have advanced nothing but *ipse dixit* in response.

1. *The Eighth Circuit Correctly Concluded That the FCC's Interpretation Is Not Unambiguously Foreclosed by the Statutory Text.*

The incumbents have not shown that the text of § 251 (c)(3), either standing alone or in context, "has directly spoken to the precise question at issue" and unambiguously foreclosed the FCC's interpretation. *See Chevron*, 467 U.S. at 842-43. In upholding the FCC, the Eighth Circuit relied upon the "plain language" of § 251(c)(3), which expressly imposes on incumbents "[t]he duty to provide, to *any* requesting telecommunications carrier . . . nondiscriminatory access to network elements on an unbundled basis at any technically feasible point." § 251 (c)(3) (emphasis added); *see also* Pet. App. 55a. Indeed, the Eighth Circuit agreed with the FCC that a "facilities ownership" requirement is *foreclosed* by that plain language, which "is cast exclusively in terms of obligations imposed on incumbent LECs, and . . . does not discuss, reference, or suggest a limitation or requirement in connection with the right of new entrants to obtain access to unbundled elements." *In re Implementation of the Local Competition Provisions in the Telecommunications Act of 1996*, First Report and Order, 11 F.C.C.R. 15499 at ¶ 294 (1996), Pet. App. 242a ("*Local Competition Order*").

The incumbents never address the FCC's reading of "any telecommunications carrier." Instead they rely on entirely different statutory language, which requires incumbents to provide access to "network elements . . . at any technically feasible point." § 251(c)(3). This language, they assert, shows that Congress contemplated that competitors would have their own facilities to con-

nect with leased facilities. But this is not an argument based on what the text says; it is an argument based on what the incumbents claim the text presupposes. Had Congress wanted to restrict leasing to carriers who owned facilities, it surely would have imposed the intended restriction directly—as it did in the immediately preceding section of the Act. *See* § 251(c)(2) (imposing a duty to provide interconnection only for carriers that own or lease facilities).

In any event, the text does not support incumbents. The statute merely imposes a duty on incumbents to make their network elements available in a way that enables competitors to interconnect with them if that is what competitors want. Elements provided under § 251(c)(3) will, of course, be used by new entrants that do have their own facilities; the statutory language on which the incumbents rely assures that these new entrants will be able to interconnect their elements with those they lease. And, it is equally true that a new entrant relying exclusively on leased elements would require a technically feasible point of interconnection with the incumbent's operational support systems—the computers and databases that run the local network. Otherwise it would be unable to order the elements, bill for them, and connect the leased elements to long-distance networks. Thus, the inference upon which the incumbents rely is untenable.

Nor are the incumbents correct that the broader "context" of § 251 compels the facilities-ownership limitation they seek to impose. As the incumbents would have it, a facilities-ownership requirement must be read into § 251(c)(3) because the absence of such a requirement "effectively nullifie[s]" the Act's resale provision (§ 251(c)(4)), in contravention of the canon of statutory construction that a statute should be interpreted so as to give meaning to all of its parts. BA 2. But for two reasons that canon of construction is inapplicable.

First, the FCC's reading of § 251(c)(3) will have the effect the incumbents claim only if the incumbents are correct in their self-serving predictions that resale will

always be more expensive and otherwise less desirable than combinations of network elements. In other words, the incumbents' nullification argument depends on a series of empirical assumptions about contingent possibilities. That is not, in any meaningful sense, an argument about the statutory text, but is, instead, an argument about the reasonableness of the factual findings and policy judgments the FCC made in concluding that its approach would not read resale out of the Act. As will be demonstrated, the incumbents have raised no meaningful challenge to those findings and judgments, and thus they must be affirmed as reasonable. *See infra* pp. 14-21.

Second, the incumbents' own arguments make clear that the FCC's reading does not nullify the Act's resale provision. The very point of their "regulatory arbitrage" argument is that new entrants will use resale to compete for customers whose rates are presently subsidized, *see* U S West 45 ("because competitors can obtain subsidized services at a discount from the below-cost rates incumbents must charge, competitors can resell them at comparably below-cost prices"), while relying on unbundled elements (which are priced at cost-based rates pursuant to § 252(d)(1)) to compete for classes of customers whose rates generate the subsidies. Thus, even if the incumbents' views are correct, resale will remain the preferred option for competing for some classes of customers. Whatever else might be said of such an argument, it does not involve the " 'emasculat[ion of] an entire section' of a statute." BA 60 (quoting *Bennett v. Spear*, 117 S. Ct. 1154, 1166 (1997)).

In sum, because the incumbents' construction of § 251 (c)(3) "is not an inevitable one," the FCC's contrary view must be upheld so long as it is reasonable. *Regions Hosp.*, 118 S. Ct. at 916-17. The FCC's interpretation easily passes muster under that deferential standard.

2. *The FCC's Decision Not to Impose a Facilities Ownership Limitation Was Not Arbitrary and Capricious Or Otherwise Unreasonable.*

The incumbents have not shown that the FCC acted in an arbitrary or unreasonable manner in rejecting their demand that only new entrants with their own facilities be permitted to lease unbundled facilities.

First, the key premise of the incumbents' argument—that resale will always be more expensive than relying exclusively on network elements—is wrong. In some states, the price of the "platform" of all of the elements combined together is lower than the resale price. But in others the resale price for new entrants is *less* than the cost of leasing only the wire loop and port on the switch connecting the home to the switch, without even considering the cost of switching and the other elements necessary to provide service.[5] Furthermore, much of the attractiveness of using elements today results from the fact that lessors can compete in the highly profitable market for exchange access—charging long-distance companies for the use of the local lines needed to begin and end long distance calls—while resellers cannot. But this is not a permanent state of affairs; competition will reduce the price of access. When that happens, different market conditions will prevail, and market participants will make new calculations about the relative merits of building, leasing elements, or reselling existing services.

Second, resale and relying exclusively on leased elements are not "functional equivalents." As the FCC

---

[5] For example, the monthly resale price for providing residential service in Texas ranges from $6.39 to $8.66. *See Southwestern Bell Telephone Company Texas Local Exchange Tariff, 3.1.1 Residential Service*, at 3 (issued Jan. 27, 1995) (effective March 3, 1995); *Petition of MFS Communications*, Docket Nos. 16189 *et al.*, Arbitration Award, at 17-19 & Appendix B (Pub. Util. Comm'n Tex. Nov. 7, 1996). In contrast, the cost of leasing the loop and switch port alone is $17.05—almost double the highest resale rate. *Petition of MFS Communications*, Docket Nos. 16189 *et al.*, Arbitration Award, at Appendix B (Pub. Util. Comm'n Tex. Dec. 19, 1997).

found, resellers and lessors face entirely "different opportunities [and] risks." *Local Competition Order* ¶ 331, Pet. App. 244a. "[C]arriers reselling incumbent LEC services are limited to offering the same service an incumbent offers at retail." *Id.* ¶ 332, Pet. App. 244a. On the other hand,

> a carrier offering services solely by recombining unbundled elements can offer services that differ from those offered by an incumbent. For example . . . carriers using unbundled elements can bundle services that incumbent LECs sell as distinct tariff offerings, as well as services that incumbent LECs have the capability to offer, but do not, and can market them as a bundle with a single price. The ability to package and market services in ways that differ from the incumbent's existing service offerings increases the requesting carrier's ability to compete against the incumbent and is likely to benefit consumers. . . . These services, however, are not available for resale under section 251(c)(4) of the 1996 Act.

Id. ¶ 333, Pet. App. 244a-245a (footnotes omitted). Moreover, a competitor who leases the full "platform" of elements to provide service can combine the leased network in any way it sees fit, while the reseller can only use the network exactly as it is configured by the incumbent. Respondents contest none of this.

Indeed, the incumbents do not really argue that these two entry vehicles are the same. The essence of their position is that relying on leased elements is in every respect superior to resold service, and therefore to "preserve" resale, only competitors who already own some of their own facilities should be able to lease elements. *See, e.g.*, BA 62. In its order, however, the FCC concluded that resale did not need "protection," because although carriers "taking unbundled elements may have greater competitive opportunities than carriers offering services available for resale, they also face greater risks." *Local Competition Order* ¶ 334, Pet. App. 245a. As the FCC explained:

> A carrier purchasing unbundled elements must pay for the cost of that facility. . . . It thus faces the risk that end-user customers will not demand a sufficient number of services using that facility for the carrier to recoup its cost. (Many network elements can be used to provide a number of different services.) A carrier that resells an incumbent LEC's services does not face the same risk. This distinction in the risk borne by carriers entering local markets through resale as opposed to unbundled elements is likely to influence the entry strategies of various potential competitors.

Id.

The incumbents would have this Court reach precisely the opposite conclusion, on the theory that because all necessary elements can be leased on an "as needed" basis, lessors "need bear no risk of demand fluctuation." BA 62. But such a bold assertion, unsupported by any record evidence, provides no basis for overturning the FCC's contrary findings as arbitrary and capricious. Moreover, it is simply not the case that all elements may be leased on an as needed basis. The local loop, the "port" that connects the loop to the switch, and other elements are all priced at flat rates. Additionally, to compete in the market for exchange access, new entrants must lease facilities and develop billing and support systems the cost of which may or may not be recouped, depending on how much long distance service their customers use. In sum, just as the FCC determined, unlike a reseller, a lessor has no predictable margin, and faces the risk of unused capacity. For all of these reasons, competitors have chosen and will continue to choose to resell rather than to lease in a variety of market settings: for example, when the customer is receiving a subsidized rate, or when the competitor needs quick or easy entry into the market. The incumbents' argument to the contrary ignores the record and misstates the facts.

Third, the incumbents have nothing to say about the FCC's administrative and policy justifications for rejecting the facilities-ownership limitation on § 251(c)(3).

The FCC determined that such a limitation would be "administratively impossible" because "it would not be possible to identify the elements carriers must own without creating incentives to build inefficient network architectures that respond not to marketplace factors, but to regulation" and any such limitation "would likely be so easy to meet it would ultimately be meaningless." *Local Competition Order* ¶ 339, Pet. App. 248a. The FCC also concluded that such a restriction would artificially limit competition to those few markets that could "efficiently support duplication of some or all of the incumbent LEC's networks." *Id.* ¶ 340, Pet. App. 249a. Unable to respond to a single one of these conclusions, the incumbents instead berate the FCC for "seek[ing] shelter in policy arguments of [its] own." BA 63. That is, however, the FCC's job.

Fourth, and most importantly, it was eminently reasonable for the FCC to reject the incumbents' argument that the absence of a facilities-ownership restriction on § 251 (c)(3) will "subvert[] the important goal of preserving universal telephone service," BA 2, by subjecting the monopoly retail rates that allegedly fund such service to competitive pressures. The very point of the Act is to create local competition that will drive down those supracompetitive prices. As the incumbents themselves acknowledge, "[i]nterservice subsidy arrangements were economically sustainable only because the States preserved . . . legal barriers to entry." BA 4. Congress understood that the existing system of alleged implicit subsidies would not survive in a competitive market, and intended to replace it with a system of subsidies that "should be explicit, rather than implicit, as many support mechanisms are today." H.R. Conf. Rep. No. 104-458 at 131 (1996) ("Conf. Rep.").

The incumbents nevertheless insist that Congress intended this change to come gradually, so that states would have a "potentially lengthy period" of time, BA 50, in which to make the transition to a system of express "universal service" subsidies. In particular, they argue that

the current system of rate averaging should remain in place until full-fledged competing physical networks have emerged. From this they insist that it follows that the Act's leasing provision was designed to be an extremely limited transitional device, lest competition develop too quickly. Congress, the story goes, intended rapid competition to develop only through resale, a method that accordingly was designed to protect the current system.

But § 251(c)(3) is not a transitional measure—it imposes permanent obligations on the incumbents—and it contains no express or implied judgment that leasing is disfavored, or disfavored during some undefined interim period. Indeed, the FCC correctly found that Congress did not "express[] a preference for one particular entry strategy," but created alternative paths new entrants could employ "as market conditions and access to capital permit." *Local Competition Order* ¶ 12, Pet. App. 137a-138a. By requiring incumbents to facilitate all three types of competitive entry equally, Congress was drawing on past experience opening the long-distance market, where the Bell System's monopoly was broken up through a market-driven combination of resellers, lessors, and companies that built their own facilities. Congress was not attempting to micro-manage the development of local competition any more than regulators micro-managed the successful transition to long-distance competition.

Moreover, the incumbents' argument rests not on the statutory text, but on yet another assumption—namely, that Congress understood that facilities-based competition would take years to develop, and wanted no real competition in the interim. But the incumbents insistently told Congress that cable companies could provide meaningful facilities-based competition in the here and now. *See, e.g., Antitrust and Communications Reform Act of 1993 (Part 2) on H.R. 3626; Hearing Before the House Subcomm. on Economic and Commercial Law of the Comm. on the Judiciary*, 103d Cong. 154 (1994) (statement of Edward E. Whitacre, Jr., Chairman and CEO of Southwestern Bell Corp.) (noting "cable television companies

. . . already have or are entering the local telephone service market"); *see also* Conf. Rep. at 148 ("[M]eaningful facilities-based competition is possible, given that cable services are available to more than 95 percent of United States homes."). If Congress wanted to protect the current system of rate averaging and implicit subsidies, it therefore surely would have mandated full implementation of § 254's universal service reform requirements in *advance* of allowing competition by owners of competing networks.

The fact is that Congress took the opposite approach. It mandated that the local competition provisions of the Act be implemented as quickly as possible. *See* § 251 (d)(1) (FCC must issue implementing regulations within six months); § 252(b)(1) (new entrants may invoke arbitration within 160 days of seeking interconnection agreements); § 252(b)(4)(C) (state commissions must resolve arbitrations within nine months). At the same time, Congress provided that federal universal service reform would be accomplished on a less expedited basis, *see* § 254(a), while state reform could be completed as quickly as was necessary to offset the effects of emerging local competition, *see* § 254(f).

In this regard, it is telling that the state commissions have not joined the incumbents in their attacks on the FCC's unbundling rules. After all, the current system of rate averages and hidden subsidies is not the product of the incumbents' altruistic desire to ensure that everyone can afford phone service. The current system is the product of *state* policy choices. Had the FCC threatened those state policies in any meaningful way, the states would have objected. Their silence speaks volumes about the legitimacy of the incumbents' claims.

Nor did the FCC "ignore[]" the problems the state commissions would face as they were forced to address the realities of a competitive market. *Compare* GTE 52. To the contrary, the FCC enacted a series of protective measures to address the possibility "that the requirements

of the 1996 Act may be disruptive to existing state universal service support mechanisms during the period commencing with this order and continuing until we complete our universal service proceeding to implement section 254." *Local Competition Order* ¶ 715 (JA 155); *see also id.* ¶¶ 715-732 (JA 155-67) (establishing interim access charge regime to protect implicit universal service subsidies during transition to local competition). Respondents do not even acknowledge the FCC's reasoned response to the issues they have raised.

While the incumbents' principal policy argument is grounded in the premise that Congress did not intend facilities-based competition to develop too quickly, its second argument is, to the contrary, that Congress wished to encourage, not discourage, facilities-based competition, and that an unlimited right to lease is inconsistent with that legislative command. This argument suffers from the same defect as the argument that Congress favored resale over leasing. Nothing in the statutory text supports the incumbents' suggestion that Congress "carefully calibrated," BA 51, the three methods of competing service to assure that one was favored over another.[6]

Moreover, the FCC found it would serve no rational purpose for regulators artificially to encourage the building of facilities when market conditions otherwise would lead a competitor to lease them. *Local Competition Order* ¶ 340, Pet. App. 249a. No rational competitor would choose to rely on the incumbents' facilities as a long-term strategy, because it would require levels of cooperation that the incumbent would have no incentive to provide. Long-term reliance on unbundled elements would require a massive investment in monitoring, regulating, and litigation costs. For such reasons, MCI has already invested almost two billion dollars in constructing its own facilities.

Finally, the most sensible way to promote the construction of competing facilities is to encourage leasing. A competitor that leases all of the necessary elements from

---

[6] *See supra* pp. 14-19.

the incumbent must first build the necessary operations support systems to order, repair, and bill for the leased elements,[7] and must decide which services to market. Then, as traffic volumes increase, or technological advancement makes building more economical than leasing, the competitor would find it relatively easy to substitute its own facilities for those it had previously leased from the incumbent. A reseller, on the other hand, is the furthest removed from a facilities-based provider, and would not develop systems or expertise that would be helpful if it subsequently chose to build its own facilities. It is leasing, not resale, that is the strategy of choice for competitors like MCI whose ultimate goal is to build their own facilities.

C. The Incumbents' Remaining Challenges to the FCC's Unbundling Requirements Are Without Merit.

The incumbents argue that the FCC exceeded Congress' plan in ordering the unbundling of such critical components of local service as operational support systems, directory assistance, operator service facilities, and vertical features. Once again, however, the incumbents have no argument that the plain text of the 1996 Act forecloses the FCC's unbundling rules. Their arguments rest instead on the most strained inferences from statutory text and proceed from the false premise that Congress wanted new entrants either to build their own facilities or to resell incumbent services rather than to rely on unbundled network elements. But Congress directly delegated to the FCC the task of prescribing nationwide rules for unbundling, including rules dictating what elements should be unbundled. Had Congress wanted to limit the FCC in the way the incumbents propose, it surely would have said so in a straightforward manner. It did not.

---

[7] These operational support systems allow the competitor to connect directly to the incumbents' elements, including in particular to the incumbents' *own* operational support system. *See infra* pp. 23-25.

1. *The Eighth Circuit correctly upheld the FCC's reasonable interpretation of the Act's definition of network elements.*

A network element is

> a facility or equipment used in the *provision* of a telecommunications service. Such term also includes features, functions, and capabilities that are *provided* by means of such facility or equipment, including subscriber numbers, databases, signaling systems, and information sufficient for billing and collection or used in the transmission, routing, or *other provision* of a telecommunications service.

§ 153(29) (emphasis added). The incumbents argue that this text imposes a requirement that a network element must be "unalterably rooted in discrete physical parts" of the network and must be used to transmit or deliver calls. *See* GTE 54-55. The Eighth Circuit rejected that implausible reading of the Act. *See* Pet. App. 41a-43a.

The statutory text does not limit "network elements" to call routing facilities, because it encompasses all facilities used in the provision of service as well as all the features, functions, and capabilities of those facilities used "in the transmission, routing, or *other provision* of a telecommunications service." § 153(29) (emphasis added). The incumbents argue that under the principle of *ejusdem generis* the term "other provision" of service is limited only to alternate means—in addition to transmission and routing—of *physical* delivery of a call. *See, e.g.*, U S West 40. But Congress previously defined the concept of "provision" of service broadly to include the features, functions, and capabilities that are "provided by" means of a facility, and it explicitly listed "information sufficient for billing and collection" as an example of network elements so defined. § 153(29). Provision of these features—critical to telecommunications service—is not a means of physical delivery of a telephone call.

Because Congress defined the term "provision" so broadly in the first part of § 153(29), the canon of

ejusdem generis does not dictate that the terms "transmission" and "routing" necessarily modify the later use of the same term and restrict it to physical delivery of a call. *See* GTE 56; U S West 40. Had Congress meant to restrict the meaning of the term "provision" after initially defining it so broadly, it would have done so explicitly. Instead, Congress emphasized again that "provision" of a service includes more than transmission and routing: the language specifies "transmission, routing, or *other*" provision of service; in context it cannot be taken to mean "transmission, routing, or *similar*" provision of service. The FCC reasonably found that because " 'transmission' and 'routing' refer to physical delivery, the phrase 'or other provision of a telecommunications service' goes beyond mere physical delivery." *Local Competition Order* ¶ 261 (JA 40).

a. *The FCC reasonably found that the incumbents must provide access to their operational support systems.*

Operational support systems ("OSS") are "software systems and accompanying databases that are necessary to process orders, handle billing, and provide maintenance and repair capabilities to phone customers." Pet. App. 42a. They allow a telephone company to assign and track the specific facilities that serve individual customers, advise new customers of their telephone numbers, and schedule repair visits when customers report service troubles. The FCC concluded, and the Eighth Circuit agreed, that OSS and the information it contains "fall squarely within the definition of 'network element.' " *Local Competition Order* ¶ 516 (JA 116-17); Pet. App. 42a-43a. In so doing, the FCC reasoned that the text of the Act reflects Congress' recognition that new competitors cannot enter local markets successfully without access to OSS, and found that "[o]perational interfaces are essential to promote viable competitive entry." *Id.* (citation and internal quotations omitted).

The FCC further found that incumbents must lease their OSS functions to competitors pursuant to § 251(c)(3) for three independent reasons. First, OSS is a network element because the systems themselves are " 'databases' " or " 'facilit[ies] . . . used in the provision of a telecommunications service,' " and their functions are " 'features, functions, and capabilities that are provided by means of such facilit[ies].' " *Id.* ¶ 517 (JA 117) (quoting § 153(29)). Second, OSS is a network element because the information contained in and processed by the systems is "information sufficient for billing and collection or used in the transmission, routing, or other provision of a telecommunications service." *Id.* Third, even if OSS were not itself a network element, access to OSS is a "term and condition" of access to other network elements, and must, therefore, be provided on a nondiscriminatory basis pursuant to § 251(c)(3) and (c)(4). *Local Competition Order* ¶¶ 510, 518-519 (JA 114-16, 118-19). The incumbents do not even address this third and independent ground for the ordering of competitors' access to incumbents' OSS. This ground in itself provides an adequate basis for upholding the FCC's interpretation of the Act. In any event, the incumbents' argument that OSS does not fall within the statutory definition of network elements because it is not a physical part of the call-routing network fails: meeting that requirement is not necessary because the incumbents fabricated it. *See supra* pp. 22-23. The Act's definition *explicitly* encompasses OSS functions like "billing and collection," which are neither physical nor parts of the call-routing network.

Beyond this, the incumbents can only take issue with Congress' policy choices. They complain that allowing competitors access to their software would allow new entrants to run their business "just as efficiently as incumbents." GTE 59. But that is precisely what Congress hoped to accomplish when it included "databases" and "information" in the definition of network elements and directed nondiscriminatory access to those elements. *Local*

Competition Order ¶¶ 510, 518-519 (JA 114-16, 118-20). Incumbents' complaint is with the Act and not with the FCC.

b. ***The FCC reasonably found that directory assistance, operator service facilities, and vertical features are network elements.***

The Eighth Circuit's "agreement with the FCC's determination that the Act broadly defines the term 'network element' " properly led the court "also to agree with the Commission's conclusion that operator services, directory assistance, caller ID, call forwarding, and call waiting are network elements that are subject to unbundling." Pet. App. 44a. The court held that operator service facilities and directory assistance are "features, functions, or capabilities that are provided by facilities and equipment that are used in the provision of telecommunication services." *Id.* Operator service facilities include the physical equipment used to complete certain types of calls mechanically (such as calling card calls), frequently without any human intervention, as well as live operators who can, when needed, use the equipment to switch or complete calls. Contrary to the incumbents' rhetoric, it is *not* live operators that the FCC "deemed 'elements' of the network subject to unbundling." GTE 57. Rather, it is the "function" and "capability" provided by the operator services system that the FCC and the Eighth Circuit agreed fall within the Act's definition of network elements. It matters not that some human services may be involved. Human intervention is often required to deliver the features, functions, and capabilities of network equipment that are indisputably network elements.[8] For example, a switch may need to be reconfigured or to have routing information added to its database, and people perform these functions. Congress drew no line excluding the human support necessary to deliver the functions of a network element.

---

[8] Indeed, labor costs are included in the pricing of most network elements. *See supra* n.4.

Incumbents also challenge the FCC's inclusion of the software features of the switch that the incumbents use to provide caller ID, call forwarding, and call waiting as network elements. *See Local Competition Order* ¶ 423 (JA 95). The Eighth Circuit properly deferred to the FCC's judgment that these so-called "vertical features" of switches are features and functions of the switch that are no different from any other "features, functions, and capabilities" of the switch which competitors therefore have the right to lease at cost-based rates. § 153(29); *see* Pet. App. 42a-43a, 47 C.F.R. §§ 51.307(c); 51.319(c)(i)(C); *Local Competition Order* ¶¶ 412-413, 423 (JA 86-88, 95). The FCC held that switching is a "network element" that includes all of the features, functions, and capabilities of the switch: both the basic software embedded in the switch needed to route any telephone call and the switching software that makes possible *added* services such as caller ID, call forwarding, and call waiting. Both the FCC and the Eighth Circuit found this result compelled by the plain meaning of the statutory text. *See* Pet. App. 43a.

In the incumbents' view, the Court of Appeals erred in refusing to consider the practical consequences of the FCC's approach. Those consequences, the incumbents argue, are that, by leasing, competitors will be able to offer their customers services like call forwarding at a lower retail price than the inflated prices the incumbents are currently offering. The incumbents insist that if competitors can compete effectively by offering such enhanced local telephone services at cost-based rates, competition will deny the monopolists the profits they claim to need to support implicit universal service subsidies. *See, e.g.*, GTE 52-53.

That policy rationale is insupportable. A competitor's ability to offer vertical features at a lower price than an incumbent's current price is precisely what Congress intended. For the reasons previously stated, *see supra* 17-20, the incumbents' arguments based on the need to preserve universal service are groundless.

Nor do respondents gain anything by calling certain pieces of the telephone network "services." The incumbents contend that all of these systems—operator service systems, directory assistance, and vertical features—are "services" rather than "facilities," and therefore do not qualify as network elements. But the FCC and the Eighth Circuit agree that simply because certain features or functions of equipment may also be characterized as services does not preclude their characterization as network elements. *Local Competition Order* ¶ 263 (JA 41); Pet. App. 42a, 44a-45a. Indeed, the incumbents assert a distinction without a difference: *all* services are comprised of collections of features, functions, or capabilities of network facilities or equipment. The Eighth Circuit held that vertical features "satisfy the definition of 'network element;' consequently they are subject to the unbundling requirements of subsection 251(c)(3)." Pet. App. 45a. It agreed with the FCC that the incumbents' arguments to the contrary "would allow the incumbent LECs to evade a substantial portion of their unbundling obligation." Pet. App. 44a-45a.

For example, switching and lines that run from the switch to the business location have all been or could easily be offered as "services" available to retail customers. If none of these elements could be considered "network elements," the statutory provisions that allow for competitive service through unbundled network elements would be a dead letter. Nothing in the Act says (or even suggests) that "services" and "elements" are mutually exclusive categories, and the FCC's interpretation of the term facilities is, as the Eighth Circuit held, consistent with the Act's purposes. It must, therefore, be sustained.

D. The Eighth Circuit Correctly Upheld the FCC's Reasonable Interpretation of the Act's Standards for Competitors' Access to the Incumbents' Network Elements.

The incumbents also take issue with the FCC's implementation of § 251(d)(2), arguing that the agency ne-

gated the Act's limitations on competitor access to incumbents' network elements. *See, e.g.*, GTE 49. Section 251(d)(2) provides that the FCC, in determining what network elements should be unbundled pursuant to § 251(c)(3), "shall consider" whether access to proprietary network elements is "necessary" and whether the failure to provide access to such network elements would "impair the ability of the telecommunications carrier seeking access to provide the services that it seeks to offer." § 251(d)(2).

The incumbents disagree with the FCC's refusal to include in the "necessary" and "impairment" analyses an inquiry into the availability of similar but not identical network elements from alternate sources, *i.e.*, those outside the incumbents' networks. The incumbents argue that this refusal discourages innovation, particularly as to proprietary elements, BA 67, and that it creates disincentives to facilities-based competition. They invoke the antitrust doctrine of essential facilities in proposing that the proper analysis should examine whether the competitor can reasonably or practically duplicate the relevant element, BA 66, or at the very least should examine the availability of existing alternatives outside the incumbent's network, GTE 62.[9]

The factors Congress enumerated, however, need only be "considered." Having done so, the FCC is free to reach a reasoned conclusion that the element must be provided even if not necessary and not impairing the competitors' service. *See Shalala v. Guernsey Mem'l Hosp.*, 514 U.S. 87, 95 (1995); *id.* at 103 (O'Connor, J., dissenting) (agreeing with majority that where Medicare Act provides that Health and Human Services "shall consider" generally accepted accounting principles in prescribing Medicare reimbursement standards, the Secretary retains "broad and

[9] Of course, if the antitrust and the Act's standards were the same, there would be no need for the Act in this regard, because competitors would achieve no more and no less by invoking the Act rather than the antitrust laws.

flexible authority" and "is not bound" to adopt these specific principles). Thus, incumbents' argument that § 251 (d)(2) expressed a congressional policy of truncating the availability of network elements cannot stand scrutiny. Beyond that, the FCC had ample basis to reject the notion that incumbents need not provide proprietary elements if competitors can obtain similar elements from a source outside the incumbents' networks, *Local Competition Order* ¶ 283 (JA 51-52), and to reject the incumbents' position that competitors are not impaired in providing service if they can obtain similar elements from another source or can provide the proposed service through resale; *id.* ¶ 286 (JA 53-54).

The FCC could hardly have been on firmer ground in so rejecting the claim that "necessary" must mean "indispensable," an interpretation that this Court has rejected in a similar context as too rigid for a word that should "be harmonized with its context." *Armour & Co. v. Wantock*, 323 U.S. 126, 129-30 (1944); *see also M'Culloch v. Maryland*, 17 U.S. (4 Wheat.) 316, 413 (1819) ("necessary" means "convenient, or useful"). The court of appeals determined that the FCC's definition was "a reasonable one and entitled to deference," Pet. App. 49a, agreeing with the FCC that "[a]n overly strict reading of the word 'necessary,' as the petitioners propose, would unduly restrict the unbundling duty of incumbent LECs and hinder the development of competition in the local telecommunications industry." *Id.* By the same token, the court found the FCC's definition of "impair" to be consistent with dictionary definitions and consistent as well with the Act's pro-competitive purposes. It therefore concluded that the agency's definition was entitled to deference under *Chevron*. *Id.* at 50a.

As to both the "necessary" and "impairment" standards, the incumbents' "alternative sources" position would simply nullify the Act's unbundling requirements. Incumbents control almost all the network elements that currently exist. A competitor could, of course, in theory—

with enough capital and enough time—build a competing network and so provide itself with all these network elements from other sources. To say, as the incumbents do, that the analysis should at least examine existing alternatives outside the incumbents' network is to say nothing: "As a practical matter, if it is more efficient and less costly for new entrants to obtain network elements from a source other than an incumbent LEC, new entrants will likely pursue the more efficient and less costly approach." *Local Competition Order* ¶ 287 (JA 54-55); *see* Pet. App. 48a. But if (as is likely) because of economies of scale and scope, the incumbent monopolist is the most efficient source of a network element, the Act requires that those economies be shared with competitors. *See Local Competition Order* ¶ 10, Pet. App. 136a-137a. As the Eighth Circuit observed, Congress required that the monopolists' network elements be made available for lease precisely so that incumbents would have to share those economies with potential competitors, because of the extraordinary time and expense involved in constructing duplicate ubiquitous telephone networks. Pet. App. 48a.

Moreover, "requiring new entrants to duplicate unnecessarily even a part of the incumbent's network could generate delay and higher costs for new entrants, and thereby impede entry by competing local providers and delay competition, contrary to the goals of the 1996 Act." *Local Competition Order* ¶ 283 (JA 51-52). The incumbents accuse the FCC of denigrating and deliberately ignoring the Act's purpose of promoting—against other forms of entry—facilities-based competition by simply masking the concept of facilities-based competition in the pejorative term "unnecessary duplication." *See* U S West 32. But, in fact, the FCC reasonably understood that Congress could not have desired *unnecessary* duplication. Instead, competition is enhanced and consumers benefitted when the decision whether to build or to lease is dictated to the greatest extent possible by the market. Additionally, it is competition, and not just facilities-based competition, that is the primary and most urgent goal of the Act. *See*

supra 21-22. As the Eighth Circuit reasoned in determining that the FCC's alternate sources ruling was a reasonable one entitled to deference:

> Allowing incumbent LECs to evade their unbundling duties whenever a network element could be obtained elsewhere would eviscerate unbundled access as a means of entry and delay competition, because many network elements could theoretically be duplicated eventually. The Act, however, provides for unbundled access to incumbent LECs' network elements as a way to jumpstart competition in the local telecommunications industry.

Pet. App. 48a.

The FCC reasonably interpreted the Act's standards for access to network elements.

II. CONGRESS GRANTED THE FCC THE AUTHORITY TO IMPLEMENT THE LOCAL COMPETITION PROVISIONS OF THE 1996 ACT, INCLUDING THE PRICING PROVISIONS.

Congress, in the 1996 Act, unambiguously preempted state laws governing a host of local competition issues and enacted in their place a set of comprehensive federal standards. Despite this, in the name of federalism and purported loyalty to congressional intent, the Eighth Circuit denied the FCC the jurisdiction to implement many of those new federal provisions—including the pricing provisions—thus depriving the FCC of the authority to implement key provisions of federal communications law. In so doing, the Eighth Circuit ensured that, contrary to Congress' intent, the key federal provisions of the Act will be authoritatively interpreted not in an orderly, comprehensive fashion informed by the analysis of the federal agency entrusted to interpret communications law, but instead in a piecemeal fashion, over many years, by federal courts that lack any expertise in national communication policy. In part as a result of that decision, the prospects for the rapid opening of local markets have been destroyed. Neither the text of the 1996 Act, nor policy concerns, nor

any other provision of the Communications Act can justify that decision.

A. The Plain Text of the Statute Confirms That the FCC Has Authority to Implement the Local Competition Provisions of the Act, Including § 251's Rate Provisions.

The Eighth Circuit's decision to strip the FCC of rulemaking authority over most of the local competition provisions—including the pricing provisions—depends on the false premise that nothing in the 1934 Act, or in the 1996 Act (which amended it), confers on the FCC plenary authority to implement the 1996 Act's local competition provisions. Respondents' arguments in support of this premise fail.

First, the argument flies in the face of the statutory text affirmatively granting the FCC rulemaking authority. Section 251(d)(1), which instructs the FCC to "establish regulations to implement the requirements of" § 251, is not merely a time constraint but an affirmative grant of authority. Indeed, the language of § 251(d)(1) is drawn from the virtually identical provision of the House Bill, *see* H. Rep. at 4 (§ 241(b)(4)), which clearly was intended as a grant of authority. *See* Conf. Rep. at 120 ("Section 241(b)(4) directs the Commission to establish regulations"); *see id.* at 121 (same). Moreover, in § 276(b) of the Act, Congress used virtually identical language that incumbents concede (BA 36) empowers the Commission to issue regulations to implement the Act's provisions on payphone services. *See, e.g., Sorenson v. Secretary of the Treasury*, 475 U.S. 851, 861 (1986) ("identical words used in different parts of the same act are intended to have the same meaning") (citation omitted).

Section 201(b) also provides the FCC with a broad source of power. Respondents are left with the difficult prospect of arguing that § 201(b)—which authorizes the FCC to prescribe regulations "to carry out the provisions of the Act"—does not mean what it says. BA 43-44; GTE 33-34. They suggest that this clear grant of au-

thority should be limited by "context" to apply only to interstate communications. But Congress knew well the difference between a grant of authority that was section-specific, and a grant of authority that affected the entire Act. *Compare* § 317(e) ("The Commission shall prescribe appropriate rules and regulations to carry out the provisions *of this section*") (emphasis added), *with* § 201(b) ("Commission may prescribe rules and regulations . . . to carry out the provisions *of this Act*") (emphasis added).[10] Section 201(b) makes clear that Congress granted the FCC authority to prescribe regulations to carry out the provisions of the Act.[11]

Second, respondents have no cogent response to the point that their reading of § 251(d)(1) and § 201(b)

---

[10] While § 201(b) grants the FCC regulatory authority to implement the provisions of the Communications Act, provisions such as § 276(b) and § 317(e) not only *grant* the FCC authority, they also *require* the exercise of that authority or add particular instructions regarding its exercise.

[11] Respondents rely on legislative history to suggest that the last sentence of § 201(b) applies only to that portion of § 201(b) that allowed radio companies to furnish reports of the location and positions of ships at sea to newspapers without charge. *See* NARUC 27. Respondents thus suggest that when Congress gave the FCC the power to implement the provisions of "this Act" it actually meant to give the FCC the power to implement the "last sentence of part (b) of this section of the Act." To state the argument is to refute it. Indeed, respondents misread the legislative history: Earlier in the bill that added the last two sentences of § 201(b), Congress used the same term—"this Act"—in a context that plainly refers to the Communications Act, making clear that Congress' use of the same term in the next sentence could not have been accidental. *See Wisconsin Dep't of Revenue v. William Wrigley, Jr., Co.*, 505 U.S. 214, 225 (1992) (a phrase "ought to be accorded a consistent meaning within the section"). Finally, in passing this provision, Congress *explicitly* noted that it was amending § 201(b) of the Communications Act, *see* Communications Act of 1934, amendment, Pub. L. No. 561, 52 Stat. 588 (1938); Congress thus had to know that giving the FCC the power "to carry out the provisions of this Act" would give the FCC the broad power to implement the Act that the new bill amended, *i.e.*, the Communications Act of 1934.

would leave the FCC without authority to implement many of the other provisions of § 251, which all agree it may implement. *See, e.g.*, Pet. App. 12a n.10. These other provisions are not, as respondents claim, specific grants of authority in themselves. Most of these sections *presume* FCC power to regulate; they do not grant it. *See, e.g.*, § 251(c)(4)(B) ("a State commission may, *consistent with regulations prescribed by the Commission under this section*, prohibit" certain actions) (emphasis added); § 251(g) (requiring local exchange carriers to continue to comply with preexisting equal access and nondiscriminatory interconnection restrictions and obligations "until such restrictions and obligations are explicitly superseded *by regulations prescribed by the Commission*") (emphasis added). The text of these provisions also answers respondents' rhetorical question: "if section 251(d)(1) *already* provided the FCC with generic authority over all of sections 251 and 252, why would Congress have included these specific delegations of authority to the FCC?" BA 39 (emphasis in original). These provisions do not delegate authority to the FCC; they limit FCC authority delegated elsewhere or define limits on the power of state commissions. *See, e.g.*, § 251(d)(2) (limiting FCC authority by describing standards that the FCC must consider in determining what elements are available for unbundling); § 251(c)(4)(B) (giving state commissions the power to prohibit certain actions by a reseller, but limiting that power by requiring that it be "consistent with regulations prescribed by the Commission under this section").

Third, § 252(c)(2)—which provides that "[i]n resolving . . . any open issues . . . a State commission shall . . . establish any rates for interconnection, services, or network elements"—cannot bear the weight respondents place on it. Respondents' reliance on § 252(c)(2) is linked to their argument that the FCC lacks plenary authority to implement §§ 251 and 252. They contend that § 252(c)(2) unambiguously grants state commissions the power to set rates and pricing methodologies, BA 20;

GTE 27-28, or, at the very least, § 252(c)(2) confirms Congress' understanding that the FCC lacks such authority, and that the state commissions possess it.

Nothing in § 252(c)(2) can plausibly be read to deprive the FCC of jurisdiction to implement any of the provisions of the 1996 Act. Section 252(c)(2) merely assumes that state commissions will at times set rates, and it imposes substantive limits on state commissions when they do. The provision is conditional: It provides that "[i]n resolving . . . any open issues . . . a State commission shall—establish any rates . . . according to subsection (d)." § 252(c)(2). In terms, it requires only that whatever issues remain open, the state commission will resolve consistent with the limitations provided in § 252(c). *See, e.g.*, § 252(c)(1) (state commissions' resolution of any open issues must comply with § 251 and FCC regulations thereunder); § 252(c)(2) (state commissions' resolution of any open pricing issues must meet additional requirement of § 252(d)(1)).

Respondents suggest that § 252(c)(2) deprives the FCC of jurisdiction because it directs state commissions engaged in setting rates "to apply *solely* the standards of § 252(d)," and not the standards contained in § 252(c)(1), which incorporate by reference the FCC regulations promulgated under § 251. GTE 30 (emphasis added); *see also* BA 23. The word "solely," however, does not appear anywhere in § 252(c)(2), and with good reason. The restrictions on the state commissions' resolution of any open issues are conjunctive; thus § 252(c)(2) places an *additional* restriction on the state commissions' determinations of open issues concerning price: those determinations must comply with the requirements of § 252(d). The *additional* requirement imposed by § 252(c)(2), however, does not eliminate the other requirements imposed by § 252(c) with respect to "*any* open issues," a term which by its plain language includes price issues. In particular, § 252(c)(2)'s additional requirement governing pricing obligations cannot insulate such determinations from § 252(c)(1)'s directive to apply

"the regulations prescribed by the [Federal Communications] Commission pursuant to section 251." [12]

Moreover, the fact that § 252(c)(2) reflects Congress' assumption that state commissions would at times set rates does not deprive the FCC of jurisdiction over pricing methodology. Just as state commissions can resolve other "open issues" consistent with binding FCC regulations pursuant to § 252(c)(1), state commissions can "establish rates" pursuant to § 252(c)(2) by taking binding FCC regulations that prescribe a pricing methodology and applying them in concrete fact situations in a way that takes account of local conditions. *See also Local Competition Order* ¶¶ 135-137, Pet. App. 223a-224a.[13]

Fourth, the legislative history—and in particular the decision of the conference committee to split § 251 from § 252—does not help respondents. BA 24-25; GTE 29-31. The conference committee's decision to make §§ 251 and 252 separate provisions was not an effort to withdraw the FCC's authority over price and give it to the state commissions. Section 251 sets forth substantive standards for rates just as much as § 252 does. *See, e.g.*, § 251(c)(2)(D); § 251(c)(3); § 251(c)(4)(A). Moreover, Congress itself entitled § 252 "*Procedures* For Negotiation,

---

[12] For this reason, there is no merit to respondents' suggestion that petitioners' reading of the statute renders § 252(c)(2) "wholly superfluous." BA 24; GTE 29. Section 252(c)(2) imposes an additional requirement on state commissions when they resolve open rate issues that does not exist when state commissions resolve other open issues, thus making explicit that state commissions must comply with *both* the FCC's regulations *and* the requirements of § 252(d), including in particular § 252(d)(1)'s prohibition on using rate of return or other rate based methods.

[13] Respondents argue that § 252(c)(2) trumps § 251(d)(1) and § 201(b) because the specific controls the general. *See* BA 34; GTE 34. But that argument simply assumes its conclusion, *i.e.*, that there is a conflict between the two provisions that must be resolved. As noted above, however, there is no conflict (and thus no need to resolve the tension between a specific provision and a general one) because the provisions can, and therefore must, be read harmoniously.

Arbitration, and Approval of Agreements" (emphasis added). *See, e.g., INS v. National Ctr. for Immigrants' Rights, Inc.*, 502 U.S. 183, 189 (1991) (title of section can aid in resolving meaning of the statutory text). Given that Congress itself indicated that the separation of § 251 from § 252 was intended to embody a separation of the substance of the interconnection agreements from the procedures for negotiating and approving them, there is no reason to believe that Congress' decision to separate §§ 251 and 252 was at all intended to foreclose FCC regulation of prices.

Respondents' arguments are not bolstered by their reliance on unsupported and self-serving assertions that their allies successfully lobbied the conference committee to make these changes in order to protect state authority. *See* BA 25 n.13; GTE 30 & nn.15-16. These arguments —which ask this Court to interpret a statute based on the unsupported assertions of private parties that they successfully lobbied Congress—are not "legislative" history at all. *See Kelly v. Robinson*, 479 U.S. 36, 51 n.13 (1986) (declining to "accord any significance" to statements because "none of those statements was made by a Member of Congress, nor were they included in the official Senate and House Reports").

In any event, respondents' cavalier approach to legislative history ignores the conference committee's own assertion that it noted changes "except for clerical corrections, conforming changes made necessary by agreements reached by the conferees, and minor drafting and clerical changes." "Conforming" changes are those changes required as a result of other, explained agreements of the conference committee. The changes respondents claim were made in conference would have been radical, substantive changes, unrelated to any explained agreement of the committee, and thus cannot possibly be considered "minor" or "clerical" or "conforming" changes.[14] *See Central States Motor*

[14] Both the House bill and the Senate bill gave the FCC the regulatory authority over pricing the respondents claim the confer-

Freight Bureau, Inc. v. Interstate Commerce Comm'n, 942 F.2d 1099, 1107 (D.C. Cir. 1991) (R.B. Ginsburg, J.).

Fifth, respondents can reconcile their reading of the statute with the plain language of other provisions of the Act such as §§ 271 and 160 only by ignoring the terms of those provisions or reading in limitations that Congress did not include. *See* MCI Opening Brief at 36-38. For example, they suggest that in passing on an application to enter the long distance market pursuant to § 271, the FCC "can require no more than interconnection in accordance with the pricing principle promulgated *by the States*." BA 42 (emphasis in original). But that is not what § 271 says. Section 271(c)(2)(B) requires the FCC independently to determine whether the § 271 applicant has provided "[i]nterconnection in accordance with the requirements of Sections 251(c)(2) and 252(d)(1)." *See SBC Communications, Inc. v. FCC*, 138 F.3d 410, 416-17 (D.C. Cir. 1998). Section 251(c)(2) includes the requirement that rates be "just, reasonable, and nondiscriminatory." No fair reading of § 271 permits the conclusion that Congress gave state commissions the license to determine the future of the nation's long-distance telecommunications markets.[15]

Similarly, respondents' arguments that the FCC's forbearance authority is limited to "certain aspects" of § 251(c)—excluding price—ignores the fact that § 160 not only contains no such limitation, but in fact *requires* the FCC to consider whether charges are just and reasonable before the FCC may exercise that authority.

In sum, respondents' arguments cannot obscure what Congress has made clear: the FCC has authority to imple-

---

ence committee stripped away without comment. *See* MCI Opening Brief at 32.

[15] Respondents make no effort even to try to defend the procedural and jurisdictional chaos with respect to § 271 applications that would result from their reading of the Act, *see* MCI Opening Brief at 37, nor to explain why Congress would have created such a bizarre scheme.

ment the local competition provisions of the Act, including the provisions concerning rates.

B. Respondents' Contention That the 1996 Act Created a "Decentralized State-centered Scheme" Is Untenable.

Unable to make a case on the basis of statutory text, respondents once again resort to policy and rhetoric to justify limiting the FCC's authority to implement the substantive requirements of federal law. Respondents contend that Congress wanted a "decentralized, State-centered" approach, BA 44, that was "deregulatory," and advanced values of federalism. But it is simply not true that the 1996 Act sought to divest the federal government of powers that were transferred to the state commissions. To the contrary, the Act took back from the state commissions much of the substantive authority they had over intrastate matters under the 1934 Act. Indeed, respondents' arguments trivialize the revolutionary aspect of the 1996 Act. For the first time, Congress applied a comprehensive set of *federal* standards to govern entry into local markets. The 1996 Act is "State-centered" principally in the sense that the state commissions have been enlisted as partners in the administration of *federal* law embodied in the new national policy. It is manifestly *not* "State-centered" in the sense that state commissions decide all of the key substantive policy issues by themselves. That much is confirmed not only by the sweeping preemptive federal directives governing local competition, but also by Congress' choice of exclusive federal district court review of state actions applying the 1996 Act. *See Matsushita Elec. Indus. Co. v. Epstein*, 516 U.S. 367, 383 (1996) (one principal purpose underlying a grant of exclusive jurisdiction is "to achieve greater uniformity of construction") (internal quotation omitted).

The incumbents deride this argument as "audacious," BA 44, but the audacity is theirs. Here, they argue that the 1996 Act contemplated "differing discretionary judg-

ments" and "State autonomy and discretion." BA 45; *see also* GTE 40. But in federal courts in § 252(e)(6) proceedings, they conveniently advocate the opposite. Thus, for example, respondent U S West has argued that federal courts should apply a *de novo* standard of review and accord no deference to state commissions' determinations, because had Congress "intended that any deference be accorded the state commissions, it would not have precluded review in the state court systems, where deference to State commissions is routinely accorded." [16] Similarly, respondents have argued that "unlike a uniform application by a federal agency, a federal statute could be subject to 50 different interpretations in 50 different states. Under these circumstances, deference to a State agency's interpretation of federal law is not appropriate." [17] *See also GTE South Inc. v. Morrison*, Civ. Act. No. 3:97-CV-493, GTE's Brief in Opposition to the Commissioners' Motion for Partial Summary Judgment, at 7-8 (E.D. Va. filed Dec. 1, 1997) (deference to state agency is inappropriate because "giving deference to state agency interpretations of federal law would result in multiple, inconsistent legal interpretations of the federal statute around the country" and because "state agencies lack the expertise in implementing federal laws and the nationwide perspective characteristically possessed by a federal agency"). [18]

---

[16] *U S West Communications, Inc. v. MFS Intelenet, Inc.*, No. 98-35146, Brief of Appellant, at 11 (9th Cir. filed June 11, 1998).

[17] *Southwestern Bell Telephone Co. v. AT&T Communications of the Southwest, Inc.*, Civ. Act. No. A-97-CA-132-SS, Motion for Summary Judgment of Southwestern Bell Telephone Company Based On Violations Of Statutory Standards and Supporting Brief, at 16 (W.D. Tex. filed Apr. 30, 1997).

[18] State commissions have unsuccessfully argued in § 252(e)(6) proceedings that a federal court should defer to decisions of state commissions on the meaning of federal law. Although this position avoids the brazen hypocrisy of the incumbents, it is simply wrong: federal courts do not defer to state agencies on questions of federal law. *See, e.g., AMISUB (PSL), Inc. v. Colorado Dep't of Soc. Servs.*, 879 F.2d 789, 795-96 (10th Cir. 1989); *Perry v. Dowling*, 95 F.3d 231, 236 (2d Cir. 1996). Unsurprisingly, the district courts have

Ultimately, incumbents are forced to concede that the 1996 Act adopted a "centralized" approach by providing for "ultimate federal oversight of State arbitrations," but they claim that Congress "chose a judicial, not an administrative, mechanism for this oversight." BA 5. Under incumbents' approach, the federal courts, on *de novo* review of state arbitration decisions, will decide the substance of the 1996 Act's federal requirements in a piecemeal fashion, over an extended period of time, and without the benefit of the views of the expert federal agency. But respondents offer no explanation why Congress would have wanted the federal courts and not the FCC to set national communications policy within the broad statutory framework. Moreover, as noted above, respondents' view that the Act contemplates a gradual unfolding of its key provisions is contrary to the numerous provisions of the Act that emphasize the need for rapid implementation, *see supra* p. 19, and would destroy the prospects for rapid competition in local markets, *see Local Competition Order* ¶ 618 (JA 131) ("such a process could delay competition for years"); *id.* ¶ 114, Pet. App. 212a ("Lack of national rules could . . . create great uncertainty for the industry, capital markets, regulators, and courts as to what pricing policies would be pursued by each of the individual states, frustrating the potential entrants' ability to raise capital.").

Respondents' invocation of "federalism" is similarly unavailing. BA 44-45, GTE 40-41. To be sure, the 1996 Act preserves a role for the state commissions if they choose

---

uniformly refused to defer to the state commissions on the interpretation of the 1996 Act. *See, e.g., U S West Communications, Inc. v. Hix*, Civ. Act. No. 97-D-152, Memorandum Opinion and Order, at 9 (D. Colo. Dec. 5, 1997) (*Chevron* deference is inappropriate because state commissions "have little or no experience in implementing federal laws and policies and do not have the nationwide perspective characteristic of a federal agency."); *MCI Telecommunications Co. v. Bell Atlantic-Virginia Inc.*, Civ. Act. No. 3:97-CV-629, Order Ruling on the Commissioners' Motion for Partial Summary Judgment, at 3 (E.D. Va. filed Dec. 24, 1997) (no deference to state agency).

to accept it, but it is not a "State-centered scheme" that permits state commissions to act under state law with only limited federal constraints. Instead, the Act imposes federal standards interpreted at a general level by the expert federal agency, with state commissions having autonomy to apply these federal regulations to local conditions. This is not "patronizing rhetoric," GTE 38, and does not reduce the state commissions to the "ministerial" and discretionless task of implementing the FCC's methodology. *See* BA 7. To the contrary, as the FCC found, "state commissions will make critical decisions concerning a host of issues involving rates," *Local Competition Order* ¶ 137, Pet. App. 224a, including decisions about the prime components of rates, such as depreciation, joint and common costs, and profit. *See id.* ¶¶ 686, 696, 702 (JA 140-41, 143-44, 146-47). *See generally Louisiana Pub. Serv. Comm'n*, 476 U.S. at 364-65 ("depreciation practices contribute importantly to the calculation of both the carrier's investment and its expenses"). Regulations that promulgate broad ratemaking methodologies but leave open for state commission determination most of the critical inputs that go into a rate cannot be said impermissibly to establish the rate, to relegate state commissions to performing "ministerial" functions, or to deprive state commissions of their considerable discretion in carrying out federal law.

In a similar vein, respondents mistakenly trumpet the statement in the Conference Report that the 1996 Act produced a "pro-competitive, de-regulatory national policy framework." BA 4; *see also* GTE 11. The issue is not *whether* the Act will be interpreted and applied by regulators, but rather *which* regulatory agency (or agencies) will perform this task. Respondents never explain why "deregulation" counsels in favor of vesting rulemaking authority in 50 different state commissions rather than in the FCC. For national competitors such as MCI, respondents' interpretation of the Act—which subjects competitors to 50 different sets of regulations—is anything but "deregulatory." Moreover, the "deregulatory" nature of the 1996 Act surely stems in large part from its elimination

of anticompetitive *state* regulations which previously governed intrastate telephone markets. The Act's "deregulatory" nature thus cannot support the view that Congress intended for state commissions rather than the FCC to implement the Act's new federal standards.

In sum, respondents' State-centered vision of the Act is not only inconsistent with the vision of the Act they have put forth in § 252(e)(6) proceedings around the country, it is at odds with the language and purpose of the statute, ignores the extension of *federal* law to intrastate matters, and results in an irrational and unworkable scheme for local competition.

C. Section 2(b) Does Not Deprive the FCC of Jurisdiction to Implement the Federal Standards That Govern Rates.

In the 1996 Act, Congress took the extraordinary step of subjecting intrastate telephone markets to federal substantive law for the first time and (in § 253) gave the FCC unambiguous authority to preempt "*any* statute, regulation, or legal requirement" imposed by a State that "prohibits or has the effect of prohibiting" an entity from providing intrastate or interstate telephone service. In this context, it would be illogical to conclude that Congress nonetheless intended that state commissions—whose enabling acts, rules, and regulations were the very ones superseded by 1996 Act—have the *sole* authority to implement the key pricing provisions of the 1996 Act. *Cf. United Savs. Ass'n of Tex. v. Timbers of Inwood Forest Assoc.*, 484 U.S. 365, 371 (1988) ("A provision that may seem ambiguous in isolation is often clarified by the remainder of the statutory scheme . . . because only one of the permissible meanings produces a substantive effect that is compatible with the rest of the law"). Nothing in § 2(b) requires this illogical result. First, even under respondents' mistaken understanding of § 2(b), § 2(b) erects no barrier to the FCC's implementation of the local competition provisions of the Act. Just as Congress provided in a straightforward and unambiguous manner for

the federal local competition provisions—including the pricing provisions—to *apply* to intrastate telephone services, Congress provided in a straightforward and unambiguous manner to *give the FCC jurisdiction* over those same services. Second, as MCI demonstrated in its opening briefs, § 2(b) was intended to limit only the FCC's *ancillary* jurisdiction over intrastate matters not governed by substantive federal law and has no application when, as here, federal law clearly applies to those matters.

As described above, *see supra* p. 34, in §§ 251(d)(1) and 201(b), Congress unambiguously gave the FCC authority to implement the local competition provisions of the 1996 Act. Respondents contend nonetheless that Congress' expression of its intent is insufficiently clear to satisfy § 2(b), on the theory that § 2(b) "precludes the FCC's assertion and exercise of authority over intrastate pricing and related matters without an *express* grant of jurisdiction over such matters." CA 33 (emphasis in original).[19]

That cannot be correct. The statement of congressional intent necessary to overcome § 2(b)'s presumption that the Communications Act does not "apply" to intrastate matters is the same as that necessary to overcome § 2(b)'s presumption that the Act does not "give the Commission jurisdiction" to regulate intrastate matters. Thus, if respondents are correct about what is necessary to overcome the § 2(b) presumption, then virtually *none* of the obligations in § 251 would even *apply* to intrastate communications. For virtually none of § 251's local competition provisions explicitly mentions intrastate matters or otherwise demonstrates the kind of "comparable language" that respondents assert is required. Respondents' § 2(b) argument would thus render the 1996 Act a nullity.

Uncomfortable with the implications of their argument, respondents simply ignore them, and blithely assert that

---

[19] *See also* NARUC 33 ("The absence of an *explicit* grant of federal authority in sections 251 and 252 is fatal to the FCC's jurisdictional claim") (emphasis added)); BA 36; GTE 44.

Congress unambiguously intended for the pricing provisions of the Act to apply to intrastate matters but deny that Congress made sufficiently clear its intent that the FCC implement those provisions. But they cannot ignore that the applicability of § 251 to intrastate matters is just as "implicit" as—and is no more unambiguous than—the authority of the FCC to implement that section. Just as § 251(c) sets forth substantive federal requirements that all agree apply to intrastate matters, *see, e.g.*, GTE 11; *Local Competition Order* ¶ 71, Pet. App. 179a-180a ("None of the commenters appears to claim that section 251 addresses exclusively interstate matters"), § 251(d)(1) gives the FCC authority to implement those requirements.[20]

Moreover, this examination into whether Congress indicated its intent with sufficient clarity is unnecessary because § 2(b) limits only the FCC's *ancillary* jurisdiction. Thus, § 2(b) precludes the FCC from exercising jurisdiction over matters to which federal law does not unambiguously apply, *i.e.*, the sort of jurisdiction approved by this Court in *Shreveport*. Respondents' arguments to the contrary are unpersuasive. For example, respondents accuse petitioners of ignoring the term "or" and eliminating the second clause of § 2(b). BA 29; GTE 45. But this is simply incorrect. Petitioners merely disagree with respondents about the meaning of the second clause. As MCI indicated in its opening brief, the second clause of § 2(b) was intended to preclude the FCC from exer-

[20] Respondents also argue that § 251(d)(1) cannot grant the FCC jurisdiction to implement the pricing provisions because, in contrast to § 276 of the Act, which explicitly refers to "intrastate and interstate" calls, § 251(d)(1) makes no mention of intrastate matters. BA 36; GTE 44. In § 276, however, had Congress omitted the term "intrastate," it would have been unclear whether the payphone provisions applied at all to intrastate matters. With respect to the local competition provisions, all concede that the relevant provisions of the Act clearly apply to intrastate matters, so the added specificity that was critical in § 276 to ensure that the substantive provisions applied intrastate would have been completely redundant.

cising ancillary jurisdiction; there is simply no indication that the clause was intended to perform the quite different function of severing the jurisdiction of the FCC from the substantive reach of federal law.

Respondents' treatment of the interaction of § 2(b) with § 201(b) only highlights their insupportable approach to statutory interpretation. They argue that the plain language of § 201(b) cannot mean what it says because it is limited by "context," and that, even if it does, it is trumped by § 2(b). But respondents' approach, in addition to doing violence to the plain language of § 201(b), relies on an inconsistent approach to context, using it to limit the plain meaning of § 201(b) but ignoring it when deciding the meaning of § 2(b). Respondents are forced into this inconsistency because, under their erroneous understanding of § 2(b), the provisions are in irreconcilable conflict. But as MCI showed in its opening brief, that conflict is purely one of respondents' own creation. In fact, the provisions are complementary: § 201(b) gives the FCC authority over interstate and intrastate matters to the extent that federal law applies to those matters, and § 2(b)—which limits the FCC's ancillary jurisdiction—provides that the FCC may go no further. *See Louisiana Pub. Serv. Comm'n*, 476 U.S. at 370 ("where possible, provisions of a statute should be read so as not to create a conflict").

Similarly meritless is respondents' assertion that *Louisiana* resolved the question now before this Court. In *Louisiana*, the Court resolved two separate issues; first, whether § 220 of the Act, establishing a uniform system of accounts, itself preempted state law, and second, if it did not, whether the FCC nevertheless could exercise *ancillary* jurisdiction—*i.e.*, jurisdiction over matters to which the Act did not directly apply—to preempt state law concerning depreciation. In the instant case, however, the contested division of authority between the FCC and the state commissions has nothing to do with preemption because Congress has already made the decision to preempt state law. Whatever entity regulates will indis-

putably be implementing new provisions of *federal* law that now govern local (*i.e.*, intrastate) telephone markets. Nothing in the holding of *Louisiana* suggests that § 2(b) was intended to deny the FCC jurisdiction even when federal law clearly applies and preempts state law.

Respondents nevertheless suggest that the ancillary jurisdiction argument is untenable because the *Louisiana* Court rejected the argument that § 2(b) was intended solely to prevent application of the *Shreveport* doctrine. *See* BA 30; GTE 46. But the *Louisiana* Court rejected an entirely different argument based on *Shreveport*. Respondents there argued that because *Shreveport* applied only to "rates," § 2(b) also applied only to rates and not to the other intrastate matters such as depreciation. Thus, the Court noted that it was "certainly true" that § 2(b) was intended to prevent "excessive federal regulation of intrastate service such as was sanctioned by the *Shreveport Rate Case*," but found "no authority in the legislative history to support respondents' proposition that the sole concern of the state commissioners was with 'protection against federal preemption of the states' setting of *individual customer charges* for specific intrastate services.'" 476 U.S. at 372 (citation omitted) (emphasis added). The *Louisiana* decision thus was not a rejection of the contention that § 2(b) was intended to overturn the *Shreveport* ancillary jurisdiction principle, but rather was a rejection of respondents' overly restrictive characterization of what that principle was.

Finally, there is no merit to respondents' argument that the legislative history of the 1996 Act is inconsistent with petitioners' approach. GTE 42-43; BA 27-28. Respondents view the conference committee's decision not to amend § 2(b) as working a major substantive change, even though that change appeared nowhere in the conference report. As noted above, that inference is flatly inconsistent with the conference committee's own description of its actions. *See supra* pp. 37-38. Respondents' reading of the conference committee's actions is particularly inappropriate when there is a ready explanation for those

actions: because an amendment to § 2(b) would be redundant with respect to the FCC's authority over the substantive provisions of the 1996 Act, amending § 2(b) could be seen as giving the FCC the license to exercise precisely the sort of ancillary jurisdiction the 1934 Congress had intended to prevent—for example, jurisdiction over local *retail* rates and depreciation, which remain regulated by state law. In any event, given the uninterrupted congressional practice of the last century and given Congress' decision to displace state laws governing competition in local markets, something more than silence is required to justify the conclusion that Congress intended to sever the FCC's authority to regulate from the reach of federal communications law.[21]

---

[21] California and NARUC suggest that the legislative silence supports their argument because § 2(b) has a 60-year history as a "universally understood reservation of State authority." CA 32; NARUC 36-37. But so far as petitioner is aware, § 2(b) has *never* been relied upon to deny the FCC jurisdiction to implement a federal provision that clearly applied to intrastate matters. Indeed, the state respondents' argument on this point serves only to underscore their inability to come to grips with the revolutionary aspect of the 1996 Act: Congress' decision to apply for the first time substantive *federal* law to intrastate matters.

CONCLUSION

The Eighth Circuit's decisions invalidating Rule 315(b) and stripping the FCC of plenary authority to implement the requirements of § 251 of the 1996 Act should be reversed, and its decision upholding the FCC's remaining unbundling rules should be affirmed.

MOTION OF *AMICUS CURIAE* COVAD COMMUNICATIONS COMPANY FOR LEAVE TO FILE SUPPLEMENTAL BRIEF

Amicus curiae Covad Communications Company ("Covad") respectfully moves the Court for leave to file the accompanying supplemental brief. In support of this motion, Covad states as follows:

1. Covad is a Competitive Local Exchange Carrier ("CLEC") that provides high-speed, digital telecommunications services. Covad has created its network by leasing local loops, which are Unbundled Network Elements ("UNEs"), from Incumbent Local Exchange Carriers ("ILECs") and combining them with Digital Subscriber Line ("DSL") equipment. Many customers use Covad's advanced network to transport telecommunications traffic between the subscriber's premises and the subscriber's Internet Service Provider ("ISP").

2. On April 3, 1998 Covad, with the consent of the parties, filed a brief *amicus curiae* in support of petitioners Federal Communications Commission ("FCC") and the United States of America.* In its brief, Covad demonstrated that a significant portion of the traffic carried over its UNE-based network is jurisdictionally interstate. Covad therefore concluded that the Eighth Circuit erred when it held that the FCC lacks authority to establish a pricing methodology for UNEs because these facilities are "fundamentally intrastate in character."

---

* *See* Brief of *Amicus Curiae* Covad Communications Company in Support of Petitioners Federal Communications Commission and the United States of America, *AT&T Corp. v. Iowa Utilities Bd.* (U.S. Apr. 2, 1998) (Nos. 97-826, 97-829, 97-830, 97-831, 97-1075, 97-1087, 97-1099 and 97-1411).

3. In the seven months since Covad filed its initial brief, two developments — one originating in the Eighth Circuit, the other from the ILECs — have occurred. These developments provide significant support for Covad's position.

4. First, on August 19, 1998, the Eighth Circuit — in an opinion by the same panel that authored the decision below — held that telecommunications traffic between subscribers and their ISPs is jurisdictionally mixed and cannot be separated into interstate and intrastate components. *See Southwestern Bell Telephone Company v. FCC*, No. 97-2618, slip op. at 41 (8th Cir. Aug. 19, 1998). Because Internet traffic constitutes a significant portion of the traffic carried over CLECs' UNE-based networks, this decision demonstrates that UNEs are not "fundamentally intrastate in character."

5. Second, in recent months, four major Incumbent Local Exchange Carriers (Bell Atlantic, BellSouth, GTE, and Pacific Bell) have voluntarily filed tariffs with the FCC for their new Digital Subscriber Line services, which are used primarily to transport local telecommunications traffic between subscribers and their ISPs. By filings these tariffs at the FCC, rather than with the state public utility commissions, the ILECs have recognized that a significant portion of the traffic carried over physically local telecommunications networks is jurisdictionally interstate.

6. As a Competitive Local Exchange Carrier that uses Unbundled Network Elements to provide Digital Subscriber Line service that enables small businesses and residential subscribers to have high-speed access to the Internet and other multi-state networks, Covad is able to provide this Court with a perspective on these new developments that, to the best of the Company's knowledge, will not be provided by any of the parties.

For the foregoing reasons, *amicus curiae* Covad Communications Company requests that the Court grant it leave to file this supplemental brief.

SUPPLEMENTAL BRIEF OF *AMICUS CURIAE* COVAD COMMUNICATIONS COMPANY

Amicus curiae Covad Communications Company ("Covad") respectfully submits this supplemental brief.[1]

INTERESTS OF THE *AMICUS CURIAE*

Covad is a Competitive Local Exchange Carrier ("CLEC") that provides high-speed, digital telecommunications services. Covad has created its network by leasing local loops, which are Unbundled Network Elements ("UNEs"), from Incumbent Local Exchange Carriers ("ILECs") and combining them with Digital Subscriber Line ("DSL") equipment. Covad's advanced telecommunications network is used by small businesses and residential subscribers who seek affordable, high-speed access to the Internet in order to access information stored in computer servers anywhere in the world. The Covad telecommunications network also is used by employees who work at home and connect to their company's multi-state and multi-national computer networks.

INTRODUCTION

The decision below stripped the Federal Communications Commission ("FCC") of the express rulemaking authority granted by Congress, pursuant to which the agency established the pricing methodology for Unbundled Network Elements.[2] The court did

1. Counsel for a party did not author this brief in whole or in part, and no person or entity, other than *amicus curiae*, has made a monetary contribution to the preparation or submission of the brief.

2. Section 251(c)(3) of the Communications Act requires that UNE rates be "just, reasonable, and nondiscriminatory in accordance with the . . . requirements of this section and section 252." 47 U.S.C. § 251(c)(3). Section 251(d)(1), in turn, directs that the FCC is to adopt rules "necessary . . . to implement the requirements of this section." *Id.* at § 251(d)(1). Taken together, these provisions expressly grant the FCC rulemaking authority to promulgate a binding national methodology to guide the States in their adjudicative determination regarding UNE rates.

so because it assumed that UNEs are "fundamentally intrastate in character." As a result, each State is now exercising exclusive and unfettered authority to establish UNE prices. This decision has had an adverse impact on CLECs, such as Covad, that rely on UNEs to provide service.[3]

In its initial brief,[4] Covad demonstrated that the Court's decision is based on two fundamental errors. The court's initial mistake was to assume that UNEs are "fundamentally intrastate in character" because they are used almost exclusively to provide *intrastate* telecommunications service.[5] This is simply wrong. UNE-based networks often are used to provide jurisdictionally *interstate* service. For example, these networks increasingly transport telecommunications traffic between a subscriber and his or her ISP. The ISP, in turn, sends the traffic on to computer servers, which often are located outside the subscriber's home State.[6] The court compounded its mistake by holding that, even if UNEs are "sometimes" used to provide interstate service, the States have the exclusive and unfettered

---

3. Some States have still not established UNE rates. Other States have set these rates at levels that appear to be substantially in excess of cost.

4. On April 3, 1998, Covad, with the consent of the parties, filed an *amicus* brief in this matter (the "Covad *Amicus* Brief"). *See* Brief of *Amicus Curiae* Covad Communications Company in Support of Petitioners Federal Communications Commission and the United States of America, *AT&T Corp. v. Iowa Utilities Bd.* (U.S. Apr. 2, 1998) (Nos. 97-826, 97-829, 97-830, 97-831, 97-1075, 97-1087, 97-1099, and 97-1411).

5. *Iowa Utilities Bd. v. FCC*, 120 F.3d 753, 796-99 (8th Cir. 1997), *cert. granted*, 66 U.S.L.W. 3484 (U.S. Jan. 26, 1998).

6. Covad *Amicus* Brief at 16-19.

right to set prices for those facilities.[7] This conflicts with well-established precedent. Because UNEs may be used to provide jurisdictionally interstate service, the FCC may regulate UNEs to the extent of their interstate use.[8]

SUMMARY OF ARGUMENT

In the seven months since Covad filed its brief, two significant developments — one originating from the Eighth Circuit, the other from the ILECs — have occurred. These developments relate to the use of the local telecommunications network to transport traffic between subscribers and their Internet Service Providers.

- First, on August 19, 1998, the United States Court of Appeals for the Eighth Circuit — in an opinion by the very same panel that authored the decision below – held that traffic between subscribers and their ISPs is jurisdictionally mixed, and that it is not feasible to separate this traffic into interstate and intrastate components. *See Southwestern Bell Telephone Company v. FCC*, No. 97-2618, slip op. at 41 (8th Cir. Aug. 19, 1998).

- Second, in recent months, four major Incumbent Local Exchange Carriers – Bell Atlantic, BellSouth, GTE, and Pacific Bell – have voluntarily filed tariffs with the FCC for their Digital Subscriber Line service. This service is used to transport traffic between subscribers and their ISPs. The ILECs stated that Federal tariffing is appropriate because, "at a minimum, a large portion of [this] traffic is interstate."

---

7. *Iowa Utilities Bd. v. FCC*, 120 F.3d at 799.

8. Covad *Amicus* Brief at 19-24.

These developments demonstrate a clear recognition — by the court below and by the ILECs — that a significant, and rapidly growing, portion of the traffic carried over local telecommunications networks is jurisdictionally interstate. This is true for both ILEC and CLEC networks. Consequently, the court below erred when it assumed that the UNEs that CLECs use to provide service are "fundamentally intrastate in character." Because this assumption provided the basis for the court's conclusion that the FCC lacks authority to adopt a UNE pricing methodology, that decision must be reversed.

I.

THE EIGHTH CIRCUIT'S RECENT RECOGNITION THAT INTERNET TRAFFIC CARRIED ON LOCAL NETWORKS IS JURISDICTIONALLY MIXED DEMONSTRATES THAT THE LOCAL NETWORK FACILITIES THAT CLECs USE TO PROVIDE SERVICE ARE NOT "FUNDAMENTALLY INTRASTATE IN CHARACTER."

In its initial brief, Covad demonstrated that, in the decision below, the court focused on only one category of traffic carried over local telecommunications networks: traditional voice telephone calls.[9] As a result, the court assumed that the vast majority of *all* traffic carried over local telecommunications networks is jurisdictionally intrastate. The court further assumed that regulation of this traffic could readily be separated into interstate and intrastate components.[10] Based on these assumptions, the court concluded that the FCC lacks any authority to adopt a pricing methodology for Unbundled Network Elements, which are the local network facilities that CLECs use to transport telecommunications traffic.[11]

9. *Id.* at 16-19.

10. *See id.*

11. *See id.* at 19-24.

In the subsequent *Southwestern Bell* case, however, the same panel was required to consider the jurisdictional nature of a different — and rapidly growing — category of traffic carried over local networks: data communications between a subscriber and the subscriber's ISP. The court, quite properly, recognized that this data traffic is jurisdictionally mixed, and that it cannot feasibly be separated into interstate and intrastate components.

The specific issue before the court in *Southwestern Bell* was whether the FCC had properly exercised its authority when it required incumbent local exchange carriers to recover the cost of transporting traffic between subscribers and their ISPs using a combination of Federal and State charges. The court upheld the FCC's action.

In reaching this conclusion, the court observed that:

> [T]he services provided by ISPs may involve both an intrastate and an interstate component and it may be impractical if not impossible to separate the two elements. *See People of State of California v. FCC*, 905 F.2d 1217, 1243 (9th Cir. 1990). Consequently, the FCC has determined that the [local telecommunications] facilties used by ISPs are "jurisdictionally mixed," carrying both interstate and intrastate traffic. FCC Brief at 79. Because the FCC cannot reliably separate the two components involved in completing a particular call, or even determine what percentage of overall ISP traffic is interstate or intrastate . . . the Commission has appropriately exercised its discretion to require ISPs [to compensate the ILECs through a combination of Federal and State charges].

Southwestern Bell Telephone, slip op. at 41. The court went on to note, with apparent approval, that the FCC is considering the imposition of "additional [Federal] regulation" of this physically local traffic "under a scheme yet to be determined." *Id.* at 42.

The Eighth Circuit's belated recognition that communications between subscribers and their ISPs are jurisdictionally mixed requires reversal of the decision below. There is wide-spread agreement that communications between subscribers and their ISPs now constitutes a substantial — and growing — portion of the traffic carried over local telecommunications networks. Indeed, such communications account for the vast majority of traffic that Covad transports on its UNE-based network. Because a significant amount of traffic carried over CLECs' UNE-based networks is jurisdictionally interstate, the Eighth Circuit plainly erred when it assumed that UNEs are "fundamentally intrastate in character."

As Covad demonstrated in its initial brief,[12] under well-established jurisdictional principles, the FCC has the authority to regulate local telecommunications network facilties used to transport jurisdictionally mixed telecommunications traffic "to the extent of their interstate use." *National Association of Regulatory Utility Commissioners v. FCC*, 746 F.2d 1492, 1498 (D.C. Cir. 1984). Given the Eighth Circuit's recognition that traffic between subscribers and their ISPs is jurisdictionally mixed, the FCC — at a minimum — may regulate UNEs used to transport this traffic "to the extent of their interstate use." Indeed, given the Eighth Circuit's further finding that the FCC cannot separate the traffic between a subscriber and the subscriber's ISP into discrete interstate and intrastate components, the FCC may assert exclusive Federal authority

12. Covad *Amicus* Brief at 19-24.

over UNEs used to transport such traffic. *See Louisiana Public Service Commission v. FCC*, 476 U.S. 355, 375 n.4 (1986) (FCC can preempt State regulation when it is "not possible to separate the interstate and intrastate components of . . . [an] FCC regulation.").

II.

THE ILECs' RECENT FCC TARIFF FILINGS RECOGNIZE THAT, AS A RESULT OF THE GROWTH OF THE INTERNET, A SIGNIFICANT PORTION OF THE TRAFFIC CARRIED OVER LOCAL TELECOMMUNICATIONS NETWORKS IS JURISDICTIONALLY INTERSTATE.

In the months since Covad filed its initial brief, four major Incumbent Local Exchange Carriers — Bell Atlantic, BellSouth, GTE, and Pacific Bell — have filed tariffs at the Federal Communications Commission for their new Digital Subscriber Line services.[13] The ILECs are deploying DSL service in order

13. *See* GTE Telephone Operating Companies, GTOC Tariff FCC No. 1, GTOC Transmittal No. 1148 (May 15, 1998); Pacific Bell Telephone Company, Pacific Bell Tariff FCC No. 128, Pacific Bell Transmittal No. 1986 (June 15, 1998); BellSouth Telecommunications, Inc., BellSouth Tariff FCC No. 1, BellSouth Transmittal No. 476 (Aug. 18, 1998); Bell Atlantic Telephone Companies, Bell Atlantic Tariff FCC No. 1, Bell Atlantic Transmittal No. 1076 (Sept. 1, 1998). After suspending each tariff for one day, the FCC allowed the tariffs to go into effect. The FCC is now conducting an investigation of the jurisdictional issues raised by each of these tariffs. *See GTE Telephone Operating Companies, GTOC Transmittal No.1148*, Order Designating Issues for Investigation, CC Docket No. 98-79 (Com. Car. Bur. Aug. 20, 1998); *Pacific Bell Telephone Company, Pacific Bell Transmittal No. 1986*, Order Designating Issues for Investigation, CC Docket 98-103 (Com. Car. Bur. Sept. 2, 1998); *BellSouth Telecommunications, Inc.*, (Cont'd)

to respond to the significant increase in ISP-bound traffic on their local networks.[14]

The ILECs' decision to file DSL tariffs at the FCC constitutes a significant departure from their established practice. The ILECs customarily have recovered most of the cost of carrying traditional voice traffic through tariffs filed with the State public utilities commissions. The ILECs, however, correctly recognize that ISP-bound traffic differs fundamentally from voice traffic. They have stated that Federal tariffing is appropriate because, while ISP-bound traffic cannot be separated into interstate and intrastate components,[15] "at a

---

(Cont'd)
BellSouth Transmittal No. 476, Order Designating Issues for Investigation, CC Docket No. 98-161 (Com. Car. Bur. Sept. 1, 1998); *Bell Atlantic Telephone Companies, Bell Atlantic Transmittal No. 1076*, Order Suspending Tariff and Designating Issues for Investigation, CC Docket No. 98-168 (Com. Car. Bur. Sept. 15, 1998).

14. The ILECs claim that, as a result of the phenomenal growth of the Internet, this traffic has created significant network congestion. DSL service is designed to address that problem by diverting ISP-bound traffic off the ILECs' circuit-switched networks and on to packet networks. *See, e.g.*, GTE Telephone Operating Companies, GTOC Tariff FCC No. 1, GTOC Transmittal No. 1148, Description and Justification, at 1-2. *See generally* Covad *Amicus* Brief at 3-4 (describing the operation of DSL service).

15. *See, e.g.*, Direct Case of Pacific Bell, CC Docket No. 98-103, at 10-11 (Sept. 11, 1998) ("Although ISP traffic clearly involved interstate communications, Pacific is unaware of any technical way to determine the physical location of a destination point on the Internet. Internet addresses are assigned logically, not geographically like telephone numbers. . . . It is thus simply not possible to determine whether a communication is intrastate or interstate when the destination point is unknown." Moreover, a customer that uses DSL to access his or (Cont'd)

minimum, a large portion of [this] traffic" is jurisdictionally interstate.[16]

Like the ILECs, Covad has deployed DSL service to accommodate ISP-bound traffic. And, like the ILECs, Covad has determined that, at a minimum, a large portion of this traffic is jurisdictionally interstate. The Eighth Circuit's decision, however, has stripped the FCC of authority to establish the pricing methodology for the Unbundled Network Elements that CLECs such as Covad use to provide DSL service. This has divested the FCC of its authority to regulate facilties used to provide a jurisdictionally interstate telecommunications service. As Covad demonstrated in its initial brief, the Communications Act neither permits — much less requires — such a result.

(Cont'd)
her Internet Service Provider "may communicate simultaneously with multiple destinations around the world. . . . It is not possible to separate the intrastate and interstate portions [of the DSL service when the customer] is simultaneously engaged in intrastate and interstate communications over the Internet.").

16. *See, e.g.*, Direct Case of GTE, CC Docket No. 98-79, at 15-16 (Sept. 8, 1998) (quoting *ACLU v. Reno*, 929 F. Supp. 824, 830-49 (E.D. Pa. 1998), *aff'd*, 117 S. Ct. 2329 (1997)) ("The overwhelming weight of authority confirms that, at a minimum, a large portion of the Internet traffic carried over [Digital Subscriber Line services] is interstate in nature. The Internet is a 'global medium of communications' that 'links people, institutions, corporations, and governments around the world.' ").

CONCLUSION

For the foregoing reasons, and those contained in Covad's initial brief, the Court should reverse the decision of the Eighth Circuit insofar as it holds that the FCC may not establish the pricing methodology that the States must apply to set UNE prices. At a minimum, the Court should make clear that the FCC may mandate the application of its pricing methodology when UNEs are used to provide jurisdictionally interstate telecommunications services.

Appendix 1 — The Covad Network 1a

Appendix 2 — Monthly Analog And Digital Loop Prices 2a

CONSENT OF PARTIES

Pursuant to Rule 37 of the Rules of Court, all the parties have consented to the filing of this brief. Their letters of consent have been filed with the Clerk of the Court.[1]

QUESTION PRESENTED

This brief addresses a single question raised by the Petitioners in this case: Whether the Federal Communications Commission has authority to adopt a national pricing methodology for Unbundled Network Elements.

INTEREST OF THE *AMICUS CURIAE*

Covad Communications Company ("Covad") is a Competitive Local Exchange Carrier ("CLEC") that provides high-speed, data-oriented telecommunications services. Covad was founded eight months after passage of the Telecommunications Act of 1996 in direct reliance on the Federal Communications Commission ("FCC") order at issue in this case. The Company's interests have been adversely affected by the decision of the court below.

Since its recent founding, Covad has built an all-digital,[2] all-packet[3] telecommunications network in the San Francisco Bay

1. Counsel for a party did not author this brief in whole or in part, and no person or entity, other than *amicus curiae*, has made a monetary contribution to the preparation or submission of the brief.

2. Digital technology uses electronic or optical "pulses" to represent the user's information. In contrast, traditional telephone networks, such as those deployed by the Incumbent Local Exchange Carriers ("ILECs"), rely on analog technology, which employs a continuous electrical signal that varies in frequency, to transmit information. The absence of frequency variations contributes to the superior quality of sound and video transmitted digitally.

3. A packet-switched network breaks user information into (Cont'd)

area that passes approximately one million homes and businesses. Covad has announced plans to expand its network to five other metropolitan areas in the coming year. Covad's advanced telecommunications network is used by small businesses and residential subscribers who seek affordable, high-speed access to the Internet in order to access information stored in computer servers anywhere in the world.[4] The Covad telecommunications network also is used by employees who work at home and connect to their company's multi-state and multi-national computer networks.

Covad's construction of its network would not have been possible without the provisions of the Telecommunications Act of 1996 that are under review in this case. In particular, Section 251(c)(3)[5] allows a CLEC, such as Covad, to enter the local telecommunications market by combining its own facilities with Unbundled Network Elements ("UNEs"). UNEs, which are leased from Incumbent Local Exchange Carriers ("ILECs"), are

---

(Cont'd)
individuals "packets" (sometimes called "cells" or "frames"), routes each packet over one of many possible transmission paths, and reassembles the packets at the point of reception. Packet-switched networks differ from the ILECs' circuit-switched networks, which create a temporary dedicated physical connection between the caller and the recipient. Packet-switched networks are especially well suited for data communications.

4. A server is a computer that is used to store information, such as a World Wide Web home page, which can be retrieved by an interested party. *See, infra*, n.29 (describing the operation of the World Wide Web).

5. The Telecommunications Act of 1996, Pub. L. No. 104-104, 110 Stat. 56 (1996), substantially amended the Communications Act of 1934, 47 U.S.C. §§ 151, *et seq*. For simplicity, all references to Sections are to the new sections of the Communications Act.

the physical "building blocks" of the ILECs' networks. Among the most critical of the UNEs is the "local loop," the wires running between almost every home and business in the United States and the ILEC "central office" that serves that customer. The Telecommunications Act directs the FCC to ensure that ILECs make UNEs available to CLECs at just and reasonable prices. *See* 47 U.S.C. §§ 251(c)(3), 251(d)(1).

Covad provides high-speed local telecommunications services by leasing the local loop from the ILEC in its service area and locating digital subscriber line ("DSL") equipment on the customer's premises and at the ILEC central office serving that customer.[6] From the central office, traffic is carried over high-capacity lines[7] to Covad's regional data aggregation center and, from there, to the user's Internet Service Provider ("ISP") or company computer network.

Covad's DSL network allows users to send and receive information over the existing local loop at much faster rates than conventional methods offered by the ILECs.[8] For example,

---

6. The DSL equipment located at the subscriber's premises is referred to as a DSL modem. The DSL equipment located at the ILEC's central office is referred to as a Digital Subscriber Line Access Multiplexer ("DSLAM"). A diagram depicting the Covad network is attached to this brief as Appendix One.

7. These lines include T1 lines (which carry data at the rate of 1.544 million bits per second), DS3 lines (which carry data at the rate of 45 million bits per second), and OC3 lines (which carry data at the rate of 155.52 million bits per second).

8. There are a number of variants of DSL technology, including Asymmetric DSL ("ADSL"), High bit rate DSL ("HDSL"), ISDN DSL ("IDSL"), and Very high bit rate DSL ("VDSL"). Collectively, these technologies often are referred to as xDSL. From the customer's perspective, the most significant difference among these technologies is the speed at which they can transport information.

an ILEC customer that has a personal computer and a standard analog modem generally can receive information over the local telephone network at speeds no greater than *56 thousand* bits per second. Covad's DSL service, in contrast, allows the customer to receive information over the same facilities at speeds up to *1.5 million* bits per second.[9]

Because DSL technology uses the existing local loop infrastructure, Covad's prices are substantially lower than the prices that the ILECs charge for services that require the deployment of entirely new facilities (such as end-to-end fiber optic links) to provide transmission service at equivalent speeds. Thus, Covad has helped to fulfill one of the Telecommunications Act's main goals: promoting the rapid deployment of advanced telecommunications services at affordable prices. *See* 47 U.S.C. § 157 (statutory notes).

SUMMARY OF ARGUMENT

In the Telecommunications Act, Congress created a "pro-competitive, deregulatory, national policy framework" designed to replace State-created regulated monopolies with competitive markets. The decision of the court below, however, has radically altered the division of responsibility between the FCC and the States established in the Act. In particular, the court held that the FCC cannot require the States to implement a uniform national methodology designed to ensure that the prices ILECs charge for UNEs are just and reasonable. Rather, in the court's view, each State has exclusive and unfettered authority to establish UNE prices.

---

9. By way of example, a user who seeks to download a 5 megabyte file — which is large enough to hold approximately 1 minute of video programming — would have to wait over *20 minutes* using traditional telephone technology. A user that obtained Covad's DSL service, in contrast, could download this information in just *27 seconds*.

The States' exercise of this judicially created authority has had a significant adverse effect on entrepreneurial companies, such as Covad, that are seeking to enter the local telecommunications market. Two years after adoption of the Act, many States have not issued a final order setting UNE prices. Where UNE prices have been set, they vary considerably — with some States mandating rates that plainly are not cost-based. For example, the price of an unbundled loop used to provide DSL service is *ten times higher* in Houston than in Chicago. Consequently, Covad has had to shelve plans to enter several significant markets. The end-result has been to deprive consumers of the benefits of the competitive local telecommunications market that Congress sought to create.

The conclusion of the court below that the FCC lacks any authority over UNE pricing is premised on two fundamental errors. First, the court erroneously concluded that Section 252 grants the States exclusive jurisdiction to set UNE prices. Second, the court wrongly held that, because UNEs are "fundamentally intrastate in character," Section 2(b) precludes the FCC from establishing a national pricing methodology for these facilities.

The court erred by finding that Section 252 — which provides that, in any arbitration, the State regulatory authority is to set UNE prices at a just and reasonable level — strips the FCC of authority to adopt a national pricing methodology for UNEs. In adopting the Telecommunications Act, Congress divided responsibilities between the FCC and the States. Section 251 unambiguously gives the FCC authority to adopt regulations necessary to implement the statutory requirement that ILEC rates for UNEs be just and reasonable. The court eviscerated this grant of authority by holding that Section 251 merely acts as a "time constraint" that gave the FCC six months to adopt regulations implementing a handful of statutory

provisions that *expressly* refer to FCC regulations. Rather than gutting the FCC's authority under Section 251, the court should have deferred to the FCC's reading of the statute. Under the FCC's approach, the agency may adopt a binding pricing methodology for UNEs, which the State regulatory authorities must apply in any arbitration to establish the specific rate that an ILEC is to charge.

The court also erred by finding that Section 2(b) — which limits the FCC's authority over facilities used to provide intrastate telecommunications services — prevents the FCC from adopting any pricing standards for UNEs. The court's first mistake was to assume that UNEs are used almost exclusively to provide intrastate telecommunications service. This is demonstrably incorrect. Covad's customers extensively use its UNE-based network to access information stored in computer servers outside their home State. The court further erred by holding that, even though UNEs are "sometimes" used to transport interstate traffic, the States have the exclusive and unfettered right to set UNE prices because those facilities are "fundamentally intrastate in character." This analysis is flatly inconsistent with the long-standing recognition, by numerous Courts of Appeals, that the FCC has authority to regulate physically intrastate facilities to the extent they are used to provide jurisdictionally interstate telecommunications services.

While the data communications carried over Covad's UNE-based network cannot readily be separated into interstate and intrastate categories, a very significant portion of this traffic plainly is jurisdictionally interstate. Consequently, the application of State pricing methodologies to the UNEs that Covad uses to provide service has prevented the FCC from applying its TELRIC methodology to facilities used to provide interstate telecommunications services. Such "reverse preemption" plainly violates the jurisdictional division of authority embodied in Section 2(b).

I.

THE EIGHTH CIRCUIT'S DECISION IS IMPEDING CONGRESS' EFFORTS TO CREATE A COMPETITIVE LOCAL TELECOMMUNICATIONS MARKET.

Historically, most States opposed competition in the local telecommunications market. Indeed, on the eve of the adoption of the Telecommunications Act, thirty-nine States had laws or regulations in effect that prohibited or restricted the competitive provision of telecommunications service.[10] In the Telecommunications Act, Congress created a "pro-competitive, deregulatory national policy framework"[11] designed to replace the State-created regulated monopolies with competitive markets.[12]

Congress crafted a two-pronged strategy to advance its pro-competitive national policy. As a start, Congress voided the legal restrictions on telecommunications competition adopted by the States.[13] Congress recognized, however, that eliminating legal

---

10. *See* National Association of Regulatory Utility Commissioners, Report on the State of Competition in Intrastate Telecommunications 203-05 (Sept. 1, 1994) (listing states); *see also* H.R. REP. No. 104-204, at 50 (1995), *reprinted in* 1996 U.S.C.C.A.N. 10, 14 ("[T]he majority of States restrict full and fair competition in the local exchange, either by statute or through the public utility commission's regulations.").

11. CONF. REP. No. 104-458, 104th Cong. 2d Sess. 1 (1996).

12. *See* H.R. REP. No. 104-204, at 48, *reprinted in* 1996 U.S.C.C.A.N. 10, 11 ("Technological advances would be more rapid and services would be more widely available and at lower prices if telecommunications markets were competitive rather than regulated monopolies.").

13. *See* 47 U.S.C. § 253(a) ("No State or local statute or regulation, or other State or local legal requirement, may prohibit or have the effect of prohibiting the ability of any entity to provide any interstate or intrastate telecommunications service.").

barriers to competition would not be sufficient: this would merely turn the ILECs' *de jure* monopolies into *de facto* monopolies, with little prospect that the American people would soon reap the benefits of competition. In order to "jump start" the competitive process, Congress also required the ILECs to break their networks into individual building blocks — UNEs — and to make those facilities available to new entrants at just and reasonable rates. *See* 47 U.S.C. §§ 251(c)(3), 251(d)(1).

Acting pursuant to an express grant of statutory authority, *see id.* § 251(d)(1), the FCC specified the network elements that the ILECs must unbundle.[14] The FCC further directed the States to apply a pricing methodology known as Total Element Long-Run Incremental Cost ("TELRIC"), which is intended to ensure that the rates that ILECs charge CLECs for UNEs are just and reasonable.[15] The TELRIC methodology seeks to estimate the prices that would exist for UNEs if they were sold in a competitive market.[16] The FCC concluded that setting prices in accordance with this methodology is essential to promote economically efficient entry into the local telecommunications market.[17]

17. *Id.*

Covad has used the statutory right to purchase UNEs to construct its state-of-the-art digital network.[18] However, the decision of the Eighth Circuit — which vacated the pro-competitive pricing rules adopted by the FCC, and held that the State regulatory authorities have exclusive and unfettered authority to set UNE prices — allows the States to set those prices at levels that create an insurmountable barrier for entrepreneurial companies such as Covad that seek to enter the local telecommunications market.

The prices that some State regulatory authorities have established for the local loop have been an especially serious obstacle to Covad's effort to bring the benefits of competition to additional markets.[19] Without a national standard, the price of these loops varies dramatically from State to State.[20] A comparison of loop prices in Illinois and Texas is illustrative. The Illinois Commerce Commission has set the monthly charge for loops at $3.72 in urban areas, $10.02 in suburban areas, and $11.53 in rural areas.[21] The State Commission has further

---

18. Covad uses the same two-wire local loops that the ILECs use to provide analog service. Covad can use most of these loops "as is." However, approximately fifteen percent of the loops that the Company orders require minor "conditioning" to make them suitable for its digital service. Such conditioning is not substantially different from the conditioning that ILECs often perform in order to make these loops useable for their analog services.

19. A chart comparing loop costs in several States is attached as Appendix Two.

20. In many States, moreover, Covad is required to pay a premium for loops capable of carrying digital traffic.

21. *See AT&T Communications of Illinois, Inc. Petition for Arbitration of Interconnection Rates, Terms and Conditions and* (Cont'd)

determined that the price of loops certified to carry analog or digital traffic should be the same.[22] In Texas, by contrast, the Public Utility Commission has established prices for loops that are significantly higher than in Illinois. A CLEC that seeks to obtain loops certified to carry digital traffic in Texas must make a monthly payment of $34.91 in urban areas, $37.54 in suburban areas, and $46.09 in rural areas.[23] The end-result is that the price a CLEC must pay to obtain a loop certified to carry digital traffic is *ten times more* in Houston than in Chicago.

(Cont'd)
Related Arrangements with Illinois Bell Telephone Company d/b/a/ Ameritech Illinois, Docket No. 96-AB-003 (Ill. Comm. Comm'n, Aug. 1, 1996); *Ameritech Illinois Petition for Arbitration of Interconnection Rates, Terms and Conditions and Related Arrangements with AT&T Communications of Illinois, Inc.*, Docket No. 96-AB-004 (Ill. Comm. Comm'n, Aug. 2, 1996).

22. *See id.* This approach is consistent with cost studies, prepared by the ILECs and filed at the FCC before the Telecommunications Act was passed, which show that the costs of loops certified to carry analog or digital traffic are virtually identical. *See Access Charge Reform*, First Report and Order, 12 FCC Rcd 15982, 16028-32 (1997) ("*Access Charge Order*") (comparing costs of analog-certified loops and loops which have been certified for Basic Rate Integrated Service Digital Network ("ISDN") service). Indeed, NYNEX submitted data showing that loops certified for digital traffic actually cost *less* than analog-certified loops because they can be tested and maintained remotely. *See id.* at 16197-99.

23. *See Petition of MFS Communications Company, Inc. for Arbitration of Pricing of Unbundled Loops*, Docket Nos. 16189, 16196, 16226, 16285, 16290, 16455, 17065, 17579, 17587, 17781, Arbitration Award (Tex. Public Utility Comm'n, Dec. 17, 1997). The monthly charge for an analog-certified loop in Texas is $12.14 in urban areas, $13.65 in suburban areas, and $18.98 in rural areas. *See id.* The State authorities thus have imposed a premium of nearly 200 percent for digital-certified loops.

The disproportionately high loop prices in some States cannot be based entirely on higher costs in those locations. Rather, these differentials must reflect a decision by the regulatory authorities in those States to price UNEs at levels well in excess of the level that would exist in a competitive market. For example, in one State, the Legislature apparently directed the regulatory authorities to set UNE prices based on historic cost. *See* Telecommunications Regulatory Reform Act of 1997, 1997 Ark. Acts 77, Section 9(E) (Feb. 4, 1997) (Arkansas).[24]

State regulatory decisions that set loop prices at levels far in excess of those that would exist in a competitive market have a significant adverse impact on Covad's ability to extend its network to additional States. There is broad consensus in the industry that the "price point" for mass-market acceptance of DSL service will be approximately $40 per month.[25] Indeed, U S WEST currently offers DSL service in several States at that price.[26] Plainly, Covad cannot profitably offer a competing DSL-based transport service if the cost of only one element of that service — the local loop — is close to, meets, or exceeds $40 per month. Consequently, Covad has had no choice but to

---

24. In a competitive market, sellers do not base their prices on historic costs. Rather, they set prices at a level equal to the marginal cost of the most efficient provider. Firms that cannot profitably sell their goods or services at that price exit the market.

25. This is comparable to prices now being charged for equally high-speed access services provided over cable systems. Forrester Research, Inc., The Forrester Report, *Cable Modems Kick In*, Jan. 1997.

26. *See, e.g.*, U S WEST Communications Advanced Communications Services Tariff, New Mexico, issued Jan. 26, 1998, section 8, page 9, release 1; *see also 1500-kbps Modems for Christmas? Not for Most of Us*, PC World, Apr. 1998 at 64.

shelve its plans to provide service in Texas. Covad may have to do the same in other States. The loss of market opportunities as a result of State regulatory decisions obviously harms Covad. More importantly, however, the Eighth Circuit's decision to give the States free reign to set UNE prices plainly undermines Congress' goal of rapidly bringing the benefits of a competitive local telecommunications market to *all* Americans.

Unless this Court acts, there is little hope that this situation will soon improve. Many States — including Washington and California — have yet to adopt final prices for UNEs, despite the fact that the deadlines contained in Section 252 have long since passed. *See* 47 U.S.C. § 252(b)(4)(c) (requiring State regulatory authorities to resolve disputed issues within nine months after a CLEC makes an initial request to an ILEC). Until they do, it will not be possible to appeal their decisions to the Federal District Courts, as provided for in the statute. *See id.* § 252(e)(5). Even then, however, it may take years for a single national standard to emerge from case-by-case adjudications in courts throughout the country.

II.

IN DETERMINING THAT THE STATES HAVE EXCLUSIVE AND UNFETTERED AUTHORITY TO SET PRICES FOR UNBUNDLED NETWORK ELEMENTS, THE EIGHTH CIRCUIT MISREAD CLEAR STATUTORY PROVISIONS, MISUNDERSTOOD CRITICAL FACTS, AND MISAPPLIED WELL-SETTLED PRECEDENT.

As demonstrated above, the Eighth Circuit's decision to allow States to exercise exclusive and unfettered authority over UNE prices is depriving consumers of the benefits of a competitive market. This outcome is not mandated by the Telecommunications Act. Rather, it results from two fundamental errors made by the court. First, the court erroneously concluded

that Section 252 grants the States exclusive and unfettered jurisdiction to set UNE prices. Second, the court wrongly held that, because UNEs are "fundamentally intrastate in character," Section 2(b) precludes the FCC from adopting any pricing standards for these facilities.

A. Sections 251 and 252 Empower the Federal Communications Commission to Adopt a National Pricing Methodology, Which the States Must Implement.

In its decision, the Eighth Circuit held that Section 252 strips the FCC of authority to adopt a pricing methodology applicable to UNEs. Neither the words nor the legislative history of the Telecommunications Act support this conclusion. To the contrary, the Act expressly grants the FCC the authority to establish a pricing methodology for UNEs, which the States must use in any arbitration.

In adopting the Telecommunications Act, Congress divided responsibilities between the FCC and the States. Section 251 requires that UNE rates be "just, reasonable, and nondiscriminatory in accordance with the . . . requirements of this section and section 252." 47 U.S.C. § 251(c)(3). Section 251(d)(1), in turn, directs the FCC to adopt rules "necessary . . . to implement the requirements of this section." *Id.* § 251(d)(1). Taken together, these provisions unambiguously grant the FCC authority to adopt regulations governing UNE pricing. At the same time, Section 252 provides that, in any arbitration between an ILEC and a CLEC, "a State Commission shall . . . establish any rates . . . for network elements . . . [at] just and reasonable rate[s]." *Id.* §§ 252(c)(2), 252(d)(1).

The court below sought to reconcile Sections 251 and 252 by eviscerating the FCC's authority under Section 251. The court reasoned that the "plain language" of Section 252

"authorize[s] the State commissions to determine the prices an incumbent LEC may charge for [UNEs]." *Iowa Utils. Bd. v. FCC*, 120 F.3d 753, 794 (8th Cir. 1997). By contrast, the court read Section 251(d)(1) "primarily as a time constraint" that gave the FCC six months to adopt regulations to implement a handful of statutory provisions that *expressly* refer to FCC regulations. *Id.* By doing so, the Court violated a cardinal rule of statutory construction: wherever possible, different sections of a statute should be interpreted so as to give effect to each provision. *See, e.g., Walters v. Metro. Educ. Enters.*, 117 S. Ct. 660, 664 (1997) ("Statutes must be interpreted, if possible, to give each word some operative effect.") (citation omitted); *United States v. New York & Cuba Mail S.S. Co.*, 269 U.S. 304, 305-06 (1925) (recognizing "fundamental canon, that a statute must be construed, if possible, as a harmonious whole, and in such a way as to give effect to all its parts.").

Rather than gutting the FCC's statutory authority, the court should have deferred to the FCC's reading of the statute. In the *Local Competition Order*, the agency concluded that Congress intended for it to play a quasi-legislative role, while the State regulatory authorities are to play a quasi-judicial role. Under this approach, the FCC has authority to adopt a binding *methodology* designed to ensure that an ILEC fulfills its statutory obligation to make UNEs available at just and reasonable prices. At the same time, in any arbitration, the State regulatory authorities are to apply the Federal methodology to establish *specific rates*. This interpretation is consistent with the terms of Section 252(c), which directs the State commission to "ensure" that its decision in any arbitration meets "the requirements of Section 251, including the regulations prescribed by the [FCC] pursuant to section 251." 47 U.S.C. § 252(c)(1).

This interpretation also is consistent with the structure of the Telecommunications Act, which seeks to ensure

implementation of Congress' pro-competitive policy by imposing a series of Federal "checks" on the authority of the States. For example, Congress provided that if a State fails to carry out its Federal obligation under the Act, the FCC is to "preempt[] the State commission's jurisdiction" and fulfill the obligations itself. *Id.* § 252(e)(5). Similarly, Congress specified that any decision made by a State regulatory authority pursuant to this legislation is subject to judicial review by a Federal district court. *See id.* § 252(e)(6).

In each of these cases, the Federal entity (whether the FCC or the district court) must apply a *Federal* standard in order to fulfill its statutory obligation. This inevitably will require the FCC or the Federal courts to develop a *Federal* pricing methodology. It defies credulity to argue that the FCC was powerless to adopt a Federal pricing methodology at the outset of the process of opening-up the local market to competition, even though the agency and the courts will be required to develop such a methodology on a case-by-case basis over time.

B. Section 2(b) Does Not Preclude Federal Communications Commission Regulation of Unbundled Network Elements Used to Provide Interstate Services.

The Eighth Circuit also found that Section 2(b) of the Communications Act — which limits the FCC's ability to set "charges . . . for or in connection with intrastate telecommunications service" — precludes the FCC from adopting any pricing standards for UNEs. The court based this conclusion on two assumptions: (1) UNEs are almost always used to provide jursidictionally intrastate service, *Iowa Utils. Bd.*, 120 F.3d at 796, 799, and (2) limited use of UNEs to provide interstate service does not provide the FCC with *any* jurisdiction over these facilities because they are "fundamentally intrastate in character." *id.* Both of these assumptions are incorrect.

1. Unbundled Network Elements are used extensively to provide interstate services.

The court's first mistake was to assume that UNEs are used almost exclusively to provide intrastate telecommunications service. This is demonstrably incorrect. While UNEs are *physically* intrastate facilities, the Telecommunications Act does not restrict their use to the provision of *jurisdictionally* intrastate services. To the contrary, Section 251(c)(3) provides that ILECs must lease UNEs to "any requesting telecommunications carrier" for the provision of any "telecommunications service." 47 U.S.C. § 251(c)(3). Indeed, the Eighth Circuit recognized these facilities "sometimes" are used for the provision of interstate telecommunications services. *See Iowa Utils. Bd.*, 20 F.3d. at 799 & n.20. However, the court wrongly assumed that the amount of interstate traffic carried over the local network is relatively small and, therefore, that State regulation of these facilities would have only a "tangential impact on interstate services." *Id.* at 800.

The Eighth Circuit plainly focused on only one type of interstate use of the local network: the origination and termination of circuit-switched long-distance voice telephone calls. *See id.* at 799 n.20. The court ignored the fact that the local network increasingly is used to carry data traffic, such as data transmitted during lengthy on-line "sessions" in which a user "downloads" information from the Internet. Indeed, several of the Bell Operating Companies ("BOCs") have predicted that, by the year 2000, data traffic will account for between 25 to 30 percent of all traffic carried on the telephone network.[27] Such

---

27. *See, e.g.*, Comments of U S WEST at 2-3 (filed May 8, 1996) ("Internet usage is growing exponentially .... [B]y the year 2000, as much as 30% of all local exchange traffic may be traffic which ultimately uses the Internet. A high percentage of this traffic will be (Cont'd)

traffic is far more likely than voice traffic to be interstate.[28]

Covad's experience provides clear evidence that a significant (and ever-increasing) portion of traffic carried over the physically intrastate network is jurisdictionally interstate. Covad's UNE-based network is extensively used by subscribers with personal computers seeking to access information located on the World Wide Web.[29] A subscriber who seeks to do so sends an information request over Covad's network to his or her information service provider. The subscriber's request is broken into numerous data packets, which are then routed to computer servers that contain the information requested by the user. During a single on-line session, the subscriber may receive information from computer servers located in several different

---

(Cont'd)
interstate in nature — much more than the current interstate traffic percentages on the voice network."); Comments of Pacific Bell and Nevada Bell at 11 (filed May 8,1996) (estimating that on-line data calls could comprise up to 25% of Pacific Bell's traffic by the end of the decade), filed in *The Provision of Telecommunications Service via the "Internet" by Non-tariffed, Uncertified Entities*, RM No. 8775.

28. At the present time approximately 15 percent of circuit-switched voice traffic is jurisdictionally interstate. *See* Federal Communications Commission, Federal-State Joint Board, *Monitoring Report*, CC Docket No. 87-339 (May 1997) at Table 4.5.

29. The World Wide Web is a powerful method of accessing information through the Internet. Web "browsers" can combine text and graphical material into a standard interface. The Web also incorporates a "hypertext" system that allows direct links between Web "pages." *See* Federal Communications Commission, Office of Plans and Policy, OPP Working Paper No. 29, *Digital Tornado: The Internet and Telecommunications Policy*, at 20 (Mar. 1997).

States.[30] In most cases, neither the subscriber, nor the ISP, nor Covad knows the location of the servers.[31]

30. Popular content is often "cached" in computer servers located close to major metropolitan areas, while less-popular content may be stored in only one remote location. For example, when a subscriber calls up the box score from last night's basketball game between the Chicago Bulls and the Boston Celtics on the ESPNET SportsZone Web site, that request may be sent to an in-state computer server. However, when the subscriber clicks an icon on his computer screen to request the career statistics of Michael Jordan, who played in that game, that request may be sent to a server in another State. A computer in a third State may perform authorization and billing functions.

31. Because traffic between a subscriber and an ISP is jurisdictionally mixed, and because it often is not possible to determine the portion of this traffic that is jurisdictionally interstate, the FCC has allowed ISPs to use the same State-tariffed local telephone service as other business customers, rather than the federally tariffed interstate access services used by long-distance carriers. *See Access Charge Order*, 12 FCC Rcd at 16133-34. The FCC's decision to delegate regulatory authority to the States, however, does not alter the fact that a significant portion of the traffic that flows between ISPs and their subscribers is jurisdictionally interstate. Consistent with this view, several of the Bell Operating Companies have informed Covad that Sections 51.701 through 51.717 of the FCC's Rules — which require ILECs to compensate CLECs for terminating ILEC-originated intrastate traffic — are not applicable to the ILEC-originated traffic that the CLEC terminates at an ISP's premises. *See* Letter from Patrick Garzillo, Managing Director, Carrier Markets, NYNEX, to Dhruv Khanna, Convergence Law Group, Apr. 15, 1997 ("[T]raffic that is being delivered to Internet Service Providers . . . is interstate in nature and not eligible for reciprocal compensation under the FCC's rules."); Letter from P. Doug Garrett, Executive Director, Local Interconnection Industry Market Group, to Tom Regan, Covad Communications, June 16, 1997 (ISP "originating traffic does not become 'local traffic' simply because the FCC permits an ISP to use business local exchange service. . . .").

Covad's local network also is used by employees to "telecommute." In this application, an employee who is working at home sends information to, and receives information from, the computer network located in his or her company's office. These office-based computer networks often are referred to as Local Area Networks ("LANs"). Increasingly, companies with multiple offices located in different States are connecting their LANs together into Wide Area Networks ("WANs"). Thus, an employee working at home in San Francisco can use Covad's network to access information stored in a server in his company's New York office, while another Bay Area employee can use the network to send an e-mail message to her colleagues in the company's Los Angeles and Seattle offices. Because most companies now provide access through their corporate computer networks to the Internet, the employee can send a copy of the e-mail to a friend who lives in Chicago.

Given the significant amount of interstate traffic carried over local network facilities, it is clear that the Eighth Circuit erred when it concluded that State regulation of UNE pricing would have only "a tangential impact on interstate services." *Id.* at 800. To the contrary, State regulation of UNE pricing is having a direct, substantial, and growing effect on the provision of jurisdictionally interstate telecommunications services by CLECs.

2. The Federal Communications Commission has jurisdiction over physically intrastate facilities to the extent of their interstate use.

The Eighth Circuit compounded its factual error with legal error. The court assumed that the presence of "some" interstate traffic on the CLECs' networks did not provide the FCC with *any* authority over UNE pricing because the presence of this traffic did not alter the UNEs' "fundamentally intrastate . . .

character." *Id.* at 799. While the Eighth Circuit claimed that it was engaging in a "traditional analysis" of the jurisdictional issues, *id.*, the court's approach is at odds with nearly seventy years of consistent judicial precedent. These cases have consistently recognized that the FCC has authority to regulate local telecommunications facilities to the extent that they are used to provide jurisdictionally interstate services. *See generally,* J. Nadler, *Give Peace a Chance: FCC-State Relations After California III*, 47 Fed. Comm. L.J. 457, 493-501 (1995).

The origin of the established jurisdictional approach is this Court's decision in *Smith v. Illinois Telephone Company*, 282 U.S. 133 (1930). In that case, the Illinois Commerce Commission established the rates that the local telephone company, Illinois Bell, could charge for telephone service in Chicago. The record indicated that *99.5 percent* of the traffic carried over Illinois Bell's local facilities was jurisdictionally intrastate. In developing the rates, however, the State regulatory authorities allocated *100 percent* of the costs of those facilities to the intrastate jurisdiction. On appeal, the three-judge district court — much like the Court of Appeals in the present case — concluded that, because *most* of the traffic carried over the local network was jurisdictionally intrastate, the regulatory authorities could ignore the fact that a portion of the traffic carried over the network was jurisdictionally interstate. *See id.* at 147.

This Court reversed. The Court stressed that "[t]he proper regulation of rates can be had only by maintaining the limits of state and federal jurisdiction." *Id.* at 149. While the Court recognized the difficulty of making "an exact apportionment of the property" between the Federal and the State jurisdictions, it made clear that regulatory authorities may not "ignore altogether the actual uses to which the property is put." *Id.* at 150-51. Rather, to the extent that the local network is used to provide even the smallest amount of interstate service, the Federal

regulatory authorities have the right — and, indeed, the obligation — to see that those costs are recovered through federally regulated rates. *See id.* at 148-49.

In the present case, the portion of traffic carried over UNE-based local networks that is jurisdictionally interstate is far greater than it was in *Smith*. Yet, the court below concluded that the FCC lacks *any* authority to ensure that the rates charged for these facilities are just and reasonable because it believed that the amount of interstate traffic is not great enough to alter the "fundamentally intrastate character" of the local network. The Eighth Circuit's jurisdictional analysis plainly is at odds with this Court's decision in *Smith*.

Rather than using the "fundamental character" approach concocted by the Eighth Circuit, the Courts of Appeals have repeatedly held that the FCC has jurisdiction over a physically intrastate facility to the extent that the facility is used to provide interstate communications. As the D.C. Circuit explained in *National Association of Regulatory Utilility Commissioners v. FCC* ("*NARUC II*"):

> The dividing line between the regulatory jurisdictions of the FCC and the States depends on the nature of the communications that pass through the facilities [and not on] the physical location of the lines. *Thus, purely intrastate facilities . . . used to complete even a single interstate call may become subject to FCC regulation to the extent of their interstate use.* Every court that has considered the matter has emphasized that the nature of the communication is determinative rather than the physical location of the facilities used. . . .

746 F.2d 1492, 1498 (D.C. Cir. 1984) (Bork, J.) (emphasis added) (quotations and citations omitted). This approach, the

court made clear, is grounded firmly on the Supremacy Clause. Because virtually all telecommunications facilities are physically intrastate, the FCC simply could not exercise its plenary authority to regulate interstate communications if it "were barred from regulating any facility that carried interstate calls but was physically intrastate." *Id.* at 1499.

In a closely analogous case, *California v. FCC*, 4 F.3d 1505 (9th Cir. 1993) ("*California II*"), the Ninth Circuit affirmed the authority of the FCC to regulate the prices that the ILECs charge for a type of unbundled network elements used for interstate purposes. *California II* grew out of the FCC's decision, in the mid-1980s, to establish a regulatory regime known as Open Network Architecture ("ONA"). The FCC adopted ONA in order to facilitate competition in the market for interstate enhanced services.[32] Under ONA, the BOCs were to unbundle their local networks into basic service elements ("BSEs"), which are network features and functions that enhanced service providers obtain from the BOCs in order to deliver service to their customers. *See Filing and Review of Open Network Architecture Plans*, 4 FCC Rcd 1, 36 (1988) ("*ONA Order*").

In the *ONA Order*, the FCC required the BOCs to file a Federal tariff for any BSE that could be used to provide an interstate enhanced service. California objected, arguing that "because BSEs are . . . [physically] intrastate features and functions, the FCC lacked authority to regulate them." *California II*, 4 F.3d at 1514. The Ninth Circuit rejected this argument. The court explained that, to the extent that BSEs could be used

---

32. Enhanced services are offerings — such as Internet access, electronic mail, access to on-line databases, and remote data processing — that combine telephone-company-provided transmission services with computer processing. *See* 47 C.F.R. § 64.702(a). The Telecommunications Act refers to these offerings as "information services." *See* 47 U.S.C. § 153(20).

to provide jurisdictionally interstate enhanced services, the FCC has the authority to regulate the price that the BOCs could charge for these network elements. *Id.* at 1515. The court observed that, in effect, "the state is seeking to preempt FCC regulation of [interstate] communication." This attempt at "reverse preemption," the court concluded, violates the division of Federal-State authority embodied in Section 2(b) of the Communications Act. *Id.*

The Eighth Circuit's decision in the present case cannot be reconciled with *Smith, NARUC II, California II,* or any of the numerous other cases that address the division of authority between the FCC and the States. Nor can the approach adopted by the court stand on its own merits. The fatal weakness in the court's approach is revealed in its discussion of the Federal access charge regime. The court recognized, as it must, that the FCC has jurisdiction to regulate the rates that the ILECs charge interexchange carriers ("IXCs") that use the ILECs' local facilities to originate and terminate interstate traffic. Yet, the court insisted that the FCC has no role in regulating the rates that the ILECs charge CLECs to lease the *identical* local facilities in order to provide the *identical* interstate service.

The only distinction that the court could muster is that an ILEC that provides interstate access service to an IXC is offering a "service," while an ILEC that leases a UNE to a CLEC is offering "a direct hookup" to the ILEC's network. *Iowa Utils. Bd.*, 120 F.3d at 799 n.20. This is a distinction without a difference. The extent of the FCC's jurisdiction plainly does not turn on whether the agency is seeking to regulate a telephone company service or whether it is seeking to regulate a telephone company facility used to provide that service. To the contrary, the FCC has authority to regulate both telephone company services and facilities to the extent of their interstate use. Were it otherwise, the FCC would be devoid of power to set depreciation

rates for local telephone company facilities to the extent that they are used to provide interstate services. This, of course, is plainly not the case. *See Louisiana Public Service Comm'n v. FCC*, 476 U.S. 355, 375-76 (1986).

Because UNEs can be (and extensively are) used to provide jurisdictionally interstate service, they are subject to the jurisdiction of the FCC to the extent of their interstate use. While the data communications carried over Covad's UNE-based network cannot readily be separated into interstate and intrastate categories,[33] a very significant portion of this traffic plainly is jurisdictionally interstate. The application of State pricing methodologies to the UNEs that Covad uses to provide service has prevented the FCC from applying its TELRIC methodology to facilities used to provide interstate services. As a result, the FCC has been stripped of its plenary authority to regulate interstate telecommunications. Section 2(b) does not require this result. To the contrary, such "reverse preemption" plainly violates the jurisdictional division of authority embodied in that provision.

---

33. *See, supra*, pp. 16-19.

CONCLUSION

By adopting the Telecommunications Act, Congress created a comprehensive Federal regime intended to rapidly replace State-created monopolies with competitive markets. The decision of the Eighth Circuit has effectively denied the American public the benefits that Congress sought to provide. Only this Court can set the matter straight.

Covad — on behalf of itself, its customers, and all those who believe in the benefits of competitive markets — respectfully asks this Court to reverse the decision of the Eighth Circuit insofar as it holds that the FCC may not establish the pricing methodology that the States must apply to set UNE prices. At a minimum, the Court should make clear that the FCC may mandate the application of its pricing methodology when UNEs are used to provide jurisdictionally interstate telecommunications services.
